- detection of HPV DNA subtype using nucleic acid probes (not routinely done but can be done in presence of abnormal Pap test to guide treatment)

### Treatment

- patient administered:
  - podofilox 0.5% solution or gel bid x 3 d in a row (4 d off) then repeat x 4 wk
  - imiquimod (Aldara®) 5% cream 3x/wk qhs x 16 wk
- provider administered:
  - cryotherapy with liquid nitrogen: repeat q1-2wk
  - podophyllin resin in tincture of benzoin: weekly
  - trichloroacetic acid (TCA) or bichloroacetic acid weekly (80-90%); safe in pregnancy
  - surgical removal/laser
  - intralesional interferon

### Prevention

- vaccination: Gardasil®, Cervarix® see Table 25, GY44
- condoms may not fully protect (areas not covered, must be used every time throughout entire sexual act)

Test of cure for *C. trachomatis* and *N. gonorrhoeae* is not routinely indicated. Repeat testing if symptomatic, if compliance with treatment is uncertain, or if pregnant.

### Genital Warts During Pregnancy

- Condyloma tend to get larger in pregnancy and should be treated early (consider excision)
- C-section only if obstruction of birth canal or risk of extensive bleeding.
- Do not use imiquimod, podophyllin or podofilox

### Human Rights in Health Equity: Cervical Cancer and HPV Vaccines

*Am J Law Med* 2009;35:365-387

- While cervical cancer rates have drastically fallen in developed countries due to effective prevention and treatment, socially disadvantaged women within these countries remain disproportionately more likely to develop and die of cervical cancer
- In most developing countries cervical cancer rates have risen or remained unchanged
- Must recognize that cervical cancer disparities between race groups, urban and rural residence, and high and low SES are attributed to disparate screening and vaccination coverage
- Programs are implemented without sufficient attention to conditions that render screening less effective or inaccessible to disadvantaged social groups including: lack of information, undervaluing of preventive care, opportunistic delivery in limited health care settings, sexual health stigma and related privacy concerns

## HERPES SIMPLEX VIRUS (HSV) OF VULVA

### Etiology

- 90% are HSV-2, 10% are HSV-1

### Clinical Features

- may be asymptomatic
- initial symptoms: present 2-21 d following contact
- prodromal symptoms: tingling, burning, pruritus
- multiple, painful, shallow ulcerations with small vesicles appear 7-10 d after initial infection (absent in many infected persons); lesions are infectious
- inguinal lymphadenopathy, malaise, and fever often with first infection
- dysuria and urinary retention if urethral mucosa affected
- recurrent infections: less severe, less frequent and shorter in duration (especially with HSV-1)

### Investigations

- viral culture preferred in patients with ulcer present, however decreased sensitivity as lesions heal
- cytologic smear (Tzanck smear)
  - multinucleated giant cells, acidophilic intranuclear inclusion bodies
- type specific serologic tests for antibodies to HSV-1 and HSV-2 (not available routinely in Canada)
- HSV DNA PCR

### Treatment

- first episode
  - acyclovir 400 mg PO tid x 7-10 d, or famciclovir 250 mg PO tid x 7-10 d, or valacyclovir 1 g PO bid x 7-10 d
- recurrent episode
  - acyclovir 400 mg PO tid x 3-5 d, or famciclovir 125 mg PO bid x 3-5 d, or valacyclovir 500 mg PO bid x 3 d
- daily suppressive therapy
  - consider if 6-8 recurrences per year
  - acyclovir 400 mg PO bid, or famciclovir 250 mg bid, or valacyclovir 0.5-1 g PO OD
- severe disease
  - consider IV therapy acyclovir 5-10 mg/kg IV q8h x 5-7 d
- education regarding transmission
- avoid contact from onset of prodrome until lesions have cleared
- use barrier contraception

#### Classically

**HSV I:** disease above the belt (oral).

**HSV II:** disease below the belt (genital).

#### HSV Infections During Pregnancy

- Antiviral suppression of women with first episode or history of HSV infections from 36 wk GA on
- C-section should be performed on women who have active genital lesions at time of delivery
- Treatment: acyclovir 400 mg PO tid

## SYPHILIS

### Etiology

- *Treponema pallidum*

### Classifications

- primary syphilis
  - 3-4 wk after exposure
  - painless chancre on vulva, vagina or cervix
  - painless inguinal lymphadenopathy
  - serological tests usually negative, local infection only
- secondary syphilis (can resolve spontaneously)
  - 2-6 mo after initial infection
  - nonspecific symptoms: malaise, anorexia, headache, diffuse lymphadenopathy
  - generalized maculopapular rash: palms, soles, trunk, limbs
  - condylomata lata: anogenital, broad-based fleshy grey lesions
  - serological tests usually positive
- latent syphilis
  - no clinical manifestations; detected by serology only
- tertiary syphilis
  - may involve any organ system
  - neurological: tabes dorsalis, general paresis
  - cardiovascular: aortic aneurysm, dilated aortic root
  - vulvar gumma: nodules that enlarge, ulcerate and become necrotic (rare)
- congenital syphilis
  - may cause fetal anomalies, stillbirths or neonatal death

#### Epidemiology of Genital Ulcers

HSV	70-80%
1° syphilis	5%
Chancroid ( <i>haemophilus ducreyi</i> )	<1%

### Investigations

- aspiration of ulcer serum or node
- darkfield microscopy (most sensitive and specific diagnostic test for syphilis)
  - spirochetes
- non-treponemal screening tests (VDRL, RPR); nonreactive after treatment, can be positive with other conditions
- specific anti-treponemal antibody tests (FTA-ABS, MHA-TP, TP-PA)
  - confirmatory tests; remain reactive for life (even after adequate treatment)

### Treatment

- treatment of primary, secondary, latent syphilis of <1 yr duration
  - benzathine penicillin G 2.4 million units IM single dose
  - treat partners, reportable disease
- treatment of latent syphilis >1 yr duration
  - benzathine penicillin G 2.4 million units IM q1wk x 3 wk
- treatment of neurosyphilis
  - IV aqueous penicillin G 3-4 million units IM q4h x 10-14 d
- screening
  - high risk groups
  - in pregnancy (see [Obstetrics](#), Table 13, OB21)

### Complications

- if untreated, 1/3 will experience late complications

### HIV

- see [Infectious Diseases](#), ID41

## Bartholinitis/Bartholin Gland Abscess

### Etiology

- often anaerobic and polymicrobial
- *U. urealyticum*, *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, *P. mirabilis*, *Streptococcus* spp., *S. aureus* (rare)
- blockage of duct

### Clinical Features

- unilateral swelling and pain in inferior lateral opening of vagina
- sitting and walking may become difficult and/or painful

### Treatment

- sitz baths, warm compresses
- antibiotics: cephalexin x 1 wk
- incision and drainage using local anesthesia with placement of Word catheter (10 French latex catheter) for 2-3 wk
- marsupialization under general anesthetic – more definitive treatment
- rarely treated by removing gland

**Figure 13. Bartholin's gland abscess**

## Pelvic Inflammatory Disease (PID)

- up to 20% of all gynecology-related hospital admissions

### Etiology

- causative organisms (in order of frequency)
  - *C. trachomatis*
  - *N. gonorrhoeae*
  - gonorrhea and chlamydia often co-exist
  - endogenous flora: anaerobic, aerobic, or both
    - ♦ *E. coli*, *Staphylococcus*, *Streptococcus*, *Enterococcus*, *Bacteroides*, *Peptostreptococcus*, *H. influenzae*, *G. vaginalis*
    - ♦ cause of recurrent PID
    - ♦ associated with instrumentation
  - *Actinomyces israelii* (Gram-positive, non acid-fast anaerobe)
    - ♦ 1-4% of PID cases associated with IUDs
  - others (TB, Gram-negatives, CMV, *U. urealyticum*, etc.)

### Risk Factors

- age <30 yr
- risk factors as for chlamydia and gonorrhea
- vaginal douching
- IUD (within first 10 d after insertion)
- invasive gynecologic procedures (D&C, endometrial biopsy)

#### PID

Inflammation of the upper genital tract (above cervix) including endometrium, fallopian tubes, ovaries, pelvic peritoneum, ± contiguous structures.

PID accounts for up to 20% of all gynecology hospital admissions.

### Clinical Presentation

- up to 2/3 asymptomatic: many subtle or mild symptoms
- common
  - fever  $>38.3^{\circ}\text{C}$
  - lower abdominal pain and tenderness
  - abnormal discharge: cervical or vaginal
- uncommon
  - nausea and vomiting
  - dysuria
  - AUB
- chronic disease (often due to chlamydia)
  - constant pelvic pain
  - dyspareunia
  - palpable mass
  - very difficult to treat, may require surgery

### Investigations

- bloodwork
  - $\beta$ -hCG (must rule out ectopic pregnancy), CBC, blood cultures if suspect septicemia
- urine R&M
- speculum exam, bimanual exam
  - vaginal swab for Gram stain, C&S
  - cervical cultures for *N. gonorrhoeae*, *C. trachomatis*
  - endometrial biopsy will give definitive diagnosis (rarely done)
- ultrasound
  - may be normal
  - free fluid in cul-de-sac
  - pelvic or tubo-ovarian abscess
  - hydrosalpinx (dilated fallopian tube)
- laparoscopy (gold standard)
  - for definitive diagnosis: may miss subtle inflammation of tubes or endometritis

### Treatment

- must treat with polymicrobial coverage
- inpatient if:
  - moderate to severe illness
  - atypical infection
  - adnexal mass, tubo-ovarian or pelvic abscess
  - unable to tolerate oral antibiotics or failed oral therapy
  - immunocompromised
  - pregnant
  - adolescent – first episode
  - surgical emergency cannot be excluded (e.g. ovarian torsion)
  - PID is secondary to instrumentation
  - recommended treatment
    - ♦ cefoxitin 2 g IV q6h (no longer available in U.S.A.) or cefotetan 2 g IV q12h + doxycycline 100 mg IV/PO q12h or
    - ♦ clindamycin 900 mg IV q8h + gentamicin 2 mg/kg IV loading dose then gentamicin 1.5 mg/kg q8h maintenance dose
    - ♦ continue IV antibiotics for 24 h after symptoms have improved then doxycycline 100 mg PO bid to complete 14 d
    - ♦ percutaneous drainage of abscess under U/S guidance
    - ♦ when no response to treatment, laparoscopic drainage
    - ♦ if failure, treatment is surgical (salpingectomy, TAH/BSO)
- outpatient if:
  - typical findings
  - mild to moderate illness
  - oral antibiotics tolerated
  - compliance ensured
  - follow-up within 48-72 h (to ensure symptoms not worsening)
  - recommended treatment:
    - ♦ ofloxacin 400 mg PO bid x 14 d or levofloxacin 500 mg PO bid x 14 d  $\pm$  metronidazole 500 mg PO bid x 14 d (if suspect abscess)
    - ♦ ceftriaxone 250 mg IM x 1 + doxycycline 100 mg PO bid x 14 d or cefoxitin 2 g IM x 1 + probenecid 1 g PO + doxycycline 100 mg PO bid  $\pm$  metronidazole 500 mg PO bid x 14 d
    - ♦ consider removing IUD after a minimum of 24 h of treatment
    - ♦ reportable disease
    - ♦ treat partners
    - ♦ consider re-testing for *C. trachomatis* and *N. gonorrhoeae* 4-6 wk after treatment if documented infection

#### PID Complications

##### I FACE PID

Infertility  
 Fitz-Hugh-Curtis syndrome  
 Abscesses  
 Chronic pelvic pain  
 Ectopic pregnancy  
 Peritonitis  
 Intestinal obstruction  
 Disseminated infection (sepsis, endocarditis, arthritis, meningitis)

#### PID Diagnosis

- **Must** have:
  - Lower abdominal pain
- **Plus** one of:
  - Cervical motion tenderness
  - Adnexal tenderness
- **Plus** one or more of:
  - High risk partner
  - Temperature  $>38^{\circ}\text{C}$
  - Mucopurulent cervical discharge
  - Positive culture for *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, or other vaginal flora
  - Cul-de-sac fluid, pelvic abscess or inflammatory mass on U/S or bimanual
  - Leukocytosis
  - Elevated ESR or CRP (not commonly used)

Treat PID with **FOXY DOXY**  
 (cefoxitin + doxycycline)

#### Alternative PID Treatments

For patients with contraindications to treatment with cephalosporins or quinolones, recent evidence suggests that a short course of azithromycin at a dose of either 250 mg PO daily for 1 wk or 1 g PO weekly for 2 wk combined with metronidazole is effective in achieving a clinical cure for acute PID.

Source: Update to the Canadian Guidelines on Sexually Transmitted Infections. January 2010.

**Complications of Untreated PID**

- chronic pelvic pain
- abscess, peritonitis
- adhesion formation
- ectopic pregnancy
- infertility
  - 1 episode of PID → 13% infertility
  - 2 episodes of PID → 36% infertility
- bacteremia
- septic arthritis, endocarditis

**Toxic Shock Syndrome**

- see [Infectious Diseases](#), ID26

**Risk Factors**

- tampon use
- diaphragm, cervical cap or sponge use (prolonged use, i.e. >24 h)
- wound infections
- post-partum infections
- early recognition and treatment of syndrome is imperative as incorrect diagnosis can be fatal

**Clinical Presentation**

- sudden high fever
- sore throat, headache, diarrhea
- erythroderma
- signs of multisystem organ failure
- refractory hypotension
- exfoliation of palmar and plantar surfaces of the hands and feet 1-2 wk after onset of illness

**Treatment**

- remove potential sources of infection (foreign objects and wound debris)
- debride necrotic tissues
- adequate hydration
- penicillinase-resistant antibiotics, e.g. cloxacillin
- steroid use controversial but if started within 72 h, may reduce severity of symptoms and duration of fever

**Toxic Shock Syndrome**

Multiple organ system failure due to *S. aureus* exotoxin (rare condition).

**Surgical Infections****Post-Operative Infections in Gynecological Surgery**

- pelvic cellulitis
  - common post hysterectomy, affects vaginal vault
  - erythema, induration, tenderness, discharge involving vaginal cuff
  - treat if fever and leukocytosis with broad spectrum antibiotics, i.e. clindamycin and gentamicin
  - drain if excessive purulence or large mass
  - can result in intra-abdominal and pelvic abscess
- see [General Surgery](#), *Post-Operative Fever*, GS7

**Sexual Abuse**

- see [Family Medicine](#), FM28, [Emergency Medicine](#), ER29

**Sexuality and Sexual Dysfunction****SEXUAL RESPONSE**

1. desire: energy that allows an individual to initiate or respond to sexual stimulation
2. arousal: physical and emotional stimulation leading to breast and genital vasodilation and clitoral engorgement
3. orgasm: physical and emotional stimulation is maximized, allowing the individual to relinquish their sense of control
4. resolution: most of the congestion and tension resolves within seconds, complete resolution may take up to 60 min

**SEXUAL DYSFUNCTION****Etiology**

- intrapsychic: patient's life experiences, value system
- relationship/interpersonal issues
- physical/organic

### Classification

- lack of desire (60-70% of women)
- lack of arousal
- anorgasmia (5-10%)
  - primary anorgasmia: never before achieved orgasm under any circumstances
  - secondary anorgasmia: was able to achieve orgasms before but now unable to
- dyspareunia (3-6%): painful intercourse, superficial or deep
  - vaginismus (15%)
  - vulvodynia
  - vaginal atrophy
  - vulvar vestibulitis: associated with history of frequent yeast infections
  - PID

### Treatment

- lack of desire: assess factors, rule out organic causes, relationship therapy, sensate focus exercises
- anorgasmia: self-exploration/pleasuring, relationship therapy if needed, bridging techniques (different sexual positions, clitoral stimulation during intercourse)
- dyspareunia
  - Kegel and reverse Kegel exercises
  - dilator treatment
  - comfort with self-exam
  - psychotherapy, other behavioural techniques
  - female on top position: allows for control of speed and duration
  - vestibulitis: remove local irritants, change in contraceptive methods, and dietary changes (increased citrate, decreased oxalate), vestibulectomy (rare)
  - vulvodynia: local moisturization, cold compresses, systemic nerve blocking therapy (amitriptyline, gabapentin), topical anesthetics, estrogen cream
  - pain clinic

#### Dyspareunia Cycle

#### Kegel Exercises

Regular contraction and relaxation to strengthen pelvic floor muscles.

#### Reverse Kegel Exercises

1 s contraction then 5 s of relaxation.

#### Menopause

Occurrence of last spontaneous menstrual period, resulting from loss of ovarian function (loss of oocyte response to gonadotropins).

#### "Being in menopause"

Lack of menses for 1 yr.

#### Perimenopause

Period of time surrounding menopause (2-8 yr preceding + 1 yr after last menses) characterized by fluctuating hormone levels, irregular menstrual cycles, and symptom onset.

- 85% of women experience hot flashes
- 20-30% seek medical attention
- 10% are unable to work

- Osteoporosis is the single most important health hazard associated with menopause
- Cardiovascular disease is the leading cause of death post-menopause

- Increased risk of breast cancer (RR 1.3) is associated with estrogen + progesterone HRT, but not with estrogen-only HRT
- All women taking HRT should have periodic surveillance and counseling regarding its benefits and risks

## Menopause

- see [Family Medicine](#), FM42

### Definitions

- lack of menses for 1 yr
- types of menopause
  - physiological; average age 51 yr (follicular atresia)
  - premature ovarian failure; before age 40 (autoimmune disorder, infection, Turner's syndrome)
  - iatrogenic (surgical/radiation/chemotherapy)

### Clinical Features

- associated with estrogen deficiency
  - vasomotor instability (tends to dissipate with time)
    - ♦ hot flashes/flushes, night sweats, sleep disturbances, formication, nausea, palpitations
  - urogenital atrophy involving vagina, urethra, bladder
    - ♦ dyspareunia, pruritus, vaginal dryness, bleeding, urinary frequency, urgency, incontinence
  - skeletal
    - ♦ osteoporosis, joint and muscle pain, back pain
  - skin and soft tissue
    - ♦ decreased breast size, skin thinning/loss of elasticity
  - psychological
    - ♦ mood disturbance, irritability, fatigue, decreased libido, memory loss

### Investigations

- increased levels of FSH (>35 IU/L) on day 3 of cycle (if still cycling) and LH (FSH>LH). But FSH level not always predictive due to monthly variation. Use absence of menses for 1 yr to diagnose
- decreased levels of estradiol (later)

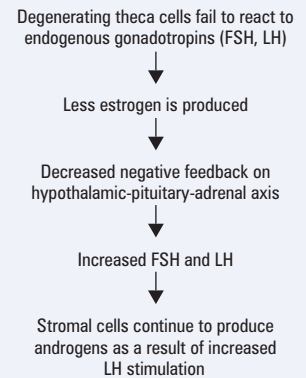

### Treatment

- goal is for individual symptom management
  - vasomotor instability
    - ♦ HRT (first line), SSRIs, venlafaxine, gabapentin, propranolol, clonidine
    - ♦ acupuncture
  - vaginal atrophy
    - ♦ local estrogen: cream (Premarin\*), vaginal suppository (VagiFem\*), ring (Estring\*)
    - ♦ lubricants (Replens\*)
  - urogenital health
    - ♦ lifestyle changes (weight loss, bladder re-training), local estrogen replacement, surgery

- osteoporosis
  - 1000-1500 mg calcium OD, 800-1000 IU vitamin D, weight-bearing exercise, quit smoking
  - bisphosphonates (e.g. alendronate)
  - selective estrogen receptor modifiers (SERMs): raloxifene (Evista®) – mimics estrogen effects on bone, avoids estrogen-like action on breast and uterine cancer; does not help hot flashes
  - HRT: second-line treatment (unless for vasomotor instability as well)
- decreased libido
  - vaginal lubrication, counseling, androgen replacement (testosterone cream or the oral form Andriol®)
- cardiovascular disease
  - management of cardiovascular risk factors
- mood and memory
  - antidepressants (first line), HRT (augments effect)
- alternative choices (not evidence-based, safety not established)
  - black cohosh, phytoestrogens, St. John's wort, ginkgo biloba, valerian, evening primrose oil, ginseng, Don Quai

#### Menopause Pathophysiology

#### Absolute Contraindications to HRT

##### ABCD

Acute liver disease  
 Undiagnosed vaginal Bleeding  
 Cancer (breast/uterine), Cardiovascular disease  
 DVT (thromboembolic disease)

## Hormone Replacement Therapy (HRT)

- see [Family Medicine](#), FM42
- primary indication is treatment of menopausal symptoms (vasomotor instability)
- keep doses low (e.g. 0.3 mg Premarin®) and duration of treatment short (<5 yr)

### HRT Components

- estrogen
  - oral or transdermal (e.g. patch, gel)
  - transdermal preferred for women with hypertriglyceridemia or impaired hepatic function, smokers and women who suffer from headaches associated with oral HRT
  - low-dose (preferred dose: 0.3 mg Premarin®/25 µg Estradot® patch, can increase if necessary)
- progestin
  - given in combination with estrogen for women with an intact uterus to prevent development of endometrial hyperplasia/cancer

**Table 15. Examples of HRT Regimens**

HRT Regimen	Estrogen Dose	Progestin Dose	Notes
<b>Unopposed Estrogen</b>	CEE 0.625 mg PO OD	None	If no intact uterus
<b>Standard-dose</b>	CEE 0.625 mg PO OD	MPA 2.5 mg PO OD, or micronized progesterone 100 mg PO OD	Withdrawal bleeding may occur in a spotty, unpredictable manner Usually abates after 6-8 mo due to endometrial atrophy Once patient has become amenorrheic on HRT, significant subsequent bleeding episodes require evaluation (endometrial biopsy)
<b>Standard-dose Cyclic</b>	CEE 0.625 mg PO OD	MPA 5-10 mg PO days 1-14 only, or micronized progesterone 200 mg PO OD days 1-14 only	Bleeding occurs monthly after day 14 of progestin (can continue for years) PMS-like symptoms (breast tenderness, fluid retention, headache, nausea) are more prominent with cyclic HRT
<b>Pulsatile</b>	CEE 0.625 mg PO OD	MPA low-dose	3 d on, 3 d off
<b>Transdermal</b>	Estroderm®-Estradiol 0.05 mg/d or 0.1 mg/d Estalis®-Estradiol 140 µg/d or 250 µg/d	Estroderm®-MPA 2.5 mg PO OD Estalis®-NEA 50 µg/d	Use patch twice weekly Can use oral progestins (Estroderm®) Combined patches available (Estalis®)

CEE = conjugated equine estrogen (e.g. Premarin®); MPA = medroxyprogesterone acetate (e.g. Provera®); NEA = norethindrone acetate  
 Consider lower dose regimens, PREMPRO® 0.45/1.5 (Premarin® 0.45 mg and Provera® 1.5 mg)

### Side Effects of HRT

- abnormal uterine bleeding
- mastodynia – breast tenderness
- edema, bloating, heartburn, nausea
- mood changes (progesterone)
- can be worse in progesterone phase of combined therapy

### Contraindications to HRT

- absolute
  - acute liver disease
  - undiagnosed vaginal bleeding
  - known or suspected uterine cancer/breast cancer
  - acute vascular thrombosis or history of severe thrombophlebitis or thromboembolic disease
  - cardiovascular disease

- relative
  - pre-existing uncontrolled hypertension
  - uterine fibroids and endometriosis
  - familial hyperlipidemias
  - migraine headaches
  - family history of estrogen-dependent cancer
  - chronic thrombophlebitis
  - diabetes mellitus (with vascular disease)
  - gallbladder disease, hypertriglyceridemia, impaired liver function (consider transdermal estrogen)
  - fibrocystic disease of the breasts

#### WOMEN'S HEALTH INITIATIVE (WHI) (launched in 1991)

- two non-randomized studies investigating health risks and benefits of HRT in healthy postmenopausal women 50-79 yr old
  - continuous combined HRT (CEE 0.625 mg + MPA 2.5 mg OD) in 16,608 women with an intact uterus
  - estrogen-alone (CEE 0.625 mg) in 10,739 women with a previous hysterectomy
- both arms of the trial were stopped early because of evidence of increased risk of breast cancer, stroke, PE and CHD in the combined HRT arm, and increased risk of stroke with no CHD benefits in the estrogen-alone arm
- the apparent increase in CHD was in disagreement with results of previous observational trial
- results of the WHI study have since been challenged and revision of how CHD was diagnosed led to loss of statistical significance of the results
- benefits and risks reported as number of cases per 10,000 women each year

**Table 16. HRT Benefits versus Risks**

Benefits	Risks
<b>Vasomotor Symptoms:</b> less frequent and severe with use of either combined or estrogen-alone HRT	<b>Stroke:</b> 8 additional cases with combined HRT, and 12 additional cases for estrogen alone (WHI)
<b>Osteoporosis:</b> 5 fewer cases of hip fractures and 47 fewer cases of all fractures with combined HRT. 6 fewer cases of hip fractures with estrogen alone	<b>DVT/PE:</b> 18 additional cases with combined HRT, and 9 additional cases for estrogen-alone (WHI)
<b>Colon Cancer:</b> 6 fewer cases with combined HRT (WHI). One additional case with estrogen-alone	<b>CHD:</b> 7 additional MIs with combined HRT (WHI). Secondary analysis suggests greater absolute risk for women aged > 70 yr and for women who start HRT > 10 yr post-menopause
	<b>Breast Cancer:</b> 8 additional cases with combined HRT (WHI). Risk only increased after > 5 yr of combined HRT use. No increased risk for estrogen-alone
	<b>Dementia and Mild Cognitive Impairment:</b> 50% greater risk of developing dementia in women taking estrogen-alone after age 65. Risk is greater for women taking combined HRT. Risk of developing dementia was reduced for women taking HRT before age 65

## Urogynecology

### Pelvic Relaxation/Prolapse

#### Etiology

- relaxation, weakness, or defect in the cardinal and uterosacral ligaments which normally maintain the uterus in an anteflexed position and prevent it from descending through the urogenital diaphragm (i.e. levator ani muscles)
- related to:
  - vaginal childbirth
  - aging
  - decreased estrogen (post-menopause)
  - following pelvic surgery
  - increased intra-abdominal pressure (obesity, chronic cough, constipation, ascites, heavy lifting)
  - congenital (rarely)
  - ethnicity (Caucasian women > Asian or African women)
  - collagen disorders

#### GENERAL CONSERVATIVE TREATMENT

- (for pelvic relaxation/prolapse and urinary incontinence)
- Kegel exercises
- local vaginal estrogen therapy
- vaginal pessary (intravaginal suspension disc)

#### Pelvic Relaxation/Prolapse

Protrusion of pelvic organs into or out of the vagina.

Table 17. Pelvic Prolapse

Type	Clinical Features	Treatment
<b>Uterine Prolapse</b> (protrusion of cervix and uterus into vagina)	<ul style="list-style-type: none"><li>Groin/back pain (stretching of uterosacral ligaments)</li><li>Feeling of heaviness/pressure in the pelvis<ul style="list-style-type: none"><li>Worse with standing, lifting</li><li>Worse at the end of the day</li><li>Relieved by lying down</li></ul></li><li>Ulceration/bleeding (particularly if hypoestrogenic)</li><li>± urinary incontinence</li></ul>	<ul style="list-style-type: none"><li>See <i>General Conservative Treatment</i>, GY34</li><li>Vaginal hysterectomy ± surgical prevention of vault prolapse</li><li>Consider additional surgical procedures if urinary incontinence, cystocele, rectocele, and/or enterocele are present</li></ul>
<b>Vault Prolapse</b> (protrusion of apex of vaginal vault into vagina, post-hysterectomy)		<ul style="list-style-type: none"><li>See <i>General Conservative Treatment</i>, GY34</li><li>Sacralcolpopexy (vaginal vault suspension), sacrospinous fixation, or uterosacral ligament suspension</li></ul>
<b>Cystocele</b> (protrusion of bladder into the anterior vaginal wall)	<ul style="list-style-type: none"><li>Frequency, urgency, nocturia</li><li>Stress incontinence</li><li>Incomplete bladder emptying ± associated increased incidence of urinary tract infections – may lead to renal impairment</li></ul>	<ul style="list-style-type: none"><li>See <i>General Conservative Treatment</i>, GY34</li><li>Anterior colporrhaphy (“anterior repair”)</li><li>Consider additional/alternative surgical procedure if documented urinary stress incontinence</li></ul>
<b>Rectocele</b> (protrusion of rectum into posterior vaginal wall)	<ul style="list-style-type: none"><li>Straining/digitation to evacuate stool</li><li>Constipation</li></ul>	<ul style="list-style-type: none"><li>See <i>General Conservative Treatment</i>, GY34</li><li>Also laxatives and stool softeners</li><li>Posterior colporrhaphy (“posterior repair”), plication of endopelvic fascia and perineal muscles approximated in midline to support rectum and perineum (can result in dyspareunia)</li></ul>
<b>Enterocele</b> (prolapse of small bowel in upper posterior vaginal wall)		<ul style="list-style-type: none"><li>Similar to hernia repair</li><li>Contents reduced, neck of peritoneal sac ligated, uterosacral ligaments, and levator ani muscles approximated</li></ul>

**Grading of Pelvic Organ Prolapse**

- 0 = no descent during straining
- 1 = distal portion of prolapse > 1 cm above level of hymen
- 2 = distal portion of prolapse ≤ 1 cm above or below level of hymen
- 3 = distal portion of prolapse > 1 cm below level of hymen but without complete vaginal eversion
- 4 = complete eversion of total length of lower genital tract
- **Procidentia:** failure of genital supports and complete protrusion of uterus through the vagina

The only **true** hernia of the pelvis is an **ENTEROCELE** because peritoneum herniates with the small bowel.

Figure 14. Pelvic anatomy

**Rectocele**

**Cystocele**

**Uterine Prolapse**

**Enterocele**

**Figure 15. Rectocele, cystocele, uterine prolapse, enterocele**

## Urinary Incontinence

- see [Urology](#), U6

### STRESS INCONTINENCE

#### Risk Factors for Stress Incontinence in Women

- pelvic prolapse
- pelvic surgery
- vaginal delivery
- hypoestrogenic state (post-menopause)
- age
- smoking
- neurological/pulmonary disease

#### Treatment

- see *General Conservative Treatment*, GY34
- surgical
  - tension-free vaginal tape (TVT), tension-free obturator tape (TOT), prosthetic/fascial slings or retropubic bladder suspension (Burch or Marshall-Marchetti-Krantz procedures)

### URGE INCONTINENCE

#### Definition

- urine loss associated with an abrupt, sudden urge to void
- “overactive bladder”
- diagnosed based on symptoms

#### Etiology

- idiopathic (90%)
- detrusor muscle overactivity (“detrusor instability”)

#### Associated Symptoms

- frequency, urgency, nocturia, leakage

#### Treatment

- behaviour modification (reduce caffeine/liquid, smoking cessation, regular voiding schedule)
- Kegel exercises
- medications
  - anticholinergics: oxybutinin (Ditropan®), tolterodine (Detrol®), solifenacin (VESIcare®)
  - tricyclic antidepressants: imipramine

#### Stress Incontinence

Involuntary loss of urine with increased intra-abdominal pressure (coughing, laughing, sneezing, walking, running).

The gold standard diagnostic test for urinary incontinence is multichannel urodynamics. A large proportion of cases are correctly diagnosed from clinical history alone and this can be supplemented with patient urinary and intake diaries.

Systemic review and evaluation of methods of assessing urinary incontinence. *Health Technol Assess* 2006;10:1-132.

#### Urge Incontinence

Urine loss associated with an abrupt, sudden urge to void.

#### Rule Out Neurological Causes of Urge Incontinence

- Multiple sclerosis
- Herniated disc
- Diabetes mellitus

## Gynecological Oncology

### Uterus

### ENDOMETRIAL CARCINOMA

#### Epidemiology

- most common gynecological malignancy in North America (40%); 4th most common cancer in women
- 2-3% of women develop endometrial carcinoma during lifetime
- mean age is 60 yr
- majority are diagnosed in early stage due to detection of symptoms
- 85-90% 5-yr survival for stage I disease
- 70-80% overall 5-yr survival for all stages

#### Risk Factors

- Type I: excess estrogen (estrogen unopposed by progesterone)
  - obesity
  - PCOS
  - unbalanced HRT (balanced HRT is protective)
  - nulliparity
  - late menopause
- estrogen-producing ovarian tumours (e.g. granulosa cell tumours)
- HNPCC (hereditary non-polyposis colorectal cancer)/Lynch II syndrome
- tamoxifen

#### Incidence of Malignant Gynecological Lesions in North America

endometrium > ovary > cervix > vulva  
> vagina > fallopian tube

#### Complications of Therapy:

- Surgical site infection
- Lymphedema
- Radiation fibrosis
- Cystitis
- Proctitis

- Type II: not estrogen-related
  - possibly tamoxifen

### Classification and Clinical Features

- Type I (well-differentiated endometrioid adenocarcinoma) ~80% of cases:
  - postmenopausal bleeding in majority, abnormal uterine bleeding in majority of affected premenopausal women (menorrhagia, intermenstrual bleeding)
- Type II (serous, clear cell carcinoma, grade 3 endometrioid, undifferentiated, carcinosarcoma) ~15% of cases:
  - may not present with bleeding in early stage, more likely to present with advanced stage disease with symptoms like ovarian cancer (i.e. bloating, bowel dysfunction, pelvic pressure)

### Investigations

- endometrial sampling:
  - office endometrial biopsy
  - D&C ± hysteroscopy
- ± pelvic ultrasound (in women where adequate endometrial sampling not feasible without invasive methods)
  - not acceptable as alternative to pelvic exam or endometrial sampling to rule out cancer

**Table 18. FIGO Staging of Endometrial Cancer (2009)**

Stage	Description	Stage	Description
I	<b>Confined to corpus</b>	IIIC	Metastasis to pelvic ± para-aortic LNs
IA	No or less than half myometrial invasion	IIIC1	Positive pelvic LN
IB	Invades through ≥½ of myometrium	IIIC2	Positive para-aortic LN ± positive pelvic LNs
II	<b>Tumour invades cervical stroma, but does not extend beyond uterus*</b>	IV	<b>Invasion of bladder ± bowel mucosa ± distant metastases</b>
		IVA	Invasion of bladder ± bowel mucosa
III	<b>Local and/or regional spread of the tumour</b>	IVB	Distant mets, including intra-abdominal mets ± inguinal LNs
IIIA	Invasion of serosa, corpus uteri ± adnexae		
IIIB	Vaginal ± parametrial involvement		

FIGO: International Federation of Gynecology and Obstetrics

\*Note: endocervical glandular involvement is now considered as Stage I (previously Stage II)

### Spread

- direct extension is most common
- lymphatic spread to pelvic and para-aortic nodes
- transtubal dissemination to peritoneal cavity
- hematogenous spread (usually to lungs, liver)

### Treatment

- surgical: hysterectomy/bilateral salpingo-oophorectomy (BSO) and pelvic washings ± pelvic and para-aortic node dissection ± omentectomy
  - goals: diagnosis, staging, treatment, defining optimal adjuvant treatment
  - laparoscopic approach associated with improved quality of life (optimal for most patients)
- adjuvant radiotherapy (for improved local control in patients at risk for local recurrence) and adjuvant chemotherapy (in patients at risk for distant recurrence or with metastatic disease): based on presence of poor prognostic factors in definitive pathology
- chemotherapy: often used for recurrent disease (especially if high grade or aggressive histology)
- hormonal therapy: progestins can be used for recurrent disease (especially if low grade)

### UTERINE SARCOMA

- rare; 2-6% of all uterine malignancies
- arise from stromal components (endometrial stroma, mesenchymal or myometrial tissues)
- behave more aggressively and are associated with worse prognosis than endometrial carcinoma; 5-yr survival is 35%
- vaginal bleeding is most common presenting symptom

#### Risk Factors for Endometrial Cancer

##### COLD NUT

Cancer (ovarian, breast, colon)

Obesity

Late menopause

Diabetes mellitus

Nulliparity

Unopposed estrogen: PCOS, anovulation, HRT

Tamoxifen: chronic use

Postmenopausal bleeding = endometrial cancer until proven otherwise.  
95% present with vaginal bleeding.

An endometrial thickness of 5 mm or more is considered abnormal in a postmenopausal woman with vaginal bleeding.

#### True Pelvis

Area of pelvis between pelvic inlet and outlet, i.e. it does not include the abdominal contents in the pelvis found above the pelvic inlet.

#### Prognostic Factors

Most important is FIGO stage

Other Prognostic Factors:

- Age
- Grade
- Histologic subtype
- Depth of myometrial invasion
- Presence of lymphovascular space involvement (LVSI)
- Hormone receptor status

#### Uterine Sarcoma – Symptoms

##### BAD-P

Bleeding

Abdominal distention

Foul smelling vaginal Discharge

Pelvic Pressure

**Table 19. Summary of Uterine Sarcoma Subtypes and Features**

Type	Epidemiology	Features	Diagnosis	Treatment
<b>PURE TYPE</b>				
<b>1. Leiomyosarcoma</b>	<ul style="list-style-type: none"> <li>Accounts for 40%</li> <li>Average age of presentation is 55 yr but may present in pre-menopause</li> <li>Often coexists with benign leiomyomata (fibroids)</li> <li>50% arise within a fibroid ("sarcomatous degeneration")</li> </ul>	<ul style="list-style-type: none"> <li>Histologic distinction from leiomyoma               <ol style="list-style-type: none"> <li>Increased mitotic count (&gt;10 mitoses/10 high power fields)</li> <li>Tumour necrosis</li> <li>Cellular atypia</li> </ol> </li> <li>Rapidly enlarging fibroids in a pre-menopausal woman</li> <li>enlarging fibroids in a postmenopausal woman</li> </ul>	<ul style="list-style-type: none"> <li>Often postoperatively after uterus removed for presumed fibroids</li> <li>Staging using FIGO 2009 staging for Leiomyosarcomas</li> </ul>	<ul style="list-style-type: none"> <li>Hysterectomy/BSO usually</li> <li>No routine pelvic lymphadenectomy</li> <li>Adjuvant chemotherapy may be used if tumour has spread beyond uterus, for palliation</li> <li>Radiation therapy does not improve local control or survival</li> <li>Poor outcomes overall, even for early stage disease</li> </ul>
<b>2. Endometrial Stromal Sarcoma (ESS)</b>	<ul style="list-style-type: none"> <li>Accounts for 10-15%</li> <li>Usually presents in perimenopausal or postmenopausal women with abnormal uterine bleeding</li> </ul>	<ul style="list-style-type: none"> <li>Abnormal uterine bleeding</li> <li>Good prognosis</li> </ul>	<ul style="list-style-type: none"> <li>Diagnosed by histology of endometrial biopsy or D&amp;C</li> <li>Staging using FIGO 2009 staging for ECC and Adenosarcoma</li> </ul>	<ul style="list-style-type: none"> <li>Hysterectomy/BSO (remove ovaries as ovarian hormones may stimulate growth)</li> <li>No routine pelvic lymphadenectomy</li> <li>Adjuvant therapy based on stage and histologic features (hormones and/or radiation)</li> <li>Hormonal therapy (progestins) may be used for metastatic disease</li> </ul>
<b>3. Undifferentiated Sarcoma</b>	<ul style="list-style-type: none"> <li>Accounts for 5-10%</li> </ul>	<ul style="list-style-type: none"> <li>Severe nuclear pleomorphism, high mitotic activity, tumour cell necrosis and lack smooth muscle or endometrial stromal differentiation</li> <li>Poor prognosis</li> </ul>	<ul style="list-style-type: none"> <li>Often found incidentally postoperatively for abnormal bleeding</li> </ul>	<ul style="list-style-type: none"> <li>Treatment primarily surgical</li> <li>Radiation and/or chemotherapy for advanced disease or unresectable disease</li> </ul>
<b>MIXED TYPE</b>				
<b>4. Adenosarcoma</b>	<ul style="list-style-type: none"> <li>The rarest of the uterine sarcoma</li> <li>Mixed tumour of low malignant potential</li> </ul>	<ul style="list-style-type: none"> <li>Present with abnormal vaginal bleeding</li> <li>Polypoid mass in uterine cavity</li> </ul>	<ul style="list-style-type: none"> <li>Mixture of benign epithelium with malignant low-grade sarcoma</li> <li>Often found incidentally at time of hysterectomy for PMB</li> </ul>	<ul style="list-style-type: none"> <li>Treatment is surgical with TAH/BSO</li> </ul>
<b>RECLASSIFIED</b>				
<b>5. Carcinosarcoma</b>	<ul style="list-style-type: none"> <li>Most common (43%)</li> <li>Recently reclassified as high grade endometrioid carcinoma with associated metaplasia of the mesenchyme, rather than arising separately from stroma</li> <li>Surgical staging using FIGO 2009 staging for endometrial cancer</li> </ul>	<ul style="list-style-type: none"> <li>Both epithelial and stromal malignant elements present</li> <li>Tend to form bulky polypoid masses that often fill uterine cavity and extend into or through the endocervical canal – often have extrauterine disease at presentation</li> </ul>	<ul style="list-style-type: none"> <li>Diagnosed by histology of endometrial biopsy or D&amp;C</li> </ul>	<ul style="list-style-type: none"> <li>Usually treated as "high grade endometrial carcinoma" since behaviour and treatment similar (i.e. surgical staging and resection of any gross metastatic disease, adjuvant chemotherapy and radiation)</li> </ul>

**Table 20. FIGO Staging of Uterine Sarcoma (2009)**

Stage	Description	Stage	Description
<b>I</b>	<b>Tumour limited to uterus</b>	<b>III</b>	
IA	<5 cm	IIIA	Tumour invades abdominal tissues, one site
IB	>5 cm	IIIB	Metastasis to pelvic and/or para-aortic lymph nodes
		IIIC	Tumour invades bladder and/or rectum
<b>II</b>	<b>Tumour extends beyond uterus</b>	<b>IV</b>	
IIA	To the pelvis, adnexal involvement	IVA	Tumour invades bladder and/or rectum
IIB	To extra-uterine pelvic tissue	IVB	Distant metastasis

A rapidly enlarging uterus, especially in a postmenopausal woman, should prompt consideration of leiomyosarcoma.

## Ovary

### BENIGN OVARIAN TUMOURS

- see Table 21
- many are asymptomatic
- usually enlarge slowly, if at all
- may rupture or undergo torsion, causing pain
  - pain associated with torsion of an adnexal mass usually originates in the iliac fossa and radiates to the flank
- peritoneal irritation may result from an infarcted tumour – rare

#### Ovarian Tumor Markers

- Epithelial cell – CA-125
- Stromal
  - Granulosa cell – inhibin
  - Sertoli-Leydig – androgens
- Germ cell
  - Dysgerminoma – LDH
  - Yolk sac – AFP
- Choriocarcinoma –  $\beta$ -hCG
- Immature Teratoma – none
- Embryonal cell – AFP +  $\beta$ -hCG

## MALIGNANT OVARIAN TUMOURS

- see Table 21

### Epidemiology

- lifetime risk 1.4% (1/70)
- in women >50 yr, more than 50% of ovarian tumours are malignant
- causes more deaths in North America than all other gynecologic malignancies combined
- 4th leading cause of cancer death in women
- 65% epithelial; 35% non-epithelial
- 5-10% of epithelial ovarian cancers are related to hereditary predisposition

### Risk Factors (for epithelial ovarian cancers)

- excess estrogen:
  - nulliparity
  - early menarche/late menopause
- age
- family history of breast, colon, endometrial, ovarian cancer
- race: Caucasian

### Protective Factors (for epithelial ovarian cancers)

- OCP: likely due to ovulation suppression (significant reduction in risk even after 1 yr of use)
- pregnancy/breastfeeding
- tubal ligation (recently questioned)
- hysterectomy (without removal of ovaries)
- BSO (prophylactic surgery performed for this reason in high risk women – i.e. BRCA mutation carriers)

### Screening

- no effective method of mass screening
- routine CA-125 level measurements or U/S not recommended
  - high false positive rates
- controversial in high risk groups: transvaginal U/S and CA-125, starting age 30 (no consensus on interval)
  - familial ovarian cancer (>1 first degree relative affected, BRCA-1 mutation)
  - other cancers (e.g. endometrial, breast, colon)
  - BRCA-1 or BRCA-2 mutation: may recommend prophylactic bilateral oophorectomy after age 35 or when child-bearing is completed

### Clinical Features

- most women with epithelial ovarian cancer present with advanced stage disease since often “asymptomatic” until disseminated disease (symptoms with early stage disease are vague and non-specific)
- when present, symptoms may include:
  - abdominal symptoms (nausea, bloating, dyspepsia, anorexia, early satiety)
  - symptoms of mass effect
    - ♦ increased abdominal girth – from ascites or tumour itself
    - ♦ urinary frequency
    - ♦ constipation
  - postmenopausal bleeding; irregular menses if pre-menopausal (rare)

### Low Malignant Potential (also called “Borderline”) Tumours

- pregnancy, OCP and breastfeeding are protective factors
- ~15% of all epithelial ovarian tumours
- tumour cells display malignant characteristics histologically, but no invasion is identified
- able to metastasize, but not commonly
- treated primarily with surgery (BSO/omental biopsy ± hysterectomy)
  - NO proven benefit of chemotherapy
- generally slow growing, excellent prognosis
  - 5-yr survival >99%
  - recurrences tend to occur late, may be associated with low grade serous carcinoma

#### Ovaries are like GEMS

Germ-cell  
Epithelial  
Metastatic  
Sex cord stromal

#### Risk/Protective Factors for Epithelial Ovarian Cancer

##### NO CHILD

Nulliparity  
OCP, breast-feeding, tubal ligation, hysterectomy (protective)  
Caucasian  
Family History  
Increasing age (>40)  
Late menopause  
Delayed child-bearing

**Effects of screening on ovarian cancer mortality: The prostate, lung, colorectal and ovarian cancer screening randomized controlled trial**  
JAMA 2011;305:2295-2303

**Objective:** To evaluate the effect of screening for ovarian cancer with CA-125 and transvaginal ultrasound on mortality in the prostate, lung, colorectal and ovarian (PLCO) cancer screening trial.

**Participants:** 78,216 women aged 55-74 yr.

**Study Groups:** Intervention group – annual screening with CA-125 for 6 yr, transvaginal ultrasound for 4 yr; control group – no CA-125 or transvaginal ultrasound screening, received usual medical care.

**Follow-up:** Maximum 13 yr (median, 12.4 yr).

**Outcome Measures:** Mortality from ovarian cancer, including primary fallopian tube cancers. Secondary outcomes included ovarian cancer incidence and complications associated with screening, examinations and diagnostic procedures.

**Results:** Of those diagnosed with ovarian cancer in the intervention and usual care group, the mortality was 3.1% and 2.6% respectively. 15% of women undergoing diagnostic evaluation following a false positive screening test suffered a complication of the procedure.

**Conclusions:** Simultaneous screening with CA-125 and transvaginal ultrasound compared with usual care did not reduce ovarian cancer mortality. Diagnostic evaluation following a false positive screening test was associated with complications.

Any adnexal mass in postmenopausal women should be considered malignant until proven otherwise.

Most (70%) epithelial ovarian cancers present at stage III disease.

Diagnosis of ovarian tumours requires surgical pathology.

Table 21. Ovarian Tumours

Type	Description	Presentation	Ultrasound/Cytology	Treatment
<b>FUNCTIONAL TUMOURS (all benign)</b>				
<b>Follicular cyst</b> 	Follicle fails to rupture during ovulation	Usually asymptomatic May rupture, bleed, tort, infarct causing pain $\pm$ signs of peritoneal irritation	4-8 cm mass, unilocular, lined with granulosa cells	Symptomatic or suspicious masses warrant surgical exploration Otherwise if < 6 cm, wait 6 wk then re-examine as cyst usually regresses with next cycle OCP (ovarian suppression) – will prevent development of new cysts Treatment usually laparoscopic (cystectomy vs. oophorectomy, based on fertility choice)
<b>Lutein cyst</b>	Corpus luteum fails to regress after 14 d, becoming cystic or hemorrhagic	More likely to cause pain than follicular cyst May delay onset of next period	Larger (10-15 cm) and firmer than follicular cysts	Same as for follicular cysts
<b>Theca-lutein cyst</b>	Due to atretic follicles stimulated by abnormal $\beta$ -hCG levels	Associated with molar pregnancy, ovulation induction with clomiphene		Conservative Cyst will regress as $\beta$ -hCG levels fall
<b>Luteoma of pregnancy</b>	Usually bilateral Due to prolonged elevation of $\beta$ -hCG	Associated with multiple pregnancy		Same as for theca-lutein (conservative) Regresses postpartum
<b>Endometrioma</b>	See <i>Endometriosis</i> , GY16			
<b>Polycystic Ovaries</b>				
<b>BENIGN GERM-CELL TUMOURS</b>				
<b>Benign cystic teratoma (dermoid)</b> 	Single most common ovarian germ cell neoplasm Elements of all 3 cell lines; contains dermal appendages (sweat and sebaceous glands, hair follicles, teeth)	May rupture, twist, infarct 20% bilateral 20% occur outside of reproductive yr	Smooth-walled, mobile, unilocular Ultrasound may show calcification which is pathognomonic	Treatment usually laparoscopic cystectomy; may recur
<b>MALIGNANT GERM-CELL TUMOURS</b>				
<b>General Information</b>	Rapidly growing, 2-3% of all ovarian cancers	Usually children and young women (<30 yr)		Surgical resection (often conservative unilateral salpingo-oophorectomy $\pm$ nodes) $\pm$ chemo
<b>Dysgerminoma</b>	Produces lactate dehydrogenase (LDH)	10% bilateral		Usually very responsive to chemotherapy, therefore complete resection is not necessary for cure
<b>Immature teratoma</b>	No tumour marker identified			
<b>Yolk sac tumour</b>	Produces fetoprotein (AFP) Rare	Unilateral		More aggressive subtype, often need chemo (bleomycin, etoposide, cisplatin, BEP)
<b>Embryonal</b>	Produces AFP and $\beta$ -hCG			
<b>Carcinoma</b>	Rare			
<b>Choriocarcinoma</b>	Produces $\beta$ -hCG			
<b>Mixed Germ Cell</b>	Depends on type of tumour involved			
<b>EPITHELIAL OVARIAN TUMOURS (malignant or borderline)</b>				
<b>General Information</b>	Derived from mesothelial cells lining peritoneal cavity Classified based on histologic type 80-85% of all ovarian neoplasms (includes malignant)		Varies depending on subtype	<b>Borderline</b> Cystectomy vs. unilateral salpingo-oophorectomy <b>Malignant</b> 1. Early stage (stage 1): Hysterectomy/BSO/staging (omentectomy, peritoneal biopsies, washings, pelvic and para-aortic lymphadenectomy) 2. Advanced stage: Upfront cytoreductive (debulking) followed by adjuvant chemotherapy consisting of IV carboplatin/paclitaxel versus Intraperitoneal chemotherapy (stage III) Neoadjuvant chemotherapy with IV carboplatin/paclitaxel followed by delayed debulking with further adjuvant IV chemotherapy
<b>Serous</b>	Most common ovarian tumour 50% of all ovarian cancers 75% of epithelial tumours 70% benign	20-30% bilateral	Lining similar to fallopian tube epithelium Often multilocular Histologically contain Psammoma bodies (calcified concentric concretions)	

Table 21. Ovarian Tumours (continued)

Type	Description	Presentation	Ultrasound/Cytology	Treatment
<b>EPITHELIAL OVARIAN TUMOURS (malignant or borderline)</b>				
<b>Mucinous</b>	20% of epithelial tumours 85% benign	Rarely complicated by <i>Pseudomyxoma peritonei</i> : implants seed abdominal cavity and produce large quantities of mucin	Resembles endocervical epithelium Often multilocular May reach enormous size	Poor response to chemotherapy If mucinous, remove appendix as well to rule out possible source of primary disease
<b>Endometrioid</b>	20% of epithelial ovarian Ca High malignant potential		Histology resembles endometrium	
<b>Clear cell</b>	≤1% of epithelial ovarian Ca High malignant potential		Histology resembles mesonephric cells	
<b>Brenner tumour</b>	≤1% of epithelial ovarian Ca Majority benign		Fibrotic tumour with transitional cell-like epithelial core	
<b>SEX CORD STROMAL OVARIAN TUMOURS</b>				
<b>General Information</b>				Surgical resection of tumour Chemotherapy may be used for unresectable metastatic disease
<b>Fibroma/thecoma (benign)</b>	From mature fibroblasts in ovarian stroma	Non-functioning Occasionally associated with Meig's syndrome (benign ovarian tumour and ascites and pleural effusion)	Firm, smooth rounded tumour with interlacing fibrocytes	
<b>Granulosa-theca cell tumours (benign or malignant)</b>	Can be associated with endometrial cancer Inhibin is tumour marker	Estrogen-producing → feminizing effects (precocious puberty, menorrhagia, postmenopausal bleeding)	Histologic hallmark of cancer is small groups of cells known as Call-Exner bodies	
<b>Sertoli-Leydig cell tumour (benign or malignant)</b>	Can measure elevated androgens as tumour markers	Androgen-producing → virilizing effects (hirsutism, deep voice, recession of front hairline)		
<b>METASTATIC OVARIAN TUMOURS</b>				
<b>From GI tract, breast, endometrium, lymphoma</b>	4-8% of ovarian malignancies Krukenberg tumour – metastatic ovarian tumour (usually GI tract, commonly stomach or colon, breast) with "signet-ring" cells			

### Investigation of Suspicious Ovarian Mass

- women with suspected ovarian cancer based on history, physical, or investigations should be referred to a gynecologic oncologist
  - bimanual examination
    - solid, irregular, or fixed pelvic mass is suggestive of ovarian cancer
  - RMI (Risk of Malignancy Index) is best tool available to assess likelihood of ovarian malignancy and need for pre-operative gynaecologic oncology referral (see sidebar)
- bloodwork: CA-125 for baseline, CBC, liver function tests, electrolytes, creatinine
- radiology:
  - bone scan or PET scan not indicated
  - transvaginal ultrasound best to visualize ovaries
  - CT scan abdomen and pelvis to look for metastatic disease
- try to rule out other primary source if suspected, based on:
  - occult blood per rectum: endoscopy ± barium enema
  - gastric symptoms, gastroscopy ± upper GI series
  - abnormal vaginal bleeding, endometrial biopsy to rule out concurrent endometrial cancer, colposcopy ± ECC to rule out cervical cancer if abnormal cervix
  - breast lesion identified or risk factors present: mammogram

**A Risk of Malignancy Incorporating CA125, Ultrasound and Menopausal Status for the Accurate Preoperative Diagnosis of Ovarian Cancer**  
BJOG 1990;97:922-929

$RMI = U \times M \times CA-125$

Ultrasound Findings (1 pt for each)

- Multilocular cyst
  - Evidence of solid areas
  - Evidence of metastases
  - Presence of ascites
  - Bilateral lesions
- $U = 1$  (for U/S scores of 0 or 1)  
 $U = 4$  (for U/S scores of 2-5)

Menopausal Status

- Postmenopausal:  $M = 4$
- Pre-menopausal:  $M = 1$

Absolute Value of CA-125 Serum Level  
 • For  $RMI > 200$ : Gynecologic oncology referral is recommended

**Table 22. FIGO Staging for Primary Carcinoma of the Ovary (Surgical Staging) (2009)**

Stage	Description
<b>I</b>	<b>Growth limited to the ovaries</b>
IA	1 ovary, no ascites, no tumour on external surface, capsule intact
IB	2 ovaries, no ascites, no tumour on external surface, capsule intact
IC	1 or 2 ovaries with any of the following: capsule ruptured, tumour on ovarian surface or malignant cells in ascites
<b>II</b>	<b>Growth involving one or both ovaries with pelvic extension</b>
IIA	Extension ± metastases to uterus/tubes
IIB	Extension to other pelvic structures
IIC	II A/B with malignant cells in ascites or positive peritoneal washings
<b>III</b>	<b>Tumour involving one or both ovaries with peritoneal implants outside the pelvis and/or positive retroperitoneal or inguinal nodes. Superficial liver mets is Stage III</b>
IIIA	Microscopic peritoneal metastasis beyond pelvis, LNs negative
IIIB	Macroscopic peritoneal metastasis beyond pelvis <2 cm, LNs negative
IIIC	Implant >2 cm and/or retroperitoneal or inguinal nodes
<b>IV</b>	<b>Distant metastasis beyond peritoneal cavity</b>

FIGO: International Federation of Gynecology and Obstetrics

**Causes of Elevated CA-125**

- Age influences reliability of test as a tumour marker
- 50% sensitivity in early stage ovarian cancer (poor) – therefore not good for screening

**Malignant**

- Gyn: ovary, uterus
- Non-Gyn: pancreas, stomach, colon, rectum

**Non Malignant**

- Gyn: benign ovarian neoplasm, endometriosis, pregnancy, fibroids, PID
- Non-Gyn: cirrhosis, pancreatitis, renal failure

CA-125 is indicated for monitoring response to treatment.

**Malignant Ovarian Tumour Prognosis**

<b>5-yr Survival</b>	
Stage I	75-95%
Stage II	60-75%
Stage III	23-41%
Stage IV	11%

**Figure 16. The cervix**

## Cervix

**BENIGN CERVICAL LESIONS**

- Nabothian cyst/inclusion cyst
  - no treatment required
- endocervical polyps
  - treatment is polypectomy (office procedure)

**MALIGNANT CERVICAL LESIONS****Epidemiology**

- majority are squamous cell carcinomas (95%); adenocarcinomas increasing (5%); rare subtypes include small cell, adenosquamous
- 8,000 deaths annually in North America
- annual Pap test reduces a woman's chance of dying from cervical cancer from 0.4% to 0.05%
- average age at presentation: 52 yr old

**Etiology**

- at birth, vagina is lined with squamous epithelium; columnar epithelium lines only the endocervix and the central area of the ectocervix (original squamocolumnar junction)
- during puberty, estrogen stimulates eversion of a single columnar layer (ectopy), thus exposing it to the acidic pH of the vagina, leading to metaplasia (change of exposed epithelium from squamous to columnar)
  - a new squamocolumnar junction forms as a result
- the transformation zone (TZ) is the area located between the original and the current squamocolumnar junction
- the majority of dysplasias and cancers arise in the TZ of the cervix
- must have active metaplasia in presence of inducing agent (HPV) to get dysplasia
- dysplasia → carcinoma in situ (CIS) → invasion
- slow process (~10 yr on average)
- growth is by local extension
- metastasis occurs late

**Risk Factors**

- HPV infection
  - see *Sexually Transmitted Infections*, GY27
  - high risk of neoplasia associated with types 16, 18
  - low risk of neoplasia associated with types 6, 11
  - >99% of cervical cancers contain one of the high risk HPV types
- high risk behaviours (risk factors for HPV infection)
  - multiple partners
  - other STIs (HSV, trichomonas)
  - early age at first intercourse
  - high risk male partner
- smoking
- poor screening uptake is the most important risk factor for cervical cancer in Canada
- at-risk groups include:
  - immigrant Canadians
  - First Nations Canadians
  - geographically isolated Canadians
  - sex-trade workers
  - low socioeconomic status

Cervical Cancer Screening Guidelines (Pap Test)

- see [Family Medicine](#), FM4

Clinical Features

- squamous cell carcinoma (SCC): exophytic, fungating tumour
- adenocarcinoma: endophytic, with barrel-shaped cervix
- early
  - asymptomatic
  - discharge: initially watery, becoming brown or red
  - post-coital bleeding
- late
  - 80-90% present with bleeding: either post-coital, postmenopausal or irregular bleeding
  - pelvic or back pain (extension of tumour to pelvic walls)
  - bladder/bowel symptoms
- signs
  - friable, raised, reddened or ulcerated area visible on cervix

Cervical cancer is caused by HPV infection.

Table 23. Cytological Classification: Terminology Used to Describe Lesions

Bethesda Grading System (Pap Test Cytology)	Classic System/Cervical Intraepithelial Neoplasia (CIN) Grading System (Biopsy)
Within normal limits	Normal
Infection	Inflammatory atypia (organism)
Reactive and reparative changes	
Squamous cell abnormalities	
Atypical squamous cells of undetermined significance (ASCUS)	Squamous atypia of uncertain significance
Atypical squamous cells, cannot exclude HSIL (ASC-H)	
Low grade squamous intraepithelial lesion (LSIL)	HPV atypia or mild dysplasia (CIN I)
High grade squamous intraepithelial lesion (HSIL)	Moderate dysplasia (CIN II) Severe dysplasia (CIN III) Carcinoma in situ (CIS)
Squamous cell carcinoma (SCC)	Squamous cell carcinoma (SCC)
Glandular cell abnormalities	
Atypical glandular cells of undetermined significance (AGUS)	Glandular atypia of uncertain significance
Endocervical adenocarcinoma	Adenocarcinoma
Endometrial adenocarcinoma	
Extrauterine adenocarcinoma	
Adenocarcinoma, not otherwise specified (NOS)	

**The Bethesda Classification System** is based on cytological results of a Pap test that permits the examination of cells but not tissue structure. The diagnosis of cervical intraepithelial neoplasia (CIN) or cervical carcinoma requires a tissue sample, obtained by biopsy of suspicious lesions (done during colposcopy), to make a histologic diagnosis.

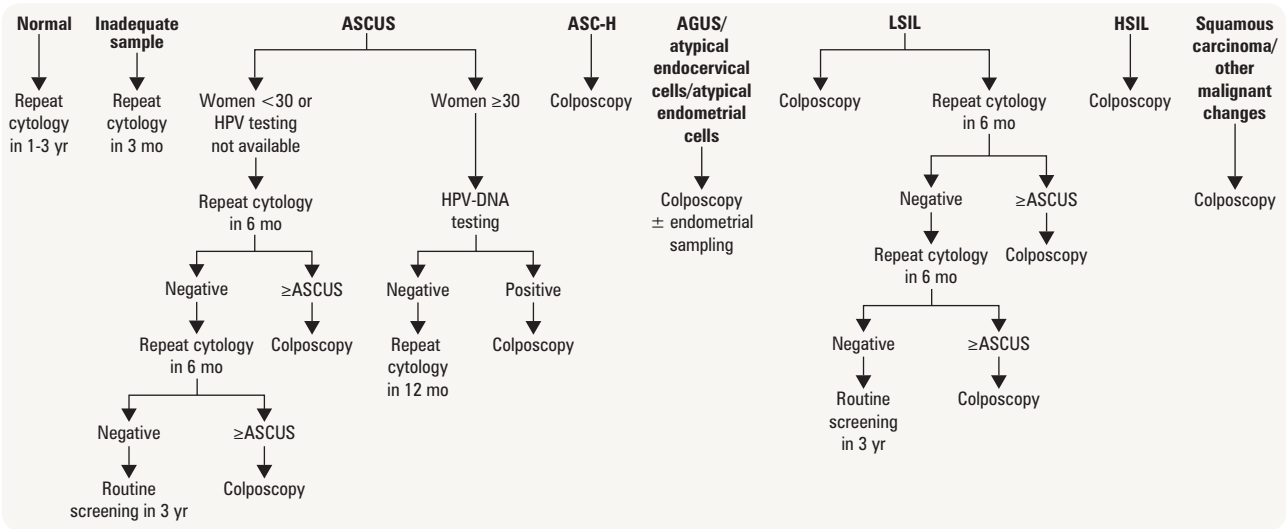

Figure 17. Decision making chart for Pap test (not applicable for adolescents)

Adapted from Ontario Cervical Screening Practice Guidelines. May 2012. Cervical screening guidelines unique to each province.

## Diagnosis

- see *Colposcopy*, GY9
- apply acetic acid and identify acetowhite lesions, punctation, mosaicism, and abnormal blood vessels to guide cervical biopsy
- endocervical curettage (ECC) if entire lesion is not visible or no lesion visible
- diagnostic excision (loop electrosurgical excision procedure, LEEP) if:
  - lesion extends into endocervical canal
  - positive ECC
  - discrepancy between Pap test results and colposcopy
  - microinvasive carcinoma
- consider cold knife conization (in OR) if glandular abnormality suspected based on cytology or colposcopic findings due to concern for margin interpretation
- tests permitted for FIGO clinical staging include: physical exam (including EUA), cervical biopsy (including cone biopsy), proctoscopy/cystoscopy, IVP, ultrasound liver/kidneys, CXR, LFTs
- MRI and/or CT and/or PET scan often done to facilitate planning of radiation therapy, results do not influence clinical stage

**Table 24. FIGO Staging Classification of Cervical Cancer (Clinical Staging)**

Stage	Description
<b>I</b>	<b>Confined to cervix</b>
IA	Microinvasive (diagnosed only by microscopy)
IA <sub>1</sub>	Stromal invasion not >3 mm deep, not >7 mm wide
IA <sub>2</sub>	3-5 mm deep; not >7 mm wide
IB	Clinically visible lesion confined to cervix, or microscopic lesion >IA
IB <sub>1</sub>	Clinically visible lesion ≤4 mm in greatest dimension
IB <sub>2</sub>	Clinically visible lesion >4 mm in greatest dimension
<b>II</b>	<b>Beyond uterus but not to the pelvic wall or lower 1/3 of vagina</b>
IIA	No obvious parametrial involvement
IIA <sub>1</sub>	Clinically visible lesion ≤4 mm in greatest dimension
IIA <sub>2</sub>	Clinically visible lesion >4 mm in greatest dimension
IIB	Obvious parametrial involvement
<b>III</b>	<b>Extends to pelvic wall, and/or involves lower 1/3 of vagina and/or causes hydronephrosis or non-functioning kidney</b>
IIIA	Involves lower 1/3 vagina but no extension into pelvic side wall
IIIB	Extension into pelvic side wall and/or hydronephrosis or non-functioning kidney
<b>IV</b>	<b>Carcinoma has extended beyond true pelvis or has involved (biopsy proven) the mucosa of the bladder or rectum</b>
IVA	Spread of the growth to adjacent organs
IVB	Distant metastases

## Treatment: Prevention and Management

### Prevention: HPV Vaccine

- two vaccines currently approved (Gardasil®, Cervarix®)

**Table 25. Comparison of Two Vaccines against Human Papillomavirus (HPV)**

	Gardasil®	Cervarix®
Viral strains covered	6, 11, 16, 18	16, 18
Route of administration	IM	IM
Schedule of dosing	0, 2, 6 mo	0, 1, 6 mo
Side effects	Local: redness, pain, swelling General: headache, low grade fever, GI upset	Local: redness, pain, swelling General: headache, low grade fever, GI upset
Approved age	Females age 9-45, males age 9-26	Females age 10-25
Contraindications	Pregnant women and women who are nursing (limited data)	

- for optimal benefit of vaccination, should be administered before onset of sexual activity (i.e. before exposure to virus)
- may be given at the same time as Hep B or other vaccines using a different injection site
- not for treatment of active infections
- most women will not be infected with all four types of the virus at the same time, therefore vaccine is still indicated for sexually active females or those with a history of previous HPV infection or HPV-related disease
- conception should be avoided until 30 d after last dose of vaccination

### Liquid-based Cytologic Smear Study and Conventional Papanicolaou Smears: A Meta-analysis of Prospective Studies Comparing Cytologic Diagnosis and Sample Adequacy

*Am J Obstet Gynecol* 2001;185:308-317

**Purpose:** To assess the cytologic diagnosis and sample adequacy of liquid-based cervical cytologic smear (ThinPrep) versus conventional Papanicolaou smear.

**Study:** Systematic review of prospective trials comparing ThinPrep and conventional Pap smears. Main outcomes: Frequency of diagnoses of ASCUS, LSIL, HSIL; and adequacy of sample collection (i.e. contains squamous cells, endocervical cells, and possibly metaplastic cells).

**Results:** 25 studies met the selection criteria (n=533,039 women; 221,864 in ThinPrep group; 378,659 in conventional smear group; 67,484 in both groups). Liquid-based smears (ThinPrep) had significantly improved cytologic diagnosis of LSIL (OR = 1.27 to 2.15) and diagnosis of HSIL (OR = 2.26), but no difference in rate of diagnosis of ASCUS (OR = 1.03). Liquid-based Pap smear also resulted in improved sample adequacy (OR = 1.64 to 2.11).

**Conclusion:** Liquid-based cytologic smears resulted in better diagnosis of cervical premalignant lesions (HSIL and LSIL) and improved sample adequacy, compared to conventional Pap smears.

### Prophylactic Vaccination Against Human Papillomavirus Infection in Women: A Systematic Review of Randomized Controlled Trials

*CMAJ* 2007;177:469-479

**Purpose:** To assess the effectiveness of HPV vaccination for preventing HPV infection and precancerous cervical lesions.

**Study:** Systematic review of studies of prophylactic HPV vaccination.

**Data Sources:** MEDLINE, EMBASE, Cochrane Central Registry of Controlled Trials, and the Cochrane Library.

**Patients:** Of 457 studies, nine were included in the review (six of these were RCTs). A total of 40,323 females were enrolled. All participants had received HPV vaccinations that included coverage of the HPV 16 strain.

**Main outcomes:** Frequency of high-grade cervical lesions, persistent HPV infection, low-grade cervical lesions, external genital lesions, adverse events, and death.

**Results:** HPV vaccination was associated with a reduction in the frequency of high-grade cervical lesions caused by vaccine-type HPV strains compared with control groups. The HPV vaccination was also found to be efficacious in reducing persistent HPV infection, low-grade lesions, and genital warts.

**Conclusion:** Prophylactic vaccination of women between 15-25 yr not previously infected with vaccine-type HPV strains, has been found to be efficacious in preventing HPV infection and precancerous cervical lesions.

**Table 26. Management of Patients Abnormal Cervical Histology and Cervical Cancer**

Management	
CIN I	<ul style="list-style-type: none"> <li>Preferred option for biopsy-proven CIN I is observation</li> <li>Repeat assessment and cytology in 12 mo</li> <li>Management according to cytology results</li> </ul> If after HSIL or AGC <ul style="list-style-type: none"> <li>Cytology and histology should be reviewed</li> <li>If discrepancy remains, excisional biopsy may be considered</li> </ul>
CIN II and CIN III	Women over 25 yr <ul style="list-style-type: none"> <li>CIN II or III should be treated</li> <li>Excisional procedures preferred for CIN III</li> <li>Those with + margins should have follow-up with colposcopy and directed biopsies and/or endocervical curettage</li> <li>Treatment for recurrent CIN II or III should be by excision</li> </ul> Women less than 25 yr <ul style="list-style-type: none"> <li>Pathologist should be asked to clarify whether lesion is CIN II or CIN III</li> <li>CIN II: observe with colposcopy at 6-mo intervals for up to 24 mo before treatment considered</li> <li>CIN III: should be treated</li> </ul> During pregnancy: <ul style="list-style-type: none"> <li>CIN II or III suspected or diagnosed during pregnancy, repeat colposcopy and treatment delayed until 8-12 wk after delivery</li> </ul>
Stage IA <sub>1</sub> (no LVSI)	<ul style="list-style-type: none"> <li>Trachelectomy (removal of only the cervix) if future fertility desired (and lesion ≤2 cm)</li> <li>Simple hysterectomy if future fertility is not desired</li> </ul>
Stage IA <sub>2</sub> , IB <sub>1</sub>	<ul style="list-style-type: none"> <li>Typically treated with radical hysterectomy and pelvic lymphadenectomy (sentinel nodes under study)</li> <li>Equal cure rates may be obtained with primary radiation therapy; advantage of surgery: may accurately stage and grade and more targeted adjuvant therapy</li> <li>Advantage is that ovaries can be spared if pre-menopausal</li> <li>For fertility preservation, may have radical trachelectomy (removal of cervix and parametria) and nodes instead of radical hysterectomy for early-stage disease</li> <li>Concurrent chemoradiation therapy if adverse high risk prognostic factors on radical surgical specimen, such as: positive pelvic lymph nodes, positive parametria and/or positive margins</li> </ul>
Stages IB <sub>2</sub> (>4 cm), II, III, IV	<ul style="list-style-type: none"> <li>Primary chemoradiation therapy</li> <li>PET/CT to grade: evaluate pelvic and para-aortic nodes</li> <li>For positive nodes on PET: primary chemoradiation with extended field RT</li> <li>Hysterectomy generally not suggested following primary treatment with curative intent</li> </ul>

**Abnormal Pap Tests in Pregnancy**

- incidence: 1/2,200
- Pap test at all initial prenatal visits
  - if abnormal Pap or suspicious lesion, refer to colposcopy
- if diagnostic conization required, should be deferred until second trimester (T2) to minimize risk of pregnancy loss
- if invasive cancer ruled out, management of dysplasia deferred until completion of pregnancy (may deliver vaginally)
- if invasive cancer present, management depends on prognostic factors, degree of fetal maturity, and patient wishes
  - general recommendations in T1: consider pregnancy termination, management with either radical surgery (hysterectomy vs. trachelectomy if desires future fertility) or concurrent chemoradiation therapy
  - recommendations in T2/T3: delay of therapy until viable fetus and C/S for delivery with concurrent radical surgery or subsequent concurrent chemoradiation therapy

Cervical cancer is most prevalent in developing countries and therefore is the only gynecologic cancer that uses clinical staging. This facilitates consistent international staging with countries that do not have technologies such as CT and MRI.

**Cervical Cancer Prognosis****5-yr Survival**

Stage 0	99%
Stage I	75%
Stage II	55%
Stage III	30%
Stage IV	7%
Overall	50-60%

**PHAC National Advisory Committee on Immunization (NACI) Recommends Quadrivalent HPV4 Vaccine for Males**

- HPV4 (Gardasil®) is recommended in males between 9 and 26 yr of age for the prevention of anal intraepithelial neoplasia (AIN) grades 1, 2, and 3, anal cancer, and anogenital warts
- HPV4 (Gardasil®) is recommended in males between 9 and 26 yr of age (NACI Recommendation Grade B) for the prevention of penile, perianal and perineal intraepithelial neoplasias and associated cancers
- HPV4 (Gardasil®) is recommended in males who have sex with males (MSM) ≥9 yr of age
- Cervarix™ is not recommended in males at this time

Source: PHAC National Advisory Committee on Immunization (NACI). Update on human papillomavirus (HPV) vaccines. Canada Communicable Dis Rep 2012;38:ACS-1

## Vulva

**BENIGN VULVAR LESIONS****Non-Neoplastic Disorders of Vulvar Epithelium**

- biopsy is necessary to make diagnosis and/or rule out malignancy
- hyperplastic dystrophy (squamous cell hyperplasia)
  - surface thickened and hyperkeratotic
  - pruritus most common symptom
  - typically postmenopausal women
  - treatment: 1% fluorinated corticosteroid ointment bid for 6 wk
- lichen sclerosis
  - subepithelial fat becomes diminished, labia become thin and atrophic, membrane-like epithelium, labial fusion
  - pruritus, dyspareunia, burning
  - figure of 8' distribution
  - most common in postmenopausal women but can occur at any age
  - treatment: ultrapotent topical steroid 0.05% clobetasol x 2-4 wk then taper down

Any suspicious lesion of the vulva should be biopsied.

- mixed dystrophy (lichen sclerosis with epithelial hyperplasia)
  - hyperkeratotic areas with areas of thin, shiny epithelium
  - treatment: fluorinated corticosteroid ointment

### Tumours

- papillary hidradenoma, nevus, fibroma, hemangioma

## MALIGNANT VULVAR LESIONS

### Epidemiology

- 5% of genital tract malignancies
- 90% squamous cell carcinoma; remainder melanomas, basal cell carcinoma, Paget's disease, Bartholin's gland carcinoma
  - Type I disease: HPV-related (50-70%)
    - ♦ more likely in younger women
    - ♦ 90% of vulvar intraepithelial neoplasia (VIN) contain HPV DNA (usually types 16, 18)
  - Type II disease: not HPV-related, associated with current or previous vulvar dystrophy
    - ♦ usually postmenopausal women

### Risk Factors

- HPV infection (see above)
- VIN (vulvar intraepithelial neoplasia): precancerous change which presents as multicentric white or pigmented plaques on vulva (may only be visible at colposcopy)
  - progression to cancer rarely occurs with appropriate management
  - treatment: local excision (i.e. superficial vulvectomy ± split thickness skin grafting to cover defects if required) vs. ablative therapy (i.e. laser, cauterization) vs. local immunotherapy (imiquimod)

### Clinical Features

- many patients asymptomatic at diagnosis (many also deny or minimize symptoms)
- most lesions occur on the labia majora, followed by the labia minora (less commonly on the clitoris or perineum)
- localized pruritus or lesion most common
- less common: raised red, white or pigmented plaque, ulcer, bleeding, discharge, pain, dysuria
- patterns of spread
  - local
  - groin lymph nodes (usually inguinal → pelvic nodes)
  - hematogenous

### Investigations

- ± colposcopy
- ALWAYS biopsy any suspicious lesion

**Table 27. FIGO Staging Classification and Treatment of Vulvar Cancer (Surgical Staging)**

Stage	Description	Treatment
0	<b>Intraepithelial neoplasia (VIN), carcinoma in situ</b>	Local excision/superficial vulvectomy Laser ablation Local immunotherapy (imiquimod)
I	<b>Tumour confined to vulva</b>	Radical local excision + groin node dissection if > 1 mm invasion
IA	≤2 cm lesion, confined to vulva, perineum ± stromal invasion ≤1 mm, no LN involvement	Sentinel node dissection acceptable if lesion < 4 cm and no suspicious nodes on examination
IB	>2 mm lesion or stromal invasion > 1 mm, confined to vulva or perineum, no LNs	
II	<b>Tumour any size with adjacent extension (1/3 lower urethra, 1/3 lower vagina or anus) with negative LN</b>	Individualized Radical surgical excision ± chemoradiation Neoadjuvant chemoradiation followed by surgical resection Assessment of regional nodes
III	<b>Tumour any size with or without extension to perineal structures plus positive inguino-femoral LNs</b>	Individualized Primary resection versus neoadjuvant chemoradiation followed by surgical resection
IIIA	LN met (≥5 mm) or 1-2 LN mets (<5 mm)	Chemoradiation ± radical surgical excision
IIIB	2 or more LN mets (≥5 mm) or >3 LNs mets (<5 mm)	
IIIC	Positive LNs with extracapsular spread	
IV	<b>Regional Invasion (2/3 upper urethra, 2/3 upper vagina or distal structures)</b>	Individualized Palliative therapy
	<b>Tumour invades any of the following:</b>	Individualized
IVA	1. Spread to upper urethra ± vaginal mucosa, bladder, rectal mucosa or fixed to pelvic bone	Chemoradiation ± radical surgical excision
IVB	2. Fixed or ulcerated inguino-femoral LN Distant mets including pelvic LN	

### Prognosis

- depends on stage – particularly nodal involvement (single most important predictor followed by tumour size)
- lesions >4 cm associated with poorer prognosis
- overall 5 yr survival rate: 79%

## Vagina

### BENIGN VAGINAL LESIONS

- inclusion cysts
  - cysts form at site of abnormal healing of laceration (e.g. episiotomy)
  - no treatment required
- endometriosis
  - dark lesions that tend to bleed at time of menses
  - treatment: excision
- Gartner's duct cysts
  - remnants of Wolffian duct, seen along side of cervix
  - treatment: conservative unless symptomatic
- urethral diverticulum
  - can lead to recurrent urethral infection, dyspareunia
  - treatment: surgical correction if symptomatic

### MALIGNANT VAGINAL LESIONS

#### Epidemiology

- primary carcinomas of the vagina represent 2-3% of malignant neoplasms of the female genital tract
- 80-90% are squamous cell carcinoma
- more than 50% diagnosed between 70-90 yr old

#### Risk Factors

- associated with HPV infection (analogous to cervical cancer)
- increased incidence in patients with prior history of cervical and vulvar cancer

#### Investigations

- cytology
  - significant false negative rate for existing malignancy (i.e. if gross lesion present, biopsy!)
- colposcopy
- Schiller test (normal squamous epithelium takes up Lugol's iodine)
- biopsy, partial vaginectomy (wide local excision for diagnosis)
- rule out disease on cervix, vulva, or anus (most vaginal cancers are actually metastatic from one of these sites)
- staging (see Table 29)

#### Clinical Features

**Table 28. Clinical Features of Malignant Vaginal Lesions**

Type	Clinical Features
<b>Vaginal Intra-Epithelial Neoplasia (VAIN)</b>	Grades: analogous to cervical dysplasia
<b>Squamous Cell Carcinoma (SCC)</b>	Most common site is upper 1/3 of posterior wall of vagina Asymptomatic Painless discharge and bleeding Vaginal discharge (often foul-smelling) Vaginal bleeding especially during/post-coitus Urinary and/or rectal symptom 2° to compression
<b>Adenocarcinoma</b>	Most are metastatic, usually from cervix, endometrium, ovary or colon Most primaries are clear cell adenocarcinomas 2 types: non-DES and DES syndrome

### Diethylstilbestrol (DES) Syndrome

- fetal exposure to DES (due to maternal use) predisposes to cervical or vaginal clear cell carcinoma: occurs in 30-95% of exposed females
- if exposed, <1 in 1,000 risk of developing clear cell adenocarcinoma
- clinical features
  - adenosis is persistent Müllerian type glandular epithelium in vagina
  - malformations of upper vagina, cervix, and interior of uterus (T-shaped); cockscomb or hooded cervix, cervical collar and pseudopolyps of cervix
- patients with DES exposure should have annual Pap tests (cervix and vagina) and digital vaginal exam for subepithelial masses
  - if any abnormality, refer for colposcopy

**Table 29. FIGO Staging Classification of Vaginal Cancer (Clinical Staging) and Treatment**

Stage	Description	Treatment
0	Intraepithelial neoplasia (VAIN), carcinoma in situ	<ul style="list-style-type: none"> <li>Must rule out invasive cancer via biopsies and colposcopy prior to conservative treatment</li> <li>Laser ablation vs. surgical excision vs. local immunotherapy (e.g. imiquimod)</li> </ul>
I	Limited to the vaginal wall	<ul style="list-style-type: none"> <li>Radiation is main stay of therapy: combination of brachytherapy and external beam radiation</li> <li>In certain situations where surgery has a role in management: <ol style="list-style-type: none"> <li>Stage I disease involving upper posterior vagina</li> <li>Young patients who require radiation therapy</li> <li>Stage IVA disease, particularly if rectovaginal or vesicovaginal fistula is present</li> <li>In patients with a central recurrence after radiation therapy</li> </ol> </li> <li>Limited reported evidence with chemoradiation</li> </ul>
II	Involves subvaginal tissue, NO pelvic wall extension	
III	Pelvic wall extension	
IV	Extension beyond true pelvis OR bladder/rectum involvement	
IVA	Bladder $\pm$ rectal mucosal spread $\pm$ extension beyond true pelvis	
IVB	Spread to distant organs	

**Prognosis**  
**5-yr Survival Rates**  
 Stage I 70%  
 Stage II 40%  
 Stage III 30%  
 Stage IV 15-20%

## Fallopian Tube

- least common site for carcinoma of female reproductive system (0.3%)
- usually serous epithelial carcinoma
- recently considered to be origin of serous ovarian cancer
- more common in fifth and sixth decade

### Clinical Features

- classic triad present in minority of cases, but very specific
  - watery discharge (most specific) = "hydrops tubae profluens"
  - vaginal bleeding or discharge in 50% of patients
  - crampy lower abdominal/pelvic pain
- most patients present with a pelvic mass (see *Ovarian Cancer*, GY39 for guidelines regarding diagnosis/investigation)

### Treatment

- as for malignant epithelial ovarian tumours

**Classic Triad (<15% of patients)**

- Watery vaginal discharge
- Pelvic pain
- Vaginal bleeding

Current hypotheses suggest epithelial serous ovarian cancer originates from malignant fallopian tube cells.

## Gestational Trophoblastic Disease/Neoplasia (GTD/GTN)

- refers to a spectrum of proliferative abnormalities of the trophoblast

### Epidemiology

- 1/1000 pregnancies
- marked geographic variation – as high as 1/125 in Taiwan
- 80% benign, 15% locally invasive, 5% metastatic
- cure rate >95%

With development of hypertension early in pregnancy (i.e. <20 wk), think gestational trophoblastic disease!

### HYDATIDIFORM MOLE (Benign GTD)

#### Complete Mole

- most common type of hydatidiform mole
- diffuse trophoblastic hyperplasia, hydropic swelling of chorionic villi, no fetal tissues or membranes present
- 46XX or 46XY, chromosomes completely of paternal origin (90%)
- 2 sperm fertilize empty egg or 1 sperm with reduplication
- 15-20% risk of progression to malignant sequelae
- risk factors
  - geographic (South East Asia most common)
  - others (maternal age >40 yr,  $\beta$ -carotene deficiency, vitamin A deficiency) – not proven
- clinical features
  - often present during apparent pregnancy with abnormal symptoms/findings:
    - vaginal bleeding (97%)
    - excessive uterine size for LMP (51%)
    - theca-lutein cysts >6 cm (50%)
    - preeclampsia (27%)
    - hyperemesis gravidarum (26%)
    - hyperthyroidism (7%)
    - $\beta$ -hCG >100,000 IU/L
    - no fetal heart beat detected

### Partial (or Incomplete) Mole

- focal trophoblastic hyperplasia and hydropic villi are associated with fetus or fetal parts
- often triploid (XXY, XYY, XXX) with chromosome complement from both parents
  - usually related to single ovum fertilized by two sperm
- low risk of progression to malignant sequelae (<4%)
- associated with fetus, which may be growth-restricted and/or have multiple congenital malformations
- clinical features
  - typically present similar to threatened/spontaneous/missed abortion
  - pathological diagnosis often made after D&C

### Investigations

- quantitative  $\beta$ -hCG levels (tumour marker) abnormally high for gestational age
- U/S findings:
  - if complete: no fetus (classic “snow storm” due to swelling of villi)
  - if partial: molar degeneration of placenta  $\pm$  fetal anomalies, multiple echogenic regions corresponding to hydropic villi, and focal intrauterine hemorrhage
- CXR (may show metastatic lesions)
- features of molar pregnancies at high risk of developing persistent GTN post-evacuation
  - local uterine invasion as high as 31%
  - $\beta$ -hCG >100,000 IU/L
  - excessive uterine size
  - prominent theca-lutein cysts

### Treatment

- suction D&C with sharp curettage and oxytocin
- Rhogam® if Rh negative
- consider hysterectomy (if patient no longer desires fertility)
- prophylactic chemotherapy of no proven benefit
- chemotherapy for GTN if develops after evacuation

### Follow-up

- contraception required to avoid pregnancy during entire follow-up period
- serial  $\beta$ -hCGs (as tumour marker) every week until negative x 3 (usually takes several wk), then monthly for 6-12 mo prior to trying to conceive again
- increase or plateau of  $\beta$ -hCG indicates GTN  $\rightarrow$  patient needs chemotherapy

### GTN (MALIGNANT GTD)

#### Invasive Mole or Persistent GTN

- diagnosis made by rising or plateau in  $\beta$ -hCG, development of metastases following treatment of documented molar pregnancy (see sidebar)
- histology: molar tissue from D&C
- metastases are rare (4%)

#### Choriocarcinoma

- often present with symptoms from metastases
- highly anaplastic, highly vascular
- no chorionic villi, elements of syncytiotrophoblast and cytotrophoblast
- may follow molar pregnancy, abortion, ectopic, or normal pregnancy

#### Placental-site Trophoblastic Tumour

- rare aggressive form of GTN
- abnormal growth of intermediate trophoblastic cells
- low  $\beta$ -hCG, production of human placental lactogen (hPL), relatively insensitive to chemotherapy

### CLASSIFICATION of GTN

- non-metastatic
  - ~15% of patients after molar evacuation
  - may present with abnormal bleeding
  - all have rising or plateau of  $\beta$ -hCG
  - negative metastases on staging investigations
- metastatic
  - 4% patients after treatment of complete molar pregnancy
  - metastasis more common with choriocarcinoma which tends toward early vascular invasion and widespread dissemination
  - if signs or symptoms suggest hematogenous spread, do not biopsy (they bleed)
    - ♦ lungs (80%): cough, hemoptysis, CXR lesion(s)
    - ♦ vagina (30%): vaginal bleeding, “blue lesions” on speculum exam
    - ♦ pelvis (20%): rectal bleeding (if invades bowel), U/S lesion(s)
    - ♦ liver (10%): elevated LFTs, U/S or CT findings
    - ♦ brain (10%): headaches, dizziness, seizure (symptoms of space-occupying lesion), CT/MRI findings

#### GTN Diagnosis

- $\beta$ -hCG plateau: <10% drop in  $\beta$ -hCG over four values in 3 wk (e.g. days 1, 7, 14 and 21) OR
- $\beta$ -hCG rise >20% in any two values over two wk or longer (e.g. measure at days 1, 7, 14) OR
- $\beta$ -hCG persistently elevated >6 mo OR
- Metastases on work-up

Lungs are #1 site for malignant GTN metastases. When pelvic exam and chest x-ray are negative, metastases are uncommon.

- highly vascular tumour → bleeding → anemia
- all have rising or plateau of  $\beta$ -hCG
- classification of metastatic GTN
  - ♦ divided into good prognosis and bad prognosis
  - ♦ features of bad prognosis
    - long duration (>4 mo from antecedent pregnancy)
    - high pre-treatment  $\beta$ -hCG titre: >100,000 IU/24 h urine or >40,000 IU/L of blood
    - brain or liver metastases
    - prior chemotherapy
    - metastatic disease following term pregnancy
  - ♦ good prognosis characterized by the absence of each of these features

### Investigations – For Staging

- bloodwork: CBC, electrolytes, creatinine,  $\beta$ -hCG, TSH, LFTs
- imaging: CXR, U/S pelvis, CT abdo/pelvis, CT brain
- if suspect brain metastasis but CT brain negative, consider lumbar puncture for CSF  $\beta$ -hCG
  - ratio of plasma  $\beta$ -hCG:CSF  $\beta$ -hCG <60 indicates metastases

**Table 30. FIGO Staging and Management of Malignant GTN**

Stage	Findings	Management
I	Disease confined to uterine corpus	Single agent chemotherapy for low risk disease (WHO score $\leq 6$ ) 1st line: pulsed – actinomycin D (Act-D) IV q2wk Alternatives: MTX-based regimen 20% of patients need to switch to alternate single-agent regimen due to failure of $\beta$ -hCG to return to normal Combination chemotherapy (EMA-CO: etoposide, MTX, ACT-D, cyclophosphamide, vincristine) if high risk (WHO score $\geq 7$ ) or if resistant to single agent chemotherapy Can consider hysterectomy if fertility not desired or placental-site trophoblastic tumour
II	Metastatic disease to genital structures	As above
III	Metastatic disease to lungs with or without genital tract involvement	As above
IV	Distant metastatic sites including brain, liver, kidney, GI tract	Usually high risk (EMA-CO) with surgical resection of sites of disease Persistence/resistance to chemotherapy Consider radiation for brain mets

**Table 31. WHO Prognostic Score for GTD (2011)**

Prognostic Factor	Score			
	0	1	2	4
Maternal age	>40	40		
AP	Mole	Abortion	Term	
Interval (end of AP to chemotherapy in months)	<4	4-6	7-13	>13
HCG IU/l	<103	103-104	104-105	>105
Number of metastases	0	1-4	5-8	>8
Site of metastases	Lung	Spleen, kidney	GI tract	Brain, liver
Largest tumour mass		3-5 cm	>5 cm	
Prior chemotherapy			Single drug	Two drug

### Follow-up (for GTN)

- contraception for all stages to avoid pregnancy during entire follow-up period
- stage I, II, III
  - weekly  $\beta$ -hCG until 3 consecutive normal results
  - then monthly x 12 mo
- stage IV
  - weekly  $\beta$ -hCG until 3 consecutive normal results
  - then monthly x 24 mo

## Common Medications

Table 32. Common Medications

Drug Name (Brand Name)	Action	Dosing Schedule	Indications	Side Effects (S/E), Contraindications (C/I), Drug Interactions (D/I)
acyclovir (Zovirax®)	Antiviral; inhibits DNA synthesis and viral replication	<b>First Episode:</b> 400 mg PO tid x 7-10 d <b>Recurrence:</b> 400 mg PO tid x 5 d	Genital herpes	<b>S/E:</b> headache, GI upset <b>D/I:</b> zidovudine, probenecid
bromocriptine (Parlodel®)	Dopaminomimetic Agonist at D <sub>2</sub> R Antagonist at D <sub>1</sub> R Acts directly on anterior pituitary cells to inhibit synthesis and release of prolactin	<b>Initial:</b> 1.25-2.5 mg PO qhs with food <b>Then:</b> increase by 2.5 mg every 2-7 d as needed until optimal therapeutic response <b>Usual Range:</b> 1.5-15 mg OD <b>For IVF:</b> <b>Initial:</b> 1.25 mg/d PO between days 4-6 of follicular phase <b>Then:</b> 2.5 mg/d until 3 d after onset menstruation	Galactorrhea + amenorrhea 2° to hyperprolactinemia Prolactin-dependent menstrual disorders and infertility Prolactin-secreting adenomas (microadenomas, prior to surgery of macroadenomas) IVF	<b>S/E:</b> nausea, vomiting, headache, postural hypotension, somnolence <b>C/I:</b> uncontrolled hypertension, pregnancy-induced hypertension, CAD, breastfeeding <b>D/I:</b> domperidone, macrolides, octreotide
clomiphene citrate (Clomid®)	Increases output of pituitary gonadotropins which induces ovulation	50 mg OD x 5 d Try 100 mg or 160 mg OD if ineffective 3 courses = adequate trial	Patients with persistent ovulatory dysfunction (e.g. amenorrhea, PCOS) who desire pregnancy	<b>S/E:</b> Common – hot flashes, abdominal discomfort, exaggerated cyclic ovarian enlargement, accentuation of Mittelschmerz Rare – ovarian hyperstimulation syndrome, multiple pregnancy, visual blurring, birth defects <b>C/I:</b> pregnancy, liver disease, hormone-dependent tumours, ovarian cyst, undiagnosed vaginal bleeding
clotrimazole (Canesten®)	Antifungal; disrupt fungal cell membrane	<b>Tablet:</b> 100 mg/d intravaginally x 7 d or 200 mg/d x 3 d or 500 mg x 1 dose <b>Cream</b> (1 or 2%): 1 applicator intravaginally qhs x 3-7 d <b>Topical:</b> apply bid x 7 d	Vulvovaginal candidiasis	<b>S/E:</b> vulvar/vaginal burning
danazol (Cyclomen® – CAN) (Danocrine® – US)	Synthetic steroid that inhibits pituitary gonadotropin output and ovarian steroid synthesis Has mild androgenic properties	200-800 mg in 2-3 divided doses Used for 3-6 mo Biannual hepatic U/S required if >6 mo use	Endometriosis 1° menorrhagia/DUB	<b>S/E:</b> weight gain, acne, mild hirsutism, hepatic dysfunction <b>C/I:</b> pregnancy, undiagnosed vaginal bleeding, breastfeeding, severely impaired renal/hepatic/cardiac function, porphyria, genital neoplasia, thromboembolic disease <b>D/I:</b> warfarin, carbamazepine, cyclosporine, tacrolimus, anti-hypertensives
doxycycline	Tetracycline derivative; inhibit protein synthesis	100 mg PO bid x ≥7 d	Chlamydia, gonococcal infection, syphilis	<b>S/E:</b> GI upset, hepatotoxicity <b>C/I:</b> pregnancy, severe hepatic dysfunction <b>D/I:</b> warfarin, digoxin
fluconazole (Diflucan®)	Antifungal; disrupt fungal cell membrane	150 mg PO x 1 dose	Vulvovaginal candidiasis unresponsive to clotrimazole	<b>S/E:</b> headache, rash, nausea, vomiting, abdominal pain, diarrhea <b>D/I:</b> terfenadine, cisapride, astemizole, hydrochlorothiazide, phenytoin, warfarin, rifampin
leuprolide (Lupron®)	Synthetic GnRH analog Induces reversible hypoestrogenic state	3.75 mg IM q1mo or 11.25 mg IM q3mo Usually ≤6 mo, check bone density if >6 mo Retreatment with Lupron® alone not recommended because of effects on bone density	Endometriosis Leiomyomata DUB Precocious puberty	<b>S/E:</b> hot flashes, sweats, headache, vaginitis, reduction in bone density, acne, GI upset <b>C/I:</b> pregnancy, undiagnosed vaginal bleeding, breastfeeding
menotropin (Pergonal®)	Human Gonadotropin with FSH and LH effects; induce ovulation and stimulate ovarian follicle development	75-150 U of FSH and LH IM OD x 7-12 d, then 10,000 U hCG one day after last dose	Infertility	<b>S/E:</b> bloating, irritation at injection site, abdominal/pelvic pain, headache, nausea and vomiting, multiple pregnancy <b>C/I:</b> primary ovarian failure, intracranial lesion (e.g. pituitary tumour), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, undiagnosed uterine bleeding
metronidazole (Flagyl®)	Bactericidal; forms toxic metabolites which damage bacterial DNA	2 g PO x 1 dose or 500 mg PO bid x 7 d	Bacterial vaginosis, trichomonas vaginitis	<b>S/E:</b> headache, dizziness, nausea, vomiting, diarrhea, disulfiram-like reaction (flushing, tachycardia, nausea and vomiting) <b>C/I:</b> pregnancy (1 <sup>st</sup> trimester) <b>D/I:</b> cisapride, warfarin, cimetidine, lithium, alcohol, amiodarone, milk thistle, carbamazepine

**Table 32. Common Medications** (continued)

Drug Name (Brand Name)	Action	Dosing Schedule	Indications	Side Effects (S/E), Contraindications (C/I), Drug Interactions (D/I)
oxybutinin (Ditropan®)	Anticholinergic – relaxes bladder smooth muscle, inhibits involuntary detrusor contraction	5 or 10 mg/d PO May increase doses by 5 mg weekly to a max of 30 mg/d	Overactive bladder (urge incontinence)	<b>S/E:</b> dry mouth/eyes, constipation, palpitations, urinary retention, dizziness, headache <b>C/I:</b> glaucoma, GI ileus, severe colitis, obstructive uropathy, use with caution if impaired hepatic/renal function
tolterodine (Detrol®)	Anticholinergic	1-2 mg PO bid	Overactive bladder (urge incontinence)	<b>S/E:</b> anaphylaxis, psychosis, tachycardia, dry mouth/eyes, headache, constipation, urinary retention, chest pain, abdominal pain <b>C/I:</b> glaucoma, gastric/urinary retention, use with caution if impaired hepatic/renal function
tranexamic acid (Cyklokapron®)	Anti-fibrinolytic, reversibly inhibits plasminogen activation	1-1.5 g tid-qid for first 4 d of cycle Max 4 g/d Ophthalmic check if used for several wk	Menorrhagia	<b>S/E:</b> nausea, vomiting, diarrhea, dizziness, rare cases of thrombosis, abdominal pain, MSK pain <b>C/I:</b> thromboembolic disease, acquired disturbances of colour vision, subarachnoid hemorrhage, age < 15 yr
urofollitropin (Metrodin®)	FSH	75 U/d SC x 7-12d	Ovulation induction in PCOS	<b>S/E:</b> ovarian enlargement or cysts, edema and pain at injection site, arterial thromboembolism, fever, abdominal pain, headache, multiple pregnancy <b>C/I:</b> primary ovarian failure, intracranial lesion (e.g. pituitary tumour), uncontrolled thyroid/adrenal dysfunction, ovarian cyst (not PCOS), pregnancy, abnormal uterine bleeding
combined oral contraceptive pill (OCP)	Ovulatory suppression by inhibiting LH and FSH Decidualization of endometrium Thickening of cervical mucus to prevent sperm penetration		Contraception Disorders of menstruation	See Tables 8-12
intrauterine device (IUD) copper IUD (Nova-T®) progesterone-releasing IUD (Mirena®)	<b>Copper IUD:</b> mild foreign body reaction in endometrium which is toxic to sperm and alters sperm motility <b>Progesterone-releasing IUD:</b> decidualization of endometrium and thickening of cervical mucus, may suppress ovulation	Contraceptive effects last 5 yr	Same as above	See Table 8-12

## Acronyms

AFIB	atrial fibrillation	HUS	hemolytic uremic syndrome	RAEB	refractory anemia with excess blasts
AIHA	autoimmune hemolytic anemia	IMF	idiopathic myelofibrosis	RARS	refractory anemia with ringed sideroblasts
ALL	acute lymphoblastic leukemia	IPC	intermittent pneumatic compression	RBC	red blood cells
AML	acute myeloid leukemia	IPSS	international prognostic scoring system	RCMD	refractory cytopenia with multilineage dysplasia
ANC	absolute neutrophil count	ITP	immune thrombocytopenic purpura	RCMD-RS	refractory cytopenia with multilineage dysplasia and ringed sideroblasts
APC	activated protein C	LMWH	low molecular weight heparin	RDW	RBC distribution width
APCR	activated protein C resistance	MAHA	microangiopathic hemolytic anemia	SPEP	serum protein electrophoresis
APS	antiphospholipid antibody syndrome	MCH	mean corpuscular Hb	sTfR	soluble transferrin receptor
CLL	chronic lymphocytic leukemia	MCHC	mean corpuscular Hb concentration	TIBC	total iron binding capacity
CML	chronic myeloid leukemia	MCV	mean corpuscular volume	TPO	thrombopoietin
DIC	disseminated intravascular coagulation	MDS	myelodysplastic syndromes	TTP	thrombotic thrombocytopenic purpura
EPO	erythropoietin	MGUS	monoclonal gammopathy of unknown significance	UFH	unfractionated heparin
ET	essential thrombocythemia	MM	multiple myeloma	UPEP	urine protein electrophoresis
G6PD	glucose-6-phosphate dehydrogenase	MPN	myeloproliferative neoplasm	VTE	venous thromboembolism
G-CSF	granulocyte colony-stimulating factor	MPV	mean platelet volume	vWD	von Willebrand disease
GSH	glutathione	NHL	non-Hodgkin lymphoma	vWF	von Willebrand Factor
Hb	hemoglobin	PCC	prothrombin complex concentrates	WBC	white blood cell
Hct	hematocrit	Ph	Philadelphia chromosome	WHO	World Health Organization
HA	hemolytic anemia	PNH	paroxysmal nocturnal hemoglobinuria		
HIT	heparin-induced thrombocytopenia	PV	polycythemia vera		

## Basics of Hematology

**Figure 1. Hematopoiesis**

- over  $10^{11}$  blood cells are produced daily
- sites of hematopoiesis in adults: pelvis, sternum, vertebral bodies
- lifespan of mature cells in blood:
  - erythrocytes (120 d), neutrophils (~1 d), platelets (10 d), lymphocytes (varies – memory cells persist for years)
- role of lymphoid organs
  - spleen: part of reticuloendothelial system, removes aged RBCs, removes antibody-coated bacteria/cells, site of antibody production
  - thymus: site of T-cell maturation, involutes with age
  - lymph nodes: sites of B and T-cell activation (adaptive immune response)

**Erythrocyte:** carries oxygen from lungs to peripheral tissues.

**Reticulocyte:** immature erythrocyte.

**Neutrophil:** granulocyte integral in innate immunity; main cell in acute inflammation.

**Eosinophil:** involved in response to parasites (especially helminths) and allergic response.

**Basophil:** granulocyte mainly involved in allergy and parasitic infection.

**Lymphocyte:** integral cell in adaptive immunity.

**Monocyte:** involved in innate immunity; can differentiate into macrophage or dendritic cell.

**Platelet:** mediator of primary hemostasis.

**Plasma:** liquid component of blood containing water, proteins, coagulation factors and immunoglobulins.

**Serum:** equivalent to plasma minus clotting factors and fibrinogen.

## Complete Blood Count (CBC)

Table 1. Common Terms Found on CBC

Test	Definition	Normal Values*
<b>Red blood cell (RBC) count</b>	The number of RBCs per volume of blood	4.2-6.9 x 10 <sup>6</sup> /mm <sup>3</sup>
<b>Hemoglobin (Hb)</b>	Amount of oxygen-carrying protein in the blood	130-180 g/L (13-18 g/dL) (male) 120-160 g/L (12-16 g/dL) (female)
<b>Hematocrit (Hct)</b>	Percentage of a given volume of whole blood occupied by packed RBCs	45%-62% (male) 37%-48% (female)
<b>Mean corpuscular volume (MCV)</b>	Measurement of size of RBCs	80-100 µm <sup>3</sup>
<b>Mean corpuscular Hb (MCH)</b>	Amount of oxygen-carrying Hb inside RBCs	27-32 pg/cell
<b>Mean corpuscular Hb concentration (MCHC)</b>	Average concentration of Hb inside RBCs	32%-36%
<b>RBC distribution width (RDW)</b>	Measurement of variance in RBC size	11.0%-15.0%
<b>White blood cell (WBC) count</b>	The number of WBCs per volume of blood	4.3-10.8 x 10 <sup>9</sup> /mm <sup>3</sup>
<b>WBC differential</b>	Includes neutrophils, eosinophils, basophils, lymphocytes and monocytes	
<b>Platelet count</b>	The number of platelets per volume of blood	150-400 x 10 <sup>9</sup> /mm <sup>3</sup>
<b>Mean platelet volume (MPV)</b>	Measurement of platelet size	
<b>Reticulocytes</b>	Immature RBCs that contain no nucleus but have residual RNA	Normally make up 1% of total RBC count

\*Normal values may vary depending on site and age

### Approach to Interpreting a CBC

- Consider values in the context of individual's baseline
  - up to 5% of population without disease may have values outside "normal" range
  - an individual may display a clinically significant change from their baseline without violating "normal" reference range
- Is one cell line affected or are several?
  - if all lines are low: pancytopenia (see *Pancytopenia*, H7)
  - if RBCs and platelets are low: consider a microangiopathic hemolytic anemia (MAHA) (see H21)
  - if single cell line affected: see corresponding section in *Common Presenting Problems*, H5

#### Clinical Use of RDW

- To distinguish the etiologies of microcytosis:
  - Iron deficiency: increased RDW (anisocytosis) as cells are of varying sizes in iron deficiency.
  - Thalassemia minor: normal RDW (also expect a high RBC count) as cells are of similar size due to genetic defect in Hb.

#### Complete Blood Count

## Blood Film Interpretation

### RED BLOOD CELLS

#### Size

- microcytic (MCV<80), normocytic (MCV=80-100), macrocytic (MCV>100)
- anisocytosis: RBCs with increased variability in size (increased RDW)
  - iron deficiency anemia, hemolytic anemias, myelofibrosis, blood transfusion

#### Colour

- hypochromic: increase in size of central pallor (normal = less than 1/3 of RBC diameter)
  - iron deficiency anemia, anemia of chronic disease, sideroblastic anemia
- polychromasia: increased reticulocytes (pinkish-blue cells)
  - increased RBC production by bone marrow

#### Shape

- poikilocytosis: increased proportion of RBCs of abnormal shape
  - iron deficiency anemia, myelofibrosis

Table 2. Common Erythrocyte Shapes

Shape	Definition	Associated Conditions
<b>Discocyte</b>	Biconcave disc	Normal RBC
<b>Spherocyte</b>	Spherical RBC (due to loss of membrane)	Hereditary spherocytosis, immune hemolytic anemia, post-transfusion
<b>Elliptocyte/Ovalocyte</b>	Oval-shaped, elongated RBCs <ul style="list-style-type: none"> <li>Elliptocytes: the RBC long axis is ≥2x the length of the short axis</li> <li>Ovalocytes: the RBC long axis is &lt;2x the length of the short axis</li> </ul>	Hereditary elliptocytosis, megaloblastic anemia, myelofibrosis, iron-deficiency, MDS (myelodysplastic syndrome)
<b>Schistocyte (helmet cell)</b>	Fragmented cells (due to traumatic disruption of membrane)	Microangiopathic hemolytic anemia (HUS/TTP, DIC, preeclampsia, HELLP, malignant HTN), vasculitis, glomerulonephritis, prosthetic heart valve
<b>Sickle cell</b>	Sickle-shaped RBC (due to polymerization of hemoglobin S)	Sickle cell disorders: HbSC, HbSS
<b>Codocyte (target cell)</b>	"Bull's eye" on dried film	Liver disease, hemoglobin SC, thalassemia, Fe deficiency, asplenia
<b>Dacocyte (teardrop cell)</b>	Single pointed end, looks like a teardrop	Myelofibrosis, thalassemia major, megaloblastic anemia

Figure 2. Morphology

**Table 2. Common Erythrocyte Shapes** (continued)

Shape	Definition	Associated Conditions
<b>Acanthocyte (spur cell)</b>	Distorted RBC with irregularly distributed thorn-like projections (due to abnormal membrane lipids)	Severe liver disease (spur cell anemia), starvation/anorexia, post-splenectomy
<b>Echinocyte (burr cell)</b>	RBC with numerous regularly spaced, small spiny projections	Uremia, HUS, burns, cardiopulmonary bypass, post-transfusion, storage artifact
<b>Rouleaux formation</b>	Aggregates of RBC resembling stacks of coins (due to increased plasma concentration of high molecular weight proteins)	Pregnancy: most common cause; due to physiological increase in fibrinogen Inflammatory conditions: due to polyclonal immunoglobulins Plasma cell dyscrasias: due to monoclonal paraproteinemia, e.g. multiple myeloma, macroglobulinemia Storage artifact

HUS = Hemolytic uremic syndrome; TTP = Thrombotic thrombocytopenic purpura; DIC = disseminated intravascular coagulation; HELLP = hemolysis, elevated liver enzymes and low platelets

**Table 3. RBC Inclusions** (see Figure 2)

Inclusions	Definition	Associated Conditions
<b>Nucleus</b>	Present in erythroblasts (immature RBCs)	Hyperplastic erythropoiesis (seen in hypoxia, hemolytic anemia), BM infiltration disorders, MPNs (MF)
<b>Heinz bodies</b>	Denatured and precipitated hemoglobin	G6PD deficiency (post-exposure to oxidant), thalassemia, unstable hemoglobins
<b>Howell-Jolly bodies</b>	Small nuclear remnant resembling a pyknotic nucleus	Post-splenectomy, hyposplenism (sickle cell disease), neonates, megaloblastic anemia
<b>Basophilic stippling</b>	Deep blue granulations indicating ribosome aggregation	Thalassemia, heavy metal (Pb, Zn, Ag, Hg) poisoning, megaloblastic anemia, hereditary (pyrimidine 5'nucleotidase deficiency)
<b>Sideroblasts</b>	Erythrocytes with Fe containing granules in the cytoplasm	Hereditary, idiopathic, drugs, hypothyroidism (see <i>Sideroblastic Anemia</i> , H15), myelodysplastic syndrome

BM = bone marrow; MPN = myeloproliferative neoplasm; MF = myelofibrosis

## WHITE BLOOD CELLS

- lymphocytes: comprise 30-40% of WBCs; great variation in "normal" lymphocyte morphology
  - Reed-Sternberg cell: giant, multinucleated B-lymphocyte, only seen with bone marrow specimens
    - associations: primarily Hodgkin lymphoma, also seen in some non-Hodgkin lymphoma, CLL and EBV infection
  - smudge cells: lymphocytes damaged during blood film preparation indicating cell fragility
    - associations: chronic lymphocytic leukemia (CLL) and other lymphoproliferative disorders – pathognomonic in EBV infection
- neutrophils
  - normally only mature neutrophils (with 3-4 lobed nucleus) and band neutrophils (immediate precursor with horseshoe-shaped nucleus) are found in circulation
  - hypersegmented neutrophil: >5 lobes suggests megaloblastic process ( $B_{12}$  or folate deficiency)
  - left shift (increased granulocyte precursors)
    - seen in leukemoid reactions: acute infections, pregnancy, neonates, hypoxia, shock, myeloproliferative neoplasms (CML, MF)
- blasts
  - immature, undifferentiated precursors; associated with acute leukemia, MDS, G-CSF (growth factor that stimulates neutrophil production) use
  - Auer rods: clumps of granular material that form long needles in the cytoplasm of myeloblasts
    - pathognomonic for acute myeloid leukemia (AML)

## PLATELETS

- small, purple, anuclear cell fragments

### Left Shift

Refers to an increase in granulocyte precursors in the peripheral smear (myelocytes, metamyelocytes, promyelocytes, blasts). If present, implies increased marrow production of granulocytes (e.g. inflammation, infection, G-CSF administration, CML). The presence of predominantly blasts in the peripheral smear without cells between mature neutrophil and blast suggests clonal cell disorder (MDS, acute leukemias).  
This is a MEDICAL EMERGENCY.

## Bone Marrow Aspiration and Biopsy

- sites: posterior iliac crest, sternum
- possible analyses
  - aspiration: takes a fluid marrow sample for cellular morphology, flow cytometry, cytogenetics, molecular studies, microbiology (C&S, AFB, PCR)
  - biopsy: takes a sample of intact bone marrow to assess histology and immunohistochemistry

### Indications

- unexplained CBC abnormalities
- diagnosis and evaluation of infiltrating cancers: plasma cell disorders, leukemias, solid tumours
- diagnosis and staging of lymphoma or solid tumours
- evaluate iron metabolism and stores (gold standard, but rarely done)

- evaluate suspected deposition and storage disease (e.g. amyloidosis, Gaucher's disease)
- evaluate fever of undetermined origin, suspected mycobacterial, fungal or parasitic infections, or granulomatous disease
- unexplained splenomegaly
- confirm normal bone marrow in potential allogenic hematopoietic cell donor

### Contraindications

- absolute: untreated hemophilia, severe DIC, infection over skin site
- relative: platelet count <10, recent warfarin use with INR >2.0, liver disease with associated coagulopathy
- thrombocytopenia is not a contraindication; may need platelet transfusion prior to procedure

## Common Presenting Problems

### Anemia

#### Definition

- a decrease in red blood cell (RBC) mass that can be detected by hemoglobin (Hb) concentration, hematocrit (Hct), and RBC count
  - adult males: Hb <130 g/L or Hct <0.41
  - adult females: Hb <120 g/L or Hct <0.36

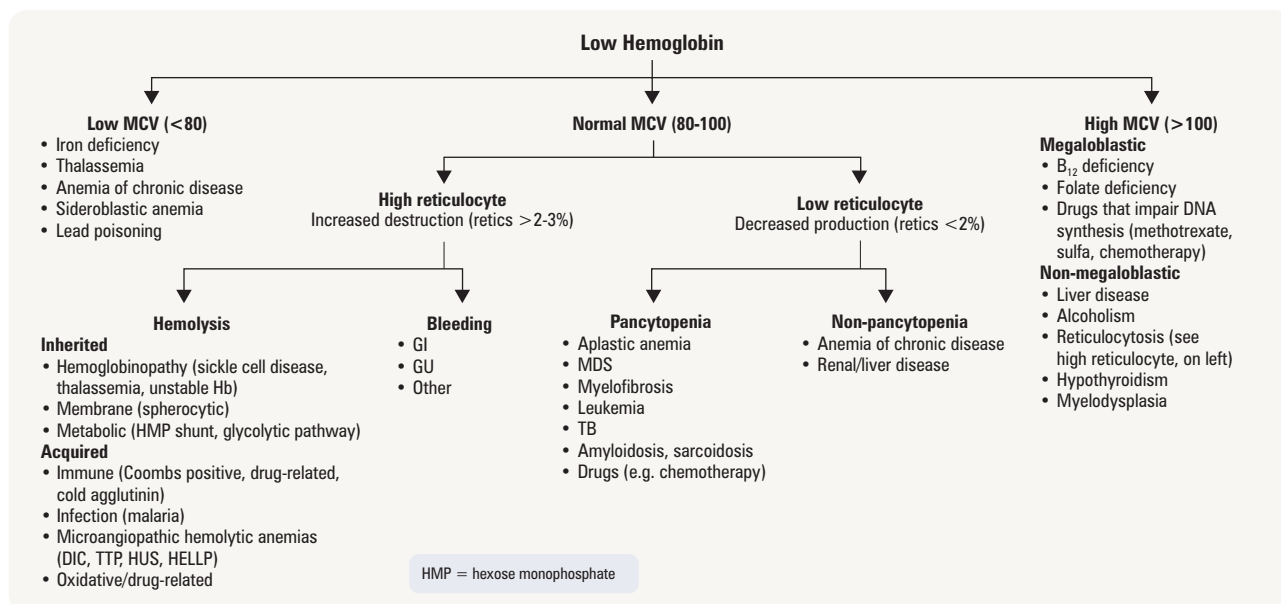

Figure 3. Approach to anemia

#### Clinical Features

- history
  - symptoms of anemia: fatigue, malaise, weakness, dyspnea, decreased exercise tolerance, palpitations, headache, dizziness, tinnitus, syncope
  - acute vs. chronic, bleeding, systemic illness, diet, alcohol, family history
  - menstrual history: menorrhagia, menometrorrhagia, dysfunctional uterine bleeding
  - rule out pancytopenia (recurrent infection, mucosal bleeding/easy bruising)
- physical signs
  - HEENT: pallor in mucous membranes, palmar creases and conjunctiva at Hb <90 g/L (<9 g/dL), ocular bruits at Hb <55 g/L (<5.5 g/dL), angular chelosis, jaundice
  - cardiac: tachycardia, orthostatic hypotension, systolic flow murmur, wide pulse pressure, signs of CHF
  - dermatologic: pallor in palmar skin creases at Hb <75 g/L, jaundice (if due to hemolysis), nail changes, glossitis

#### Investigations

- rule out dilutional anemia (low Hb due to increased effective circulating volume)
- CBC with differential (MCV, RDW, RBC count)
- reticulocyte count
- blood film
- rule out nutritional deficit, gastrointestinal and genitourinary disease in iron deficiency anemia
- additional laboratory investigations as indicated (see *Microcytic Anemia*, H12, *Normocytic Anemia*, H16, *Hemolytic Anemia*, H17 and *Macrocytic Anemia*, H22)

#### Reticulocytes

- Reticulocytes are immature erythrocytes and are markers of erythrocyte production
- Should normally increase when there is a decrease in RBC
- With blood loss, reticulocytes should increase 2-3x initially and then 5-7x over the next week
- A normal reticulocyte count in anemia should be interpreted as a sign of decreased production

## Erythrocytosis

### Definition

- an increase in the number of RBCs: Hb >185 g/L or Hct >52% (males); Hb >165 or Hct >47% (females and African males)

### Etiology

- relative/spurious erythrocytosis (decreased plasma volume): diuretics, severe dehydration, burns, "stress" (Gaisböck's syndrome)
- absolute erythrocytosis

**Table 4. Etiology of Erythrocytosis**

Primary	Secondary	Inappropriate Production of Erythropoietin
Polycythemia Vera (PV) (see H39)	<b>Poor tissue oxygenation/hypoxia:</b> Carbon monoxide poisoning Heavy smoking High altitude <b>Pulmonary disease:</b> COPD Sleep apnea Pulmonary hypertension <b>Cardiovascular disease:</b> R to L shunt (Eisenmenger syndrome) RBC defects (Hb with increased O <sub>2</sub> affinity, methemoglobinemia)	<b>Tumours:</b> Hepatocellular carcinoma Renal cell carcinoma Cerebellar hemangioblastoma Pheochromocytoma Uterine leiomyoma Ovarian tumour <b>Other:</b> Polycystic kidney disease Post-kidney transplant Hydronephrosis Androgens Exogenous erythropoietin

### Clinical Features

- secondary to high red cell mass and hyperviscosity
  - headache, dizziness, tinnitus, visual disturbances, hypertensive symptoms
  - symptoms of angina, congestive heart failure, aquagenic pruritis
- thrombosis (venous or arterial) or bleeding (abnormal platelet function)
- physical findings
  - splenomegaly ± hepatomegaly, facial plethora/ruddy complexion (70%) and/or palms, gout

### Investigations

- serum erythropoietin (EPO): increased EPO suggests autonomous production or hypoxia, and is used to rule out PV
  - search for tumour as source of EPO as indicated (e.g. abdominal U/S, CT head)
  - JAK-2 mutation analysis: positive in >96% of cases of PV
    - only send if low/normal EPO level
- ferritin (iron deficiency can mask the diagnosis)

### Treatment

- if primary: see PV, H39
- if secondary: treat underlying cause
  - O<sub>2</sub> for hypoxemia, CPAP for sleep apnea, surgery for EPO-secreting tumours
  - often cardiologists will not treat high HCT in cyanotic patients (or will have high threshold)

## Thrombocytopenia

### Definition

- platelet count <150 x10<sup>9</sup>/L

### Clinical Features

- history: bleeding gums, epistaxis, bleeding post-surgical procedures, metromenorrhagia
- physical exam: bruising, petechiae, ecchymoses, non-palpable purpura
  - hemarthrosis and deep muscle hematomas are rarely initial signs in patients with primary hemostatic disorders
- see *Disorders of Primary Hemostasis*, H25, for complications

### Investigations

- CBC and differential
- blood film
  - decreased production: other cell line abnormalities, blasts, hypersegmented PMNs, leukoerythroblastic changes
  - increased destruction: large platelets, schistocytes (seen in MAHA)
  - rule out platelet clumping
- work-up for nutritional deficiencies: B<sub>12</sub>, RBC folate
- PT/INR, aPTT and fibrinogen if DIC suspected
- LFTs

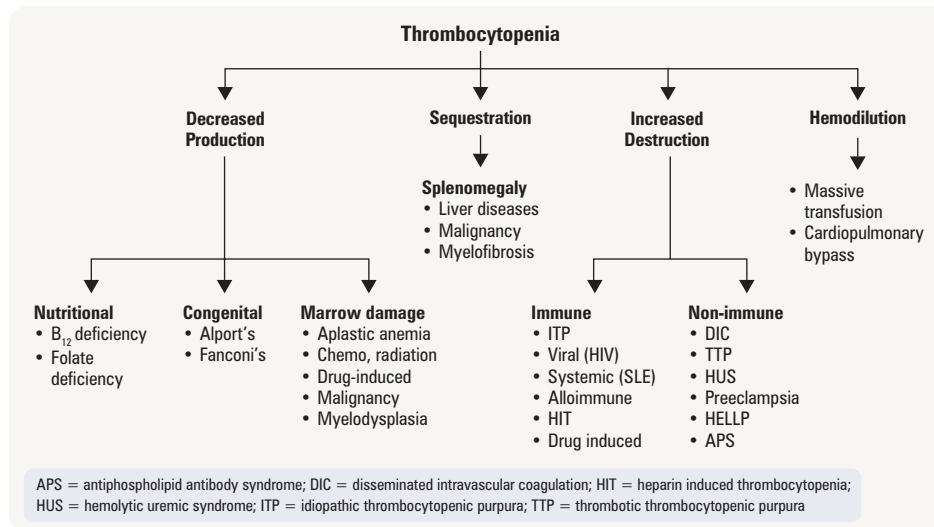

#### Must rule out factitious

**thrombocytopenia:** platelet clumping (secondary to EDTA antibodies from collection tube). This can be seen on blood film and confirmed by repeating in a citrated sample (i.e. using a sodium citrate tube to collect blood, rather than EDTA).

### Treatments

- life threatening bleed: platelet transfusion (repeat CBC 1 h post-transfusion to confirm an appropriate rise in counts)
- if secondary: treat underlying cause
- ITP: see *ITP*, H26

Figure 4. Approach to thrombocytopenia

Adapted from Cecil's Essentials of Medicine

## Thrombocytosis

### Definition

- platelet count  $>400 \times 10^9/L$
- primary thrombocytosis: due to myeloproliferative neoplasms [e.g. CML, polycythemia vera (PV), primary myelofibrosis, essential thrombocytosis (ET). Rarely associated with MDS]
- reactive/secondary thrombocytosis: acute phase reactant (e.g. surgery, inflammation, infection, trauma, bleeding, iron deficiency, neoplasms, ischemic injury); much more common than primary

### Clinical Features

- history: trauma, surgery, splenectomy, infection, inflammation, bleeding, iron deficiency, prior diagnosis of chronic hematologic disorder, constitutional symptoms (malignancy)
- vasomotor symptoms: headache, visual disturbances, lightheadedness, atypical chest pain, acral dysesthesia, erythromelalgia, livedo reticularis, aquagenic pruritus
- clotting risk, bleeding risk (rare)
- physical exam: splenomegaly can be seen in myeloproliferative neoplasms (MPNs)

### Investigations

- CBC, peripheral blood film, serum ferritin concentration
- non-specific markers of infection or inflammation (e.g. CRP, ESR, ferritin)
- if reactive process has been ruled out, bone marrow biopsy may be required to rule out MPN/MDS

### Treatment

- primary: ASA  $\pm$  cytoreductive agents
- secondary: treat underlying cause

## Pancytopenia

### Definition

- a decrease in all hematopoietic cell lines

### Clinical Features

- anemia: fatigue
- leukopenia: recurrent infections
- thrombocytopenia: mucosal bleeding and ecchymoses

### Investigations

- CBC and differential, blood film
- reticulocyte count
- investigate secondary causes as per history: HIV test, serum B<sub>12</sub>, RBC folate, ANA
  - on history, inquire about drug (including OTC/herbal) and environmental exposures
- often requires bone marrow biopsy to determine cause

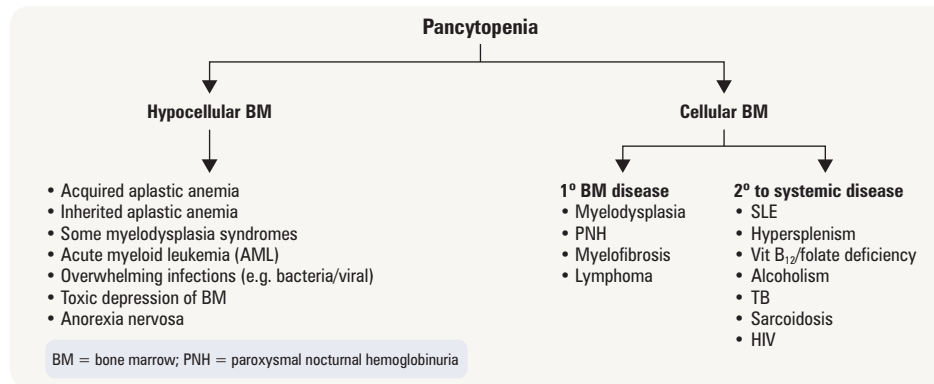

Figure 5. Approach to pancytopenia

## Neutrophilia

### Definition

- different guidelines, but absolute neutrophil count (ANC)  $>7.7 \times 10^9/L$

### Etiology

- primary neutrophilia
  - chronic myeloid leukemia (CML)
  - other myeloproliferative disorders: PV, essential thrombocytosis (ET), myelofibrosis
  - hereditary neutrophilia (autosomal dominant)
  - chronic idiopathic neutrophilia in otherwise healthy patients leukocyte adhesion deficiency
- secondary neutrophilia
  - smoking: most common cause of mild neutrophilia
  - infection: leukocytosis with left shift  $\pm$  toxic granulation, Döhle bodies (intra-cytoplasmic structures composed of agglutinated ribosomes)
  - inflammation: e.g. rheumatoid arthritis (RA), IBD, chronic hepatitis, MI, PE, burns
  - malignancy: hematologic (i.e. marrow invasion by tumour) and non-hematologic (especially large cell lung cancer)
  - stress/exercise/epinephrine: movement of neutrophils from marginated pool into circulating pool
  - medications: glucocorticoids,  $\beta$ -agonists (e.g. epinephrine), lithium

### Clinical Features

- look for signs and symptoms of fever, inflammation, malignancy to determine appropriate further investigations
  - including lymph nodes and organomegaly
- examine oral cavity, teeth, peri-rectal area, genitals and skin for signs of infection

### Investigations

- CBC and differential: mature neutrophils or bands  $>20\%$  of total WBC suggests infection/inflammation
- blood film: Döhle bodies, toxic granulation, cytoplasmic vacuoles in infection
- review other blood counts
- may require bone marrow biopsy if MPN suspected

### Treatment

- directed at underlying cause

## Neutropenia

### Definition

- mild: ANC  $1.0\text{--}1.5 \times 10^9/L$
- moderate: ANC  $0.5\text{--}1.0 \times 10^9/L$  (risk of infection starts to increase)
- severe: ANC  $<0.5 \times 10^9/L$
- profound: ANC  $<0.1 \times 10^9/L$  for  $>7$  d

Absolute Neutrophil Count (ANC) =  
WBC count  $\times$  (%PMNs + %bands)

Beware of fever + ANC  $<0.5 \times 10^9/L$  =  
FEBRILE NEUTROPENIA

## Etiology

**Table 5. Etiology of Neutropenia**

Decreased Production	Peripheral Destruction	Excessive Margination (Transient Neutropenia)
<b>Infection:</b> Viral hepatitis, EBV, HIV, TB, typhoid, malaria <b>Hematological diseases:</b> Idiopathic, aplastic anemia, myelofibrosis, BM infiltration <b>Drug-induced:</b> Alkylating agents, antimetabolites, anticonvulsants, antipsychotics, anti-inflammatory agents, anti thyroid drugs <b>Toxins/Chemicals:</b> High dose radiation, benzene, DDT <b>Nutritional Deficiency:</b> B <sub>12</sub> , folate <b>Idiopathic:</b> Constitutional neutropenia, benign cyclic neutropenia, cyclical	Anti-neutrophil antibodies Spleen or lung trapping Autoimmune disorders: RA, SLE Granulomatosis with polyangiitis (formerly Wegener's) Drugs: haptens (e.g. $\alpha$ -methyl dopa)	Idiopathic (most common) Overwhelming bacterial infection Hemodialysis Racial variation (e.g. African or Ashkenazi Jewish descent)

### Clinical Features

- fever, chills (only if infection present)
- infection by endogenous bacteria (e.g. *S. aureus*, gram negatives from GI and GU tract)
- painful ulceration on skin, anus, mouth and throat following colonization by opportunistic organisms
- avoid digital rectal exam

### Investigations

- dependent on degree of neutropenia, history, and symptoms
- ranges from observation with frequent CBCs to bone marrow aspiration and biopsy

### Treatment

- regular dental care: chronic gingivitis and recurrent stomatitis major sources of morbidity
- febrile neutropenia (see [Infectious Diseases](#), ID39)
- in severe immune-mediated neutropenia, G-CSF may increase neutrophil counts
  - if no response to G-CSF, consider immunosuppression (e.g. steroids, cyclosporine, methotrexate)

#### Prophylactic Hematopoietic Colony-Stimulating Factors on Mortality and Infection

*Ann Intern Med* 2007;147:400-411

**Purpose:** To review the effects of colony-stimulating factor (CSF) on mortality, infections, and febrile neutropenia in patients undergoing chemotherapy or stem-cell transplant (SCT).

**Study Selection:** 148 RCTs comparing the effects of CSFs to either placebo or no therapy were included. Prophylactic CSFs were given concurrently with or after initiation of chemotherapy.

**Results:** There were no differences in all-cause mortality or infection-related death between CSF and placebo groups. Compared to placebo or no therapy, CSFs reduced infection rate (median rate 38.9% vs. 43.1%; rate ratio 0.85), microbiologically documented infections (MR 23.5% vs. 28.6%; rate ratio 0.86), and febrile neutropenia (MR 25.3% vs. 44.2%; rate ratio 0.71).

**Conclusions:** Prophylactic CSFs decrease infection rates and episodes of febrile neutropenia in patients undergoing chemotherapy or SCT, but have no effect on mortality.

**G-CSF = Neupogen® = Filgrastim**

## Lymphocytosis

### Definition

- absolute lymphocyte count  $>4 \times 10^9/L$

### Etiology

- infection
  - viral infections (majority); particularly mononucleosis
  - TB, pertussis, brucellosis, toxoplasmosis
- physiologic response to stress (e.g. trauma, status epilepticus)
- hypersensitivity (e.g. drugs, serum sickness)
- autoimmune (e.g. rheumatoid arthritis)
- neoplasm (e.g. ALL, CLL, lymphoma)

### Investigations

- peripheral smear

### Treatment

- treat underlying cause

Presence of smudge cells suggests a lymphoproliferative disorder if persistently elevated above  $5.0 \times 10^9/L$  for  $>3$  mo. Consider flow cytometry.

Presence of atypical lymphocytes suggests viral infection.

## Lymphopenia

### Definition

- absolute lymphocyte count  $<1.5 \times 10^9/L$

### Etiology

- idiopathic CD4+ lymphocytopenia
- radiation
- HIV/AIDS, hepatitis B, hepatitis C
- malignancy/chemotherapeutic agents
- malnutrition, alcoholism
- autoimmune disease (e.g. SLE)

**Clinical Features**

- opportunistic infections (see [Infectious Diseases](#), ID39)

**Treatment**

- treat underlying cause
- treat opportunistic infections aggressively and consider antimicrobial prophylaxis (see [Infectious Diseases](#), ID47)

## Eosinophilia

**Definition**

- absolute eosinophil count  $>0.5 \times 10^9/L$

**Etiology**

- primary: due to clonal bone marrow disorder
  - if no primary etiology identified, classified as hypereosinophilic syndrome
    - ♦ 6 mo of eosinophilia with no other detectable causes
    - ♦ can involve heart, bone marrow, CNS
- secondary:
  - most common causes are parasitic (usually helminth) infections and allergic reactions
  - less common causes:
    - ♦ polyarteritis nodosa, see [Rheumatology](#), RH19
    - ♦ respiratory causes (asthma, eosinophilic pneumonia, Churg-Strauss)
    - ♦ cholesterol emboli
    - ♦ hematologic malignancy: CML, Hodgkin lymphoma, see H38, H43
    - ♦ adrenal insufficiency, see [Endocrinology](#), E35
    - ♦ medications (penicillins)

**Basophilia and/or Eosinophilia**

Can be an indicator of chronic myeloid leukemia or other myeloproliferative neoplasm, associated with pruritus due to excessive histamine production.

**Treatment**

- treat underlying cause

## Agranulocytosis

**Definition**

- severe depletion of granulocytes (neutrophils, eosinophils, basophils) from the blood and granulocyte precursors from bone marrow

**Etiology**

- associated with medications in 70% of cases: e.g. chemotherapy, clozapine, thionamides (antithyroid drugs), sulfasalazine and ticlopidine
  - immune-mediated destruction of circulating granulocytes by drug-induced antibodies or direct toxic effects upon marrow granulocytic precursors

**Clinical Features**

- abrupt onset of fever, chills, weakness, and oropharyngeal ulcers

**Prognosis**

- high fatality without vigorous treatment

**Investigations/Treatment**

- discontinue offending drug
- pan-culture and screen for infection if patient is febrile (blood cultures x2, urine culture and chest x-ray as minimum, initiate broad-spectrum antibiotics)
- consider bone marrow aspirate and biopsy if cause unclear
- consider G-CSF

## Leukemoid Reactions

- blood findings resembling those seen in certain types of leukemia which reflect the response of healthy BM to cytokines released due to infection or trauma
- leukocytosis  $>50 \times 10^9/L$ , marked left shift (myelocytes, metamyelocytes, bands in peripheral blood smear)

**Etiology**

- important to rule out CML
- differential diagnosis:
  - myeloid progenitors: pneumonia, other acute bacterial infections, intoxications, burns, malignant disease, severe hemorrhage or hemolysis
  - lymphoid progenitors: pertussis, TB, infectious mononucleosis
- monocytic progenitors: TB

# Approach to Lymphadenopathy

## History

- constitutional/B-symptoms: seen in TB, lymphoma, other malignancies
- exposures: cats (cat scratch – *Bartonella henselae*), ticks (Lyme disease – *Borrelia burgdorferi*), high risk behaviors (HIV)
- joint pain/swelling, rashes (connective tissue disorder)
- pruritus (seen in Hodgkin lymphoma)
- medications (can cause serum sickness → lymphadenopathy)

## Physical Exam

- basic assessment: occipital, preauricular, submandibular, cervical, supra/infra-clavicular, axillary, epitrochlear, inguinal, popliteal nodes
  - characteristics of lymph nodes (see Table 6)
  - look for signs of infection in regions which lymph nodes drain
- determine if lymphadenopathy is localized or generalized
- localized: typically reactive or neoplastic
  - cervical (bacterial/mycobacterial infections, ENT malignancies, metastatic cancer)
  - supraclavicular
    - ♦ right (mediastinal, bronchogenic, esophageal cancer)
    - ♦ left (gastric, gall bladder, pancreas, renal, testicular/ovarian cancer)
  - axillary (cat scratch fever, breast cancer, metastatic cancer)
  - epitrochlear (infections, sarcoidosis, lymphoma)
  - lower/inguinal (STDs, skin, cervix, vulva/penis, rectum/anus cancer)
- generalized: see Table 7
- thorough examination required to assess for systemic disease

## Investigations

- CBC and differential, blood film
- ± tuberculin test, HIV RNA, RPR/VDRL, monospot/EBV serology, ANA, imaging as indicated
- if localized and no symptoms suggestive of malignancy, can observe 3-4 wk (if no resolution → biopsy)
- excisional biopsy is preferred as it preserves node architecture (essential for diagnosing lymphoma)
- in difficult to access areas (retroperitoneal, mediastinal/hilar) multiple core biopsies may be more practical/feasible
- FNA should NOT be used for diagnostic purposes in lymphoproliferative disease (use excisional biopsy instead)
  - helpful for recurrence of solid tumour malignancy

**Table 6. Inflammatory vs. Neoplastic Lymph Nodes**

Feature	Inflammatory	Neoplastic
Consistency	Rubbery	Firm/hard
Mobility	Mobile	Matted/Immobile
Tenderness	Tender	Non-tender
Size	<2 cm	>2 cm

\*Note: these classifications are not absolute; lymphoma and CLL nodes can feel rubbery and are frequently mobile, non-tender

**Table 7. Differential Diagnosis of Generalized Lymphadenopathy**

Reactive	Inflammatory	Neoplastic
Bacterial (TB, Lyme, brucellosis, cat-scratch disease), syphilis)	Collagen disease (RA, dermatomyositis, SLE, vasculitis, Sjögren)	Lymphoproliferative disorder/Lymphoma
Viral (EBV, CMV, HIV)	Drug hypersensitivity	Metastatic cancer
Parasitic (toxoplasmosis)	Sarcoidosis, amyloidosis	Histiocytosis X
Fungal (histoplasmosis)	Serum sickness	

### B-symptoms

- Unexplained temperature >38°C
- Unexplained weight loss (>10% of body weight in 6 mo)
- Night sweats

### Drugs That Can Cause Lymphadenopathy

- Allopurinol
- Atenolol
- Captopril
- Carbamazepine
- Cephalosporins
- Gold
- Hydralazine
- Penicillin
- Phenytoin
- Primidone
- Pyrimethamine
- Quinidine
- Sulfonamides

## Approach to Splenomegaly

**Table 8. Differential Diagnosis of Splenomegaly**

Increased Demand for Splenic Function			Congestive	Infiltrative
<b>Hematological</b>	<b>Infectious</b>	<b>Inflammatory</b>	<b>Cirrhosis</b>	<b>Non-malignant</b>
Spherocytosis	CMV	Felty syndrome	Splenic vein thrombosis	Benign metaplasia
Hemoglobinopathies	Bacterial endocarditis	Still's disease	Portal vein obstruction	Amyloidosis, Sarcoidosis
Hemolysis	TB	SLE	Portal HTN (including right heart failure)	<u>Lysosomal storage diseases</u>
Sequestration crisis	<u>HIV/AIDS</u>	Sarcoidosis		(Gaucher's, Niemann-Pick)
Nutritional anemias	EBV			Glycogen storage diseases
Elliptocytosis	<u>Malaria</u>			Hamartomas
	Histoplasmosis			Cysts
	<u>Leishmaniasis</u>			Vascular abnormalities
				<b>Malignant</b>
				<u>Leukemia (CML, CLL)</u>
				<u>Lymphoproliferative disease</u>
				<u>Hodgkin lymphoma</u>
				<u>Myeloproliferative disorders</u>
				Metastatic tumour

The underlined conditions cause massive splenomegaly (spleen crosses midline or reaches pelvis)

### History

- constitutional symptoms, feeling of fullness in LUQ
- signs or symptoms of infection or malignancy
- history of liver disease, hemolytic anemia or high-risk exposures

### Physical Exam

- jaundice, petechiae
- signs of chronic liver disease
- percussion (Castell's sign, Traube's space, Nixon's method) and palpation
- associated lymphadenopathy or hepatomegaly
- signs of CHF

### Investigations

- CBC and differential, blood film
- as indicated: liver enzymes/liver function tests, reticulocyte count, Monospot®, haptoglobin, LDH, infectious and autoimmune workups
- imaging
  - ultrasound of abdomen/liver to rule out cirrhosis and portal vein thrombosis
  - echo for cardiac function
  - CT to rule out lymphoma

#### Causes of Splenomegaly

##### CHINA

Cirrhosis/Congestion (portal HTN)

Hematological

Infectious

Neoplasm (malignant, non-malignant)

Autoimmune

#### Does this Adult Patient have Splenomegaly?

From The Rational Clinical Examination  
JAMA 2009; <http://www.jamaevidence.com/content/3487298>

**Study:** Systematic review of articles assessing the sensitivity and specificity of clinical exam maneuvers for detecting splenomegaly.

**Results:** On percussion, Nixon sign had a positive likelihood ratio (+LR) of 3.6 (95% CI, 1.8-7.3) and a negative likelihood ratio (-LR) of 0.41 (95% CI, 0.26-0.64). Percussion of Traube's space had a +LR of 2.3 (95% CI, 1.8-2.9) and -LR of 0.48 (95% CI, 0.39-0.60), while Castell sign had a +LR of 1.2 (95% CI, 0.98-1.6) and -LR of 0.45 (95% CI, 0.19-1.1). On palpation, supine 1-handed palpation had a +LR of 8.2 (95% CI, 5.8-1.2) and -LR of 0.41 (95% CI, 0.30-0.57). Middleton hooking maneuver had a +LR of 6.5 (95% CI, 3.1-1.5) and -LR of 0.16 (95% CI, 0.08-0.32).

**Conclusions:** Palpation may have greater accuracy than percussion, but may be best when both are used in tandem. Specifically, Nixon sign and supine 1-handed palpation are the most accurate, respectively.

## Microcytic Anemia

- MCV <80 fL
- see Figure 3, *Approach to Anemia*, H5

**Table 9. Iron Indices and Blood Film in Microcytic Anemia (MCV <80)**

	Lab Tests				Blood Film
	Ferritin	Serum Iron	TIBC	RDW	
<b>Iron Deficiency Anemia</b>	↓↓	↓	↑	↑ (>15)	• Hypochromic, microcytic
<b>Anemia of Chronic Disease</b>	N/↑	↓	↓	N	• Normocytic/microcytic
<b>Sideroblastic Anemia</b>	N/↑	↑	N	↑	• Dual population • Basophilic stippling
<b>Thalassemia</b>	N/↑	N/↑	N	N/↑	• Hypochromic, microcytic • Basophilic stippling • Poikilocytosis

TIBC = total iron-binding capacity

#### Causes of Microcytic Anemia

##### TAILS

Thalassemia

Anemia of chronic disease

Iron deficiency

Lead poisoning

Sideroblastic anemia

## Iron Metabolism

### Iron Intake (Dietary)

- average North American adult diet = 10-20 mg iron (Fe) daily
- absorption is 5-10% (0.5-2 mg/d); enhanced by citric acid, ascorbic acid (vitamin C) and reduced by polyphenols (e.g. in tea), phytate (e.g. in bran), dietary calcium, and soy protein
- males have positive Fe balance; up to 20% of menstruating females have negative Fe balance

**Iron Indices** (see Table 9 and Figure 6)

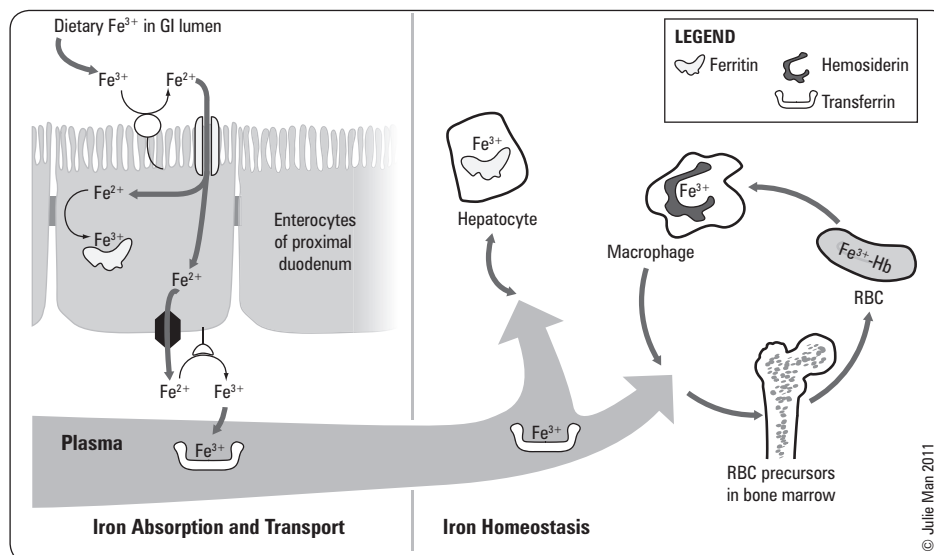

- bone marrow aspirate: gold standard test for iron stores (rarely done)
- serum ferritin: most important blood test for iron stores
  - decreased in iron deficiency anemia
  - elevated in:
    - ♦ infection, inflammation, malignancy
    - ♦ liver disease, hyperthyroidism and iron overload
- serum iron: measure of all non-heme iron present in blood
  - varies significantly daily
  - virtually all serum iron is bound to transferrin, only a trace is free or complexed in ferritin
- total iron binding capacity (TIBC): total amount of transferrin present in blood
  - normally, one third of TIBC is saturated with iron
  - high specificity for decreased iron, low sensitivity
- saturation:
  - serum Fe divided by TIBC, expressed as a proportion or a percentage
  - low in iron deficiency anemia
- soluble transferrin receptor (sTfR):
  - reflects the availability of iron at the tissue level
  - the transferrin receptor is expressed on the surface of erythroblasts and is responsible for iron uptake – some is cleaved off and is present in circulation as sTfR
  - in iron deficient states more transferrin receptor is expressed on erythroblasts leading to an increase in sTfR
  - low in reduced erythropoiesis and iron overload
  - useful in determining iron deficiency in the setting of chronic inflammatory disorders (see *Iron Deficiency Anemia*, H14)

**Iron Absorption and Transport** (see Figure 6)

- dietary iron is absorbed in the duodenum (impaired by IBD, celiac disease, etc.)
- in circulation the majority of non-heme iron is bound to transferrin which transfers iron from enterocytes and storage pool sites (macrophages and hepatocytes) to RBC precursors in the bone marrow

**Iron Storage**

- ferritin
  - ferric iron ( $\text{Fe}^{3+}$ ) complexed to a protein called apoferritin (hepatocytes are main ferritin storage site)
  - small quantities are present in plasma in equilibrium with intracellular ferritin
  - also an acute phase reactant – can be spuriously elevated despite low Fe stores in response to a stressor
- hemosiderin
  - aggregates or crystals of ferritin with the apoferritin partially removed
  - macrophage-monocyte system is main source of hemosiderin storage

**Figure 6. Iron metabolism**

## Iron Deficiency Anemia

- see [Pediatrics](#), P47
- most common cause of anemia in North America

### Etiology

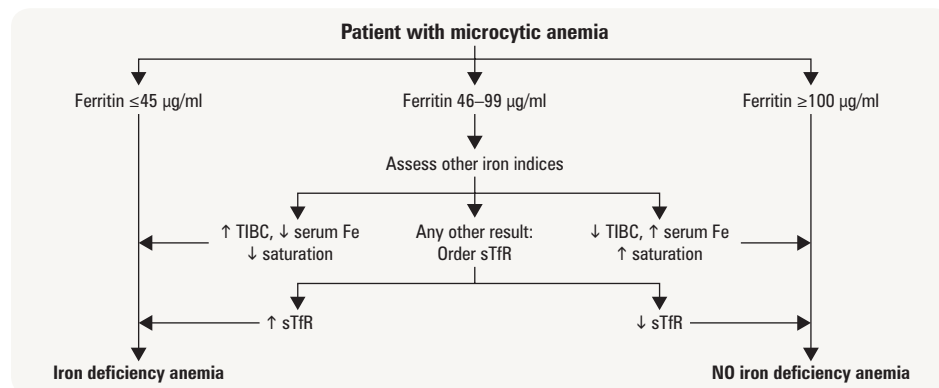

- increased demand
  - increased physiological need for iron in the body (e.g. pregnancy)
- decreased supply: dietary deficiencies (rarely the only etiology)
  - cow's milk (infant diet)
  - "tea and toast" diet (elderly)
  - absorption imbalances
  - post-gastrectomy
  - malabsorption (IBD of duodenum, celiac disease, autoimmune atrophic gastritis)
- increased losses
  - hemorrhage
    - ♦ obvious causes: menorrhagia, abnormal uterine bleeding, frank GI bleed
    - ♦ occult: peptic ulcer disease, GI cancer
  - hemolysis
    - ♦ intravascular (e.g. paroxysmal nocturnal hemoglobinuria (PNH), cardiac valve RBC fragmentation)
    - ♦ extravascular (e.g. immune hemolytic anemias)

### Clinical Features

- iron deficiency may cause fatigue before clinical anemia develops
- signs/symptoms of anemia: see *Approach to Anemia*, H5
- brittle hair, nail changes (brittle, koilonychia)
- Plummer-Vinson syndrome: dysphagia (esophageal webs), glossitis, angular stomatitis (inflammation and fissuring at the corners of the mouth)
- pica (appetite for non-food substances e.g. ice, paint, dirt)

### Investigations

- iron indices, including soluble transferrin receptor (Figure 7)
  - low ferritin (<45 µg/L) is diagnostic of iron deficiency (Table 10)
  - ferritin is an acute phase reactant and is elevated in the setting of inflammatory conditions and liver disease; serum ferritin <100 µg/L in these settings is suggestive of iron deficiency, necessitating further workup (Figure 7)
- peripheral blood film
  - hypochromic microcytosis: RBCs have low Hb levels due to lack of iron
  - pencil forms, anisocytosis
  - target cells (thin)
- bone marrow (gold standard but rarely done)
  - iron stain (Prussian blue) shows decreased iron in macrophages and in erythroid precursors (sideroblasts)
  - intermediate and late erythroblasts show micronormoblastic maturation

**Figure 7. Approach to interpreting iron indices**

Adapted from Am Fam Physician 2007;75:671-678

### Treatment

- treat underlying cause
- supplementation
  - oral (tablets, syrup)
    - ♦ ferrous sulphate 325 mg tid, ferrous gluconate 300 mg tid, or ferrous fumarate 300 mg tid
    - ♦ supplement until anemia corrects, then continue for 3+ mo until serum ferritin returns to normal
    - ♦ oral iron should be taken with citrus juice to enhance absorption
  - IV (iron sucrose or dextran) can be used if patient cannot tolerate or absorb oral iron

#### Plummer-Vinson Syndrome Triad

- Dysphagia (esophageal)
- Glossitis
- Iron deficiency anemia

**Table 10. The Utility of Ferritin in the Diagnosis of Iron Deficiency Anemia**

Ferritin (µg/L)	Likelihood ratio for iron deficiency anemia
>100	0.13
45-100	0.46
18-45	3.12
≤18	41.47

Am J Med 1990;88:205-209

Iron deficiency anemia is a common presentation of chronic lower GI bleeds (right-sided colorectal cancer, angiodysplasia, etc.).

In males and in post-menopausal women a GI work-up is always warranted.

- monitoring response
  - reticulocyte count will begin to increase after one wk
  - Hb normalizes by 10 g/L per wk (if no blood loss)
  - iron supplementation required for 4-6 mo to replenish stores

## Anemia of Chronic Disease

- see [Pediatrics](#), P48

### Etiology

- infection, malignancy, inflammatory and rheumatologic disease, chronic renal and liver disease, endocrine disorders (e.g. diabetes mellitus, hypothyroidism, hypogonadism, hypopituitarism)

### Pathophysiology

- an anemia of underproduction due to impaired iron utilization (hepcidin is a key regulatory peptide)
  - enterocyte trapping of iron → increased hepcidin inhibits ferroportin (↓ iron into circulation)
  - macrophage trapping of iron → reduced plasma iron levels making iron relatively unavailable for new hemoglobin synthesis
  - marrow unresponsive to normal or slightly elevated EPO
- mild hemolytic component is often present
- RBC survival is modestly decreased

### Investigations

- diagnosis of exclusion
- associated with elevation in acute phase reactants (ESR, CRP, fibrinogen)
- “classic” serum iron indices (see Table 9)
  - serum iron and TIBC low, % saturation normal
  - serum ferritin is normal or increased
- anemia of chronic disease often co-exists with iron deficiency (see sidebar)
- peripheral blood
  - mild: usually normocytic and normochromic
  - moderate: may be microcytic and normochromic
  - severe: may be microcytic and hypochromic
  - absolute reticulocyte count is frequently low, reflecting overall decrease in RBC production
- bone marrow
  - normal or increased iron stores
  - decreased or absent staining for iron in erythroid precursors

### Treatment

- treat underlying disease
- only treat anemia in patients who can benefit from a higher hemoglobin
- IV iron if no benefit from PO iron
- erythropoietin indicated in chronic renal failure. Not to be used if patient has concomitant curative solid tumour malignancy. Ensure Hb target <110 g/L

**Iron-deficiency anemia commonly co-exists with anemia of chronic disease. Suggested by:**

- Serum ferritin <100 µg/L in setting of a chronic inflammatory disease
- Elevation of soluble transferrin receptor
- Absence of stainable iron on bone marrow aspiration/biopsy
- Response to a therapeutic trial of oral iron

## Sideroblastic Anemia

- uncommon compared to iron deficiency anemia or anemia of chronic disease

### Sideroblasts

- erythrocytes with iron-containing (basophilic) granules in the cytoplasm
- “normal”: granules are small, randomly spread in the cytoplasm
  - found in healthy individuals
- “ring”: iron deposits in mitochondria, forming a ring around the nucleus
  - abnormal, large granules
  - the hallmark of sideroblastic anemia

### Etiology

- due to defects in heme biosynthesis in erythroid precursors
- hereditary (rare): X-linked; median survival 10 yr
- idiopathic (acquired)
  - aka refractory anemia with ringed sideroblasts: a subtype of MDS (see *Myelodysplastic Syndromes*, H36)
  - may be a preleukemic phenomenon (10% transform to AML)
- reversible
  - drugs (isoniazid, chloramphenicol), alcohol, lead, copper deficiency, zinc toxicity, hypothyroidism

**Clinical Features**

- anemia symptoms (see *Approach to Anemia*, H5)
- hepatosplenomegaly,  $\text{Fe}^{2+}$  overload syndrome

**Investigations**

- serum iron indices
  - increased serum  $\text{Fe}^{2+}$ , normal TIBC, increased ferritin, increased sTfR
- blood film/bone marrow biopsy
  - ringed sideroblasts (diagnostic hallmark)
  - RBCs are hypochromic; can be micro-, normo-, or macrocytic
  - anisocytosis, poikilocytosis, basophilic stippling

**Treatment**

- depends on etiology
  - X-linked: high dose pyridoxine (vitamin B<sub>6</sub>) in some cases
  - acquired: EPO and G-CSF
  - reversible: remove precipitating cause
- supportive transfusions for severe anemia

Consider lead poisoning in any child microcytic anemia who lives in a house built before 1977.

**Features of Lead Poisoning****LEAD**

Lead lines on gingivae and epiphyses of long bones on x-ray  
 Encephalopathy and Erythrocyte basophilic stippling  
 Abdominal colic and microcytic Anemia (sideroblastic)  
 Drops (wrist and foot drop)

**Causes of Normocytic Anemia****ABCD**

Acute blood loss  
 Bone marrow failure  
 Chronic disease  
 Destruction (hemolysis)

## Lead Poisoning

**Definition/Etiology**

- blood lead levels greater than 80  $\mu\text{g}/\text{dL}$ , possible symptomatology at 50  $\mu\text{g}/\text{dL}$

**Clinical Features**

- identify source: consider occupational history, exposures history
- abdominal pain, constipation, irritability, difficulty concentrating

**Treatment**

- chelation therapy: dimercaprol and EDTA are first line agents

## Thalassemia

- see *Hemolytic Anemia – Thalassemia*, H18

## Normocytic Anemia

- MCV 80-100 fL
- see Figure 3, *Approach to Anemia*, H5

## Aplastic Anemia

**Definition**

- destruction of hematopoietic cells of the bone marrow leading to pancytopenia and hypocellular bone marrow

**Epidemiology**

- occurs at any age
- slightly more common in males

**Etiology**

**Table 11. Etiology of Aplastic Anemia**

Congenital	Acquired
Fanconi's anemia Shwachman-Diamond syndrome	<b>Idiopathic</b> Often T-cell mediated <b>Drugs</b> Dose-related (i.e. chemotherapeutics) Idiosyncratic (chloramphenicol, phenylbutazone) <b>Toxins</b> Benzene/organic solvents DDT, insecticides
	<b>Ionizing Radiation</b> <b>Post-viral infection</b> Parvovirus B19, EBV, HDV, HEV, HBV, HHV6, HIV <b>Autoimmune (rare)</b> SLE, Graft-versus-host disease <b>Others</b> PNH, pregnancy, anorexia nervosa, thymoma

**Clinical Features**

- can present acutely or insidiously
- symptoms of anemia (see *Approach to Anemia*, H5), thrombocytopenia (see *Thrombocytopenia*, H6) and/or infection
- $\pm$  splenomegaly and lymphadenopathy (depending on the cause)

### Investigations

- exclude other causes of pancytopenia (Figure 3)
- CBC
  - anemia or neutropenia or thrombocytopenia (any combination)  $\pm$  pancytopenia
  - decreased reticulocytes ( $<1\%$  of the total RBC count)
- blood film
  - decreased number of normal RBCs
- bone marrow
  - aplasia or hypoplasia of marrow cells with fat replacement
  - decreased cellularity

### Treatment

- remove offending agents
- supportive care (red cell and platelet transfusions, antibiotics)
  - judicious use so as to not increase the risk of immune sensitization to blood products
- immunosuppression
  - anti-thymocyte globulin: 50-60% of patients respond
  - cyclosporine
- allogenic bone marrow transplant

## Hemolytic Anemia (HA)

### Classification

- hereditary
  - abnormal membrane (spherocytosis, elliptocytosis)
  - abnormal enzymes (pyruvate kinase deficiency, G6PD deficiency)
  - abnormal hemoglobin synthesis (thalassemias, hemoglobinopathies)
- acquired
  - immune
    - ♦ hemolytic transfusion reaction, autoimmune HA (AIHA), drugs (e.g. penicillin), cold agglutinins
    - ♦ alloimmune (transfusion reaction, hemolytic disease of the fetus/newborn)
  - non-immune
    - ♦ microangiopathic HA (MAHA): thrombus in blood vessel causes RBCs to be sheared – associated with DIC, HUS/TTP, preeclampsia/HELLP, vasculitides, malignant hypertension
    - ♦ other causes: paroxysmal nocturnal hemoglobinuria (PNH), hypersplenism, march hemoglobinuria (exertional hemolysis), infection (e.g. malaria), snake venoms, mechanical heart valves
- also classified as intravascular or extravascular:
  - intravascular: G6PD deficiency, TTP, DIC and PNH
  - extravascular: AIHA and hereditary spherocytosis

### Clinical Features Specific to HA

- jaundice
- dark urine (hemoglobinuria, bilirubin)
- cholelithiasis (pigment stones)
- potential for an aplastic crisis (i.e. BM suppression in overwhelming infection)
- iron overload with extravascular hemolysis
- iron deficiency with intravascular hemolysis

### Investigations

Table 12. Investigations for Hemolytic Anemia

Screening Tests	Tests Specific For Intravascular Hemolysis
Increased LDH	Schistocytes on blood film
Decreased haptoglobin	Free hemoglobin in serum
Increased unconjugated bilirubin	Methemalbuminemia (heme + albumin)
Increased urobilinogen	Hemoglobinuria (immediate)
Reticulocytosis	Hemosiderinuria (delayed)
	Plasma hemoglobin
Tests Specific for Extravascular Hemolysis	
Direct Coombs test (direct antiglobulin test)	
• Detects IgG or complement on the surface of RBC	
• Add anti-IgG or anti-complement Ab to patient's RBCs; positive if agglutination	
• Indications: hemolytic disease of newborn, AIHA, hemolytic transfusion reaction	
Indirect Coombs test (indirect antiglobulin test)	
• Detects antibodies in serum that can recognize antigens on RBCs	
• Mix patient's serum + donor RBCs + Coombs' serum (anti-human Ig Ab); positive if agglutination	
• Indications: cross-matching donor RBCs, atypical blood group, blood group Ab in pregnant women, AIHA	

#### Laboratory Findings in HA

- $\uparrow$  retics
- $\downarrow$  haptoglobin
- $\uparrow$  unconj. bilirubin
- $\uparrow$  urobilinogen
- $\uparrow$  LDH

Disruption of the heme breakdown pathway causes the **porphyria** disorders.

#### Heme Breakdown

## Thalassemia

### Definition

- defects in production of the  $\alpha$  or  $\beta$  chains of hemoglobin
  - resulting imbalance in globin chains leads to ineffective erythropoiesis and hemolysis in the spleen or BM
- clinical manifestations and treatment depends on specific gene and number of alleles affected
- common features:
  - increasing severity with increasing number of alleles involved
  - hypochromic microcytic anemia
  - basophilic stippling, abnormally shaped RBCs on blood film

### Pathophysiology

- defect may be in any of the Hb genes
  - normally 4 $\alpha$  genes in total; 2 on each copy of chromosome 16
  - normally 2 $\beta$  genes in total; 1 on each copy of chromosome 11
  - fetal hemoglobin, HbF ( $\alpha_2\gamma_2$ ), switches to adult forms HbA ( $\alpha_2\beta_2$ ) and HbA<sub>2</sub> ( $\alpha_2\delta_2$ ) at 3-6 mo of life
  - HbA constitutes 97% of adult hemoglobin
  - HbA<sub>2</sub> constitutes 3% of adult hemoglobin

#### ThalasSEAmia

$\beta$ -Thal → prevalent in Mediterranean

$\alpha$ -Thal → prevalent in **South East Asia (SEA)** and Africa ( $\alpha$  = Asia, Africa)

## $\beta$ -Thalassemia Minor (Thalassemia Trait)

### Definition

- defect in single allele of  $\beta$  gene (heterozygous)
- common in people of Mediterranean and Asian descent

### Clinical Features

- None; a palpable spleen is very rare

### Investigations

- Hb 100-140 g/L or 9-14 g/dL, MCV < 70, normal Fe, normal RBC count
- peripheral blood film – microcytosis basophilic stippling
- Hb electrophoresis
  - specific: HbA<sub>2</sub> increased to 2.5-5% (normal 1.5-3.5%)
  - non-specific: 50% have slight increase in HbF

### Treatment

- no treatment required
- genetic counselling for patient and family

#### Microcytosis in $\beta$ -Thal Minor

Microcytosis is much more profound and the anemia is much milder than that of iron deficiency.

## $\beta$ -Thalassemia Major

### Definition

- defect in both alleles of  $\beta$  gene (homozygous, autosomal recessive)

### Pathophysiology

- ineffective chain synthesis leading to ineffective erythropoiesis, hemolysis of RBCs and increase in HbF

### Clinical Features

- initial presentation at age 6-12 mo when HbA normally replaces HbF
  - severe anemia, jaundice
- stunted growth and development (hypogonadal dwarf)
- gross hepatosplenomegaly (due to extramedullary hematopoiesis)
- radiologic changes (due to expanded marrow cavity) and extramedullary hematopoietic masses (erythroid tissue tumours)
  - skull x-ray has “hair-on-end” appearance
  - pathologic fractures common
- evidence of increased Hb catabolism (e.g. pigmented gallstones)
- death can result from
  - untreated anemia (should transfuse)
  - infection (should identify and treat early)
  - iron overload: late complication secondary to repeated transfusions and ineffective erythropoiesis

### Investigations

- CBC: Hb 40-60 g/L (4-6 g/dL)
- Hb electrophoresis
  - HbA: 0-10% (normal >95%)
  - HbA<sub>2</sub> >2.5%
  - HbF: 90-100%

### Treatment

- lifelong regular transfusions to suppress endogenous erythropoiesis
- iron chelation (e.g. deferoxamine, deferasirox, deferiprone) to prevent iron overload in organs and the formation of free radicals (which promote tissue damage and fibrosis)
- folic acid supplementation if not transfused
- allogenic bone marrow transplantation
- splenectomy (now performed less frequently)

## α-Thalassemia

### Definition

- defect(s) in α genes
- similar geographic distribution as β-thalassemia, but higher frequency among Asians and Africans

### Clinical Features

- 1 defective α gene: clinically silent; normal Hb, normal MCV
- 2 defective α genes: decreased MCV, normal Hb
- 3 defective α genes: HbH (β<sub>4</sub>) disease; presents in adults, decreased MCV, decreased Hb, splenomegaly
- 4 defective α genes: Hb Barts (γ<sub>4</sub>) disease (hydrops fetalis); usually incompatible with life

### Investigations

- peripheral blood film – screen for HbH inclusion bodies with special stain
- Hb electrophoresis not diagnostic for α-thalassemia
- DNA analysis using α gene probes is the only way to confirm the diagnosis

### Treatment

- depends on degree of anemia:
  - 1 or 2 defective α genes: no treatment required
  - HbH disease: similar to β-thalassemia intermedia
  - HbBarts: intrauterine transfusion

## Sickle Cell Disease

- see [Pediatrics](#), P48

### Definition

- sickling disorders arise due to a mutant β-globin chain, most commonly caused by a Glu → Val substitution at position 6 (chromosome 11) resulting in HbS variant, rather than HbA (normal adult Hb)
  - increased incidence of HbS allele with African or Mediterranean heritage (thought to be protective against malaria)
- sickle cell disease occurs when an individual has two HbS genes (homozygous, HbSS) or one HbS gene + another mutant β-globin gene (compound heterozygote) – most commonly HbS-β-thal and HbSC disease

### Pathophysiology (Figure 8)

- at low pO<sub>2</sub>, deoxy HbS polymerizes leading to rigid crystal-like rods that distort membranes → 'sickles'
- the pO<sub>2</sub> level at which sickling occurs is related to the percentage of HbS present
  - heterozygotes (HbAS); sickling occurs at a pO<sub>2</sub> of 40 mmHg
  - homozygotes (HbSS); sickling occurs at a pO<sub>2</sub> of 80 mmHg
- sickling aggravated by acidemia, increased CO<sub>2</sub>, increased 2,3-DPG, fever and osmolality
- fragile sickle cells hemolyze (nitric oxide depletion); they also occlude small vessels (ischemia-reperfusion injury)

**Figure 8. Pathophysiology of sickling**

**Functional asplenism:** increased susceptibility to infection by encapsulated organisms

- *S. pneumoniae*
- *N. meningitidis*
- *H. influenzae*
- *Salmonella* (osteomyelitis)

#### Acute Chest Syndrome

Affects 30% of patients with sickle cell disease and may be life threatening. Presentation includes dyspnea, chest pain, fever, tachypnea, leukocytosis, and pulmonary infiltrate on CXR. Caused by vaso-occlusion, infection, or pulmonary fat embolus from infarcted marrow.

### Clinical Features

- HbAS (sickle cell trait): patient will be asymptomatic except during extreme hypoxia or infection
  - increased risk of renal medullary carcinoma
- SCD-SS (HbSS)
  - chronic hemolytic anemia
  - jaundice in the first year of life
  - retarded growth and development ± skeletal changes
  - splenomegaly in childhood; splenic atrophy in adulthood
- SCD-SS often presents with acute pain episode:
  1. aplastic crises
    - ♦ toxins and infections (especially parvovirus B19) transiently suppress bone marrow
  2. splenic sequestration crises
    - ♦ usually in children; significant pooling of blood in spleen resulting in acute Hb drop and shock
    - ♦ uncommon in adults due to functional asplenia from repeated infarction
  3. vaso-occlusive crises (infarction)
    - ♦ may affect various organs causing ischemia-reperfusion injury (especially in back, chest, abdomen and extremities), fever, and leukocytosis
    - ♦ precipitated by infections, dehydration, rapid change in temperature, pregnancy, menses and alcohol
  4. acute chest syndrome (see sidebar, H19)
- SCD-SC (most common compound heterozygote)
  - 1:833 live births in African-Americans, common in West Africa
  - milder anemia than HbSS
  - similar complications as HbSS although typically milder and less frequent (exception is proliferative sickle retinopathy, glomerulonephritis and avascular necrosis)
  - spleen not always atrophic in adults

### Investigations

- sickle cell prep (detects sickling of RBCs under the microscope in response to O<sub>2</sub> lowering agent): determines the presence of a HbS allele, but does not distinguish HbAS from HbSS
- Hb electrophoresis distinguishes HbAS, HbSS, HbSC and other variants

**Table 13. Investigations for Sickle Cell Disease**

	HbAS	HbSS
<b>CBC</b>	Normal	Increased reticulocytes, decreased Hb, decreased Hct
<b>Peripheral blood</b>	Normal; possibly a few target cells	Sickled cells
<b>Hb electrophoresis</b>	HbA fraction of 0.65 (65%) HbS fraction of 0.35 (35%)	No HbA, only HbS and HbF (proportions change with age). Normal amount of HbA2.

### Treatment

- genetic counselling
- HbAS: no treatment required
- HbSC: treatment as per HbSS, but is dictated by symptom severity
- HbSS
  1. folic acid to prevent folate deficiency
  2. hydroxyurea to enhance production of HbF
    - ♦ mechanism of action: stops repression of Hb-gamma chains and/or initiates differentiation of stem cells in which this gene is active
    - ♦ presence of HbF in the SS cells decreases polymerization and precipitation of HbS
    - ♦ NB: hydroxyurea is cytotoxic and may cause bone marrow suppression
  3. treatment of vaso-occlusive crisis
    - ♦ oxygen
    - ♦ hydration (reduces viscosity)
    - ♦ correct acidosis
    - ♦ analgesics/narcotics
    - ♦ indication for exchange transfusion: acute chest syndrome, stroke, multi-organ failure, ICU admission
    - ♦ less routinely: antimicrobials, magnesium (inhibits potassium and water efflux from RBCs thereby preventing dehydration)
  4. prevention of crises
    - ♦ establish diagnosis
    - ♦ avoid conditions that promote sickling (hypoxia, acidosis, dehydration, fever)
    - ♦ vaccination in childhood (pneumococcus, meningococcus, *H. influenzae* b)
    - ♦ prophylactic penicillin (age 3 mo-5 yr)
    - ♦ good hygiene, nutrition and social support
  5. screen for complications
    - ♦ regular bloodwork (CBC, reticulocytes, iron indices, BUN, LFTs, creatinine)
    - ♦ urinalysis annually (proteinuria, glomerulopathy)
    - ♦ transcranial doppler annually until 16 yr old (stroke prevention)
    - ♦ retinal examinations annually from 8 yr old (screen for retinopathy)
    - ♦ echocardiography every two years from 10 yr old (screen for pulmonary hypertension)

#### Organs Affected by Vaso-Occlusive Crisis

Organ	Problem
Brain	Seizures, stroke
Eye	Hemorrhage, blindness
Liver	Infarcts, RUQ syndrome
Lung	Chest syndrome, long-term pulmonary hypertension
Gallbladder	Stones
Heart	Hyperdynamic flow murmurs
Spleen	Enlarged (child); atrophic (adult)
Kidney	Hematuria, loss of renal concentrating ability, proteinuria
Intestines	Acute abdomen
Placenta	Stillbirths
Penis	Priapism
Digits	Dactylitis
Femoral and humeral head	Avascular necrosis
Bone	Infarction, infection
Ankle	Leg ulcers

#### NIH Consensus Development Conference Statement: Hydroxyurea Treatment for Sickle Cell Disease

*Ann Intern Med* 2008;148:932-938

**Efficacy:** Strong evidence for adolescents and adults and there is emerging data supporting its use in children. In the single RCT, the Hb level was higher in hydroxyurea recipients than placebo recipients after 2 yr (difference, 6 g/L), as was HbF (absolute difference, 3.2%). The median number of painful crises was 44% lower than in the placebo arm. The 12 observational studies that enrolled adults reported a relative increase in HbF of 4% to 20% and a relative reduction in crisis rates by 68% to 84%. Hospital admissions declined by 18% to 32%.

**Effectiveness:** Data is limited but seems to be highly effective but is currently underutilized.

**Short-Term harms (within 6 mo):** Dose-related leukopenia, thrombocytopenia, anemia, and decreased reticulocyte count. Others include decreased sperm production and dry skin.

**Long-Term Harms:** Birth defects in offspring of people receiving the drug, growth delays in children receiving the drug, and cancer in both children and adults who receive the drug.

## Autoimmune Hemolytic Anemia (AIHA)

**Table 14. Classification of AIHA**

	Warm	Cold
<b>Antibody Allotype</b>	IgG	IgM
<b>Agglutination Temperature</b>	37°C	4-21°C
<b>Direct Coombs' Test (direct anti-globulin test)</b>	Positive for IgG $\pm$ complement	Positive for complement
<b>Etiology</b>	Idiopathic Secondary to lymphoproliferative disorder (e.g. CLL, Hodgkin) Secondary to autoimmune disease (e.g. SLE) Drug induced: Type I: hapten-mediated (e.g. penicillin) Type II: immune-complex mediated (e.g. quinine) Type III: "true" anti-RBC Ab (e.g. methylolpa)	Idiopathic Secondary to infection (e.g. mycoplasma pneumonia, EBV) Secondary to lymphoproliferative disorder (e.g. macroglobulinemia, CLL)
<b>Blood Film</b>	Spherocytes	Agglutination
<b>Management</b>	Treat underlying cause Corticosteroids Immunosuppression Splenectomy Folic acid	Treat underlying cause Warm patient Immunosuppression Plasmapheresis Folic acid

## Microangiopathic Hemolytic Anemia (MAHA)

### Definition

- hemolytic anemia due to intravascular fragmentation of RBCs

### Etiology

- thrombotic thrombocytopenic purpura (TTP)/hemolytic uremic syndrome (HUS), see H28
- disseminated intravascular coagulation (DIC), see H30
- eclampsia, HELLP syndrome, AFLP (see [Obstetrics](#), OB17, OB19)
- malignant hypertension
- vasculitis
- malfunctioning heart valves
- metastatic carcinoma
- drugs (calcineurin inhibitors, quinine, simvastatin)
- infections (severe CMV or meningococcus)
- catastrophic antiphospholipid antibody syndrome

### Investigations

- blood film: evidence of hemolysis, schistocytes
- hemolytic work-up
- urine: hemosiderinuria, hemoglobinuria

**Figure 9. Schistocyte**

**Figure 10. Spherocyte**

## Hereditary Spherocytosis

- most common type of hereditary hemolytic anemia
- abnormality in RBC membrane proteins (e.g. spectrin)
  - spleen makes defective RBCs more spherocytotic (and more fragile) by membrane removal; also acts as site of RBC destruction
- autosomal dominant with variable penetrance

### Investigations

- blood film shows spherocytes, increased osmotic fragility, molecular analysis for spectrin gene

### Treatment

- in severe cases, splenectomy + vaccination against pneumococcus, meningococcus and *H. influenzae* b (avoid in early childhood)

## Hereditary Elliptocytosis

### Definition/Etiology

- abnormality in spectrin interaction with other membrane proteins
- autosomal dominant
- 25-75% elliptocytes
- hemolysis is usually mild

**Treatment**

- immunizations; splenectomy for severe hemolysis

**G6PD Deficiency****Definition**

- deficiency in glucose-6-phosphate dehydrogenase (G6PD) leads to RBC sensitivity to oxidative stress due to a lack of reduced glutathione (GSH) (Figure 11)

**Pathophysiology**

- X-linked recessive, prevalent in individuals of African, Asian and Mediterranean descent

**Clinical Features**

- frequently presents as episodic hemolysis precipitated by:
  - oxidative stress
  - drugs (e.g. sulfonamide, antimalarials, nitrofurantoin)
  - infection
  - food (fava beans)
- in neonates: can present as prolonged, pathologic neonatal jaundice

**Investigations**

- neonatal screening
- G6PD assay (may not be useful if result is normal)
  - should not be done in acute crisis when reticulocyte count is high (reticulocytes have high G6PD levels)
- blood film
  - Heinz bodies (granules in RBCs due to oxidized Hb); passage through spleen results in the generation of bite cells
  - may have features of intravascular hemolysis (e.g. RBC fragments)

**Treatment**

- folic acid
- stop offending drugs and avoid triggers
- transfusion in severe cases

**Figure 11. G6PD deficiency****Macrocytic Anemia**

- MCV >100 fL
- see Figure 3, *Approach to Anemia*, H5

**Table 15. Comparison Between Megaloblastic and Non-Megaloblastic Macrocytic Anemia**

	Megaloblastic	Non-Megaloblastic
<b>Morphology</b>	Large, oval, nucleated RBC precursor Hypersegmented neutrophils	Large round RBC Normal neutrophils
<b>Pathophysiology</b>	Failure of DNA synthesis resulting in asynchronous maturation of RBC nucleus and cytoplasm	Reflects membrane abnormality with abnormal cholesterol metabolism

**Causes of Macrocytic Anemia****ABCDE F**

- A**lcoholism (liver disease)
- B**<sub>12</sub> deficiency
- C**ompensatory reticulocytosis
- D**rugs (cytotoxic, AZT)/Dysplasia
- E**ndocrine (hypothyroidism)
- F**olate deficiency/Fetus (pregnancy)

**Vitamin B<sub>12</sub> Deficiency**

**B<sub>12</sub> (cobalamin)** see [Gastroenterology](#), G17 and [Family Medicine](#) – *Nutrition*, FM5

- binds to intrinsic factor (IF) secreted by gastric parietal cells
- absorbed in terminal ileum
- total body stores sufficient for 3-4 yr

**Etiology****Table 16. Etiology of Vitamin B<sub>12</sub> Deficiency**

Diet	Gastric	Intestinal Absorption	Genetic
<b>Strict vegan</b> More likely to present in pediatric population	<b>Mucosal atrophy</b> Gastritis, autoimmune	<b>Malabsorption</b> Crohn's, celiac sprue, pancreatic insufficiency	<b>Transcobalamin II deficiency</b>
<b>Vegetarian in pregnancy</b>	<b>Pernicious anemia</b> (see H23) <b>Post-gastrectomy</b>	<b>Stagnant bowel</b> Blind loop, stricture <b>Fish tapeworm</b> <b>Resection of ileum</b> <b>Drugs</b> Neomycin, biguanides, PPI, N <sub>2</sub> O anesthesia	

### Pathophysiology of Pernicious Anemia

- auto-antibodies produced against gastric parietal cells leading to achlorhydria and lack of intrinsic factor secretion
- intrinsic factor is required to stabilize B<sub>12</sub> as it passes through the bowel
- decreased intrinsic factor leads to decreased ileal absorption of B<sub>12</sub>
- may be associated with other autoimmune disorders (polyglandular endocrine insufficiency)
- female:male = 1.6:1; often >60 yr old

### Clinical Features

- neurological
  - cerebral (common, reversible with B<sub>12</sub> therapy)
    - ♦ confusion, delirium, dementia
  - cranial nerves (rare)
    - ♦ optic atrophy
  - cord (irreversible damage)
    - ♦ subacute combined degeneration
      - posterior columns: decreased vibration sense, proprioception and 2-point discrimination
      - pyramidal tracts: spastic weakness, hyperactive reflexes
  - peripheral neuropathy (variable reversibility)
    - ♦ usually symmetrical, affecting lower limbs more than upper limbs

### Investigations

- CBC, reticulocyte count
  - anemia often severe ± neutropenia ± thrombocytopenia
  - MCV >110 fL
  - low reticulocyte count relative to the degree of anemia (<2%)
- serum B<sub>12</sub> and RBC folate
  - caution: low serum B<sub>12</sub> leads to low RBC folate because of failure of folate polyglutamate synthesis in the absence of B<sub>12</sub>
  - alternatively, can measure urine metabolites (methylmalonate, homocysteine)
- blood film
  - oval macrocytes, hypersegmented neutrophils
- bone marrow
  - hypercellularity
  - nuclear-cytoplasmic asynchrony in RBC precursors (less mature nuclei than expected from the development of the cytoplasm)
- bilirubin and LDH
  - elevated unconjugated bilirubin and LDH due to breakdown of cells in BM
- Schilling test (see sidebar) to distinguish pernicious anemia from other causes
  - anti-intrinsic factor antibody, anti-parietal cell antibody

### Treatment

- vitamin B<sub>12</sub> 1000 µg IM monthly for life or 1000-1200 µg PO daily if intestinal absorption intact
- less frequent, higher doses may be as effective (e.g. 1000 µg IM q3mo)
- watch for hypokalemia and rebound thrombocytosis when treating severe megaloblastic anemia

#### Characteristics of Megaloblastic Macrocytic Anemia

- Pancytopenia
- Hypersegmented neutrophils
- Megaloblastic bone marrow

#### Schilling Test

##### Part 1

- Tracer dose (1 µg) of radiolabeled B<sub>12</sub>, given PO
- Flushing dose (1 mg) of unlabeled B<sub>12</sub> IM 1 h later to saturate tissue binders of B<sub>12</sub> thus allowing radioactive B<sub>12</sub> to be excreted in urine
- 24 h urine radiolabeled B<sub>12</sub> measured
- Normal >5% excretion (a normal excretion will only be seen if the low B<sub>12</sub> was due to dietary deficiency)

##### Part 2

- Same as part 1, but radiolabeled B<sub>12</sub> given with oral intrinsic factor
- Should be done only if first stage shows reduced excretion
- Normal test result (>5% excretion) = pernicious anemia
- Abnormal test result (<5% excretion) = intestinal causes (malabsorption)

#### Oral Vitamin B<sub>12</sub> versus Intramuscular Vitamin B<sub>12</sub> for Vitamin B<sub>12</sub> Deficiency

*Cochrane DB Syst Rev* 2005;3:CD004655

**Study:** Systematic review. 2 RCTs met inclusion criteria; total 108 patients with follow-up from 90 d to 4 mo.

**Intervention:** One study evaluated 1000 µg of oral B<sub>12</sub> compared to 1000 µg IM B<sub>12</sub> on the same dosing schedule. The other compared 2000 µg daily oral B<sub>12</sub> to 1000 µg IM B<sub>12</sub> on a less frequent dosing schedule. Neurological and hematological end points were evaluated.

**Results:** Meta-analysis was not attempted due to study heterogeneity. Both studies reported improvements in hematological and neurological end-points in both oral and IM groups. No significant difference was observed between groups in either study.

**Conclusions:** Limited data suggesting high dose oral vitamin B<sub>12</sub> (1000-2000 µg) is equivalent to IM vitamin B<sub>12</sub> on the same or less frequent dosing schedule. This data is severely limited by small sample sizes and short follow-up periods. Insufficient numbers of patients with malabsorption conditions were included to generalize these results to the entire primary care population.

## Folate Deficiency

- uncommon in developed countries due to extensive dietary supplementation
- folate stores are depleted in 3-6 mo
- folate commonly found in green, leafy vegetables and fortified cereals

### Etiology

Table 17. Etiology of Folate Deficiency

Diet/Deficiency	Malabsorption	Drugs	Increased Demand
Alcoholism	Celiac sprue	Anti-folates (methotrexate)	Pregnancy
Substance abuse	IBD	Anticonvulsants (phenytoin)	Hemolysis
Elderly/Infants	Infiltrative bowel disease	Alcohol	Prematurity
Poor intake	Short bowel syndrome	Oral contraceptive	Exfoliative dermatitis/psoriasis
			Hemodialysis

### Clinical Features

- mild jaundice due to hemolysis of RBCs secondary to ineffective hemoglobin synthesis
- glossitis and angular stomatitis
- melanin pigmentation (rare)
- purpura secondary to thrombocytopenia (rare)
- unlike B<sub>12</sub> deficiency, folate deficiency has no neurologic manifestations

### Investigations

- similar to B<sub>12</sub> deficiency (CBC, reticulocytes, blood film, RBC folate, serum B<sub>12</sub>)
- if decreased RBC folate, rule out B<sub>12</sub> deficiency as cause

### Management

- folic acid 1-5 mg PO OD x 1-4 mo; then 1 mg PO OD maintenance if cause is not reversible

Never give folate alone to an individual with megaloblastic anemia because it will mask B<sub>12</sub> deficiency and neurological degeneration will continue.

## Hemostasis

### Three Phases of Hemostasis

#### 1. Primary Hemostasis

- goal is rapid cessation of bleeding; main effect is on mucocutaneous bleeding
- vessel injury results in collagen/subendothelial matrix exposure and release of vasoconstrictors
- blood flow is impeded and platelets come into contact with damaged vessel wall (Figure 12a)
  - adhesion: platelets adhere to subendothelium via von Willebrand factor (vWF)
  - activation: platelets are activated resulting in change of shape and release of ADP and thromboxane A<sub>2</sub>
  - aggregation: these factors further recruit and aggregate more platelets resulting in formation of localized hemostatic plug

#### 2. Secondary Hemostasis

- platelet plug is reinforced by production of fibrin clot in secondary hemostasis (Figure 12b)
- extrinsic pathway
  - initiation of coagulation *in vivo*
- intrinsic pathway
  - amplification once coagulation has started

#### 3. Fibrin Stabilization and Fibrinolysis (resolution)

- conversion from soluble to insoluble clot
- once healing initiated, clot dissolution (anticoagulant pathway)

Normal hemostasis occurs as a result of the balance between procoagulant and anticoagulant factors.

#### 3 Phases of Hemostasis

- Primary hemostasis
  - Vascular response and platelet plug formation via vWF
- Secondary hemostasis
  - Fibrin clot formation
- Resolution
  - Fibrinolysis

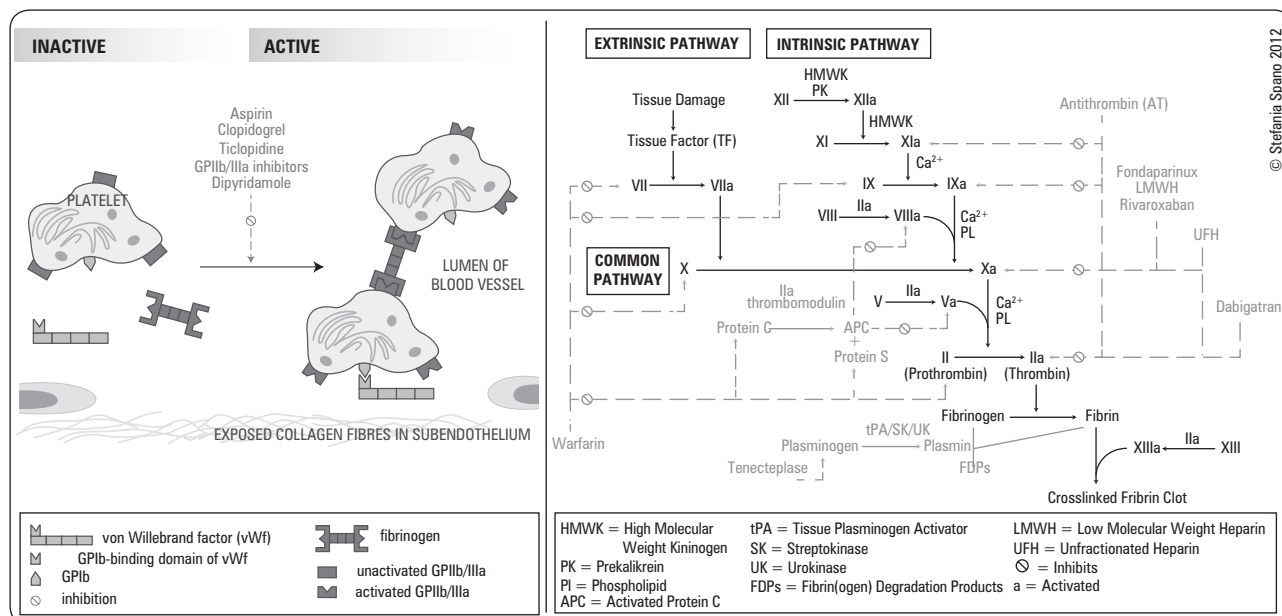

Figure 12a. Platelet activation cascade

Figure 12b. Coagulation cascade

**Table 18. Commonly Used Tests of Hemostasis**

Type of Hemostasis	Test	Reference Range	Purpose	Examples of Associated Diagnoses
<b>Primary</b>	Platelet count	150-400 x 10 <sup>9</sup> /L	To quantitate platelet number	Low in ITP, HUS/TTP, DIC
<b>Secondary</b>	aPTT	22-35 s	Measures intrinsic pathway (factors VIII, IX, XI, XII) and common pathway Used to monitor heparin therapy and intrinsic pathway factors	Prolonged in hemophilias A and B N.B. High if anti-phospholipid antibodies (i.e. lupus anti-coagulant) are present
	PT	11-24 s	Measures extrinsic pathway (factor VII in particular) and common pathway	Prolonged in factor VII deficiency
	INR	0.9-1.2	Permits determination of extrinsic pathway status independent of laboratory performing measurement Used to monitor warfarin therapy	
	Mixing studies		Differentiate inhibitors of clotting factor(s) from a deficiency in clotting factor(s) Mix patient's plasma with normal plasma in 1:1 ratio and repeat abnormal test	Clotting factor(s) deficiency if test becomes normal Inhibitors of clotting factor(s) if test still abnormal
<b>Fibrinolysis</b>	Euglobulin lysis time	N >90 min	Looks for accelerated fibrinolysis	May be accelerated in DIC or factor XIII deficiency Decreased in hereditary deficiency of fibrinogen
<b>Other</b>	Fibrinogen Fibrinogen degradation products (FDPs), D-dimers Specific factor assays Tests of physiological inhibitors [antithrombin, protein S, protein C, hereditary resistance to activated protein C (APC)] Tests of pathologic inhibitors (e.g. lupus anticoagulant)			

**Tests of Secondary Hemostasis**

PT/INR: Tennis is played outside (Extrinsic pathway)

PTT: Table Tennis is played inside (Intrinsic pathway)

**Figure 13. Clotting factors involved in PT and PTT****Table 19. Signs and Symptoms of Disorders of Hemostasis**

	Primary (Platelet)	Secondary (Coagulation)
<b>Surface Cuts</b>	Excessive, prolonged bleeding	Normal/slightly prolonged bleeding
<b>Onset After Injury</b>	Immediate	Delayed
<b>Site of Bleeding</b>	Superficial i.e. mucosal (nasal, gingival, GI tract, uterine), skin	Deep i.e. joints, muscles, GI tract, GU tract Excessive post-traumatic
<b>Lesions</b>	Petechiae, ecchymoses	Hemarthroses, hematomas

**Table 20. Lab Values in Disorders of Hemostasis**

	PT	PTT	Platelet Count	RBC Count
<b>Hemophilia A/B</b>	N	↑	N	N
<b>vWD</b>	N	±	N/↓	N
<b>DIC</b>	↑	↑	↓	N/↓
<b>Liver Failure</b>	↑	N/↑	N/↓	N
<b>ITP</b>	N	N	↓	N
<b>TTP</b>	N	N	↓	↓

vWD = von Willebrand disease; DIC = disseminated intravascular coagulation; ITP = idiopathic thrombocytopenic purpura; TTP = thrombotic thrombocytopenic purpura

## Disorders of Primary Hemostasis

**Definition**

- inability to form an adequate platelet plug due to:
  - disorders of blood vessels
  - disorders of platelets
    - abnormal function
    - abnormal numbers (thrombocytopenia)
  - disorders of vWF

## Classification

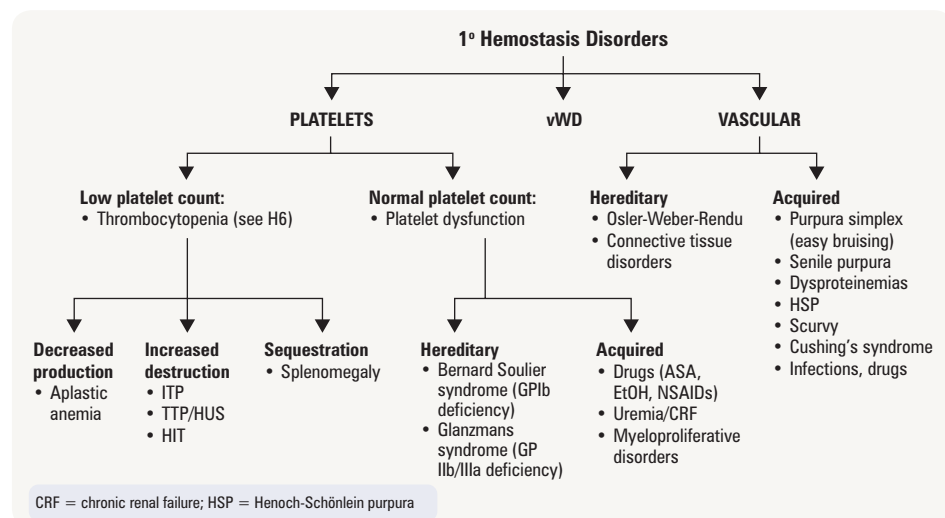

Figure 14. Approach to disorders of primary hemostasis

### Drugs Associated with Thrombocytopenia

TMP-SMX	Heparin	NSAIDs
Vancomycin	Digoxin	Acetaminophen
Rifampin	Amiodarone	Ethanol
Ethambutol	Quinidine	H <sub>2</sub> -antagonists
Amphotericin B	Quinine	

### Mechanisms for HIV-associated Thrombocytopenia

- Direct effect of HIV on marrow
- Immune-mediated platelet destruction
- Some antiretrovirals reduce platelet production

### Should Rituximab be Used Before or After Splenectomy in Patients with Immune Thrombocytopenic Purpura (ITP)?

*Curr Opin Hematol* 2007;14:642-646

**Purpose:** To determine whether the optimal timing for rituximab is before splenectomy, or after failure of splenectomy.

**Results:** Rituximab produces an initial response in approximately 60% of cases, with no significant difference between splenectomized and non-splenectomized patients. Long-term complete responses are observed in 15-20% of cases. Adverse events related to the drug were usually mild or moderate, with a low incidence of infections. Long-term safety data, however, are still lacking. Deaths have been reported for 2.9% of ITP cases treated with rituximab, but they could not be attributed to the study drug.

**Conclusion:** Both the response rate and the response duration appear lower following rituximab than following splenectomy. Although the side effects may be fewer, there is insufficient evidence to support the replacement of splenectomy with rituximab as a second-line treatment of chronic ITP outside a clinical trial. At the present time, the use of immunotherapy before splenectomy can be recommended only in patients at high risk for splenectomy and in those not willing to undergo surgery.

## Immune Thrombocytopenic Purpura (ITP)

Table 21. Immune Thrombocytopenic Purpura

Features	Acute ITP	Chronic ITP
Peak Age	2-6 yr	20-40 yr
Gender	None	F > M (3:1)
History of Recent Infection	Common	Rare
Onset of Bleed	Abrupt	Insidious
Duration	Usually weeks	Months to years
Spontaneous Remissions	80% or more	Uncommon

### ACUTE (CHILD-TYPE) ITP

- see [Pediatrics](#), P49

### CHRONIC (ADULT-TYPE) ITP

- most common cause of isolated thrombocytopenia
- diagnosis of exclusion [i.e. isolated thrombocytopenia (platelets <100 x 10<sup>9</sup>/L) and the absence of any obvious initiating and/or underlying cause]

### Pathophysiology

- an acquired immune-mediated disorder with:
  - anti-platelet antibodies bind to platelet surface → increased splenic destruction and clearance
  - impaired platelet production
  - helper T-cell and cytotoxic T-cell activation also implicated in platelet destruction

### Clinical Presentation

- can present with no symptoms, minimal bruising to a serious bleed (including GI bleed, skin and mucosal hemorrhage or intracranial hemorrhage), lethargy, fatigue

### Investigations

- CBC and reticulocyte count: thrombocytopenia (request retic count if not an isolated thrombocytopenia)
- PT and aPTT: normal
- peripheral blood film: decreased platelets, giant platelets (to rule out platelet clumping)
- HIV, HCV (if risk factors are present)
- bone marrow aspirate and biopsy: increased number of megakaryocytes
  - recommended in patients >60 yr of age, pre-splenectomy or have failed multiple lines of ITP treatment, those with systemic symptoms, an abnormal blood film and/or abnormal signs to rule out other causes of thrombocytopenia (e.g. myelodysplasia)

## Treatment

- rarely indicated if platelets  $>30 \times 10^9/L$  unless active bleeding, trauma or surgery

### A. Emergency Treatment (active bleeding (CNS, GI or GU) or in need of emergency surgery)

- general measures: stop drugs reducing platelet function, control blood pressure, minimize trauma
- corticosteroids: prednisone (1 mg/kg) or methylprednisolone (1 g/d x 3 d) or dexamethasone (40 mg PO x 4 d)
- antifibrinolytic: tranexamic acid (1 g PO tid or 1 g IV q6h) if refractory bleeding
- IVIG 1 g/kg/d x 2 doses, or 2 g/kg over 5 d
- platelet transfusion: for life-threatening bleeding
- emergency splenectomy: may be considered, vaccinations prior (pneumococcus, meningococcus, *H. influenzae* b)
- management of intracranial bleeding: IV steroids, IVIG, platelets, emergency splenectomy, and then craniotomy; maintain Plt  $>100$  for at least 7 wk post intracranial hemorrhage

### B. Non-Urgent Treatment (platelet count $<20-30 \times 10^9/L$ and no bleeding OR significant bleeding symptoms with platelet count $<50 \times 10^9$ )

- platelet transfusion does **not** work
- First Line
  - ♦ corticosteroids (dexamethasone 40 mg/d x 4 wk or prednisone 1 mg/kg/d)
  - ♦ IVIG
  - ♦ anti-D: appropriate for Rh+ non-splenectomized patients, but can cause hemolysis (avoid if low Hb at baseline or if DAT is positive)
- Second Line
  - ♦ splenectomy (need vaccinations prior to splenectomy: pneumococcus, meningococcus, *H. influenzae* b)
  - ♦ immunosuppressants (azathioprine, cyclophosphamide)
  - ♦ rituximab
  - ♦ danazol, vincristine
  - ♦ thrombopoietin (TPO) receptor agonists (romiplostim, eltrombopag)

## Prognosis

- ~20% will not attain a hemostatic platelet count after first and second line therapy
- fluctuating course
- overall relatively benign, mortality 1-2%, (2X higher mortality than the unaffected population)
- major concern is cerebral hemorrhage at Plt  $<5 \times 10^9/L$ , although very rare

## Heparin-Induced Thrombocytopenia (HIT)

- heparin-induced thrombocytopenia: immune mediated reaction following treatment with heparin leading to coagulation activation
- heparin-associated thrombocytopenia: transient thrombocytopenia following administration of heparin

**Table 22. Heparin-Induced Thrombocytopenia (HIT) (Previously Known as HIT Type II)**

<b>Pathophysiology</b>	Immune mediated Ab recognizes a complex of heparin and platelet factor 4 (PF4) leading to platelet activation via platelet Fc receptor and activation of coagulation system
<b>Diagnosis</b>	50% reduction in platelets while on heparin within 5-15 wk of initiation
<b>Onset of Decreased Platelets</b>	5-15 wk (if previously exposed to heparin, HIT can develop in hours)
<b>Risk of Thrombosis</b>	~30% (25% of events are arterial)
<b>Clinical Features</b>	Bleeding complications uncommon Venous thrombosis: DVT, PE, limb gangrene, cerebral sinus thrombosis Arterial thrombosis: MI, stroke, acute limb ischemia, organ infarct (mesentery, kidney) Heparin-induced skin necrosis (with LMWH) Acute platelet activation syndromes: acute inflammatory reactions (e.g. fever/chills, flushing, etc.) Transient global amnesia (rare)
<b>Specific Tests</b>	$^{14}C$ serotonin release assay (uses donor platelets with $^{14}C$ serotonin and heparin with patient's plasma) ELISA for HIT-Ig (more sensitive, less specific than serotonin assay) Ultrasound of lower limb veins for DVT
<b>Management</b>	Clinical suspicion of HIT should prompt discontinuation of heparin (specific tests take several days) Because of 90% cross-reactivity, LMWH should not be substituted Alternative agents include: Argatroban (effective thrombin inhibitor, monitored with aPTT, use with caution in liver disease), fondaparinux (treatment dose, not prophylaxis)

### Evaluation of Pretest Clinical Score (4 Ts) for the Diagnosis of Heparin-induced Thrombocytopenia in Two Clinical Settings

*J Thromb Haemos* 2006;4:759-765

**Study:** Prospective and retrospective clinical score application in two clinical settings (Hamilton General Hospital, HGH; and Greifswald in Germany, GW).

**Population:** 336 patients with suspected HIT.

**Intervention:** Risk stratification with 4Ts clinical score compared with serology for HIT antibody.

**Results:** 1/64 (1.6%) in HGH and 0/55 (0%) in GW with low scores tested positive on HIT serology. 8/28 (28.6%) in HGH and 11/139 (7.9%) in GW with intermediate scores tested positive for HIT. 8/8 (100%) in HGH and 9/42 (21.4%) in GW with high scores tested positive for HIT.

**Conclusions:** A low pretest clinical score can help to rule out HIT in patients with thrombocytopenia.

### Absence of 4 Ts makes HIT unlikely:

Thrombocytopenia  
Timing of platelet count fall  
Thrombosis or other sequelae  
other causes for Thrombocytopenia

LMWH is also associated with HIT, but the risk is less than unfractionated heparin (2.6% in UFH vs. 0.2% in LMWH).

### Heparin-associated thrombocytopenia (previously known as HIT type I)

- Direct heparin mediated platelet aggregation (non-immune)
- Platelets  $>100 \times 10^9/L$
- Self-limited (no thrombotic risk)
- May continue with heparin therapy
- Onset 24-72 h

## Thrombotic Thrombocytopenic Purpura (TTP) and Hemolytic Uremic Syndrome (HUS)

Table 23. TTP and HUS

	TTP	HUS
<b>Epidemiology</b>	Predominantly adult	Predominantly children
<b>Etiology</b>	Deficiency of metalloproteinase that breaks down ultra-large vWF multimers <ul style="list-style-type: none"> <li>• Congenital (genetic absence of ADAMTS-13)</li> <li>• Acquired (drugs, malignancy, transplant, HIV-associated, idiopathic)</li> </ul>	Shiga toxin ( <i>E. coli</i> serotype O157:H7)
<b>Clinical features</b>	<ol style="list-style-type: none"> <li>1. Thrombocytopenia</li> <li>2. MAHA</li> <li>3. Neurological symptoms: headache, confusion, focal defects, seizures</li> <li>4. Renal failure</li> <li>5. Fever</li> </ol>	<ol style="list-style-type: none"> <li>1. Severe thrombocytopenia: purpura, epistaxis, hematuria, hemoptysis, GI bleed</li> <li>2. MAHA</li> <li>3. Renal failure: abnormal urinalysis, oliguria, acute renal failure</li> </ol>
<b>Investigations (both TTP, HUS)</b>	CBC and blood film: decreased platelets and schistocytes PT, aPTT, fibrinogen: normal Markers of hemolysis: increased unconjugated bilirubin, increased LDH, decreased haptoglobin Negative Coombs' test Creatinine, urea, to follow renal function Stool C&S (HUS)	
<b>Management (both TTP, HUS)</b>	Medical emergency Plasmapheresis ± steroids Platelet transfusion is contraindicated (increased microvascular thrombosis) Plasma infusion if plasmapheresis is not immediately available TTP mortality ~90% if untreated	

### Pathophysiology of TTP

- vWF secreted by endothelial cells is a very large polymer rapidly cleaved by the ADAMTS-13 protease
- Congenital TTP is due to a deficiency in ADAMTS-13
- Antibodies against ADAMTS-13 are present in acquired TTP

### Differential Diagnosis of TTP:

- Sepsis
- DIC
- HELLP
- Antiphospholipid Ab syndrome
- Evans syndrome (AIHA + ITP)

## Von Willebrand Disease (vWD)

### Pathophysiology

- heterogeneous group of defects
- usually autosomal dominant (type 3 is autosomal recessive)
- qualitative or quantitative abnormality of vWF
  - vWF needed for platelet adhesion and acts as carrier for Factor VIII; abnormality of vWF can affect both primary and secondary hemostasis
  - vWF exists as a series of multimers ranging in size
    - ♦ largest multimers are most active in mediation of platelet adhesion
    - ♦ both large and small multimers complex with Factor VIII
- usually mild in severity

### Classification

- type 1: mild quantitative defect (decreased amount of vWF and proportional decrease in vWF activity) – 75% of cases
- type 2: qualitative defect (vWF activity disproportionately lower than quantity) – 20-25% of cases
- type 3: severe total quantitative defect (no vWF produced) – rare

### Clinical Features

- mild
  - asymptomatic
  - mucosal and cutaneous bleeding, easy bruising, epistaxis, menorrhagia
- moderate to severe
  - as above but more severe, occasionally soft-tissue hematomas, petechiae (rare), GI bleeding, hemarthroses

### Investigations

Table 24. Investigations in vWD

Test	Expected Result	Test	Expected Result
PTT	N/↑	von Willebrand antigen	↓
Factor VII	N/↓	Blood group	Affects antigen quantification (↓ in group O)
Plt count	N/↓	vWF multimer analysis	Multimer variants
Ristocetin activity	↓ (cofactor for vWF-Plt binding)		

Consider vWD in all women with menorrhagia.

**Treatment**

- desmopressin (DDAVP\*) is treatment of choice for type 1 vWD
  - causes release of vWF and Factor VIII from endothelial cells
  - variable efficacy depending on disease type; tachyphylaxis occurs
  - need good response before using with further bleeding
  - caution in children due to hyponatremia
- tranexamic acid (Cyklokapron®, antifibrinolytic) to stabilize clot formation
- high-purity Factor VIII concentrate containing vWF (Hemate P\*) in select cases and type
  - frozen plasma (FP) is not useful
  - need to monitor vWF and factor VIII levels (very high factor VIII level can cause thrombosis)
- conjugated estrogens (increase vWF levels)

**Prognosis**

- may fluctuate, often improves during pregnancy, inflammation and with age

## Disorders of Secondary Hemostasis

**Definition**

- inability to form an adequate fibrin clot
  - disorders of clotting factors or co-factors
  - disorders of proteins associated with fibrinolysis
- characterized by delayed bleeding, deep muscular bleeding, spontaneous joint bleeding

**Table 25. Classification of Secondary Hemostasis Disorders**

Hereditary	Acquired
Factor VIII: Hemophilia A, vWD	Liver disease
Factor IX: Hemophilia B (Christmas Disease)	DIC
Factor XI	Vitamin K deficiency
Other factor deficiencies are rare	Acquired inhibitors

## Hemophilia A (Factor VIII Deficiency)

**Pathophysiology**

- X-linked recessive, 1/5,000 males
- mild (>5% of normal factor level), moderate (1-5%), severe (<1%)

**Clinical Features**

- see Table 19 – *Signs and Symptoms of Disorders of Hemostasis*, H25
- older patients may also have HIV or HCV from contaminated blood products

**Investigations**

- prolonged aPTT, normal INR (PT)
- decreased Factor VIII (<40% of normal)
- vWF usually normal or increased

**Treatment**

- desmopressin (DDAVP\*) in mild hemophilia A
- recombinant Factor VIII concentrate for
  - prophylaxis (2-3 times a week at home)
  - minor but not trivial bleeding (e.g. hemarthroses)
  - major potentially life-threatening bleeding (e.g. multiple trauma)
- anti-fibrinolytic agents (e.g. tranexamic acid)

**Hemophilia A****Five Hs**

Hemarthroses  
 Hematomas  
 Hematochezia  
 Hematuria  
 Head hemorrhage

## Hemophilia B (Factor IX Deficiency)

- aka Christmas disease
- X-linked recessive, 1/30,000 males
- clinical and laboratory features identical to hemophilia A (except decreased Factor IX)
- treatment: recombinant Factor IX concentrate, anti-fibrinolytic agents

## Factor XI Deficiency

- aka Rosenthal syndrome
- autosomal recessive; more common in Ashkenazi Jews
- usually mild, often diagnosed in adulthood
- Factor XI level does not correlate with bleeding risk
- treatment: frozen plasma, Factor XI concentrate

## Liver Disease

- see [Gastroenterology](#), G28

### Pathophysiology

- deficient synthesis of all factors except VIII (also made in endothelium and in acute phase response)
- aberrant synthesis of fibrinogen
- deficient clearance of hemostatic 'debris' and fibrinolytic activators
- accelerated destruction due to dysfibrinogenemias: increased fibrinolysis, DIC
- miscellaneous: inhibition of secondary hemostasis by FDPs

### Investigations

- peripheral blood film: target cells
- primary hemostasis affected
  - thrombocytopenia 2° to hypersplenism, folate deficiency, alcohol intoxication, DIC, decreased production of thrombopoietin
  - platelet dysfunction (e.g. alcohol abuse)
- secondary hemostasis affected
  - elevated INR (PT), aPTT and TT, low fibrinogen in end-stage liver disease

### Treatment

- supportive, treat liver disease, blood products if active bleeding (frozen plasma, platelets, cryoprecipitate)

#### Investigations in Liver Disease

Factor V, VII, VIII. Expect decreased V and VII because they have the shortest half-life. Factor VIII will be normal or increased because it is produced in the endothelium.

## Vitamin K Deficiency

### Etiology

- drugs
  - oral anticoagulants which inhibit Factors II, VII, IX, X, proteins C and S
  - antibiotics eradicating gut flora, altering vitamin K uptake
- poor diet (especially in alcoholics)
- biliary obstruction
- chronic liver disease (decreased stores)
- malabsorption (e.g. celiac disease)
- hemorrhagic disease of newborn, see [Pediatrics](#), P71

### Investigations

- INR (PT) is elevated out of proportion to elevation of the aPTT
- decreased Factors II, VII, IX and X (vitamin K-dependent)

### Treatment

- hold anticoagulant
- vitamin K 1 mg PO for INR between 4.5 and 10 and no active bleeding (excludes hemorrhagic disease of the newborn)
- if bleeding, give vitamin K 10 mg IV
- if life-threatening bleeding and vitamin K antagonist use, give frozen plasma or prothrombin complex concentrate (PCC)
  - PCCs are contraindicated if there is a previous history of HIT
  - use FFP if PCC is contraindicated or unavailable
- note: excessive vitamin K will delay therapeutic warfarin anticoagulation once re-started

#### Vitamin K Dependent Factors

Vitamin K antagonists (e.g. warfarin) affect function of these factors: "1972 Canada vs. Soviets" X, IX, VII, II proteins C and S

PT should improve within 24 h of vitamin K administration (onset is in 6-12 h). If not, search for other causes.

## Disseminated Intravascular Coagulation (DIC)

- see also [Obstetrics](#), OB21

### Definition

- uncontrolled release of plasmin and thrombin leading to intravascular coagulation and depletion of platelets, coagulation factors and fibrinogen
- risk of life-threatening hemorrhage

### Etiology

- occurs as a complication of many other conditions
- widespread endothelial damage ± extensive inflammatory cytokine release

#### Factor Levels in Acquired Coagulopathies

Factor	Liver Disease	Vitamin K Def	DIC
V	↓	N	↓
VII	↓	↓	↓
VIII	N/↑	N	↓

DIC is a spectrum which may include thrombosis, bleeding or both.

**Table 26. Etiology of DIC**

Activation of Procoagulant Activity	Endothelial Injury	Reticuloendothelial Injury	Vascular Stasis	Other
Antiphospholipid antibody syndrome (APS) Intravascular hemolysis Incompatible blood, malaria Tissue injury Obstetric complications, trauma, burns, crush injuries Malignancy Solid tumours, hematologic malignancies (especially APLM) Snake venom, fat embolism, heat stroke	Infections/sepsis Vasculitis Metastatic adenocarcinoma Aortic aneurysm Giant hemangioma	Liver disease Splenectomy	Hypotension Hypovolemia Pulmonary embolus	Acute hypoxia/acidosis Extracorporeal circulation

**Clinical Features**

- presence of both hemorrhage and clotting

**Table 27. Clinical Features of DIC**

Signs of Microvascular Thrombosis	Signs of Hemorrhagic Diathesis
<b>Neurological:</b> multifocal infarcts, delirium, coma, seizures <b>Skin:</b> focal ischemia, superficial gangrene <b>Renal:</b> oliguria, azotemia, cortical necrosis <b>Pulmonary:</b> ARDS <b>GI:</b> acute ulceration <b>RBC:</b> microangiopathic hemolysis	Bleeding from any site in the body ( $2^{\circ}$ to decreased platelets and clotting factors) <b>Neurologic:</b> intracranial bleeding <b>Skin:</b> petechiae, ecchymosis, oozing from puncture sites <b>Renal:</b> hematuria <b>Mucosal:</b> gingival oozing, epistaxis, massive bleeding

**Investigations**

- primary hemostasis: decreased platelets
- secondary hemostasis: prolonged INR (PT), aPTT, TT, decreased fibrinogen and other factors
- fibrinolysis: increased FDPs or D-dimers, short euglobulin lysis time (i.e. accelerated fibrinolysis)
- extent of fibrin deposition: urine output, urea, RBC fragmentation

**Treatment**

- recognize early
- treat underlying disorder
- individualized critical care support
- in hemorrhage: replacement of hemostatic elements with platelet transfusion, frozen plasma, cryoprecipitate
  - maintain platelets  $>50 \times 10^9$  and hemoglobin  $>80$  g/L
  - 4-5 units of FFP if INR  $>1.5$  or aPTT  $>38$
  - 10 units of cryoprecipitate if fibrinogen  $<1$  g/L
  - 1 adult dose of buffy-coat platelets if  $<10 \times 10^9$  ( $<20$  if febrile,  $<50$  before invasive procedure)
- in thrombotic phase: UFH or LMWH in critically ill, non-bleeding patients

**Table 28. Screening Test Abnormalities in Coagulopathies**

Increased INR Only	Increased PTT Only	Both Increased
Warfarin	Hemophilia A and B	Prothrombin deficiency
Vitamin K deficiency	vWD	Fibrinogen deficiency
Factor VII deficiency	Heparin	Factor V and X deficiency
Liver disease	Antiphospholipid Ab	Severe liver disease
Factor VII inhibitors	Factor inhibitors	Factor V and X, prothrombin, and fibrinogen inhibitors
	Factor XI and XII deficiency	Excessive anticoagulation

**Important Etiologies of DIC****OMITS**

Obstetric complications  
Malignancy  
Infection  
Trauma  
Shock

Levels of fibrinogen can still be normal in DIC as it is an acute phase reactant. Serial fibrinogen levels should be measured to see if there is a trending decrease along with an increase in D-dimer.

**Risk of VTE in Hospitalized Patients Receiving Ineffective Antithrombotic Therapy**

Risk Factor	RR (95% CI)	P-value
Age $>75$ yr	1.79 (1.18-2.71)	0.007
Cancer	1.58 (1.01-2.51)	
Previous VTE	1.67 (1.01-2.77)	0.08
Obesity	0.94 (0.59-1.51)	0.91
Hormone therapy	0.51 (0.08-3.38)	0.70
Heart failure	1.08 (0.72-1.62)	0.82
NYHA III	0.89 (0.55-1.43)	0.72
NYHA IV	1.48 (0.84-2.6)	0.27
Acute infectious disease	1.50 (1.00-2.26)	0.06
Acute rheumatic disease	1.45 (0.84-2.50)	0.27

Source: JAMA 2004;164:963-968

**Differential Diagnosis of Elevated D-dimer**

- Arterial thromboembolic disease (MI, CVA, acute limb ischemia, A. fib, intracardiac thrombus)
- Venous thromboembolic disease (DVT, PE)
- DIC
- Preeclampsia and eclampsia
- Abnormal fibrinolysis; use of thrombolytic agents
- Cardiovascular disease, congestive heart failure
- Severe infection/sepsis/inflammation
- Surgery/trauma (tissue ischemia, necrosis)
- Systemic inflammatory response syndrome
- Vasoocclusive episode of sickle cell disease
- Severe liver disease
- Malignancy
- Renal disease (nephrotic syndrome, acute/chronic renal failure)
- Normal pregnancy
- Venous malformation

**Virchow's Triad**

- Endothelial damage
- Stasis
- Hypercoagulability

## Venous Thromboembolism

**Definition**

- thrombus formation and subsequent inflammatory response in a superficial or deep vein
- superficial thrombophlebitis, deep vein thrombosis (DVT) and pulmonary embolism (PE)
- thrombi propagate in the direction of blood flow (commonly originating in calf veins)
- more common in lower extremity than upper extremity
- incidence  $\sim 1\%$  if age  $>60$  yr
- most important sequelae are pulmonary embolism ( $\sim 50\%$  chance with proximal DVT) and chronic venous insufficiency

### Etiology (Virchow's Triad)

- endothelial damage
  - exposes endothelium to prompt hemostasis
  - leads to decreased inhibition of coagulation and local fibrinolysis
- venous stasis
  - immobilization (post-MI, CHF, stroke, post-op) inhibits clearance and dilution of coagulation factors
- hypercoagulability
  - inherited (see *Hypercoagulable Disorders*, H34)
  - acquired
    - ♦ age (risk increases with age)
    - ♦ surgery (especially orthopedic, thoracic, GI and GU)
    - ♦ trauma (especially fractures of spine, pelvis, femur or tibia, spinal cord injury)
    - ♦ neoplasms (especially lung, pancreas, colon, rectum, kidney and prostate)
    - ♦ blood dyscrasias (myeloproliferative neoplasms, especially PV, ET), PNH, hyperviscosity (multiple myeloma, polycythemia, leukemia, sickle cell disease)
    - ♦ prolonged immobilization (CHF, stroke, MI, leg injury)
    - ♦ hormone related (pregnancy, OCP, HRT, SERMs)
    - ♦ APS
    - ♦ heart failure (risk of DVT greatest with right heart failure and peripheral edema)
- idiopathic (10-20% are later found to have cancer)

### Clinical Features of DVT

- absence of physical findings does not rule out disease
- unilateral leg edema, erythema, warmth and tenderness
- palpable cord (thrombosed vein)
- phlegmasia cerulea dolens and phlegmasia alba dolens with massive thrombosis
- Homan's sign (pain with foot dorsiflexion) is unreliable

### Differential Diagnosis of DVT

- muscle strain or tear, lymphangitis or lymph obstruction, venous valvular insufficiency, ruptured popliteal cysts, cellulitis, arterial occlusive disease

### Investigations for DVT

- D-dimer test only useful to rule out DVT if negative with low clinical suspicion of disease and no other acute medical issues/recent surgery
- doppler ultrasound is most useful diagnostic test for DVT
  - sensitivity and specificity for proximal DVT ~95%
  - sensitivity for calf DVT ~70%
- other non-invasive tests include MRI and impedance plethysmography
- venography is the gold standard, but is expensive, invasive and higher risk
- for **Clinical Features** and **Treatment of PE**, see [Respirology](#), R17

## Approach to Treatment of Venous Thromboembolism (VTE)

### Purpose

- prevent further clot extension
- prevent acute pulmonary embolism (occurs in up to 50% of untreated patients)
- reduce the risk of recurrent thrombosis
- treatment of massive iliofemoral thrombosis with acute lower limb ischemia and/or venous gangrene (phlegmasia cerulea dolens)
- limit development of late complications, e.g. postphlebitic syndrome, chronic venous insufficiency and chronic thromboembolic pulmonary HTN

### Absolute Contraindications to Treatment

- active bleeding
- severe bleeding diathesis or platelet count  $<20 \times 10^9/L$  ( $<20,000/mm^3$ )
- intracranial bleeding
- neurosurgery or ocular surgery within 10 d

### Relative Contraindications to Treatment

- mild-moderate bleeding diathesis or thrombocytopenia
- brain metastases
- recent major trauma
- major abdominal surgery within the past 2 d
- GI or GU bleeding within 14 d
- endocarditis
- severe hypertension (sBP  $>200$  or dBP  $>120$ )
- recent stroke

#### Wells' Score for VTE

##### Criteria (Score):

- Paralysis, paresis or recent orthopedic casting of lower extremity (1)
- Recently bedridden ( $>3$  d) or major surgery within past 4 wk (1)
- Localized tenderness in deep vein system (1)
- Swelling of entire leg (1)
- Calf swelling  $>3$  cm than other leg (measured 10 cm below the tibial tuberosity) (1)
- Pitting edema greater in the symptomatic leg (1)
- Collateral non varicose superficial veins (1)
- Active cancer or cancer treated within 6 mo (1)
- Alternative diagnosis more **likely** than DVT (e.g. Baker's cyst, cellulitis, muscle damage, superficial venous thrombosis) (-2)

##### Total Score Interpretation:

3-8: High probability, 1-2: Moderate probability, -2-0: Low Probability

#### Low-Molecular-Weight Heparin versus a Coumarin for the Prevention of Recurrent Venous Thromboembolism in Patients with Cancer

*NEJM* 2003;349:146-153

**Study:** RCT comparing the efficacy of LMWH (dalteparin) with an oral anti-coagulant agent (coumarin) in preventing recurrent thrombosis in patients with cancer.

**Methods:** Patients with cancer who had acute, symptomatic proximal DVT, PE, or both were randomly assigned to either dalteparin or coumarin treatment for 6 mo.

**Results:** 27 of 336 patients in the dalteparin group had recurrent VTE versus 53 of 336 patients in the coumarin group (hazard ratio, 0.48;  $p=0.002$ ). The probability of recurrent thromboembolism at 6 mo was 9% and 17% in dalteparin and coumarin groups respectively. There was no significant difference in bleeding rates. The mortality rate was 39% in the dalteparin group and 41% in the coumarin group.

**Conclusions:** In patients with cancer and acute VTE, dalteparin was more effective than coumarin in decreasing the risk of recurrent thromboembolism without increasing the risk of bleeding.

#### Duration of Treatment with Vitamin K Antagonists in Symptomatic Venous Thromboembolism

*Cochrane DB Syst Rev* 2009;CD001367

**Study:** Meta-analysis of 8 RCTs (2994 patients) comparing different durations of treatment with vitamin K antagonists in patients with symptomatic VTE.

**Results:** In patients treated with vitamin K antagonists for a prolonged period, the reduction in risk of recurrent VTE remained consistent regardless of the period of time since the index event (OR 0.18; 95%CI 0.13-0.26). In addition, there was no observed excess of VTE recurrences following cessation of prolonged treatment (i.e. rebound phenomenon) (OR 1.24; 95%CI 0.91-1.69). However, patients who received prolonged treatment had a persistent increase in their risk of major bleeding complications (OR 2.61; 95%CI 1.48-4.61).

**Conclusion:** Prolonged treatment with vitamin K antagonists leads to a consistent reduction in the risk of recurrent VTE for as long as therapy is continued. Therapy should be discontinued when the risk of harm from major bleeding (which remains constant over time) is of greater concern than the absolute risk of recurrent VTE (which declines over time). No specific recommendation was made regarding optimal duration of treatment.

### Initial Treatment

- low molecular weight heparin (LMWH)
  - administered SC, at least as effective as UFH with a lower bleeding risk
  - advantages: predictable dose response and fixed dosing schedule; lab monitoring not required; <1% HIT; safe and effective outpatient therapy
  - disadvantages: only partially reversible by protamine, long-term use associated with osteoporosis
  - renally cleared – must adjust dose in patients with renal dysfunction
- unfractionated heparin (UFH)
  - in patient with average risk of bleed; use hospital-based nomograms that use bleeding risk and patient weight to determine appropriate dose
  - advantages: rapidly reversible by protamine
  - disadvantages: must monitor aPTT with adjustment of dose to reach therapeutic level (~2x normal value); monitor platelet counts for development of HIT
- alternatives to LMWH and UFH
  - heparinoids (patients with HIT), direct thrombin inhibitors (hirudin, lepirudin, argatroban, dabigatran), Factor Xa inhibitors (fondaparinux, rivaroxaban)
  - thrombolytic drugs (e.g. streptokinase, tPA) reserved for acute limb/life-threatening thrombosis, and low bleeding risk

### Long-term Treatment

- warfarin:
  - standard treatment; should be initiated with heparin overlap: dual therapy for at least 5 d, due to initial prothrombotic state, half life of vitamin K factors and risk of warfarin-induced skin necrosis
  - discontinue heparin after INR >2.0 for two consecutive days
  - warfarin should be dosed to maintain INR at 2-3 except in select cases
  - monitor INR twice weekly for 1-2 wk, then weekly until INR stable, then every 2-4 wk
  - LMWH more effective than warfarin at preventing recurrence of venous thrombosis in cancer patients (see sidebar, H32)
- duration of anticoagulant treatment (with warfarin unless otherwise noted):
  - first episode DVT with transient risk factor: 3 mo
  - first episode DVT with ongoing risk factor (e.g. cancer, antiphospholipid antibody) or >1 risk factor: consider indefinite therapy
  - first episode DVT with no identifiable risk factor (idiopathic) or single inherited risk factor (e.g. Factor V Leiden): 6-12 mo or indefinite therapy (controversial)
  - recurrent DVT (2 or more episodes): indefinite therapy
- IVC filters
  - temporary filter indicated only if distal acute DVT (<4 wk) with significant contraindications to anticoagulant therapy (i.e. active bleeding)
  - must remove once safe to do so as filter is pro-thrombotic in the longterm (anticoagulation if left in)
- special considerations
  - pregnancy: treat with LMWH during pregnancy, then warfarin for 4-6 wk post-partum (minimum total anticoagulation time of 3-6 mo)
  - surgery: avoid elective surgery in the first month after a venous or arterial thromboembolic event
    - ♦ preoperatively: IV heparin may be used up to 6 h pre-operatively
    - ♦ perioperatively: surgery safe when INR <1.5; warfarin should be discontinued for at least 4 wk pre-operatively to allow INR to fall
    - ♦ postoperatively: IV heparin or LMWH can be used for anticoagulation (start 12 h after major surgery until therapeutic INR reached after restarting warfarin)
    - ♦ for patients at high risk for thromboembolism (VTE <12 wk, recurrent VTE, lupus anticoagulant, atrial fibrillation with prior stroke, mechanical heart valve), IV heparin or LMWH (bridging) should be given before and after the procedure while the INR is below 2.0

### Prophylaxis

- see sidebar
- consider for those with a moderate to high risk of thrombosis without contraindications
- non-pharmacological measures include: early ambulation, elastic compression stockings (TEDs), intermittent pneumatic compression (IPC)
- UFH 5000 IU SC bid for moderate risk
- UFH 5000 IU SC tid or LMWH as per hospital protocol (i.e. enoxaparin 40 mg SC daily) or UFH 5000 IU SC tid for high risk

### Contraindications and Adverse Reactions of Anticoagulant Therapy

- absolute: active bleeding, severe bleeding diathesis or platelets <20 x 10<sup>9</sup>/L (<20,000/mm<sup>3</sup>), intracranial bleeding, neuro or ocular surgery within <10 d
- relative: mild-moderate neurologic diathesis or thrombocytopenia, brain metastases, recent major trauma, major abdominal surgery within page 2 d, GI/GU bleed within 14 d, endocarditis, severe HTN (sBP >200 or dBP >120), recent stroke

### Treatment of Pulmonary Embolism (PE)

- see [Respirology](#), R19

#### Duration of Treatment with Vitamin K Antagonists in Symptomatic Venous Thromboembolism

*Cochrane DB Syst Rev* 2006;1:CD001367

**Study:** Meta-analysis of 8 RCTs (2994 patients) comparing different durations of treatment with vitamin K antagonists in patients with symptomatic venous thromboembolism (VTE).

**Main Results:** In patients treated with vitamin K antagonists for a prolonged period, the reduction in risk of recurrent VTE remained consistent regardless of the period of time since the index event (OR 0.18, CI 0.13-0.26). In addition, there was no observed excess of VTE recurrences following cessation of prolonged vitamin K antagonist therapy (OR 1.24, CI 0.91-1.69). However, patients who received prolonged treatment had a persistent increase in their risk of major bleeding complications (OR 2.61, CI 1.48-4.61).

**Conclusion:** Prolonged treatment with vitamin K antagonists leads to a consistent reduction in the risk of recurrent VTE for as long as therapy is continued. Therapy should be discontinued when the risk of harm from major bleeding (which remains constant over time) is of greater concern than the absolute risk of recurrent VTE (which declines over time). No specific recommendation was made regarding optimal duration of treatment.

#### Common Medications that Interact with Warfarin

- Acetaminophen (interference with vit K metabolism)
- Allopurinol
- NSAIDs (GI injury)
- Fluconazole
- Metronidazole
- Sulfamethoxazole
- Tamoxifen

#### Initiation of Warfarin Therapy Requires Overlap with Heparin Therapy for 4-5 Days

- 10 mg loading dose of warfarin causes a precipitous decline in protein C levels in first 36 h resulting in a transient hypercoagulable state.
- Warfarin decreases Factor VII levels in first 48 h INR is prolonged (most sensitive to Factor VII levels), however full antithrombotic effect is not achieved until Factor IX, X, and II are sufficiently reduced (occurs after approx. 4 d).

#### Low risk surgical patients:

<40 yr, no risk factors for VTE, general anesthetic (GA) <30 min, minor elective, abdominal or thoracic surgery.

#### Moderate risk surgical patients:

>40 yr, >1 risk factor for VTE, GA >30 min.

#### High risk surgical patients:

>40 yr, surgery for malignancy or lower extremity orthopedic surgery lasting >30 min, inhibitor deficiency or other risk factor.

#### High risk medical patients:

heart failure, severe respiratory disease, ischemic stroke and lower limb paralysis, confined to bed and have >1 additional risk factor (e.g. active cancer, previous VTE, sepsis, acute neurologic disease, IBD).

# Hypercoagulable Disorders

## Hypercoagulability Workup – Venous Thrombosis

- workup for malignancy or hypercoagulable state indicated for idiopathic VTE in presence of the following: age <50, recurrent VTE, family history of VTE and age <50, unusual site of DVT (portal, hepatic, mesenteric vascular beds), heparin-resistant disease (AT deficiency), warfarin-induced skin necrosis or neonatal purpura fulminans (proteins C or S deficiency). Consider for women with VTE within 12 mo of exposure to OCP
- workup:
  - initial
    - CBC, blood smear, coagulation studies, liver/renal function, urinalysis, fasting homocysteine
    - malignancy work up (see sidebar)
    - anti-phospholipid antibodies (APLA): anticardiolipin antibodies (ACA) and lupus anticoagulant (LA)
    - activated protein C resistance (APCR)
    - DNA: FVL (Factor V Leiden), PT (prothrombin G20210A)
  - post initial insult (>72 h) (as protein levels depleted/consumed by clot)
    - antithrombin (not on heparin)
    - Factor VIII (increased levels predict recurrence)
  - post-treatment
    - proteins C, S (not on warfarin)
- Note: most of these tests do not change management, and a negative test does not rule out a hypercoagulable state. Thus more focus is on the reversible/treatable causes (APLA, cancer, etc.)

## CAUSES OF HYPERCOAGULABILITY LEADING TO VENOUS THROMBOEMBOLISM

### Activated Protein C Resistance (Factor V Leiden)

- most common cause of hereditary thrombophilia
- 5% of general population are heterozygotes
- point mutation in the Factor V gene (R506Q) results in resistance to inactivation of Factor Va by activated protein C

### Prothrombin (PT) G20210A

- G to A transposition at nucleotide position 20210 of the prothrombin gene promoter region results in increased levels of prothrombin, thus increased thrombin generation

### Protein C and Protein S Deficiency

- protein C inactivates Factor Va and VIIIa using protein S as a cofactor
- protein C deficiency
  - homozygous: neonatal purpura fulminans
  - heterozygous:
    - type I: decreased protein C levels
    - type II: decreased protein C activity
  - acquired: liver disease, sepsis, DIC, warfarin
  - 1/3 of patients with warfarin necrosis have underlying protein C deficiency
- protein S deficiency
  - type I: decreased free and total protein S levels
  - type II: decreased protein S activity
  - type III: decreased free protein S levels
  - acquired: liver disease, DIC, pregnancy, nephrotic syndrome, inflammatory conditions, warfarin

### Antithrombin Deficiency

- antithrombin slowly inactivates thrombin in the absence of heparin, rapidly inactivates thrombin in the presence of heparin
- autosomal dominant inheritance or urinary losses in nephrotic syndrome
  - type I: decreased AT levels
  - type II: decreased AT activity
- diagnosis must be made outside window of acute thrombosis and anticoagulation treatment (acute thrombosis, heparin, systemic disease all decrease antithrombin levels)
- deficiency may result in resistance to unfractionated heparin (LMWH must be used)

### Elevated Factor VIII Levels

- an independent marker of increased thrombotic risk
- genetic basis for increased levels poorly understood

### Disorders of Fibrinolysis

- include congenital plasminogen deficiency, tissue plasminogen activator deficiency

### Antiphospholipid Antibody Syndrome (APS)

- definition:  $\geq 1$  clinical and  $\geq 1$  laboratory criteria
  - clinical: thrombosis, spontaneous abortions, fetal loss, premature birth before 34 wk
  - laboratory: anticardiolipin or lupus anticoagulant antibodies
- mechanism: not well understood, antibodies interact with platelet membrane phospholipid causing increased adhesion and aggregation; can also interfere with action of proteins C and S
- see [Rheumatology](#), RH12

#### Common Causes of Hypercoagulability

##### CALM APES

Protein **C** deficiency  
 Antiphospholipid **Ab**  
 Factor **V** Leiden  
 Malignancy  
 Antithrombin deficiency  
 Prothrombin G20210A  
 Increased Factor **VIII** (Eight)  
 Protein **S** deficiency

Although lupus anti-coagulant prolongs PTT, its main clinical feature is thrombosis.

Protein C, protein S, and ATIII are decreased during acute thrombosis – therefore to test for deficiency, must be tested outside of this time period.

#### Causes of Both Venous and Arterial Thrombosis include:

- Antiphospholipid antibodies
- Myeloproliferative neoplasms
- Heparin induced thrombocytopenia
- Distal venous clot with patent foramen ovale

Malignancy is a common cause of acquired hypercoagulability.

#### Workup may include (controversial):

- Complete history and physical
- Routine bloodwork
- Urinalysis
- CXR and abdominal ultrasound
- Age appropriate screening: mammogram, Pap, PSA, colonoscopy
- Close follow-up

# Hematologic Malignancies and Related Disorders

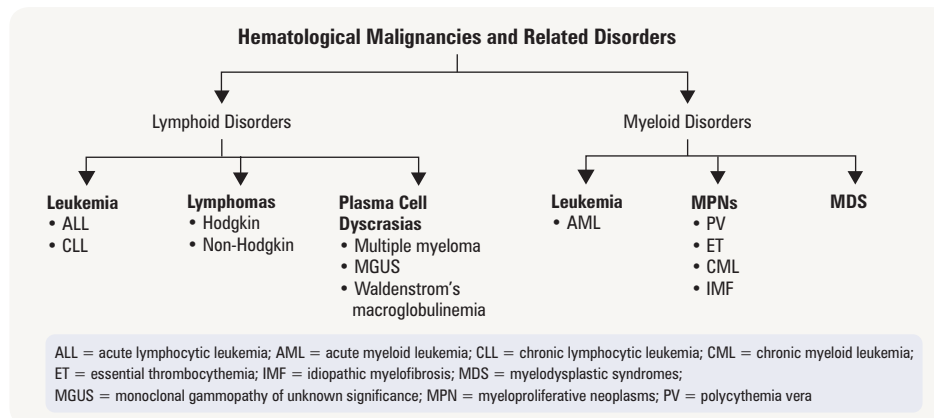

Figure 15. Overview of hematologic malignancies and related disorders

## Myeloid Malignancies

### Acute Myeloid Leukemia (AML)

#### Definition

- rapidly progressive malignancy characterized by failure of myeloid cells to differentiate beyond blast stage

#### Epidemiology

- incidence increases with age; median age of onset is 65 yr old
- accounts for 10-15% of childhood leukemias

#### Risk Factors

- myelodysplastic syndromes (MDS), benzene, radiation, alkylating agents as treatment for previous malignancy

#### Pathophysiology

- etiology subdivided into:
  - primary: *de novo*
  - secondary: hematologic malignancies (e.g. myeloproliferative disorders and MDS) or previous chemotherapeutic agents (e.g. alkylating agents)
- uncontrolled growth of blasts in marrow leads to:
  - suppression of normal hematopoietic cells
  - appearance of blasts in peripheral blood
  - accumulation of blasts in other sites (e.g. skin, gums)
  - metabolic consequences; tumour lysis syndrome

#### Clinical Features

- anemia, thrombocytopenia (associated with DIC in PML), neutropenia (even with normal WBC), leads to infections, fever
- thrombocytopenia (associated with DIC in promyelocytic leukemia)
- accumulation of blast cells in marrow
  - skeletal pain, bony tenderness (especially sternum)
- organ infiltration
  - gingival hypertrophy (particularly myelomonocytic leukemia) – may present to dentist first
  - hepatosplenomegaly (in ALL)
  - lymphadenopathy (not marked)
  - skin: leukemia cutis
  - gonads (in ALL)
  - eyes: Roth spots, cotton wool spots, vision changes (uncommon)
- leukostasis/hyperleukosis syndrome (medical emergency)
  - large numbers of blasts interfere with circulation and lead to hypoxia and hemorrhage – can cause diffuse pulmonary infiltrates, CNS bleeding, respiratory distress, altered mental status, priapism

#### Typical Age of Presentation of Leukemias

- ALL: Children and older adults
- CML: 40-60 yr
- AML, CLL: >60 yr

**Leukemia:** malignant cells arise in bone marrow and may spread elsewhere (including blood, lymph nodes and lymphoid tissue).

**Lymphoma:** malignant cells arise in lymph nodes and lymphoid tissues and may spread elsewhere (including blood and bone marrow).

**BUT** the location where the malignant cells are found does not solely define the type of hematologic malignancy – classified based on the characteristics of the cell (histology, histochemistry, immunophenotyping, cytogenetics, molecular changes).

#### Acute Leukemia

**Definition (WHO):** presence of 20% blast cells or greater in bone marrow at presentation.

**Classification:** divided into myeloid (AML) and lymphoid (ALL) depending on whether blasts are myeloblasts or lymphoblasts, respectively.

Auer rods are pathognomonic for AML.

#### 2008 WHO Classification of AML and Related Neoplasms

- AML with recurrent genetic abnormalities
- AML with myelodysplasia-related changes
- Therapy-related myeloid neoplasms
- Myeloid sarcoma
- Myeloid proliferations related to Down Syndrome
- Blastic plasmacytoid dendritic cell neoplasm
- AML, not otherwise specified (equivalent FAB classification)
  - Undifferentiated (M1)
  - Myeloblastic (M2)
  - Promyelocytic (M3)
  - Myelomonocytic (M4)
  - Monocytic (M5)
  - Erythroleukemic (M6)
  - Megakaryocytic (M7)
  - Acute basophilic leukemia
  - Acute panmyelosis with myelofibrosis

- metabolic effects; aggravated by treatment (rare)
  - increased uric acid → nephropathy, gout
  - release of phosphate → decreased  $\text{Ca}^{2+}$ , decreased  $\text{Mg}^{2+}$
  - release of procoagulants → DIC (higher risk in acute promyelocytic leukemia)
- decreased or normal  $\text{K}^+$  before treatment, increased  $\text{K}^+$  after treatment

### Investigations

- bloodwork:
  - CBC: anemia, thrombocytopenia, variable WBC
  - INR, aPTT, fibrin degradation products (FDP), fibrinogen (in case of DIC)
  - increased LDH, increased uric acid, increased  $\text{PO}_4^{3-}$  (released by leukemic blasts), decreased  $\text{Ca}^{2+}$
  - baseline renal and liver function tests
- peripheral blood film – circulating blasts with Auer rods (azurophilic granules) are pathognomonic for AML
- bone marrow aspirate:
  - blast count: AML >20% (normal is <5%)
  - morphologic, cytochemical and/or immunotypic features are used to establish lineage and maturation (see sidebar for WHO classification of AML, H35)
- CXR to r/o pneumonia, ECG, MUGA scan prior to chemotherapy (cardiotoxic)

### Treatment

- mainstay of treatment is chemotherapy (rapidly fatal without treatment)
  - all AML subtypes treated similarly except promyelocytic variant with t(15:17) translocation
    - ♦ all-trans-retinoic acid (ATRA) added to induce differentiation
- treatment strategy:
  1. **Induction:** chemotherapy to induce complete remission of AML (see sidebar)
    - ♦ several possible regimens [e.g. cytarabine with anthracycline (daunorubicin)]
    - ♦ patients with poor response to initial induction therapy – worse prognosis
    - ♦ must ensure reversal of DIC, platelet transfusions if <10
  2. **Consolidation:** to prevent recurrence
    - ♦ intensive consolidation chemotherapy
    - ♦ stem cell transplantation – autologous or allogeneic (younger patients with better performance status)
- consider acceleration with hematopoietic growth factors (e.g. G-CSF) if severe infection develops
- supportive care
  - screening for infection via regular C&S of urine, stool, sputum, oropharynx, catheter sites, perianal area
  - fever: C&S of all orifices, CXR, start antibiotics
  - platelet and RBC transfusions (irradiated to prevent transfusion-related GVHD) ± EPO
  - prevention and treatment of metabolic abnormalities
    - ♦ allopurinol for prevention of hyperuricemia

### Prognosis

- achievement of first remission
  - 70-80% if ≤60 yr old, 50% if >60 yr old
  - median survival 12-24 mo
  - 5 yr survival 40%
  - prognosis related to cytogenetics (favourable, intermediate or adverse)

**Cure:** survival that parallels age-matched population.

**Complete Remission:** tumour load below threshold of detectable disease (normal peripheral blood film, normal bone marrow with <5% blasts, normal clinical state).

#### 2008 WHO MDS Classification

- Refractory cytopenia with unilineage dysplasia
- Refractory anemia
- Refractory neutropenia
- Refractory thrombocytopenia
- Refractory anemia with ringed sideroblasts (RAS)
- Refractory cytopenia with multilineage dysplasia (RCMD)
- Refractory cytopenia with multilineage dysplasia and ringed sideroblasts (RCMD-RS)
- Refractory anemia with excess blasts (RAEB)
- Myelodysplastic syndrome with isolated del (5q)
- Myelodysplasia unclassified (seen in cases of megakaryocyte dysplasia with fibrosis and others)
- Childhood myelodysplastic syndrome

MDS is a cause of macrocytic anemia.

**Myelodysplastic Syndromes:** ineffective maturation

**Myeloproliferative Neoplasms:** overproduction of mature cells

## Myelodysplastic Syndromes (MDS)

### Definition

- heterogeneous group of malignant stem cell disorders characterized by dysplastic and ineffective blood cell production resulting in peripheral cytopenias
- syndromes defined according to World Health Organization (WHO) classifications (see sidebar)

### Pathophysiology

- disordered maturation: ineffective hematopoiesis despite presence of adequate numbers of progenitor cells in bone marrow (usually hypercellular)
- intramedullary apoptosis: programmed cell death within bone marrow
  - both processes lead to reduced mature cells in periphery
- <30% develop AML

### Risk Factors

- elderly, post-chemotherapy, benzene or radiation exposure
- occurs in 60/100,000 in patients >60 yr old

### Clinical Features

- insidious onset: associated with those of pancytopenia
- infections and bleeding out of proportion with peripheral blood counts

## Investigations

- diagnosed by:
  - anemia  $\pm$  thrombocytopenia  $\pm$  neutropenia
  - CBC and peripheral blood film
  - RBC: usually macrocytic with oval shaped red cells (macro-ovalocytes), decreased reticulocyte count
  - WBC: decreased granulocytes and abnormal morphology (e.g. bilobed or unsegmented nuclei = Pelger abnormality)
  - platelets: thrombocytopenia, abnormalities of size and cytoplasm (e.g. giant hypogranular platelets)
- bone marrow aspirate and biopsy with cytogenetic analysis required for definitive diagnosis
  - bone marrow: dysplastic and often normocellular/hypercellular
  - cytogenetics: partial or total loss of chromosomes 5, 7, Y, or trisomy 8

## Prognosis

- Revised International Prognostic Scoring System (IPSS-R) uses 5 factors to estimate mean survival:
  - cytology, % bone marrow blasts, hemoglobin, platelets, absolute neutrophil count
  - based on the calculated score, a patient's MDS prognostic risk is "Very Low", "Low", "Intermediate", "High" or "Very High" with a mean survival of 8.7, 5.3, 3.0, 1.6 and 0.8 yr, respectively

## Treatment

- low risk** of transformation to acute leukemia (IPSS-R Very Low or Low)
  - erythropoietin stimulating agents weekly is first line in reducing transfusion requirements
  - 5q(-) cytogenetic: Revlimid<sup>®</sup> PO
  - supportive care: RBC and platelet transfusion (consider iron chelation if frequent RBC transfusions)
- high risk** of transformation to acute leukemia (IPSS-R Intermediate, High or Very High)
  - supportive care
  - stem cell transplantation if age <65 yr
  - epigenetic therapy: DNA methyltransferase inhibitors (e.g. 5-Azacytidine), histone deacetylase inhibitors

### Use of Epoetin and Darbepoetin in Patients with Cancer

*Blood* 2008;111:25-41

Clinical practice guideline update by American Societies of Hematology and Clinical Oncology (2007)

#### Initial Recommendations:

- Initiate an erythropoiesis-stimulating agent (ESA) when hemoglobin (Hb) is 100 g/L (10 g/dL) in patients with palliative chemotherapy-associated anemia to decrease the need for transfusions.
- Discontinue ESAs when patient not responding to treatment beyond 6-8 wk.
- Monitor iron stores and supplement iron intake for ESA-treated patients when necessary.
- Use ESAs cautiously with chemotherapy or in patients with an elevated risk for thromboembolic complications.
- It is not recommended that ESA be used for therapy in patients with cancer who are not receiving chemotherapy, as it increases thromboembolic risks and lowers survival rate. Patients with low-risk myelodysplasia are an exception.

# Myeloproliferative Neoplasms (MPNs)

## Definition

- clonal myeloid stem cell abnormalities leading to overproduction of one or more cell lines (leading to abnormalities in erythrocytes, platelets and other cells of myeloid lineage)

## Epidemiology

- mainly middle-aged and older patients (peak 60-80 yr)

## Prognosis

- may develop marrow fibrosis with time
- all disorders may progress to AML

**Table 29. Chronic Myeloproliferative Disorders**

	CML	PV	IMF	ET
Hct	↓/N	↑↑	↓	N
WBC	↑↑	↑	↑/↓	N
Plt	↑/↓	↑	↑/↓	↑↑↑
Marrow fibrosis	±	±	+++	±
Splenomegaly	+++	+	+++	+
Hepatomegaly	+	+	++	-
Genetic Association	<i>bcr-abl</i> mut. (90+%)	JAK2 mut. (95%)	JAK2 mut. (~50%)	JAK2 mut. (~50%)

PV = polycythemia vera; CML = chronic myeloid leukemia; MF = idiopathic myelofibrosis; ET = essential thrombocythemia

Basophilia is uncommon in other medical conditions.

## Chronic Myeloid Leukemia (CML)

### Definition

- myeloproliferative disorder characterized by increased proliferation of the granulocytic cell line without the loss of their capacity to differentiate

### Epidemiology

- occurs in any age group (mostly middle age to elderly) with a median age of 65 yr

### Pathophysiology

- Philadelphia chromosome (Ph)
  - translocation between chromosomes 9 and 22
  - the *c-abl* proto-oncogene is translocated from chromosome 9 to "breakpoint cluster region" (bcr) of chromosome 22 to produce *bcr-abl* fusion gene, an active tyrosine kinase

Detection of the *bcr-abl* fusion gene is a diagnostic test for CML (present in over 90% of patients).

### Clinical Features

- 3 clinical phases**
  - chronic phase:** 85% diagnosed here
    - few blasts (<10%) in peripheral film
    - ± slightly elevated eosinophils and basophils
    - no significant symptoms
  - accelerated phase:** impaired neutrophil differentiation
    - circulating blasts (10-19%) with increasing peripheral basophils (pruritus)
    - CBC: thrombocytopenia  $<100 \times 10^9/L$
    - cytogenetic evidence of clonal evolution
    - worsening constitutional symptoms and splenomegaly (extramedullary hematopoiesis)
  - blast crisis:** more aggressive course, blasts fail to differentiate
    - blasts (>20%) in peripheral blood or bone marrow; reflective of acute leukemia (1/3 ALL, 2/3 AML)
- clinical presentation
  - 20-50% of patients are asymptomatic when diagnosed (incidental lab finding)
  - nonspecific symptoms
    - fatigue, weight loss, malaise, excessive sweating, fever
  - secondary to splenic involvement
    - early satiety, LUQ pain/fullness, shoulder tip pain (referred)
    - splenomegaly (most common physical finding)
  - anemia
  - bleeding: secondary to platelet dysfunction
  - pruritus, PUD: secondary to increased blood histamine
  - leukostasis, priapism, encephalopathy (rare): secondary to very elevated WBC (rare)

### Investigations

- high increase in WBC, decreased/normal RBC, increased/decreased platelets, increased basophils
  - WBC differential shows a bimodal distribution, with predominance of myelocytes and neutrophils
- peripheral blood film
  - leukoerythroblastic picture (immature red cells and granulocytes present, e.g. myelocytes and normoblasts)
  - presence of different mid-stage progenitor cells differentiates it from AML
- bone marrow
  - myeloid hyperplasia with left shift, increased megakaryocytes, mild fibrosis
- molecular and cytogenetic studies of bone marrow or peripheral blood for Philadelphia chromosome
- abdominal imaging for spleen size

### Treatment

- symptomatic:**
  - allopurinol and antihistamines
- chronic phase:**
  - imatinib mesylate (Gleevec®): inhibits proliferation and induces apoptosis by inhibiting tyrosine kinase activity in cells positive for *bcr-abl*
    - if loss of response or intolerance (~25%), trial of 2nd (dasatinib) or 3rd (nilotinib) generation inhibitors
  - interferon- $\alpha$ : may improve response to tyrosine kinase inhibitors
  - hydroxyurea in palliative setting
  - bone marrow transplantation if progression to accelerated or blast phases: CML (curative)
- accelerated phase or blast phase:**
  - refer for clinical trial or 2nd/3rd generation TKI and prepare for allogeneic stem cell transplant patients, in blast phase typically get standard AML induction
- stem cell transplantation may be curative: to be considered in young patients who do not meet therapeutic milestones

**Chronic Myeloproliferative Neoplasias: Six-year follow-up of patients receiving imatinib for the first-line treatment of CML**

*Leukemia* 2009;23:1054-1061

The Randomized Study of Interferon vs. ST1571 (IRIS) trial enrolled patients with chronic phase chronic myeloid leukemia (CML-CP) to either imatinib (n=533) or interferon- $\alpha$  (IFN) plus cytarabine (n=553). Assessing the imatinib arm specifically at the sixth year point, there were no reports of disease progression to accelerated phase (AP) or blast crisis (BC), toxicity profile was unchanged, and cytogenetic response rate was 82%. Estimated event-free survival was 83% and rate of freedom from progression to AP and BC was 93%. This 6-year update of IRIS demonstrates the efficacy and safety of imatinib as first-line therapy for CML patients.

- treatment success is monitored based on therapeutic milestones:
  - hematologic: improved WBC and platelet counts, reduced basophils
  - cytogenetic: undetectable Philadelphia-chromosome in the bone marrow
  - molecular: reduction/absence of *bcr-abl* transcripts in periphery and marrow

### Prognosis

- survival dependent on response
  - those achieving complete cytogenetic response (CCR) on imatinib by 18 mo of therapy: 6 yr overall survival >90%
  - those who do NOT achieve CCR on imatinib: 6 yr overall survival of 66%
- acute phase (blast crisis – usually within 3-5 yr)
  - 2/3 develop a picture similar to AML
    - ♦ unresponsive to remission induction
  - 1/3 develop a picture similar to ALL
    - ♦ remission induction (return to chronic phase) achievable

## Polycythemia Vera (PV)

### Definition

- stem cell disorder characterized by elevated RBC mass (erythrocytosis) ± increased white cell and platelet production

### Clinical Features

- symptoms are secondary to high red cell mass and hyperviscosity (see *Erythrocytosis*, H6)
- bleeding complications: epistaxis, gingival bleeding, ecchymoses and GI bleeding
  - due to platelet abnormalities
- thrombotic complications: DVT, PE, thrombophlebitis, increased incidence of stroke, MI
  - due to increased blood viscosity, increased platelet number and/or activity
- erythromelalgia (burning pain in hands and feet and erythema of the skin)
  - associated with platelets >400 x 10<sup>9</sup>/L
  - pathognomonic microvascular thrombotic complication in PV and ET
- pruritus, especially after warm bath or shower (40%)
  - due to cutaneous mast cell degranulation and histamine release
- epigastric distress, PUD
  - due to increased histamine from tissue basophils, alterations in gastric mucosal blood flow due to increased blood viscosity
- gout (hyperuricemia)
  - due to increased cell turnover
- characteristic physical findings
  - plethora (ruddy complexion) of face (70%), palms
  - splenomegaly (70%), hepatomegaly (40%)

### Investigations

- see *Erythrocytosis*, H6
- must rule out secondary polycythemia
- diagnosis (WHO 2008) requires either both major criteria plus one minor criteria OR the first major criterion plus 2 minor criteria:
  - Major Criteria:
    1. hemoglobin >18.5 g/dL in men, 16.5 g/dL in women or other evidence of increase red cell volume
    2. presence of JAK2 V617F or other functionally similar mutation such as JAK2 exon 12 mutation
  - Minor Criteria:
    1. bone marrow biopsy showing hypercellularity for age with trilineage growth (panmyelosis) with prominent erythroid, granulocytic and megakaryocytic proliferation
    2. serum erythropoietin level below the reference range for normal
    3. endogenous erythroid colony formation in vitro

### Treatment

- phlebotomy to keep hematocrit <45%
- hydroxyurea (prior thrombosis or symptoms, severe coronary artery disease, refractory to phlebotomy)
- low-dose Aspirin® (for antithrombotic prophylaxis, will also treat erythromelalgia)
- allopurinol: as needed
- antihistamines: as needed

### Prognosis

- 10-20 yr survival with treatment
- complicated by thrombosis, hemorrhage, leukemic transformation (AML)

Erythromelalgia is a pathognomonic microvascular thrombotic complication in PV and ET.

#### Efficacy and Safety of Low-dose Aspirin® in Polycythemia Vera

*N Engl J Med* 2004;350:114-124

**Study:** Double-blind, placebo-controlled, RCT.

**Participants:** 518 patients with polycythemia vera (PV) with no clear indication for, or contraindication to, ASA therapy.

**Intervention:** Patients received either low-dose ASA 100 mg daily (n=253) or placebo (n=265) and were followed for up to 5 yr.

**Primary Outcome:** Cumulative rate of (I) nonfatal MI, nonfatal stroke, or death from cardiovascular causes and the cumulative rate of (II) the previous 3 plus PE and major venous thrombosis.

**Results:** Primary outcomes (I) and (II) were reduced with treatment compared to placebo (RR 0.41; p=0.09 and RR 0.4; p=0.03, respectively). There were no differences in overall or cardiovascular mortality and major bleeding episodes.

**Conclusion:** Low-dose ASA can safely prevent thrombotic complications in patients with PV.

#### Cardiovascular Events and Intensity of Treatment in Polycythemia Vera

*NEJM* 2013;368:22-33

**Study:** Prospective, RCT, mean follow-up of 28.9 mo. Blinding not described.

**Population:** 365 patients with JAK2-positive polycythemia vera being treated with phlebotomy, hydroxyurea or both.

**Intervention:** Patients were randomized to a target hematocrit <45% (low-hematocrit group) or 45-50% (high-hematocrit group).

**Outcome:** Composite of time until death from cardiovascular causes of major thrombotic events.

**Results:** The hazard ratio (HR) for the primary outcome was 3.91 (95% CI, 1.45-10.53, P=0.007), while the HR for the primary outcome plus superficial venous thrombosis was 2.69 (95% CI, 1.19-6.12, P=0.02) for the high-hematocrit vs. low-hematocrit group.

**Conclusions:** The hematocrit target of <45% was associated with a lower incidence of CV death, major thrombotic events and superficial venous thrombosis in patients with polycythemia vera.

## Idiopathic Myelofibrosis (IMF)

### Definition

- excessive bone marrow fibrosis leading to marrow failure
- characterized by anemia, extramedullary hematopoiesis, leukoerythroblastosis, teardrop red cells in peripheral blood and hepatosplenomegaly

### Epidemiology

- rare, median age at presentation is 65 yr

### Pathophysiology

- abnormal myeloid precursor postulated to produce dysplastic megakaryocytes that secrete fibroblast growth factors
  - stimulates fibroblasts and stroma to deposit collagen in marrow
- increasing fibrosis causes early release of hematopoietic precursors leading to:
  - leukoerythroblastic blood film (primitive RBCs and WBCs present in blood)
  - migration of precursors to other sites: extramedullary hematopoiesis (leading to hepatosplenomegaly)

### Clinical Features

- anemia (severe fatigue is most common presenting complaint, pallor on exam in >60%)
- weight loss, fever, night sweats → secondary to hypermetabolic state
- splenomegaly (90%) → secondary to extramedullary hematopoiesis; may cause early satiety
- hepatomegaly (70%) → may get portal hypertension
- bone and joint pain → secondary to osteosclerosis, gout
- signs of extramedullary hematopoiesis (depends on organ involved)

### Investigations

- CBC: anemia, variable platelets, variable WBC
- biochemistry: increased ALP (liver involvement, bone disease), increased LDH (2° to ineffective hematopoiesis), increased uric acid (increased cell turnover), increased B<sub>12</sub> (2° to increased neutrophil mass)
- blood film: leukoerythroblastosis with teardrop RBCs, nucleated RBCs, variable polychromasia, large platelets and megakaryocyte fragments
- JAK2 PCR
- bone marrow aspirate: “dry tap” in as many as 50% of patients (no blood cells aspirated)
- bone marrow biopsy (essential for diagnosis): fibrosis, atypical megakaryocytic hyperplasia, thickening and distortion of the bony trabeculae (osteosclerosis)

### Treatment

- allogeneic stem cell transplant is potentially curative
- symptomatic treatment:
  - transfusion for anemia
  - erythropoietin: 30-50% of patients respond
  - androgens (e.g. danazol has shown transient response with response rates of <30%)
  - hydroxyurea for splenomegaly, thrombocytosis, leukocytosis, systemic symptoms
    - ♦ α-interferon (as second line therapy)
    - ♦ splenectomy (as third line therapy; associated with high mortality and morbidity)
  - radiation therapy for symptomatic extramedullary hematopoiesis, symptomatic splenomegaly
  - thalidomide, JAK2 inhibitors, and etanercept may improve quality of life and spleen size, but not survival

### Prognosis

- International Prognostic Scoring System (IPSS) for IMF uses 5 factors to determine mean survival:
  - presence of constitutional symptoms; age >65; hemoglobin <100 g/L; leukocyte count >25,000/mm<sup>3</sup>; circulating blast cells ≥1%
  - based on the calculated score, a patient's IMF is categorized as “low”, “intermediate 1”, “intermediate 2”, or “high” with a mean survival of 135, 95, 48 and 27 mo respectively
- risk of transformation to AML (8-10%)

Myelofibrosis can be either primary (idiopathic) or occur as a transformation of an antecedent PV or ET.

A “leukoerythroblastic” blood film (RBC and granulocyte precursors) implies bone marrow infiltration with malignancy (e.g. leukemias, solid tumour metastases) or fibrosis (e.g. IMF).

IMF typically has a dry BM aspirate and teardrop RBCs (aspiration gives no blood cells).

#### A Double-Blind, Placebo-Controlled Trial of Ruxolitinib for Myelofibrosis

*N Engl J Med* 2012;366:799-807

**Study:** Double-blinded RCT of 309 patients with myelofibrosis randomized to ruxolitinib or placebo.

**Outcome:** Primary outcome was reduction in spleen volume of >35% at 24 wk. Secondary outcomes were durability of response, symptom burden, and overall survival.

**Results:** A greater proportion of patients on ruxolitinib had reduction in spleen volume >35% (41.9% vs. 0.7%) and this was sustained in 67% at 48 wk. Ruxolitinib also led to greater symptom improvement (45% vs. 5.3%) and less mortality (13 vs. 24). There was no difference in rate of discontinuation due to adverse events (11.0% vs. 10.6%) but anemia and thrombocytopenia were more common with ruxolitinib.

**Conclusions:** Ruxolitinib reduced spleen size, improved symptoms, and improved overall survival, compared with placebo.

## Essential Thrombocythemia (ET)

### Definition

- overproduction of platelets in the absence of recognizable stimulus
- must rule out secondary thrombocythemia

## Epidemiology

- increases with age; F:M = 2:1, but F=M at older age

**Diagnosis** (2008 WHO Criteria) requires meeting all four criteria:

- sustained platelet count  $>450 \times 10^9/L$
- bone marrow biopsy specimen showing proliferation mainly of the megakaryocytic lineage with increased number of enlarged, mature megakaryocytes. No significant increase or left shift of neutrophil granulopoiesis or erythropoiesis
- not meeting WHO criteria for PV, primary myelofibrosis, BCR-ABL CML or myelodysplastic syndrome or other myeloid neoplasms
- demonstration of JAK2 V617F (or in its absence another clonal marker), no evidence for reactive thrombocytosis

## Clinical Features

- often asymptomatic
- vasomotor symptoms (40%)
  - headache (common), dizziness, syncope
  - erythromelalgia (burning pain of hands and feet, dusky colour, usually worse with heat, caused by platelet activation  $\rightarrow$  microvascular thrombosis)
- thrombosis (arterial and venous)
- bleeding (often GI; associated with platelets  $>1000 \times 10^9/L$ )
- constitutional symptoms, splenomegaly
- pregnancy complications; increased risk of spontaneous abortion
- risk of transformation to AML (0.6-5%), myelofibrosis

## Investigations

- CBC: increased platelets; may have abnormal platelet aggregation studies
- JAK2 PCR assay
- bone marrow hypercellularity, megakaryocytic hyperplasia, giant megakaryocytes
- increased  $K^+$ , increased  $PO_4^{3-}$  ( $2^\circ$  to release of platelet cytoplasmic contents)
- diagnosis: exclude other myeloproliferative disorders and reactive thrombocytosis

## Treatment

- low dose ASA if previous history of thrombotic event,  $\geq 1$  cardiovascular risk factors, older or symptomatic
- cytoreductive therapy if thrombosis or thrombotic symptoms: hydroxyurea (HU) (1st line therapy), anagrelide, interferon- $\alpha$ , or  $^{32}P$  (age  $>80$  or lifespan  $<10$  yr)
- splenectomy not recommended (increased risk of bleeding episodes, thrombosis)

### Etiology of Secondary Thrombocythemia

- Infection
- Inflammation (IBD, arthritis)
- Malignancy
- Hemorrhage
- Iron deficiency
- Hemolytic anemia
- Post splenectomy
- Post chemotherapy

### Anagrelide vs. Hydroxyurea for Essential Thrombocythemia: ANAHYDRET Study, a Randomized Controlled Trial

Blood 2013;121:1720-8

**Study:** Prospective, non-inferiority, RCT. Majority of patients followed beyond 1 yr.

**Population:** 259 previously untreated, high-risk patients with essential thrombosis as per the WHO guidelines.

**Intervention:** Patients were randomized to receive either non-immediate release formulation of anagrelide or hydroxyurea.

**Outcome:** Examined platelet counts, hemoglobin levels, leukocyte counts, and occurrence of ET-related events.

**Results:** The hazard ratio (HR) of developing thrombocythemia was 1.19 (95% CI, 0.61-2.30). The HR for a reduction of hemoglobin was 1.03 (95% CI, 0.57-1.81), and 0.92 (95% CI, 0.57-1.46) for leukocytosis. There was no statistical difference in occurrence of major or minor arterial or venous thrombosis, severe or minor bleeding events, or rate of discontinuation between the two arms.

**Conclusions:** In patients with ET, anagrelide is non-inferior to hydroxyurea in the prevention of thrombotic complications.

There is an asymptomatic "benign" form of essential thrombocythemia with a stable or slowly rising platelet count. Treatment includes observation, ASA, sulfapyrazone or dipyridamole.

75% of ALL occurs in children  $<6$  yr old; second peak at age 40.

# Lymphoid Malignancies

## Acute Lymphoblastic Leukemia (ALL)

### Definition

- malignant disease of the bone marrow in which early lymphoid precursors proliferate and replace the normal hematopoietic cells of the marrow
- WHO subdivides ALL into two types depending on cell of origin
  - B-cell: precursor B lymphoblastic leukemia
  - T-cell: precursor T lymphoblastic leukemia
- The French-American-British (FAB) classification (L1, L2, L3) is no longer encouraged, as morphology is not prognostic

### Clinical Features

- see *Acute Myeloid Leukemia*, H35 for full list of symptoms
- distinguish ALL from AML based on Table 30
- clinical symptoms usually secondary to:
  - bone marrow failure:** anemia, neutropenia (50% present with fever; also infections of oropharynx, lungs, perianal region), thrombocytopenia
  - organ infiltration:** tender bones, lymphadenopathy, hepatosplenomegaly, meningeal signs (headache, N/V, visual symptoms; especially in ALL relapse)

### Investigations

- CBC: increased leukocytes  $>10 \times 10^9/L$  (occurs in 50% of patients); neutropenia, anemia or thrombocytopenia
- may have increased uric acid,  $K^+$ ,  $PO_4^{3-}$ ,  $Ca^{2+}$ , LDH
- PT, aPTT, fibrinogen, D-dimers for DIC
- leukemic lymphoblasts lack specific morphological (no granules) or cytochemical features, therefore diagnosis depends on immunophenotyping
- cytogenetics: Philadelphia (Ph) chromosome in  $\sim 25\%$  of adult ALL cases

- CXR: patients with ALL may have a mediastinal mass
- LP prior to systemic chemotherapy to assess for CNS involvement (ensure adequate platelet count and PT/PTT)

### Treatment

- eliminate abnormal cloned cells:
  1. **Induction:** to induce complete remission (undetectable leukemic blasts, restore normal hematopoiesis)
  2. **Consolidation and/or intensification chemotherapy**
    - consolidation: continuing same chemotherapy to eliminate subclinical leukemic cells
    - intensification: high doses of different (non-cross-reactive) chemotherapy drugs to eliminate cells with resistance to primary treatment
  3. **Maintenance chemotherapy:** low dose intermittent chemotherapy over prolonged period (2-3 yr) to prevent relapse
  4. **Prophylaxis:** CNS radiation therapy or methotrexate (intrathecal or systemic)
- hematopoietic stem cell transplantation: potentially curative (due to pre-implant myeloablative chemoradiation and post-implant graft-versus-leukemia effect) but relapse rates and non-relapse mortality high

### Prognosis

- depends on response to initial induction or if remission is achieved following relapse
- good prognostic factors: young, WBC  $<30 \times 10^9/L$ , T-cell phenotype, absence of Ph chromosome, early attainment of complete remission
- achievement of first remission: 60-90%
- childhood ALL: 80% long term remission ( $>5$  yr)
  - higher cure rates in children because of better chemotherapy tolerance, lower prevalence of *bcr-abl* fusion gene (associated with chemotherapeutic resistance)
- adult ALL: 30-40% 5-yr survival

**Table 30. Differentiating AML From ALL**

AML	ALL
Big people (adults)	Small people (kids)
Big blasts	Small blasts
Big mortality rate	Small mortality rate (kids)
Lots of cytoplasm	Less cytoplasm
Lots of nucleoli (3-5)	Few nucleoli (1-3)
Lots of granules and Auer rods	No granules
Myeloperoxidase, Sudan black stain	PAS (periodic acid-Schiff)
Maturation defect beyond myeloblast or promyelocyte	Maturation defect beyond lymphoblast

#### Treatment of ALL vs. AML

- No proven benefit of maintenance chemotherapy in AML
- No routine CNS prophylaxis in AML

**To Differentiate AML From ALL:**  
Remember **Big** and **SmALL**  
(see Table 30)

## Lymphomas

### Definition

- collection of lymphoid malignancies in which malignant lymphocytes accumulate at lymph nodes and lymphoid tissues
  - leading to lymphadenopathy, extranodal disease and constitutional symptoms

**Table 31. Ann Arbor System for Staging Lymphomas**

Stage	Description
I	Involvement of a single lymph node region or extralymphatic organ or site
II	Involvement of two or more lymph node regions or an extralymphatic site and one or more lymph node regions on same side of diaphragm
III	Involvement of lymph node regions on both sides of the diaphragm; may or may not be accompanied by single extra lymphatic site or splenic involvement
IV	Diffuse involvement of one or more extralymphatic organs including bone marrow

- subtypes:
  - A = absence of B-symptoms (see *Approach to Lymphadenopathy*, H11)
  - B = presence of B-symptoms

- Ann Arbor staging can be used for both Hodgkin and non-Hodgkin lymphoma, but grade/histology is more important for non-Hodgkin lymphoma because the outcome differs significantly depending on type of lymphoma.
- Prognostic scores are different for indolent versus aggressive lymphomas.
- Highly aggressive lymphomas act like acute leukemias.

Hodgkin is distinguished from non-Hodgkin lymphoma by the presence of Reed-Sternberg cells.

**Table 32. Chromosome Translocations**

Translocation	Gene Activation	Associated Neoplasm
t(8;14)	c-myc activation	Burkitt's lymphoma
t(14;18)	bcl-2 activation	Follicular lymphoma
t(9;22)	Philadelphia chromosome ( <i>bcr-abl</i> hybrid)	CML, ALL in adults (25% of the time)
t(11;14)	Overexpression of cyclin D1 protein	Mantle cell lymphoma

## Hodgkin Lymphoma

### Definition

- malignant proliferation of lymphoid cells with Reed-Sternberg cells (thought to arise from germinal centre B-cells)

### Epidemiology

- bimodal distribution with peaks at 20 yr and >50 yr
- association with Epstein-Barr virus in up to 50% of cases, causal role not determined

### Clinical Features

- asymptomatic lymphadenopathy (70%)
  - non-tender, rubbery consistency
  - cervical/supraclavicular (60-80%), axillary (10-20%), inguinal (6-12%)
- splenomegaly (50%) ± hepatomegaly
- mediastinal mass
  - found on routine CXR, may be symptomatic (cough)
  - rarely may present with SVC syndrome, pleural effusion
- systemic symptoms
  - B symptoms (especially in widespread disease; fever in 30%), pruritus
- non-specific/paraneoplastic
  - alcohol-induced pain in nodes, nephrotic syndrome
- starts at a single site in lymphatic system (node), spreads first to adjacent nodes
  - disease progresses in contiguity with lymphatic system

Hodgkin Lymphoma classically presents as a painless, non-tender, firm, rubbery enlargement of superficial lymph nodes, most often in the cervical region.

### Investigations

- CBC
  - anemia (chronic disease, rarely hemolytic), eosinophilia, leukocytosis, platelets normal or increased early, decreased in advanced disease
- biochemistry
  - HIV serology
  - LFTs (liver involvement)
  - RFTs (prior to initiating chemotherapy)
  - ALP, Ca<sup>2+</sup> (bone involvement)
  - ESR, LDH (monitor disease progression)
- imaging
  - CXR, CT chest (lymph nodes, mediastinal mass), CT abdomen/pelvis (liver or spleen involvement), gallium scan (assess treatment response)
  - cardiac function assessment (MUGA or echocardiography): for patients at high risk of pre-treatment cardiac disease (age >60, history of HTN, CHF, PUD, CAD, MI, CVA), treatment can be cardiotoxic
  - PFTs: if history of lung disease (COPD, smoking, previous radiation to lung)
- excisional lymph node biopsy confirms diagnosis
- bone marrow biopsy to assess marrow infiltration (only necessary if B-symptoms, stage III or IV, bulky disease or cytopenia)

### Treatment

- stage I-II: chemotherapy (ABVD) followed by involved field radiotherapy (XRT)
- stage III-IV: chemotherapy (ABVD) with XRT for bulky disease
- relapse, resistant to therapy: high dose chemotherapy, bone marrow transplant
  - new imaging modalities increasingly used including PET scans used to follow response to treatment

### Complications of Treatment

- cardiac disease: secondary to XRT, adriamycin is also cardiotoxic
- pulmonary disease: secondary to bleomycin (interstitial pneumonitis)
- infertility: recommend sperm banking
- secondary malignancy in irradiated field
  - <2% risk of MDS, AML (secondary to treatment, usually within 8 yr)
  - solid tumours of lung, breast; >8 yr after treatment
  - non-Hodgkin lymphoma
- hypothyroidism: post XRT

#### Common Chemotherapeutic Regimens

**CHOP:** cyclophosphamide, hydroxydoxorubicin (Adriamycin), vincristine (Oncovin), prednisone

**VAD:** vincristine, adriamycin, dexamethasone

**ABVD:** adriamycin, bleomycin, vinblastine, dacarbazine

**BEACOPP:** bleomycin, etoposide, adriamycin, cyclophosphamide, vincristine, procarbazine and prednisone

### Prognosis

- Hasenclever adverse prognostic factors:
  - serum albumin  $<40$  g/L (4 g/dL)
  - hemoglobin  $<105$  g/L (10.5 g/dL)
  - male
  - stage IV disease
  - age  $\geq 45$  yr
  - leukocytosis (WBC  $>1.5 \times 10^9$ /L)
  - lymphocytopenia (lymphocytes  $<0.06 \times 10^9$ /L or  $<8\%$  of WBC count or both)
- prognostic score
  - each additional adverse prognostic factor decreases freedom from progression at 5 yr (FFP)

#### International Prognostic Factors Project 1998

Prognostic Factors	FFP
0	84%
1	77%
2	67%
3	60%
4	51%
5-7	42%

FFP = freedom from progression at 5 yr.

## Non-Hodgkin Lymphoma (NHL)

### Definition

- malignant proliferation of lymphoid cells of progenitor or mature B- or T-cells

### Classification

- multiple classification systems exist at present and may be used at different centres
- can originate from both B- (85%) and T- or NK- (15%) cells
  - B-cell NHL: e.g. diffuse large B-cell lymphoma, follicular lymphoma, Burkitt's lymphoma, mantle cell lymphoma
  - T-cell NHL: e.g. mycosis fungoides, anaplastic large cell lymphoma
- WHO/REAL classification system: 3 categories of NHLs based on natural history
  - indolent** (35-40% of NHL): e.g. follicular lymphoma, small lymphocytic lymphoma/CLL, mantle cell lymphoma
  - aggressive** (~50% of NHL): e.g. diffuse large B-cell lymphoma
  - highly aggressive** (~5% of NHL): e.g. Burkitt's lymphoma

### Clinical Features

- painless superficial lymphadenopathy, usually  $>1$  lymph node region
- usually presents as widespread disease (exception is aggressive lymphoma)
- constitutional symptoms not as common as in Hodgkin lymphoma
- cytopenia: anemia  $\pm$  neutropenia  $\pm$  thrombocytopenia can occur when bone marrow is involved
- abdominal signs
  - hepatosplenomegaly
  - retroperitoneal and mesenteric involvement (2nd most common site of involvement)
- oropharyngeal involvement in 5-10% with sore throat and obstructive apnea
- extranodal involvement: most commonly GI tract; also testes, bone, kidney
- CNS involvement in 1% (often with HIV)

#### NHL: Associated Conditions

- Immunodeficiency (e.g. HIV)
- Autoimmune diseases (e.g. SLE)
- Infections (e.g. EBV)

### Investigations

- CBC:
  - normocytic normochromic anemia
  - autoimmune hemolytic anemia
  - advanced disease: thrombocytopenia, neutropenia and leukoerythroblastic anemia
- peripheral blood film may show lymphoma cells
- flow cytometry of peripheral blood is valuable for low-grade NHL
- biochemistry:
  - increase in uric acid
  - abnormal LFTs in liver metastases
  - increased LDH (rapidly progressing disease, poor prognostic factor)
- CXR, CT neck, abdomen, pelvis for staging
- PET is useful for monitoring response to treatment and evaluation of residual tumour following therapy in aggressive histological disease
- diagnosed by:
  - lymph node biopsy: excisional biopsy preferred, FNA unreliable
  - bone marrow biopsy: not optimal for diagnosis as BM may not be involved

### Treatment

- localized disease (e.g. GI, brain, bone, head and neck)
  - radiotherapy to primary site and adjacent nodal areas
  - adjuvant chemotherapy
  - surgery: splenic marginal zone lymphoma
- indolent lymphoma:** goal of treatment is symptom management
  - watchful waiting
  - radiation therapy for localized disease
  - CHOP + rituximab, an anti-CD20 antibody (CHOP-R) for advanced stage disease

#### CHOP-Like Chemotherapy with or without Rituximab in Young Patients with Good-Prognosis Diffuse Large B-Cell Lymphoma (MInT)

*Lancet Oncol* 2011;12:1013-1022

**Study:** International RCT with a median follow-up of 72 mo.

**Participants:** 824 patients with good-prognosis diffuse large B-cell lymphoma who had  $\leq 1$  risk factor, stage II-IV disease or stage I disease with bulky (age: 18 to 60 yr).

**Intervention:** Patients received either 6 cycles of CHOP-like chemotherapy and rituximab (CCR;  $n=413$ ) or 6 cycles of CHOP-like chemotherapy alone (CLC;  $n=411$ ). Bulky and extranodal sites received additional radiotherapy.

**Primary Outcome:** Event-free survival.

**Results:** Patients receiving CCR had an increased 6-yr event-free survival compared with the CLC group (74.3% vs. 55.8%;  $p<0.0001$ ). Event-free survival was affected by treatment group, presence of bulky disease, and age-adjusted International Prognostic Index (IPI). Overall survival was affected by treatment group and presence of bulky disease. Within the CCR group, a favourable subgroup (IPI=0, no bulky) and less favourable subgroup (IPI=1 or bulky, or both) could be defined; event-free survival was 84.3% vs. 71.0%.

**Conclusion:** Rituximab added to six cycles of CHOP is an effective treatment for young patients with good-prognosis diffuse large B-cell lymphoma. The definition of two prognostic subgroups allows a more refined therapeutic approach to these patients than does assessment by IPI alone.

- **aggressive lymphoma:** goal of treatment is curative
  - combination chemotherapy: CHOP is mainstay, plus rituximab if B-cell lymphoma
  - radiation for localized/bulky disease
  - CNS prophylaxis with high-dose methotrexate if certain sites involved (testicular, nasopharyngeal)
  - relapse, resistant to therapy: high dose chemotherapy, BMT
- **highly aggressive lymphoma**
  - Burkitt Lymphoma: short bursts of intensive chemotherapy
  - “CODOX-M” chemotherapy regimen also often used  $\pm$  IVAC
  - CNS prophylaxis and tumour lysis syndrome prophylaxis

Treatment of HL depends on stage; treatment of NHL depends on histologic subtype.

### Complications

- hypersplenism
- infection
- autoimmune hemolytic anemia and thrombocytopenia
- vascular obstruction (from enlarged nodes)
- tumour lysis syndrome (particularly in very aggressive lymphoma) – see H50

### Prognosis

- follicular lymphoma: Follicular Lymphoma International Prognostic Index is used (5 adverse prognostic factors): age >60; number of nodal areas >4; elevated LDH; Ann Arbor stage III-IV; hemoglobin <120 g/L
  - based on calculated risk, mean 5 yr survival ranges from 53-91%
  - rarely curative, typically relapsing and remitting course with risk of transformation to aggressive lymphoma such as diffuse large B-cell lymphoma
- diffuse large B-cell lymphoma: The International Prognostic Factor Index is used (5 adverse prognostic factors): age >60; Ann Arbor stage (III-IV); performance status (ECOG/Zubrand 2-4); elevated LDH; >1 extranodal site
  - based on calculated risk, mean 5 yr survival ranges from 26-73%
  - has ~40% rate of cure

**Table 33. Characteristics of Select Non-Hodgkin Lymphomas**

	Follicular Lymphoma	Diffuse Large B-Cell Lymphoma (DLBCL)	Burkitt Lymphoma	Mantle Cell Lymphoma
<b>Percentage of NHLs</b>	22-30%	33%	<1% adult NHLs 30% childhood NHLs	6%
<b>Genetic Mutation</b>	Bcl-2 activation	Bcl-2, Bcl-6, MYC rearrangements	c-myc activation	Overexpression of cyclin D1 (Bcl-1 activation)
<b>Classification</b>	Indolent	Aggressive (high-grade)	Very aggressive	Indolent
<b>Risk Factors</b>	Middle-age – elderly	Previous CLL (Richter's transf.: 5% CLL patients progress to DLBCL)	1. Endemic: African origin, EBV-associated 2. Sporadic: no EBV 3. HIV-related: AIDS-defining illness	Male (male:female = 4:1)
<b>Clinical Features</b>	<ul style="list-style-type: none"> <li>• Widespread painless LAD* <math>\pm</math> bone marrow involvement</li> <li>• Frequent transformation to aggressive lymphoma</li> <li>• Very responsive to chemoradiation tx</li> </ul>	<ul style="list-style-type: none"> <li>• Rapidly progressive LAD and extranodal infiltration</li> <li>• 50% present at stage I/II, 50% widely disseminated</li> </ul>	<ul style="list-style-type: none"> <li>• Endemic form: massive jaw LAD</li> <li>• “Starry-sky” histology</li> <li>• High risk of tumour lysis syndrome upon treatment</li> </ul>	<ul style="list-style-type: none"> <li>• Often presents Stage IV with palpable LAD</li> <li>• Involvement of GI tract (lymphomatosis polyposis), Waldeyer's Ring</li> <li>• Extremely aggressive, 5-yr survival 25%</li> </ul>

\*LAD = lymphadenopathy

## Malignant Clonal Proliferations of Mature B-Cells

**Table 34. Characteristics of B-Cell Malignant Proliferation**

	CLL	Macroglobulinemia	Myeloma
<b>Cell Type</b>	Lymphocyte	Plasmacytoid	Plasma cell
<b>Protein</b>	IgM if present	IgM	IgG, A, light chain (rarely M, D or E)
<b>Lymph Nodes</b>	Very common	Common	Rare
<b>Hepatosplenomegaly</b>	Common	Common	Rare
<b>Bone Lesions</b>	Rare	Rare	Common
<b>Hypercalcemia</b>	Rare	Rare	Common
<b>Renal Failure</b>	Rare	Rare	Common
<b>Immunoglobulin Complications</b>	Common	Rare	Rare

Rouleaux formation on peripheral blood smear, if not artifact, denotes hyperglobulinemia (but not necessarily monoclonality).

## Chronic Lymphocytic Leukemia (CLL)

### Definition

- indolent disease characterized by clonal malignancy of mature B-cells

### Epidemiology

- most common leukemia in Western world
- mainly older patients; median age 65 yr
- M>F

### Pathophysiology

- accumulation of neoplastic lymphocytes in blood, bone marrow, lymph nodes and spleen

### Clinical Features

- 25% asymptomatic (incidental finding)
- 5-10% present with B-symptoms ( $\geq 1$  of: unintentional weight loss  $\geq 10\%$  of body weight within previous 6 mo, temperature  $>38^\circ\text{C}$  or night sweats for  $\geq 2$  wk without evidence of infection, extreme fatigue)
- lymphadenopathy (50-90%), splenomegaly (25-55%), hepatomegaly (15-25%)
- immune dysregulation: autoimmune hemolytic anemia (Coombs positive), ITP, hypogammaglobulinemia  $\pm$  neutropenia
- bone marrow failure: late, secondary to marrow involvement by CLL cells

### Investigations

- CBC: absolute lymphocytes  $>5 \times 10^9/\text{L}$  with a CLL phenotype
- peripheral blood film
  - lymphocytes are small and mature
  - smudge cells
- flow cytometry (CD5, CD20, CD23, etc.)
- cytogenetics: FISH (dictates response to therapy and prognosis)
- bone marrow aspirate
  - lymphocytes  $>30\%$  of all nucleated cells
  - infiltration of marrow by lymphocytes in 4 patterns: nodular (10%), interstitial (30%), diffuse (35%, worse prognosis) or mixed (25%)

Smudge cells are artifacts of damaged lymphocytes from slide preparation.

### Natural History and Treatment

- natural history: indolent but incurable, with slow progression; thus select gentlest treatment that will control symptoms
  - observation if early, stable, asymptomatic
  - intermittent chlorambucil or fludarabine chemotherapy combined with rituximab, chlorambucil in the elderly
  - corticosteroids, IVIG: especially for autoimmune phenomena
  - radiotherapy
- small minority present with aggressive disease; usually associated with chromosomal abnormalities (e.g. p53 deletion)
- 9 yr median survival, but varies greatly

- prognosis predicted by Rai staging
  - low risk: lymphocytosis in blood and bone marrow only
  - intermediate risk: lymphocytosis with enlarged nodes in any site or splenomegaly, hepatomegaly
  - high risk: lymphocytosis with disease-related anemia ( $<110$  g/L) or thrombocytopenia ( $<100 \times 10^9/L$ )

### Complications

- bone marrow failure
- immune complications: AIHA, ITP, immune deficiency (hypogammaglobulinemia, impaired T-cell function)
- polyclonal or monoclonal gammopathy (often IgM)
- hyperuricemia with treatment
- 5% undergo Richter's transformation: aggressive transformation to diffuse large B-cell lymphoma (see Table 33)

## Multiple Myeloma (MM)

### Definition

- neoplastic clonal proliferation of plasma cells producing a monoclonal immunoglobulin resulting in end organ dysfunction
- usually single clone of plasma cells, although biclonal myeloma also occurs. Rarely non-secretory

### Epidemiology

- incidence 3 per 100,000, most common plasma cell malignancy
- increased frequency with age; median age of diagnosis is 68 yr; M>F

### Pathophysiology

- malignant plasma cells secrete monoclonal antibody
  - 95% produce M protein (monoclonal Ig = identical heavy chain + identical light chain, or light chains only)
    - ♦ IgG 50%, IgA 20%, IgD 2%, IgM 0.5%
    - ♦ 15-20% produce free light chains or light chains alone found in either:
      - serum as an increase in the quantity of either kappa or lambda light chain (with an abnormal kappa:lambda ratio)
      - urine has Bence-Jones protein
  - <5% are non-secretors

### Clinical Features and Complications

- bone disease: pain (usually back), bony tenderness, pathologic fractures
  - lytic lesions are classical (skull, spine, proximal long bones, ribs)
  - increased bone resorption secondary to osteoclast activating factors such as PTHrP
- anemia: weakness, fatigue, pallor
  - secondary to bone marrow suppression
- weight loss
- infections
  - usually *S. pneumoniae* and Gram-negatives
  - secondary to suppression of normal plasma cell function
- hypercalcemia: N/V, confusion, constipation, polyuria, polydipsia
  - secondary to increased bone turnover
- renal disease/renal failure
  - most frequently causes cast nephropathy (see [Nephrology](#), NP30)
- bleeding
  - secondary to thrombocytopenia, may see petechiae, purpura
  - can also be caused by acquired von Willebrand disease
- extramedullary plasmacytoma
  - soft tissue mass composed of monoclonal plasma cells, purplish colour
- hyperviscosity: may manifest as headaches, stroke, angina, MI
  - secondary to increased viscosity caused by M protein
- amyloidosis
  - accumulation of insoluble fibrillar protein (Ig light chain) in tissues; can cause infiltration of any organ system: cardiac infiltration – diastolic dysfunction, cardiac arrhythmias, syncope, sudden death; GI involvement – malabsorption, beefy large or laterally scalloped tongue; neurologic involvement – orthostatic hypotension, carpal tunnel syndrome
  - may cause Factor X deficiency if fibrils bind Factor X → bleeding (raccoon eyes)
- neurologic disease: muscle weakness, pain, paresthesias
  - radiculopathy caused by vertebral fracture, extramedullary plasmacytoma
  - spinal cord compression (10-20% of patients) is a medical emergency

### Multiple Myeloma

#### CRAB

Increased Calcium

Renal failure

Anemia

Bony lesions (lytic lesions or osteoporosis felt to be caused by myeloma)

Routine urinalysis will not detect light chains as dipstick detects albumin. Need sulfosalicylic acid or 24 h urine protein for immunofixation or electrophoresis.

### Amyloid

The general term for a variety of proteinaceous materials that have a similar structural organization and are abnormally deposited in tissues.

Found in a variety of clinical disorders and can cause systemic [e.g. MM (light chains)] or localized amyloidosis [e.g. Alzheimer disease (AB amyloid)].

## Investigations

- CBC:
  - normocytic anemia, thrombocytopenia, leukopenia
  - rouleaux formation on peripheral film
- biochemistry:
  - increased  $\text{Ca}^{2+}$ , increased ESR, decreased anion gap, increased Cr, albumin,  $\beta_2$ -microglobulin (as part of staging), proteinuria (24 h urine collection)
- monoclonal proteins:
  - serum protein electrophoresis (SPEP): demonstrates monoclonal protein spike in serum in 80% (i.e. M protein)
  - urine protein electrophoresis (UPEP): demonstrates light chains in urine = Bence-Jones protein (15% only secrete light chains)
  - immunofixation: demonstrates M protein and identifies Ig type; also identifies light chains
  - serum free light chain quantification: kappa and lambda light chains, calculated ratio
- bone marrow aspirate and biopsy
  - often focal abnormality, greater than 10% plasma cells, abnormal morphology, clonal plasma cells; send for FISH or cytogenetics (prognostic implications)
- skeletal series (x-rays), MRI if symptoms of cord compression
  - presence of lytic lesions and areas at risk of pathologic fracture
  - bone scans are not useful since they detect osteoblast activity
- $\beta_2$ -microglobulin, LDH and CRP are poor prognosticators

### Light Chain Disease

15% of MM produce only light chains. Renal failure is a major problem. Kappa > lambda light chain has better prognosis.

## Diagnosis

- International Myeloma working group criteria
  1. serum or urinary monoclonal protein
  2. presence of clonal plasma cells in bone marrow or a plasmacytoma
  3. presence of end-organ damage related to plasma cell dyscrasia, such as:
    - ♦ increased serum  $\text{Ca}^{2+}$
    - ♦ lytic bone lesions
    - ♦ anemia
    - ♦ renal failure

## Treatment

- treatment is non-curative
- treatment goals:
  - improvement in quality of life (improve anemia, reverse renal failure, bony pain)
  - prevention of progression and complications
  - increase overall survival
- autologous stem cell transplant if <65 yr old
  - usually preceded by 4-6 mo of cytoreductive therapy: steroid based with novel agents (i.e. IMiDs or proteasome inhibitors)
- chemotherapy if >65 yr old or transplant-ineligible
  - melphalan, prednisone and novel agent (i.e. bortezomib)
- dexamethasone and bortezomib if ARF; bortezomib  $\pm$  dexamethasone in light chain amyloidosis
- supportive management:
  - bisphosphonates for those with osteopenia or lytic bone lesions (requires renal dosing)
  - local XRT for bone pain, spinal cord compression
  - kyphoplasty for vertebral fractures to improve pain relief and regain height
  - treat complications: hydration for hypercalcemia and renal failure, bisphosphonates for severe hypercalcemia, prophylactic antibiotics, erythropoietin for anemia, DVT prophylaxis
- all patients will relapse; choice of retreatment regimen depends on duration of remission, organ involvement, patient's comorbidities and preferences

## Prognosis

- International Staging System ( $\beta_2$ -microglobulin and albumin) used to stage and estimate prognosis
  - cytogenetic profile (i.e. p53 mutation associated with poor survival and resistance to chemotherapy)
- median survival based on stage, usually 16-70 mo

## Monoclonal Gammopathy of Unknown Significance (MGUS)

### Definition

- presence of M protein in serum in absence of any clinical or laboratory evidence of a plasma cell dyscrasia or lymphoproliferative disorders
  - incidence: 0.15% in general population, 5% of people >70 yr of age
  - asymptomatic

### Diagnosis

- presence of a serum monoclonal protein (M-protein) at a concentration <30 g/L
- <10% plasma cells in bone marrow
- absence of hyperCalcemia, Renal insufficiency, Anemia, Bony disease related to the plasma cell proliferative process (absence of "CRAB")
- 0.3-1% of patients develop a hematologic malignancy each year
  - patients with M protein peak  $\geq 15$  g/L or patients with IgA or IgM MGUS are at higher risk of malignant transformation
  - patients with serum free light chains are at increased risk of malignant transformation
- monitor with annual history, physical, CBC, Cr, calcium, albumin, serum protein electrophoresis (considered pre-malignant)

## Lymphoplasmacytic Lymphoma (Waldenstrom's Macroglobulinemia)

### Definition

- proliferation of lymphoplasmacytoid cells
  - presence of monoclonal IgM paraprotein

### Clinical Features

- chronic disorder of elderly patients; median age 64 yr
- symptoms: weakness, fatigue, bleeding (oronasal), weight loss, recurrent infections, dyspnea, CHF (triad of anemia, hyperviscosity, plasma volume expansion), neurological symptoms, peripheral neuropathy, cerebral dysfunction
- signs: pallor, splenomegaly, hepatomegaly, lymphadenopathy, retinal lesions
- key complication to avoid: hyperviscosity syndrome (see below)
  - because IgM (unlike IgG) confined largely to intravascular space

### Investigations and Diagnosis

- bone marrow shows plasmacytoid lymphocytes
- bone lesions usually not present
- bloodwork rarely see hypercalcemia
- cold hemagglutinin disease possible: Raynaud's phenomenon, hemolytic anemia precipitated by cold weather
- normocytic anemia, rouleaux, high ESR if hyperviscosity not present

### Management

- R-CVP, alkylating agents (chlorambucil), nucleoside analogues (fludarabine), thalidomide, rituximab, or combination therapy
- corticosteroids
- plasmapheresis for hyperviscosity: acute reduction in serum IgM

#### Serum Free Light Chain Ratio is an Independent Risk Factor for Progression in MGUS

*Blood* 2005;106:812-817

**Purpose:** To determine whether the presence of monoclonal free kappa or lambda immunoglobulin light chains in MGUS increases the risk of progression to malignancy.

**Methods:** Retrospective study with median follow-up of 15 yr. Baseline serum samples obtained from 1383 MGUS patients seen at the Mayo clinic between 1960-1994. 1148 baseline samples were obtained within 30 d of diagnosis.

**Results:** Malignant progression had occurred in 87 (7.6%) patients. In 379 (33%) patients, an abnormal serum free light chain (FLC) ratio was detected. There was a significantly higher risk of progression in patients with an abnormal FLC ratio relative to patients with a normal ratio (hazard ratio, 3.5; 95% CI, 2.3-5.5;  $p < 0.001$ ). This finding was independent of the size and type of the serum monoclonal (M) protein. In high-risk MGUS patients [abnormal serum FLC ratio, non-IgG MGUS, high serum M protein level ( $\geq 1.5$  gm/dL)], the risk of progression at 20 yr was 58% compared to 37% in high-intermediate-risk MGUS (two risk factors), 21% low-intermediate risk (with one risk factor) and 5% low-risk (no risk factors).

**Conclusions:** The presence of an abnormal FLC ratio is a clinically and statistically significant predictor of progression in MGUS. The low-risk subset of patients with MGUS accounts for 40% of all MGUS patients and have a small lifetime risk of progression, thus less follow-up can be justified.

Waldenstrom's macroglobulinemia accounts for 85% of all cases of hyperviscosity syndrome.

## Complications of Hematologic Malignancies

### Hyperviscosity Syndrome

#### Definition

- refers to clinical sequelae of increased blood viscosity (when relative serum viscosity >5-6 units), resulting from increased circulating serum Igs or from increased cellular blood components in hyperproliferative disorders (e.g. multiple myeloma, leukemia, PV)
- Waldenstrom's macroglobulinemia accounts for 85% of cases

**Clinical Features**

- hypervolemia causing: CHF, headache, lethargy, dilutional anemia
- CNS symptoms due to decreased cerebral blood flow: headache, vertigo, ataxia, stroke
- retina shows venous engorgement and hemorrhages
- bleeding diathesis
  - due to impaired platelet function, absorption of soluble coagulation factors (e.g. nasal bleeding, oozing gums)
- ESR usually very low

**Treatment**

- plasmapheresis, chemotherapy

## Tumour Lysis Syndrome

**Definition**

- group of metabolic complications that result from spontaneous or treatment-related breakdown of cancer cells
- more common in diseases with large tumour burden and high proliferative rate (high grade lymphoma, leukemia)

**Clinical Features**

- metabolic abnormalities
  - cells lyse, releasing  $K^+$ , uric acid,  $PO_4^{3-}$  (increased levels)
  - $PO_4^{3-}$  binds  $Ca^{2+}$  (decreased  $Ca^{2+}$ )
- complications
  - lethal cardiac arrhythmia (increased  $K^+$ )
  - acute renal failure (urate nephropathy, see [Nephrology](#), NP30)

**Treatment**

- prevention
  - aggressive IV hydration
  - alkalinization of the urine
  - allopurinol or rasburicase
  - correction of pre-existing metabolic abnormalities
- dialysis

## Blood Products and Transfusions

### Blood Products

- RBCs, platelets and coagulation factors (frozen plasma [FP], cryoprecipitate, factor concentrates) are available for transfusion
- donated blood (1 U = 450-500 mL) is fractionated into these various components
  - centrifugation separates whole blood into RBCs and platelet-rich plasma
  - platelet-rich plasma is further fractionated into platelets and plasma
    - ♦ need to pool together multiple units to obtain therapeutic amounts
    - ♦ FP (previously known as FFP) is plasma frozen within 24 h of collection
    - ♦ cryoprecipitate is the high MW precipitate generated when FP is thawed at low temperatures

**Specialized Products**

- irradiated blood products
  - prevent proliferation of donor T-cells in potential or actual BMT recipients
  - used for immunocompromised patients or for patients on purine analogue chemotherapy, first-degree relatives, HLA-matched products and intrauterine transfusions
- CMV-negative blood products
  - potential transplant recipients
  - neonates
  - AIDS patients
  - seronegative pregnant women

**Blood Groups**

Group	Antigen (on RBC)	Antibody (in serum)
O	H	Anti-A, anti-B
A	A	Anti-B
B	B	Anti-A
AB	A and B	Nil

In Canada, blood products are leukodepleted via filtration immediately after donation. Therefore it is considered:

- Low in lymphokines, resulting in a lower incidence of febrile nonhemolytic transfusion reactions
- CMV negative (because CMV is found in leukocytes)

## Red Blood Cells

### Packed Red Blood Cells

- stored at 4°C
- transfuse within 42 d of collection, otherwise cell lysis may result in hyperkalemia
- infuse each unit over 2 h, max of 4 h

### Indications for packed RBC Transfusion

- Hb <70 g/L (7 g/dL); this may change as per patient's tolerance or symptoms
  - maintain Hb between 70 and 100 g/L during active bleeds (7 g/dL to 10 g/dL)
- consider maintaining a higher Hb for patients with:
  - CAD/unstable coronary syndromes
  - uncontrolled, unpredictable bleeding
  - impaired pulmonary function
  - increased O<sub>2</sub> consumption

### Selection of Red Cells for Transfusion

- when a need for RBC transfusion is anticipated, the following should be ordered:
  - group and screen
    - ♦ determines the blood group and Rh status of the recipient as well as the presence of autoantibodies vs. major/minor blood group antigens in the patient's serum
  - crossmatch
    - ♦ involves mixing the recipient's blood with potential donor blood and looking for agglutination
    - ♦ takes 30-45 min
- when blood is required, several options are available
  - 1st line: fully crossmatched blood (not always available in emergency situations)
  - 2nd line: donor blood of the same group and Rh status as the recipient
  - 3rd line: O- blood for females of reproductive age; O+ blood for all others

1 unit of pRBC will increase Hb by approximately 10 g/L or increase Hct by 4%.

#### Transfusion Requirements in Critical Care (TRICC)

*NEMJ* 1999;340:409-417

**Study:** Multicentre, RCT.

**Participants:** 838 critically ill patients with euvolemia after initial treatment and hemoglobin less than 9 g/dL within 72 h of ICU admission.

**Intervention:** Patients receiving a transfusion followed either (1) a restrictive strategy (RS; n=418) in which red cells were transfused if hemoglobin was less than 7.0 g/dL and then maintained at 7 to 9 g/dL or (2) a liberal strategy (LS; n=420) in which transfusions occurred when the hemoglobin was less than 10.0 g/dL and then maintained at 10 to 12 g/dL.

**Primary Outcome:** Mortality at 30 d and severity of organ dysfunction.

**Results:** Mortality rates at 30 d were similar between groups. However, mortality rates were significantly lower with the RS among less acutely ill patients (8.7% and RS group and 16.1% in LS group; P=0.03) and among those less than 55 yr of age (5.7% RS and 13% LS; P=0.02), but did not differ in a subgroup with clinically significant cardiac disease.

**Conclusion:** A RS of red cell transfusion is at least as effective as, and possibly superior to, a LS transfusion in critically ill patients.

## Platelets

**Table 35. Platelet Products**

Product	Indication
Random donor (pooled)	Thrombocytopenia with bleeding
Single donor platelets	Potential BMT recipients
HLA matched platelets	Refractory to pooled or single donor platelets, presence of HLA antibodies

- stored at 20-24°C
- random donor platelets are transfused from a pool of 4 units; this should increase the platelet count by  $\geq 15 \times 10^9/L$
- single donor platelets (transfused as single units) should increase the platelet count by  $40-60 \times 10^9/L$
- if an increase in the platelet count is not seen post-transfusion: autoantibodies (i.e. ITP), alloantibodies, consumption (bleeding, sepsis) or hypersplenism may be present

**Table 36. Indications for Platelet Transfusion**

Plt ( $\times 10^9/L$ )	Indications
<10	Non-immune thrombocytopenia
<20	Procedures not associated with significant blood loss
<50	Procedures associated with blood loss or major surgery (>500 mL EBL)
<100	Pre-neurosurgery or head trauma
Any	Platelet dysfunction (or antiplatelet agents) and marked bleeding

### Relative Contra-indications of Platelet Transfusion

- TTP, HIT, post-transfusion purpura, HELLP

## Coagulation Factors

**Table 37. Coagulation Factor Products**

Product	Indication
Frozen plasma (FP)	Depletion of multiple coagulation factors (e.g. sepsis, DIC, dilution, TTP/HUS, liver disease), emergency reversal of life-threatening bleeding secondary to warfarin overdose
Cryoprecipitate (enriched fibrinogen, vWF, VIII, XIII)	Factor VIII deficiency von Willebrand's disease Hypofibrinogenemia
Hemate P	von Willebrand's disease
Factor VIII concentrate	Factor VIII deficiency (Hemophilia A)
Factor IX concentrate	Factor IX deficiency (Hemophilia B)
Recombinant VIIa	Factor VII deficiency with bleeding, Hemophilia A or B with inhibitors
Prothrombin Complex (Octaplex®)	Reversal of warfarin therapy or vitamin K deficiency in bleeding patient or in patient requiring urgent (<6 h) surgical procedure

## Acute Blood Transfusion Reactions

### IMMUNE

#### Acute Hemolytic Transfusion Reactions (AHTR)

- ABO incompatibility resulting in intravascular hemolysis secondary to complement activation
- most commonly due to incorrect patient identification
- occurs immediately after transfusion
- risk per unit of blood is <1 in 40,000
- presents with fever, chills, hypotension, back or flank pain, dyspnea, hemoglobinuria
- acute renal failure (<24 h) and DIC
- treatment
  - stop transfusion
  - notify blood bank and check for clerical error
  - maintain BP with vigorous IV fluids ± inotropes
  - maintain urine output with diuretics, crystalloids, dopamine

#### Febrile Nonhemolytic Transfusion Reactions (FNHTR)

- due to alloantibodies to WBC, platelets or other donor plasma antigens and release of cytokines from blood product cells
- occurs within 0-6 h of transfusion
- risk per unit of blood is 1 in 100 (minor), 1 in 10,000 to 40,000 (severe)
- presents with fever ± rigors, facial flushing, headache, myalgia, hypotension
- treatment
  - rule out hemolytic reaction or infection
  - if temperature <38°C, continue with transfusion but decrease rate and give antipyretics
  - if temperature >38°C, stop transfusion, give antipyretics and anti-histamine

#### Allergic Nonhemolytic Transfusion Reactions

- alloantibodies (IgE) to proteins in donor plasma result in mast cell activation and release of histamine
- occurs mainly in those with history of multiple transfusions or multiparous women
- risk per unit of blood is 1 in 100
- presents mainly as urticaria and occasionally with fever
- can present as anaphylactoid reaction with bronchospasm, laryngeal edema and hypotension, but this occurs mainly in IgA deficient patients that have anti-IgA antibodies
- treatment
  - mild: slow transfusion rate and give diphenhydramine
  - moderate to severe: stop transfusion, give IV diphenhydramine, steroids, epinephrine, IV fluids and bronchodilators

#### Transfusion-Related Acute Lung Injury (TRALI)

- new-onset acute lung injury that occurs during transfusion or within 6 h of transfusion completion
  - insidious, acute onset of pulmonary insufficiency
  - profound hypoxemia ( $\text{PaO}_2/\text{FiO}_2 < 300$  mmHg)
  - bilateral pulmonary edema on CXR
  - pulmonary artery wedge pressure <18 mmHg
  - no clinical evidence of left atrial hypertension
- pathogenesis uncertain; perhaps due to binding of donor antibodies to WBC of recipient and release of mediators that increase capillary permeability in the lungs
- typically occurs 2-4 h post transfusion and resolves in 24-72 h
- risk per unit of blood is 1:10,000
  - is currently the leading cause of transfusion-related morbidity and mortality
- treatment: supportive therapy (oxygen)
- inform blood bank; patient and donor testing will be arranged

#### DDx of Post-Transfusion Fever:

- Acute hemolytic transfusion reaction
- Febrile non-hemolytic transfusion reaction
- Bacterial contamination
- Allergy

#### DDx of Post-Transfusion Dyspnea:

- Circulatory overload (TACO)
- Transfusion-related acute lung injury (TRALI)
- Allergy (bronchospasm/anaphylaxis)

**NONIMMUNE****Bacterial Infection**

- Gram positive: *S. aureus*, *S. epidermidis*, *Bacillus cereus*
- Gram negative: *Klebsiella*, *Serratia*, *Pseudomonas*, *Yersinia*
- overall risk is 1 in 100,000 for RBC and 1 in 10,000 for platelets
- never store blood >4 h after bag has left blood bank
- treatment: stop transfusion, blood cultures, IV antibiotics, fluids

**Transfusion Associated Circulatory Overload (TACO)**

- due to impaired cardiac function and/or excessive rapid transfusion
- presents as dyspnea, orthopnea, hypotension, tachycardia, crackles at base of lung and increased venous pressure
- incidence is 1 in 700
- treatment: transfuse at lower rate, give diuretics and oxygen

**Hyperkalemia**

- due to K<sup>+</sup> release from stored RBC
- risk increases with storage time and if blood is irradiated
- decreased risk if given fresh blood
- occurs in 5% of massively transfused patients
- treatment: see [Nephrology](#), NP13

**Citrate Toxicity**

- occurs with massive transfusion in patients with liver disease – patients are unable to clear citrate from blood
- citrate binds to Ca<sup>2+</sup> and causes signs and symptoms of hypocalcemia
- treatment: IV calcium gluconate (10 mL of 10%) for every 2 units of blood

**Dilutional Coagulopathy**

- occurs with massive transfusion (>10 units)
- pRBC contains no clotting factors, fibrinogen, cryoprecipitate or platelets
- treatment: FP, platelets and cryoprecipitate

## Delayed Blood Transfusion Reactions

**IMMUNE****Delayed Hemolytic**

- due to alloantibodies to minor antigens such as Rh, Kell, Duffy, and Kidd
- level of antibody at time of transfusion is too low to cause hemolysis; later the level of antibody increases due to secondary stimulus and causes extravascular hemolysis
- occurs 5-7 d after transfusion
- presents as anemia and mild jaundice
- treatment: no specific treatment required; important to note for future transfusion

**Transfusion-Associated Graft Versus Host Disease (GVHD)**

- transfused T-lymphocytes recognize and react against “host” (recipient)
- occurs 4-30 d following transfusion
- most patients already have severely impaired immune systems (e.g. Hodgkin lymphoma or leukemia)
- presents as fever, diarrhea, liver function abnormalities and pancytopenia
- can be prevented by giving irradiated blood products

**NONIMMUNE****Iron Overload**

- due to repeated transfusions over long period of time (e.g.  $\beta$ -thalassemia major)
- can cause secondary hemochromatosis
- treatment: iron chelators or phlebotomy if not longer requiring blood transfusion and not anemic

**Viral Infection Risk**

- HBV <1 in 153,000
- Human T-lymphotropic virus (HTLV) <1 in 4,300,000
- HCV <1 in 2,300,000
- HIV <1 in 7,000,000
- other infections include EBV, CMV, WNV (West Nile virus)

# Common Medications

## Antiplatelet Therapy

- see Figure 12a, *Platelet Activation Cascade*, H24

Figure 16. Mechanisms of action of antiplatelet therapy

Table 38. Antiplatelet Therapy

	Mechanism of Action	Dose/Route of Administration	Onset/Peak/Duration	Specific Side Effects	Remarks
Aspirin® (ASA)	Irreversibly acetylates COX, inhibiting TXA <sub>2</sub> synthesis, thus inhibiting platelet aggregation	Single loading 200-300 mg PO, followed by dose of 75-100 mg PO daily	Onset: 5-30 min Peak: 0.25-3 h Duration: 3-6 h	GI ulcer/bleeding Tinnitus Bronchospasm Angioedema Reye's syndrome in pediatric patients	Indicated for stroke/MI prophylaxis Reduce incidence of recurrent MI Decrease mortality in post-MI patients Contraindicated in patients with GI ulcers
Aggrenox® (ASA + dipyridamole)	Dipyridamole increases intracellular cAMP levels, which inhibits TXA <sub>2</sub> synthesis, leading to decreased platelet aggregation	1 capsule PO bid	Peak: 75 min	Headache Dyspepsia Nausea/vomiting Abdominal pain Cardiac failure Hemorrhoids	More effective than ASA in secondary prevention of stroke Dipyridamole potentiates antiplatelet action of ASA
Clopidogrel (Plavix®)	Inhibit ADP binding to platelets, thus decreased platelet aggregation	75-300 mg PO daily	Onset: 2 h Peak: 1 h	URI Chest pain Headache Flu-like syndrome Depression UTI GI hemorrhage Pancytopenia May cause TTP	Prevention of cardiovascular events in high-risk patients CYP2C19 poor metabolizers have diminished response to clopidogrel Caution with hepatic/renal impairment
Glycoprotein IIb/IIIa inhibitors [Reopro® (abciximab), Integrelin® (epti)]	Blocking GP II/IIIa receptor inhibits fibrinogen and vWF binding, leading to decreased platelet aggregation	Variable IV	Variable	Hypotension Back pain Nausea/vomiting Chest pain Abdo pain Thrombocytopenia	Used most commonly in cardiac catheterization Contraindicated in PUD Monitoring aPTT/activated clotting time

### Antiplatelet/Anticoagulation and Pregnancy

#### Class A:

- None

#### Class B:

- Argatroban
- Fondaparinux
- Clopidogrel
- LMWH

#### Class C:

- ASA (1st and 2nd trimesters)
- Heparin
- Dabigatran
- Abciximab
- Rivaroxaban

#### Class D:

- ASA (in 3rd trimester)
- Aggrenox
- Warfarin (warfarin embryopathy)

#### Class E:

- None

## Anticoagulant Therapy

**Table 39. Anticoagulant Therapy**

	Mechanism of Action	Dose/Route of Administration	Onset/Peak/Duration	Reversing Agent	Monitoring	Specific Side Effects	Remarks
Heparin	Accelerates activity of antithrombin	As per hospital nomogram	Onset: 20-60 min Peak: 2-4 h	Protamine sulphate	aPTT (intrinsic pathway), UFH (anti-Xa) levels	Hemorrhage HIT Increased liver enzymes	Pregnancy: safe (does not cross placenta)
Warfarin	Vitamin K antagonist: inhibits production of II, VII, IX, X, proteins C and S	Individualized dosing by monitoring PT/INR PO	Onset: 36-48 h Peak: 1.5-3 d	IV vitamin K PCC FFP	PT/INR maintain 2-3 (2.5-3.5 for mechanical valves)	Hemorrhage Cholesterol embolism syndrome Intraocular hemorrhage	Pregnancy: not used, can cross placenta (teratogenic)
LMWH (enoxaparin, dalteparin, tinzaparin)	Inhibits FXa	Variable SC/IV	Onset: 3-5 h Peak: 3-5 h Duration: 12 h	Partial reversibility with protamine sulphate	FXa in pediatrics, pregnancy and weight > 150 kg	Hemorrhage Fever Increased liver enzymes <1% HIT	Increased bioavailability than heparin Can accumulate in patients low CrCl (<30)
Fondaparinux	Selective inhibitor of FXa	Variable SC daily	Onset: 2 h Peak: 2-3 h	Not reversible	None	Anemia Fever Nausea Rash	Heparin analogue Contraindicated in renal failure
Rivaroxaban	Anti-FXa	PO	Peak: 2-4 h	Not reversible	None	Syncope GI hemorrhage	Only indicated in treatment of acute VTE (not in cancer patients), and thromboprophylaxis in orthopedic patients
Argatroban	Direct thrombin inhibitor	Variable IV	Onset: 5-10 min Duration: 20-40 min	Not reversible	aPTT	Dyspnea Hypotension Fever	Indicated for HIT, renal failure, unstable patients
Dabigatran	Direct thrombin inhibitor	150 mg PO bid	Peak: 1 h	Not reversible	None (prolonged aPTT can suggest residual drug on board)	GI upset Dyspepsia	Only indicated for AFib in Canada Contraindicated in renal failure, cancer patients, mechanical heart valves

### Adverse Reactions of Heparin

- hemorrhage: depends on dose, age, and concomitant use of antiplatelet agents or thrombolytics
- heparin-induced thrombocytopenia: associated with venous or arterial thrombosis (see Table 22, H27)
- osteoporosis: with long term use

### Low Molecular Weight Heparin (enoxaparin, dalteparin, tinzaparin)

- increased bioavailability compared to normal heparin
- increased duration of action
- SC route of administration
- do not need to monitor aPTT
- adverse reactions less common than UFH
- patients with renal failure (CrCl <30) can accumulate LMWH, therefore must adjust dose
- only partially reversible with protamine sulphate

**Table 40. Recommended Therapeutic INR Ranges of Common Indications for Oral Anticoagulant Therapy**

Indication	INR Range
Prophylaxis of venous thrombosis (high-risk surgery)	2.0-3.0
Treatment of venous thrombosis	
Most cases of thrombosis with antiphospholipid antibody syndrome	
Treatment of pulmonary embolism	
Prevention of systemic embolism	
Tissue heart valves	
AMI (to prevent systemic embolism)	
Valvular heart disease	
Atrial fibrillation	
Bileaflet mechanical valve in aortic position	
Mechanical prosthetic mitral valves (high risk)	2.5-3.5
Prophylaxis of recurrent myocardial infarction	

AMI = acute myocardial infarction

#### Dabigatran versus Warfarin in Patients with Atrial Fibrillation

*NEMJ* 2009;361:1139-1151

**Study:** Non-inferiority trial with 2-yr follow-up.

**Methods:** Random assignment of 18,113 patients with atrial fibrillation and risk of stroke to fixed doses of dabigatran (blinded, 110 mg or 150 mg bid) or adjusted-dose warfarin (unblinded). Primary outcome was stroke or systemic embolism.

**Results:** The warfarin, dabigatran 110 mg, and dabigatran groups showed the following rates: 1) stroke or systemic embolism was 1.69%, 1.53%, and 1.11% per year respectively, 2) major bleeding was 3.36%, 2.71%, and 3.11% per year respectively, 3) hemorrhagic stroke was 0.38%, 0.12%, 0.10% per year respectively ( $p < 0.001$ ), 4) mortality was 4.13%, 3.75%, and 3.64% respectively.

**Conclusions:** In patients with atrial fibrillation, dabigatran 110 mg was similar to warfarin in rates of stroke and systemic embolism but had lower rates of major hemorrhage. Dabigatran 150 mg, as compared with warfarin, was associated with lower rates of stroke and systemic embolism but similar rates of major hemorrhage.

**Table 41. Recommended Management of a Supratherapeutic INR**

INR	Bleeding Present	Recommended Action
>Therapeutic to 4.5	No	Lower warfarin dose, <b>OR</b> Omit a dose and resume warfarin at a lower dose when INR is in therapeutic range, <b>OR</b> No dose reduction needed if INR is minimally prolonged
>4.5 to 10.0	No	Omit the next 1 to 2 doses of warfarin, monitor INR more frequently and resume treatment at a lower dose when INR is in therapeutic range, <b>OR</b> Omit a dose and administer 1 to 2.5 mg oral vit K in patients with increased risk of bleeding
>10.0	No	Hold warfarin and administer 5 to 10 mg oral vit K. Monitor INR more frequently and administer more vit K as needed. Resume warfarin at a lower dose when INR is in therapeutic range
Any	Serious or life threatening	Hold warfarin and administer 10 mg vit K by slow IV infusion; supplement with four-factor prothrombin complex concentrate. Monitor and repeat as needed

## Chemotherapeutic and Biologic Agents Used in Oncology

**Table 42. Selected Chemotherapeutic and Biologic Agents**

Class	Example	Mechanism of Action or Target
<b>Alkylating Agent</b>	<ul style="list-style-type: none"> <li>chlorambucil, cyclophosphamide, melphalan (nitrogen mustards)</li> <li>carboplatin, cisplatin</li> <li>dacarbazine, procarbazine</li> <li>busulfan</li> </ul>	Damage DNA via alkylation of base pairs Leads to cross-linking of bases, abnormal base-pairing, DNA breakage
<b>Antimetabolites</b>	<ul style="list-style-type: none"> <li>methotrexate (folic acid antagonist)</li> <li>6-mercaptopurine, fludarabine (purine antagonist)</li> <li>5-fluorouracil (5-FU) (pyrimidine antagonist)</li> <li>hydroxyurea</li> <li>cytarabine</li> </ul>	Inhibit DNA synthesis
<b>Antibiotics</b>	<ul style="list-style-type: none"> <li>adriamycin (anthracycline)</li> <li>bleomycin</li> <li>mitomycin C</li> <li>daunorubicin</li> </ul>	Interfere with DNA and RNA synthesis
<b>Taxanes</b>	<ul style="list-style-type: none"> <li>paclitaxel</li> <li>docetaxel</li> </ul>	Stabilize microtubules against breakdown once cell division complete
<b>Vinca-alkaloids</b>	<ul style="list-style-type: none"> <li>vinblastine</li> <li>vincristine</li> <li>vinorelbine</li> </ul>	Inhibit microtubule assembly (mitotic spindles), blocking cell division
<b>Topoisomerase Inhibitors</b>	<ul style="list-style-type: none"> <li>irinotecan, topotecan (topo I)</li> <li>etoposide (topo II)</li> </ul>	Interfere with DNA unwinding necessary for normal replication and transcription
<b>Steroids</b>	<ul style="list-style-type: none"> <li>prednisone</li> <li>dexamethasone</li> </ul>	Immunosuppression
<b>Monoclonal Antibodies</b>	<ul style="list-style-type: none"> <li>trastuzumab (Herceptin®)</li> <li>bevacizumab (Avastin®)</li> <li>rituximab (Rituxan®)</li> <li>cetuximab (Erbix®)</li> </ul>	HER2 VEGF CD20 EGFR
<b>Small Molecule Inhibitors</b>	<ul style="list-style-type: none"> <li>imatinib mesylate (Gleevec®)</li> <li>dasatinib</li> <li>nilotinib</li> <li>erlotinib (Tarceva®)</li> <li>gefitinib (Iressa®)</li> <li>bortezomib (Velcade®)</li> <li>sunitinib (Sutent®)</li> </ul>	<i>Bcr-Abl</i> <i>Bcr-Abl</i> <i>Bcr-Abl</i> EGFR EGFR 26S proteasome VEGFR, PDGFR

## Landmark Hematology Trials

Trial	Reference	Results
AZA-001	<i>Lancet Oncol</i> 2009; 10:223-32	Azacitidine increases overall survival in higher-risk myelodysplastic syndrome than conventional care
CHOP	<i>NEJM</i> 1993; 328:1002-6	In NHL, CHOP has lowest incidence of fatal toxic reactions and shows no significant difference from 3 other regimens in response or disease-free/overall survival. CHOP is the standard for advanced NHL
CLL8	<i>Lancet</i> 2010; 376:1164-74	Rituximab plus fludarabine and cyclophosphamide (FCR) improves progression-free and overall survival compared with fludarabine and cyclophosphamide alone (FC) in the treatment of CLL
CLOT	<i>NEJM</i> 2003; 349:146-53	In patients with cancer and acute venous thromboembolism, LWMH was more effective than warfarin in reducing the risk of recurrent thromboembolism without increasing the risk of bleeding
CML: Imatinib vs. IFN + Cytarabine	<i>NEJM</i> 2003; 348:994-1004	In patients with chronic-phase CML, imatinib was more effective than IFN $\alpha$ + cytarabine in inducing cytogenetic response and freedom from progression to accelerated phase/blast crisis
Dabigatran versus warfarin in VTE	<i>NEJM</i> 2009; 361:2342-52	In the treatment of venous thromboembolism, dabigatran is as effective as warfarin and also has a similar safety profile. Note: many problems in the trial, making it less pivotal in having drug approval
Dose of platelet transfusion	<i>NEJM</i> 2010; 362:600-13	Low dose prophylactic platelet transfusion decreases total number of platelets transfused but increases number of transfusions but not incidence of bleeding in patients with hypoproliferative thrombocytopenia
ESPIRIT	<i>Lancet</i> 2006; 367:1665-73	ASA plus dipyridamole is recommended over ASA alone as antithrombotic therapy after cerebral ischemia of arterial origin
Hodgkin Lymphoma: ABVD vs. MOPP	<i>NEJM</i> 1992; 327:1478-84	In Hodgkin lymphoma, ABVD regimen has equal failure-free and overall survival to MOPP + ABVD, but less myelotoxicity. ABVD is standard chemotherapy for Hodgkin lymphoma
ITP: Dexamethasone	<i>NEJM</i> 2003; 349:831-6	A four-day course of high-dose dexamethasone is effective initial therapy for adults with immune thrombocytopenic purpura
MInT Group	<i>Lancet Oncol</i> 2011; 12:1013-1022	Rituximab added to CHOP-like chemotherapy improved long-term outcomes for young patients with good-prognosis DLBCL
MSH	<i>NEJM</i> 1995; 332:1317-22	Hydroxyurea is effective in reduction of complications and clinical manifestations of sickle cell disease
Platelet transfusion threshold	<i>NEJM</i> 1997; 337:1870-5	The risk of major bleeding in patients with AML undergoing induction chemotherapy was similar whether the platelet-transfusion threshold was set at 20 or 10. Use of the lower threshold reduced platelet usage by 21.5 percent
PT1	<i>NEJM</i> 2005; 353:85-6	Hydroxyurea plus low-dose ASA is superior to anagrelide plus low-dose ASA for patients with essential thrombocythemia at high risk for vascular events
R-CHOP	<i>NEJM</i> 2002; 346:235-42	Addition of rituximab to CHOP increases complete response rate and prolongs event-free survival and overall survival in elderly with DLBCL
Therapeutic platelet transfusion	<i>Lancet</i> 2012; 380:1309-16	Therapeutic platelet transfusions (when bleeding occurs) may be used if severe bleeding can be identified early in autologous stem-cell transplant patients. Prophylactic transfusion (when platelets <10) should remain standard of care in AML patients
TRICC	<i>NEJM</i> 1999; 340:409-17	A restrictive strategy of red-cell transfusion (when Hb <70) is at least as effective as and possibly superior to a liberal transfusion strategy (when Hb <100) in ICU patients; one possible exception is patients with an acute MI or unstable angina
VISTA	<i>JCO</i> 2010; 28:2259-66	Bortezomib plus melphalan and prednisone (MPV) is superior to melphalan and prednisone (MP) in overall survival of non-transplant-eligible multiple myeloma patients

EIEC	enteroinvasive <i>E. coli</i>								

## Principles of Microbiology

### Bacteriology

#### Bacteria Basics

- bacteria are prokaryotic cells that divide asexually by binary fission
- chromosomal or plasmid DNA may be shared between bacteria through conjugation, transformation or transduction
- Gram stain divides most bacteria into two groups based on cell wall
  - Gram positive (GP): thick, rigid layer of peptidoglycan
  - Gram negative (GN): thin peptidoglycan layer + thicker outer membrane composed of lipoproteins and lipopolysaccharides
  - clinical significance: GN thick outer membrane makes it resistant to penicillin's attack
- acid-fast bacilli: "acid-fast" due to high mycolic acid content in cell wall, e.g. *Mycobacteria*, *Nocardia*
- "atypical" bacteria: not seen on Gram stain and difficult to culture
  - obligate intracellular bacteria: e.g. *Chlamydia*
  - bacteria lacking cell wall: e.g. *Mycoplasma*
  - spirochetes: e.g. *Treponema pallidum*
- O<sub>2</sub> can be either vital or detrimental to growth
  - obligate aerobes: require O<sub>2</sub>
  - obligate anaerobes: require environment without O<sub>2</sub>
  - facultative anaerobes: can survive in environments with or without O<sub>2</sub>

#### Mechanisms of Bacterial Disease

- adherence to and colonization of skin or mucous membranes
  - e.g. fimbriae (pili): microfilaments extending through the cell wall – like burrs sticking to your clothes, they attach to epithelial cells e.g. *E. coli* in the urinary tract
- invasion or crossing normal epithelial barriers
- evasion of host defense system through inhibition of:
  - phagocytic uptake: polysaccharide capsule (*S. pneumoniae*, *N. meningitidis*, *H. influenzae*) or surface proteins (*Staphylococcus*, *Streptococcus*)
- toxin production
  - exotoxins are secreted by living pathogenic bacteria and cause disease even if the bacteria is not present (e.g. *Clostridium*)
  - endotoxins are structural components of GN bacterial cell wall, and may be shed by live cells or released during cell lysis
- intracellular growth
  - obligate intracellular: *Rickettsia* and *Chlamydia*
  - facultative intracellular: *Salmonella*, *Neisseria*, *Brucella*, *Mycobacteria*, *Listeria*, *Legionella*
- biofilm
  - an extracellular polysaccharide network forming mesh around the bacteria (e.g. *S. epidermidis*) which can coat prosthetic devices like IV catheters

Gram positive bacteria have thick peptidoglycan layers.

© Paul Kelly 2011

Table 2. Commensal Flora

Site	Organisms
<b>Skin</b>	Coagulase-negative staphylococci, <i>Corynebacteria</i> , <i>Propionibacterium acnes</i> , <i>Bacillus</i> , <i>S. aureus</i>
<b>Oropharynx</b>	Viridans group streptococci, <i>Haemophilus</i> , <i>Neisseria</i> , anaerobes ( <i>Peptostreptococcus</i> , <i>Bacteroides</i> , <i>Veillonella</i> , <i>Fusobacterium</i> , <i>Actinomyces</i> , <i>Prevotella</i> )
<b>Small bowel</b>	<i>E. coli</i> , anaerobes (low numbers)
<b>Colon</b>	<i>E. coli</i> , <i>Klebsiella</i> , <i>Enterobacter</i> , <i>Enterococcus</i> , anaerobes ( <i>Bacteroides</i> , <i>Peptostreptococcus</i> , <i>Clostridium</i> )
<b>Vagina</b>	<i>Lactobacillus acidophilus</i> , Viridans group streptococci, coagulase-negative staphylococci, facultative GN bacilli, anaerobes

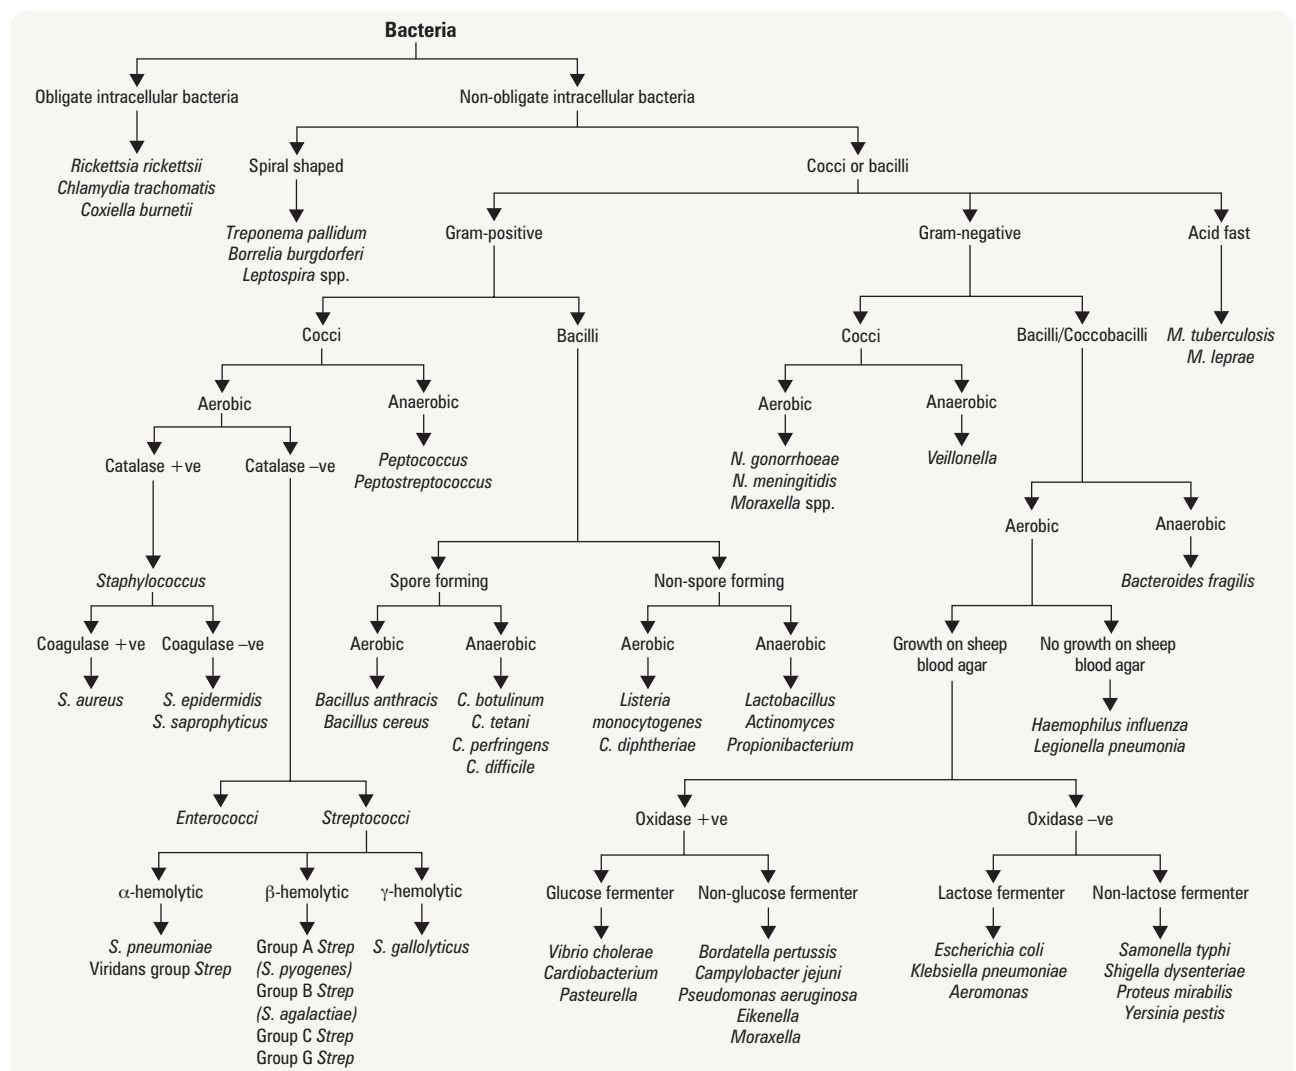

Figure 2. Laboratory identification of bacterial species

## Virology

### Viral Basics

- viruses are infectious particles consisting of RNA or DNA covered by a protein coat
  - infect cells and use host metabolic machinery to replicate
  - nucleic acid can be double stranded (ds) or single stranded (ss)
  - can be enveloped or naked
- virions are mature virus particles that can be released into the extracellular environment
- host susceptibility is governed by the host cell and virus surface proteins (viral tropism) and cellular immunity

### Viral Disease Patterns

- acute infections (e.g. adenovirus)
  - host cells are lysed in the process of virion release
  - some produce acute infections with late sequelae (e.g. measles virus → subacute sclerosing panencephalitis)
- chronic infections (>6 mo): (e.g. HBV, HIV)
  - host cell machinery is used to produce and chronically release virions
- latent infections
  - viral genome remains latent in host cell nucleus
  - can reactivate (e.g. HSV, VZV)

**Table 3. Common Viruses**

Nucleic Acid	Enveloped	Virus Family	Major Viruses	Medical Importance
dsDNA	N	<i>Adenoviridae</i>	Adenovirus	URTI Conjunctivitis Gastroenteritis
	N	<i>Papillomaviridae</i>	HPV1,4 HPV6,11 HPV16,18, etc.	Plantar warts Genital warts Cervical/anal dysplasia and cancer
	Y	<i>Herpesviridae</i>	HHV1=HSV1 HHV2=HSV2 HHV3=VZV HHV4=EBV HHV5=CMV HHV6* HHV8=KSHV	Oral, ocular and genital herpes; encephalitis Genital, oral and ocular herpes; encephalitis Chicken pox, shingles Mononucleosis, viral hepatitis Retinitis, pneumonitis, hepatitis, encephalitis Roseola Kaposi's sarcoma, multicentric Castleman's disease, body cavity lymphoma
	N	<i>Polyomaviridae</i>	JC virus	Progressive multifocal leukoencephalopathy
	Y	<i>Hepadnaviridae</i> <i>Poxviridae</i>	Hepatitis B Variola	Hepatitis Smallpox
ssDNA	N	<i>Parvoviridae</i>	Parvovirus B19	Erythema infectiosum (Fifth disease)
(+)ssRNA	N	<i>Caliciviridae</i>	Norwalk Hepatitis E	Gastroenteritis Acute hepatitis

## Mycology

### Fungal Basics

- fungi are eukaryotic organisms
  1. yeast (unicellular)
  2. molds (also known as filamentous fungi) (multicellular with hyphae)
  3. dimorphic fungi (found as mold at room temperature but grow as yeast-like forms at body temperature)

Table 4.

	Membrane Sterol	Cell wall
<b>Bacteria</b>	–	Peptidoglycan
<b>Human Cell</b>	Cholesterol	–
<b>Fungi</b>	Ergosterol	Chitin (complex glycopolysaccharide)

### Mechanisms of Fungal Disease

- primary fungal infection by:
  - overgrowth of normal flora (e.g. *Candida* species)
  - inhalation of fungal spores
  - traumatic inoculation into skin
- toxins produced by fungi (e.g. ingestion aflatoxins)
- allergic reaction to fungi (e.g. bronchopulmonary aspergillosis)

Figure 4. Common fungus morphology

## Parasitology

### Parasite Basics

- parasite: an organism that lives in or on another organism (host) and damages the host in the process
- parasites with complex life cycle requires more than one host to reproduce
  - reservoir host: maintains a parasite and may be the source for human infection
  - intermediate host: maintains the asexual stage of a parasite or allows development of the parasite to proceed to the larval stage
  - definitive host: allows the parasite to develop to the adult stage where reproduction occurs
- 2 major groups of parasites: protozoa and helminths
- see Tables 21 and 22 for examples of clinically important parasites

Table 5. Differences Between Protozoa and Helminths

Protozoa	Helminths
Unicellular	Multicellular
Motile trophozoite → inactive cyst	Adult → egg → larva
Multiplication	No multiplication
± Eosinophilia	Eosinophilia (proportional to extent of tissue invasion)*
Indefinite life span	Definite life span

\*Adult ascaris (roundworm) does not cause eosinophilia

### Characteristics of Parasitic Disease

- spectrum of disease ranging from asymptomatic to severe illness
- symptoms are usually proportional to parasite burden
- tissue damage is due to the parasite and host immune response
- chronic infections may occur with or without overt disease
- immunocompromised hosts are more susceptible to manifestations of infection, reactivation of latent infections, and more severe disease
- eosinophilia may suggest a parasitic infection

### Mechanisms of Parasitic Disease

1. mechanical obstruction (e.g. ascariasis, clonorchiasis)
2. competition with host for resources (e.g. anemia in hookworm disease, vitamin B<sub>12</sub> deficiency in diphyllorhiosis)
3. cytotoxicity leading to abscesses and ulcers (e.g. amoebiasis, leishmaniasis)
4. inflammatory
  - acute hypersensitivity (e.g. pneumonitis in Loeffler's syndrome)
  - delayed hypersensitivity (e.g. egg granulomas in schistosomiasis)
  - cytokine-mediated (systemic illness of malaria, disseminated strongyloidiasis)
5. immune-mediated injury
  - autoimmune (e.g. myocarditis of Chagas disease, tissue destruction of mucocutaneous leishmaniasis)
  - immune complex (e.g. nephritis of malaria, schistosomiasis)

Figure 5. Classification of protozoa based on movement

Parasite sampling may need to be repeated on a number of occasions before infection can be ruled out.

## Transmission of Infectious Diseases

Table 6. Mechanism of Transmission

Mechanism	Mode of Transmission	Examples	Preventative Measure*
<b>Contact</b>	Direct physical contact, or indirect contact with a fomite.	Person-to-person (MRSA) Sexual ( <i>N. gonorrhoeae</i> , <i>C. trachomatis</i> , HSV, HIV) Blood-borne (HIV, HBV, HCV)	For patients in health care facilities: Contact precautions (see <i>Prevention of Infectious Diseases</i> below) Barrier precautions Safe needlestick/sharp practices
<b>Droplet/Contact</b>	Respiratory droplets (>5 µm) can be projected short distances (≤2 m) and deposit on mucosal surfaces of the recipient (e.g. by coughing, sneezing, or talking); transmission can also occur by direct physical contact of respiratory fluids or indirect contact with a fomite contaminated with respiratory fluids	Influenza, mumps <i>N. meningitidis</i> , <i>Bordetella pertussis</i>	For patients in health care facilities: Contact/droplet precautions (see <i>Prevention of Infectious Diseases</i> below)
<b>Airborne</b>	Airborne droplet nuclei (<5 µm) remain infectious over time and distance.	<i>M. tuberculosis</i> , VZV, measles	For patients in health care facilities: Airborne precautions (see <i>Prevention of Infectious Diseases</i> below)
<b>Food/Waterborne</b>	Ingestion of contaminated food or water	<i>V. cholerae</i> , <i>Salmonella</i> , HAV, HEV	Prophylactic vaccinations where available Ensure clean food/water supply For patients in health care facilities: Contact precautions used for admitted patients with fecal incontinence when stool is unable to be contained in diapers
<b>Zoonotic</b>	Disease transmission from animals to humans either directly or via an insect vector	Animals (rabies, Q fever) Arthropods (malaria, Lyme disease)	Prophylactic medications, vaccinations Protective clothing, insect repellent, mosquito nets, tick inspection
<b>Vertical</b>	Spread of disease from parent to offspring	Congenital syndromes (TORCH infections) Perinatal (HIV, HBV, GBS)	Prenatal screening Prophylactic treatment

\*see *Prevention of Infectious Diseases* for further detail

## Prevention of Infectious Diseases

### Overview

- efforts to control the spread of infectious disease involves **infection control and prevention measures** in health care settings and **public health measures** outside of health care settings

### Infection Control and Prevention Measures

- surveillance for important nosocomial infections or problem organisms (e.g. surgical site infections, vascular access-related infections, *C. difficile* infections, colonization or infections due to antimicrobial resistant organisms (e.g. methicillin-resistant *S. aureus*) (see [Population and Community Health](#), PH19 for a definition of active vs. passive surveillance)
- routine practices (also known as standard precautions) used for all patients
  - perform hand hygiene before and after seeing patient or patient environment contact, before aseptic procedures, and after body fluid exposure
  - use gloves for any encounter with body fluids
  - wear eye protection, mask, and gown for any procedures likely to generate splashes of body fluids
  - do not recap sharps by hand and dispose of sharps in puncture-resistant container near point-of-use
  - use mouthpieces for resuscitator bags instead of using mouth-to-mouth resuscitation
  - discard soiled waste properly
  - assure routine cleaning and disinfection of patient environment and patient care equipment
- additional precautions used for various syndromes or known infectious diseases
  - contact precautions (private room, gown, gloves to be used routinely) (e.g. used for patients with *C. difficile*)
  - droplet/contact precautions (private room, gown, gloves, eye protection, fluid-resistant mask) (e.g. used for influenza, meningitis due to *Neisseria meningitidis*)
  - airborne precautions (negative-pressure private room with door closed, fit-tested N95 respirator) (e.g. used for TB, measles, VZV)

- decolonization [e.g. topical and oral antimicrobials be used in an attempt to decolonize methicillin-resistant *S. aureus* (MRSA)]
- outbreak investigations (see [Population and Community Health](#), PH18)

### Public Health Measures

- vaccination
- post-exposure prophylaxis (e.g. use of immunoglobulin or vaccination post-exposure to infectious disease agents in an attempt to reduce the likelihood or severity of disease)
- reportable diseases (e.g. list of reportable communicable diseases that physicians are legally required to report to local public health officials) (see [Population and Community Health](#), PH25)
- contact tracing (tracking of individuals who have been exposed to a person with a communicable disease during its period of communicability)
- quarantine (restriction of the activities of well persons who have been exposed to a person with a communicable disease during its period of communicability to prevent disease transmission during the incubation period if infection should occur)
- outbreak investigation (see [Population and Community Health](#), PH18)

## Nosocomial Infections

- definition: infections acquired >48 h after admission to a health care facility or within 30 d from discharge
- risk factors: prolonged hospital stay, antibiotic use, surgery, hemodialysis, intensive care, colonization with a resistant organism, immunodeficiency
- patients with nosocomial infections have higher mortality, longer hospital stays, and higher health-care costs
- hand hygiene is an essential precaution

**Table 7. Common Nosocomial Infectious Agents**

Bacteria	Characteristics	Manifestation	Investigations	Management
<b>Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA)</b>	Gram-positive cocci	Skin and soft tissue infection Bacteremia Pneumonia Endocarditis Osteomyelitis	Admission screening culture from nares and peri-anal region identifies colonization Culture of infection site CXR	Contact precautions For infection: vancomycin or daptomycin To decolonize: 2% chlorhexidine wash OD (+ rifampin + doxycycline + mupirocin cream bid to nares) x 7 d
<b>Vancomycin-resistant <i>Enterococcus</i> (VRE)</b>	Majority are <i>E. faecium</i> Resistant if minimum inhibitory concentration of vancomycin is $\geq 32$ $\mu\text{g/mL}$	Rarely causes disease in healthy people UTI Bacteremia Endocarditis Meningitis	Rectal or perirectal swab OR stool culture for colonization Culture of infected site	Contact precautions Ampicillin if susceptible Otherwise, linezolid, tigecycline, or daptomycin depending on site of infection No effective decolonization methods identified
<b><i>Clostridium difficile</i> (C. difficile)</b>	Releases exotoxins A and B Hypervirulent strain has been responsible for increase in incidence and severity	Fever, nausea, abdo pain Watery diarrhea $\pm$ occult blood Pseudomembranous colitis Severe: toxic megacolon Risk of bowel perforation Associated with antibiotic use Leukocytosis	Stool PCR Stool immunoassay for toxins A and B AXR (may see colonic dilatation) Endoscopy (if suspect fulminant colitis)	Contact precautions Stop culprit antibiotic therapy Supportive therapy (IV fluids) Mild-moderate disease: metronidazole PO/IV x 10-14 d Severe disease: vancomycin PO x 10-14 d Toxic megacolon: metronidazole IV + vancomycin PO (as above) and general surgery consult
<b>Extended spectrum <math>\beta</math>-lactamases (ESBL e.g. <i>Escherichia coli</i>, <i>Klebsiella pneumoniae</i>)</b>	Resistant to most $\beta$ -lactam producing antibiotics e.g. penicillins, aztreonam and cephalosporins	UTI Pulmonary infection Bacteremia Liver abscess in susceptible patients Meningitis	Blood, sputum, urine, or aspirated body fluid culture Imaging at infection site (CXR, CT, U/S)	Droplet or contact precautions depending on site of infection and institutional policies Depending on culture and sensitivity results, carbapenems can be used for empiric therapy

# Respiratory Infections

## Pneumonia

- see [Pediatrics](#), P93
- see [Family Medicine](#), FM18

### Definition

- infection of the lung parenchyma

### Etiology and Risk Factors

- impaired lung defenses
  - poor cough/gag reflex (e.g. illness, drug-induced)
  - impaired mucociliary transport (e.g. smoking, cystic fibrosis)
  - immunosuppression (e.g. steroids, chemotherapy, AIDS/HIV, DM, transplant, cancer)
- increased risk of aspiration
  - impaired swallowing mechanism (e.g. impaired consciousness, neurologic illness causing dysphagia, mechanical obstruction)
- no organism identified in 75% of hospitalized cases, and >90% of ambulatory cases

**Table 8. Common Organisms in Pneumonia**

Community Acquired	Nosocomial	Aspiration	HIV-associated	Alcoholic
Typical Bacteria <i>Streptococcus pneumoniae</i> <i>Moraxella catarrhalis</i> <i>Haemophilus influenzae</i> <i>Staphylococcus aureus</i> GAS	Enteric GNB ( <i>E. coli</i> ) <i>Pseudomonas aeruginosa</i> <i>S. aureus</i> (including MRSA)	Oral anaerobes ( <i>Bacteroides</i> ) Enteric GNB ( <i>E. coli</i> ) <i>S. aureus</i> Gastric contents (chemical pneumonitis)	<i>Pneumocystis jirovecii</i> Fungi ( <i>Cryptococcus</i> ) <i>Nocardia</i> CMV HSV TB	<i>Klebsiella</i> Enteric GNB <i>S. aureus</i> Oral anaerobes (aspiration) TB
Atypical Bacteria <i>Mycoplasma pneumoniae</i> <i>Chlamydia pneumoniae</i> <i>Legionella pneumophila</i>				
Viral Influenza virus Adenovirus				

\*See [Pediatrics](#) P93, Table 45 for Common Causes and Treatment of Pneumonia at Different Ages

### Clinical Features

- cough ( $\pm$  sputum), fever, pleuritic chest pain, dyspnea, tachypnea, tachycardia
- elderly often present atypically; altered LOC is sometimes the only sign
- evidence of consolidation (dullness to percussion, bronchial breath sounds, crackles, increased fremitus, whisper pectoriloquy)
- features of parapneumonic effusion (decreased air entry, dullness to percussion, decreased fremitus) (see [Respirology](#), R21)
- complications: ARDS, lung abscess, parapneumonic effusion/empyema, pleuritis  $\pm$  hemorrhage

### Investigations

- pulse oximetry to assess severity of respiratory distress
- CBC and differential, electrolytes, urea, Cr, ABG (if respiratory distress), troponin/CK, LFTs, urinalysis
- sputum Gram stain/C&S, blood C&S,  $\pm$  serology/viral detection,  $\pm$  pleural fluid C&S (if effusion >5 cm or respiratory distress)
- CXR $\pm$ CT chest shows distribution (lobar consolidation or interstitial pattern), extent of infiltrate  $\pm$  cavitation
- bronchoscopy  $\pm$  washings for
  - (1) severely ill patients refractory to treatment or (2) immunocompromised patients

### Treatment

- ABC, O<sub>2</sub>, IV fluids, consider salbutamol (nebulized or MDI)
- determine prognosis and need for hospitalization and antibiotics

When *Klebsiella* causes pneumonia; see red currant jelly.

#### 3 As of *Klebsiella*

Aspiration pneumonia  
Alcoholics and diabetics  
Abscess in lungs

Aspiration pneumonias more commonly manifest as infiltrates in the right middle or lower lobes due to the larger caliber and more vertical orientation of the right bronchus.

Lobar Pneumonia

Bronchopneumonia

Interstitial Pneumonia

## Criteria for Hospitalization

**Table 9. CURB 65 Score – Pneumonia Clinical Prediction Tool**

Component	Measurement(s)	Points	Total Score	Mortality	Disposition
Confusion	Altered mental status	1	0-1	<5%	Can treat as outpatient
Urea/BUN	Urea >7 mmol or BUN >19	1	2-3	5-15%	Consider hospitalization
Respiratory Rate	>30 breaths/min	1	4-5	15-30%	Consider ICU
Blood Pressure	Systolic <90 or diastolic <60 mmHg	1			
Age	65 or older	1			

**Table 10. IDSA/ATS Community Acquired Pneumonia Treatment Guidelines 2007**

Setting	Circumstances	Treatment
Outpatient	Previously well No antibiotic use in last 3 mo	Macrolide <sup>1</sup> OR Doxycycline
	Comorbidities <sup>2</sup> Antibiotic use in last 3 mo (use different class)	Respiratory fluoroquinolone <sup>3</sup> OR $\beta$ -lactam <sup>4</sup> + Macrolide <sup>1</sup>
Inpatient	Ward	Respiratory fluoroquinolone <sup>3</sup> OR $\beta$ -lactam <sup>4</sup> + Macrolide <sup>1</sup>
	ICU	$\beta$ -lactam <sup>4</sup> + [Macrolide <sup>1</sup> OR Respiratory fluoroquinolone <sup>3</sup> ]

1. **Macrolide:** azithromycin, clarithromycin, erythromycin

2. **Comorbidities:** chronic heart, lung, liver or renal disease, DM, alcoholism, malignancy, asplenia, immunocompromised

3. **Respiratory fluoroquinolone:** moxifloxacin, gemifloxacin, levofloxacin

4.  **$\beta$ -lactam:** cefotaxime, ceftriaxone, ampicillin-sulbactam

IDSA: Infectious Diseases Society of America

ATS: American Thoracics Society

**Table 11. IDSA/ATS Hospital/Ventilator/Healthcare-Associated Pneumonia Treatment Guidelines 2005**

Setting	Treatment
No risk factors for multi-drug resistance (MDR) Early onset (<5 d)	ceftriaxone OR levofloxacin, moxifloxacin, or ciprofloxacin OR ampicillin/sulbactam OR ertapenem
Late onset disease ( $\geq 5$ d) or With risk factors for MDR: Antibiotic use in last 3 mo High frequency of antibiotic resistance in the community or in the specific hospital unit Hospitalization >1 d in past 3 mo Residence in a nursing home or extended care facility Dialysis within 30 d Home wound care Family member with multidrug-resistant pathogen Immunosuppressive disease and/or therapy	antipseudomonal cephalosporin (cefepime or ceftazidime) OR antipseudomonal carbapenem (imipenem or meropenem) OR $\beta$ -lactam/ $\beta$ -lactamase inhibitor (piperacillin/tazobactam) PLUS antipseudomonal fluoroquinolone (ciprofloxacin or levofloxacin) OR aminoglycoside (amikacin, gentamicin, or tobramycin) PLUS for MRSA linezolid or vancomycin PLUS for <i>Legionella</i> ensure regime includes either a macrolide or a fluoroquinolone

Note: Always use directed therapy against specific organism if one is found on culture (e.g. blood, sputum, etc.)

Note: These guidelines may be less applicable in Canada given lower rates of antibiotic resistance among common nosocomial pathogens

### Does this Adult Patient have Pneumonia?

#### From The Rational Clinical Examination

JAMA 2009; http://www.jamaevidence.com/content/3485708

**Study:** Systematic review of articles assessing the sensitivity and specificity of clinical exam maneuvers for the diagnosis of adult community acquired pneumonia.

**Results:** The presence of fever or Immunosuppression had a positive likelihood ratio (+LR) of 2, while a history of dementia had a +LR of 3; however, these traits are not confirmatory. The presence of an abnormality in any vital sign, including tachycardia, tachypnea or fever had a +LR ranging from 2-4, which was not significantly affected by different cut-points. The absence of vital sign abnormality had a -LR ranging from 0.5-0.8. The combination of respiratory rate <30/min, heart rate <100/min and temperature <37.8°C had a -LR of 0.18. Findings on chest exam raised the likelihood of diagnosis, but were uncommonly seen in studies. For example, presence of asymmetric respirations essentially confirmed the diagnosis, but was only present in 4% of patients. In patients with a clinical diagnosis, but normal radiograph, only ~10% will develop radiographic findings in 72 h.

**Conclusions:** Evidence suggests no single item on clinical history or physical exam is sufficient to rule in or out pneumonia without chest x-ray. Vital sign abnormalities were correlated with a diagnosis of pneumonia. Findings on chest exam significantly raised the likelihood of pneumonia, but were uncommonly seen in studies.

## Prevention

- Public Health Agency of Canada recommends the following:

- vaccine for influenza A and B recommended annually for all ages
- pneumococcal polysaccharide vaccine (Pneumovax®) recommended for all adults >65 yr and in younger patients 24 mo of age and older at high risk for invasive pneumococcal disease (e.g. functional or anatomic asplenia; congenital or acquired immunodeficiency)
- pneumococcal conjugate vaccine (Prevnar-13®) is recommended for all children <5 yr, and for children and adolescents at high risk for invasive pneumococcal disease who are 5-17 yr who have not previously received Prevnar-13® (CDC recommends giving Prevnar-13® to all adults at high risk for invasive pneumococcal disease)

## Influenza

### Definitions and Etiology

- influenza virus A and B
- influenza A further divided into subtypes based on envelope glycoproteins:
  - hemagglutinin (H) and neuraminidase (N)
- seasonal (epidemic) influenza
  - main circulating influenza viruses: human-origin A (H1N1) and B (H3N2) subtypes
  - associated with antigenic drift (gradual, minor changes due to random point mutations)
  - may create a new viral subtype resulting in a seasonal epidemic (disease prevalence is greater than expected)
  - outbreaks occur mainly during winter months (late December to early March)
- pandemic influenza
  - associated with antigenic shift (abrupt, major changes due to mixing of two different viral strains from different hosts)
  - may create a new viral strain resulting in a pandemic outbreak (worldwide)
  - antigenic shift occurs only in type A
- transmission: droplet, possibly airborne

**Table 12. Difference between Influenza Strains**

	Influenza A	Influenza B
Host(s)	Humans, Birds, Mammals	Humans only
Antigenic drift	Yes, new strains	Yes, new strains
Antigenic shift	Yes, new subtypes	No
Epidemics	Yes	Yes
Pandemics	Yes	No

### Clinical Features

- incubation period 1-4 d
- acute onset of systemic (fever, chills, myalgias, arthralgias, headache, fatigue) and respiratory symptoms (cough, dyspnea, pharyngitis)
- complications: respiratory (viral pneumonia, secondary bacterial pneumonia, otitis media, sinusitis), muscular (rhabdomyolysis, myositis), neurologic (encephalitis, meningitis, transverse myelitis, Guillain-Barré syndrome)

### Investigations

- diagnosis is primarily clinical based on symptoms during the influenza season
- nasopharyngeal swabs for rapid antigen detection, DFA (Direct Fluorescent Antigen detection), RT-PCR (gold standard)
- serology: rarely used for clinical management

### Treatment and Prevention

- primarily supportive unless severe infection or high-risk of complications (e.g. elderly, pulmonary or cardiac disease)
- neuraminidase inhibitors: zanamivir (Relenza®) and oseltamivir (Tamiflu®) for treatment and prophylaxis against type A and B
  - decreases duration (by 1-2 d) and severity of symptoms if given within <48 h of onset
  - treatment beyond 48 h time window may be warranted in immunosuppressed and critically ill patients
- M2-inhibitors: amantidine/rimantidine for treatment and prophylaxis against type A only no longer recommended due to increased resistance
- vaccine for influenza A and B viruses is recommended annually for all ages
  - vaccine is reformulated each year to reflect circulating influenza A and B strains

**Beware! Do not confuse *H. influenzae* with influenza virus**

*H. influenzae*: a bacterium (Types A, B, C, D, E, F, refer to capsule)

Influenza: a virus (Types A and B refer to strain)

**Vaccines for Preventing Influenza in Healthy Adults**

*Cochrane DB Syst Rev* 2010;CD001269

**Study:** Meta-analysis of RCTs and quasi-RCTs evaluating influenza vaccines compared to placebo in healthy individuals aged 16 to 65 yr.

**Results:** 50 reports were included. If vaccine matched the viral circulating strain, 4% of unvaccinated people versus 1% of vaccinated people developed influenza symptoms; the corresponding figures for poor vaccine matching were 2% and 1%. Vaccination had a modest effect on time off work and had no effect on hospital admissions or complication rates. Inactivated vaccines caused local harms and 1.6 additional cases of Guillain-Barré Syndrome per million vaccinations.

**Conclusions:** Vaccination has a modest effect in reducing influenza symptoms and time off work.

## Skin and Soft Tissue Infections

### Cellulitis

#### Definition

- acute infection of the skin principally involving the dermis and subcutaneous tissue

#### Etiology

- common causative agents: *S. aureus*,  $\beta$ -hemolytic streptococci
- immunocompromised patients: may also include GN rods and fungi
- risk factors:
  - trauma with direct inoculation, recent surgery
  - peripheral vascular disease, lymphedema diabetes, cracked skin in feet/toes (tinea pedis)

**Clinical Features**

- pain, tenderness, edema, erythema with indistinct borders  $\pm$  regional lymphadenopathy, systemic symptoms (fevers, chills, malaise)
- can lead to ascending lymphangitis (visible red streaking in skin along lymphatics proximal to area of cellulitis)

**Investigations**

- CBC and differential, blood C&S if febrile
- skin swab ONLY if open wound with pus

**Treatment**

- antibiotics: cephalexin
- if extensive erythema or systemic symptoms, consider cefazolin IV
- limb rest and elevation may help reduce swelling

## Necrotizing Fasciitis

**Definition**

- life- and limb-threatening infection of the deep fascia characterized by rapid spread

**Etiology**

- Two main forms:
  - Type I: polymicrobial infection – aerobes and anaerobes (e.g. *S. aureus*, *Bacteroides*, *Enterobacteriaceae*)
  - Type II: monomicrobial infection with GAS

**Clinical Features**

- pain out of proportion to clinical findings and beyond border of erythema
- edema,  $\pm$  crepitus (subcutaneous gas from anaerobes),  $\pm$  fever
- infection spreads rapidly
- patients may rapidly become very sick (tachycardia, hypotension, lightheadedness)
- late findings:
  - skin turns dusky blue and black (secondary to thrombosis and necrosis)
  - induration, formation of hemorrhagic bullae

**Investigations**

- a clinical/surgical diagnosis – do NOT wait for results of investigations before beginning treatment
- blood and tissue C&S
- serum CK (elevated CK usually means myonecrosis – a late sign)
- plain film x-ray (soft tissue gas may be visualized)
- surgical exploration for debridement of infected tissue

**Treatment**

- resuscitation with IV fluids
- emergency surgical debridements to confirm diagnosis and remove necrotic tissue
- IV antibiotics
  - unknown organism: meropenem or piperacillin/tazobactam + clindamycin IV  $\pm$  vancomycin if MRSA is considered
  - Type I (polymicrobial): piperacillin/tazobactam + clindamycin IV
  - Type II (monomicrobial): penicillin G + clindamycin IV
  - with Type II, evaluate for streptococcal toxic shock syndrome and the need for IVIG

## Gastrointestinal Infections

### Acute Diarrhea

- see [Gastroenterology](#), G15
- see [Pediatrics](#), P35
- see [Family Medicine](#), FM26

**Epidemiology**

- one of five leading causes of death worldwide, according to World Health Organization
- significant morbidity in developed countries (over 900,000 hospitalizations in United States each year)

## Definition

- passage of  $\geq 3$  loose or liquid stools/d or  $>200$  g stool/d for  $>2$  d but  $\leq 14$  d

## Approach to Acute Diarrhea

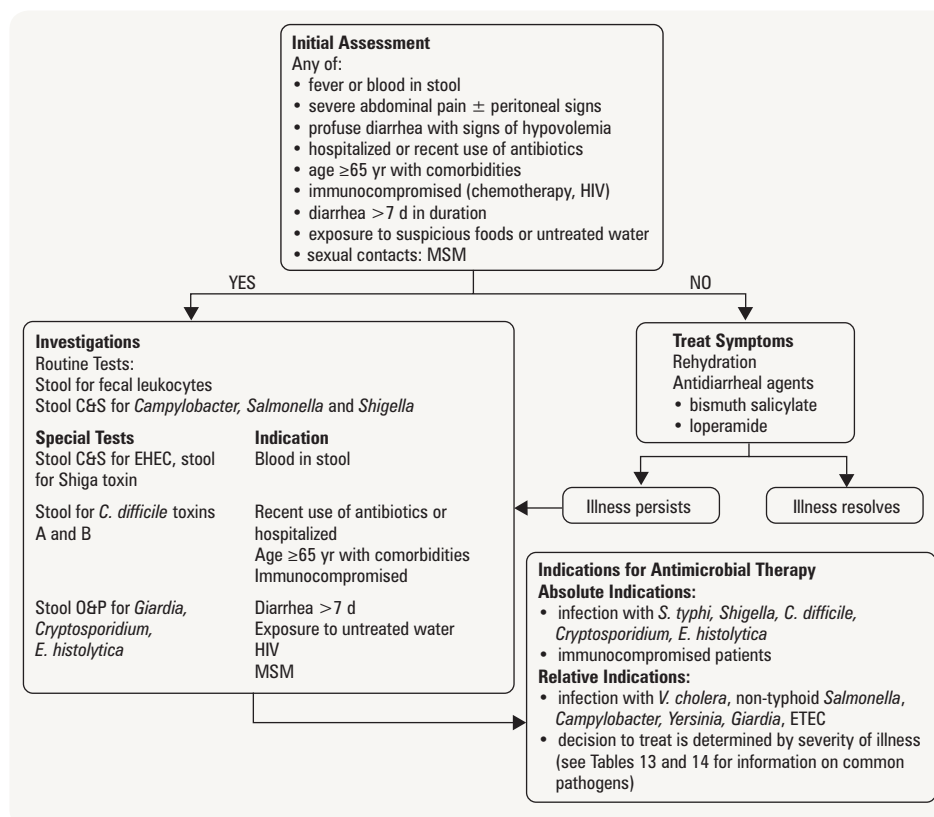

- rationale:
  - the vast majority of acute diarrhea is caused by infection
  - in most cases, acute diarrheal illness is viral and/or self-limited, and lasts  $<3$  d
  - investigations are costly and are necessary only in certain circumstances
- therefore, the evaluation of acute diarrhea involves:
  - identifying characteristics of the illness or patient that warrant further investigation
  - assessing volume status to determine appropriate method of rehydration
- see Figure 7

## Physical Exam

- volume status: appearance, level of alertness, pulse, BP, orthostatic vitals, JVP, mucous membranes, skin turgor, capillary refill
- abdominal exam: pain, guarding, peritoneal signs

## Treatment

- rehydration is mainstay of treatment
  - oral rehydration therapy
  - IV rehydration if oral intake insufficient to replace fluid loss
- antidiarrheal agents reduce duration of diarrhea: loperamide, bismuth salicylate
  - delays excretion of causative pathogens
  - contraindications: diarrhea with fever, bloody stool or diarrhea caused by *Clostridium difficile*
- antibiotic therapy is rarely indicated because:
  - most acute diarrheal illness is of viral etiology and is self-limited
  - antibiotics can eradicate normal gut flora, predisposing to *C. difficile* infection
  - antibiotics prolong the shedding of *Salmonella* and other causes of bacterial diarrhea
  - in EHEC infection, antibiotics may increase the risk of HUS
  - indications for antibiotic therapy are shown in Figure 7

### Causes of Acute Bloody Diarrhea

#### CHESS

*Campylobacter*  
Hemorrhagic *E. coli* (e.g. O157:H7)  
*Entamoeba histolytica*  
*Salmonella*  
*Shigella*

Figure 7. Approach to acute diarrhea

Table 13. Bacteria in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	N/V			
<i>B. cereus</i> – Type A (emetic)	Rice dishes	1-6 h	–	–	–	+	<12 h	None	Preformed exotoxin
<i>B. cereus</i> – Type B (diarrheal)	Meats, vegetables, dried beans, cereals	8-16 h	–	–	–	–	<24 h	None	Secondary endotoxin
<i>Campylobacter jejuni</i>	Uncooked meat, especially poultry	2-10 d	+	±	+	±	<1 wk	Macrolide or fluoroquinolone if diarrhea >1 wk, bloody diarrhea, or immunocompromised	Most common bacterial cause of diarrhea in Canada Associated with Guillain-Barré syndrome
<i>Clostridium difficile</i>	Can be normally present in colon in small numbers (primary risk factor for disease is exposure to antimicrobials)	Unclear	±	±	±	–	Variable	Discontinue offending antimicrobial agent, if possible 1st line – metronidazole (PO/IV) or vancomycin PO in severe cases 2nd line – vancomycin PO	Usually follows antibiotic treatment (especially clindamycin, fluoroquinolones, penicillins, cephalosporins) Can develop pseudomembranous colitis
<i>Clostridium perfringens</i>	Contaminated food, especially meat and poultry	8-12 h	±	–	+	–	<24 h	None	<i>Clostridium</i> spores are heat resistant Secondary enterotoxin
Enteroinvasive <i>E. coli</i> (EIEC)	Contaminated food/water	1-3 d	+	±	+	–	7-10 d	None	Relatively uncommon
Enterotoxigenic <i>E. coli</i> (ETEC)	Contaminated food/water	1-3 d	–	–	+	–	3 d	Fluoroquinolone or azithromycin for moderate to severe symptoms	Most common cause of traveller's diarrhea Heat-labile and heat-stable toxins
Enterohemorrhagic <i>E. coli</i> (EHEC/STEC) i.e. O157:H7	Contamination of hamburger, raw milk, drinking and recreational water	3-8 d	–	+	+	±	5-10 d	None: antibiotics increase risk of HUS	Shiga toxin production Monitor renal function: 10% develop HUS Antidiarrheals increase risk of HUS
<i>Salmonella typhi</i> <i>S. paratyphi</i> (aka Enteric Fever, Typhoid)	Fecal-oral Contaminated food/water, travel to endemic area	10-14 d	+	±	+	±	<5-7 d	Empiric treatment with ceftriaxone or azithromycin Fluoroquinolone resistance is increasing	<i>Salmonella typhi</i> : "Rose spot" rash (on anterior thorax, upper abdomen), fever and abdominal pain precedes diarrhea
Non-typhoidal Salmonellosis <i>S. typhimurium</i> , <i>S. enteritidis</i>	Contaminated animal food products, especially eggs, poultry, meat, milk	12-72 h	+	±	+	+	3-7 d	Ciprofloxacin only in severe illness, extremes of age, joint prostheses, valvular heart disease, severe atherosclerosis, cancer, uremia	
<i>Shigella dysenteriae</i>	Fecal-oral Contaminated food/water	1-4 d	+	±	+	+	<1 wk	Fluoroquinolone	Very small inoculum needed for infection Complications include toxic megacolon, HUS Antidiarrheals may increase risk of toxic megacolon
<i>Staphylococcus aureus</i>	Unrefrigerated meat and dairy products (custard, pudding, potato salad, mayo)	2-4 h	–	–	+	+	1-2 d	None	Heat-stable preformed exotoxin
<i>Vibrio cholerae</i>	Contaminated food/water, especially shellfish	1-3 d	–	–	–	–	3-7 d	Tetracycline or quinolones (ciprofloxacin)	Massive watery diarrhea (1-3 L/d) Mortality <1% with treatment
<i>Yersinia</i>	Contaminated food Unpasteurized milk	5 d	+	±	+	±	Up to 3 wk	Fluoroquinolone only for severe illness	Majority of cases in children 1-4 yr Mesenteric adenitis and terminal ileitis can occur without diarrhea, mimicking appendicitis

**Table 14. Parasites in Infectious Diarrhea**

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	N/V			
<i>Cryptosporidium</i>	Fecal-oral	7 d	±	–	–	+	1-20 d	Paramomycin + nitazoxanide	
<i>Entamoeba histolytica</i>	Worldwide endemic areas Fecal-oral	2-4 wk	±	+	–	+	Variable	Metronidazole + iodoquinol if symptomatic infection Only iodoquinol for asymptomatic cyst passage	If untreated, potential for liver abscess Sigmoidoscopy shows flat ulcers with yellow exudates
<i>Giardia lamblia</i>	Fecal-oral Contaminated food/water	1-4 wk	–	–	+	+	Variable	Metronidazole or nitazoxanide Treatment of asymptomatic carriers not recommended	Higher risk in: day care children, intake of untreated water ("beaver fever"), MSM, immunodeficiency (decreased IgA) May need duodenal biopsy

**Table 15. Viruses in Infectious Diarrhea**

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	N/V			
Norovirus	Fecal-oral	24 h	–	–	+	+	24 h	None	Noroviruses includes Norwalk virus
Rotavirus	Fecal-oral	2-4 d	±	–	–	±	3-8 d	None	Can cause severe dehydration Virtually all children are infected by 3 yr of age Oral vaccine given at 2 and 4 mo of age

## Traveller's Diarrhea

- see *Acute Diarrhea*, ID11

### Epidemiology

- the most common illness to affect travellers
- up to 50% of travellers to developing countries affected in first 2 wk and 10-20% after returning home

### Etiology

- bacterial (80-90%): *E. coli* most common (ETEC), *Campylobacter*, *Shigella*, *Salmonella*, *Vibrio* (non-cholera); wide regional variation (e.g. *Campylobacter* more common in Southeast Asia)
- viral: norovirus, rotavirus, and astrovirus account for 5-8%
- protozoal (rarely): *Giardia*, *Entamoeba histolytica*, *Cryptosporidium*, *Cyclospora* for ~10% in long-term travellers
- pathogen-negative traveller's diarrhea common despite exhaustive microbiological work-up

### Treatment

- rehydration is mainstay of therapy
  - rehydrate with sealed beverages
  - in severe fluid loss use oral rehydration solutions (1 package in 1L boiled or treated water)
- treat symptoms: antidiarrheal agents (e.g. bismuth salicylate, loperamide)
- empiric antibiotics in moderate or severe illness: ciprofloxacin or azithromycin or rifaximin
  - note: there is increasing fluoroquinolone resistance in causative agents, especially in Southeast Asia

Bismuth salicylate (Pepto-Bismol®) can cause patients to have black stools, which may be mistaken for melena.

### Prevention

- proper hygiene practices
  - avoid consumption of: foods or beverages from establishments with unhygienic conditions (e.g. street vendors), raw fruits or vegetables without a peel, raw or undercooked meat and seafood
  - avoid untreated water
- bismuth salicylate (Pepto-Bismol®): 60% effective (2 tablets qid according to CDC website)
- CDC Guideline: antibiotic prophylaxis not recommended
  - increased risk of infection with resistant organisms
  - high risk groups (e.g. immunocompromised) likely to be infected with pathogen not covered by standard antimicrobial agents

- Dukoral®: oral vaccine that offers protection against *V. cholera* (efficacy ~80%) and ETEC (efficacy ~50-67%). Not recommended for routine use in travellers, but PHAC recommends that it may be considered in short-term travellers >2 yr who are high-risk (e.g. chronic illness) for whom there is an increased risk of serious consequences for traveller's diarrhea (e.g. chronic renal failure, congestive heart failure, type 1 diabetes mellitus, inflammatory bowel disease), immunosuppressed, history of repeat traveller's diarrhea, increased risk of acquiring traveller's diarrhea (gastric hypochlorhydria or young children >2 yr)

## Chronic Diarrhea

- see [Gastroenterology](#), G16

## Peptic Ulcer Disease (*H. pylori*)

- see [Gastroenterology](#), G12

# Bone and Joint Infections

## Septic Arthritis

### Routes of Infection

- hematogenous (adults)
- contiguous osteomyelitis (children)
- direct inoculation via skin/trauma
- iatrogenic (surgery, arthroscopy, arthrocentesis)

### Etiology

- gonococcal
  - *N. gonorrhoeae*: previously accounted for 75% of septic arthritis in young sexually active adults
- non-gonococcal
  - *S. aureus*: affects all ages, rapidly destructive, accounts for most non-gonococcal cases of septic arthritis in adults (especially in those with rheumatoid arthritis)
  - *Streptococcus* species (Group A and B)
  - Gram-negatives: affects neonates, elderly, IV drug users, immunocompromised
  - *S. pneumoniae*: affects children
  - *Kingella kingae*: affects children aged <2 yr since Hib immunization
  - *Salmonella* spp.: characteristic of sickle cell disease
  - coagulase-negative *Staphylococcus* species: prosthetic joints
- if culture negative: *Borrelia* spp. (Lyme disease) or *Tropheryma whippelii* (Whipple's disease)

### Risk Factors

- gonococcal
  - age (<40 yr old), recent menses, pregnancy, MSM
- non-gonococcal
  - bacteremia (extra-articular infection with hematogenous seeding, endocarditis)
  - prosthetic joints/recent joint surgery
  - underlying joint disease (rheumatoid arthritis, osteoarthritis)
  - immunocompromise (diabetes, chronic kidney disease, alcoholism, cirrhosis)
  - loss of skin integrity (cutaneous ulcer, skin infection)
  - age >80 yr

### Clinical Features of Gonococcal Arthritis

- two forms (although overlap often):
  - bacteremic form:
    - ♦ systemic symptoms: fever, malaise, chills
    - ♦ gonococcal triad: migratory polyarthralgias, tenosynovitis, dermatitis (pustular skin lesions)
  - septic arthritis form:
    - ♦ local symptoms in involved joint: swelling, warmth, pain, inability to bear weight, marked decreased in range of motion (see [Rheumatology](#), RH3 for differential diagnosis)

#### Medical Emergency

Septic arthritis is a medical emergency! If untreated, rapid joint destruction will occur.

#### Gonococcal Triad

- Migratory arthralgias
- Tenosynovitis next to inflamed joint
- Pustular skin lesions

### Clinical Features of Non-gonococcal Arthritis

- acute onset of pain, swelling, warmth, decreased range of motion ± fever, chills
- most often in large weight bearing joints (knee, hip, ankle) and wrists
- usually monoarticular (polyarticular risk factors: rheumatoid arthritis, endocarditis, GBS)

### Investigations

- consider rheumatologic causes for monoarthritis (see [Rheumatology](#), RH3)
- gonococcal: blood C&S, as well as endocervical, urethral, rectal and oropharyngeal testing
- non-gonococcal: blood C&S
- arthrocentesis (synovial fluid analysis) is mandatory: CBC and differential, Gram stain, C&S, examine for crystals
  - infectious = opaque, increased WBC count ( $>15\,000/\text{mm}^3$ : likelihood of infection increases with increasing WBC count), PMNs  $>90\%$ , culture positive
  - growth of *N. gonorrhoeae* from synovial fluid is successful in  $<50\%$  of cases
- $\pm$  plain x-ray: assess for osteomyelitis, provides baseline to monitor treatment

### Treatment

- medical
  - empiric IV antibiotics (vancomycin + ceftriaxone) – delay may result in joint destruction
  - Gram stain guides subsequent treatment
  - gonococcal: ceftriaxone + azithromycin, for concurrent treatment of *C. trachomatis*
  - non-gonococcal: antibiotics against *Streptococcus* spp. (2 wk), *S. aureus* (4 wk IV minimum), or GN rods (4 wk)
- surgical drainage if: (see [Orthopedics](#), OR10)
  - persistent positive joint cultures on repeat arthrocentesis
  - hip joint involvement
  - prosthetic joint
- daily joint aspirations until culture sterile; no need to give intra-articular antibiotics
- physiotherapy

### Prognosis

- gonococcal: responds well after 24–48 h of initiating antibiotics (usually complete recovery)
- non-gonococcal: up to 50% morbidity (decreased joint function/mobility)

Intra-articular steroids are contraindicated until septic arthritis has been excluded.

## Diabetic Foot Infections

### Etiology

- neuropathy, peripheral vascular disease and hyperglycemia contribute to foot ulcers that heal poorly and are predisposed to infection
- organisms in mild infection: *S. aureus*, *Streptococcus* spp.
- organisms in moderate/severe infection: polymicrobial with aerobes (*S. aureus*, *Streptococcus*, *Enterococcus*, GN bacilli) and anaerobes (*Peptostreptococcus*, *Bacteroides*, *Clostridium*)

### Clinical Features

- not all ulcers are infected
- diagnosis of infected ulcer:  $\geq 2$  of the cardinal signs of inflammation (redness, warmth, swelling, pain) or the presence of pus
- $\pm$  crepitus, osteomyelitis, systemic toxicity
- visible bone or probe to bone = osteomyelitis
- infection severity:
  - mild = superficial (no bone/joint involvement)
  - moderate = deep (beneath superficial fascia, involving bone/joint)
  - severe = infection in a patient with systemic toxicity (fevers, chills, tachycardia, hypotension)

### Investigations

- curettage specimen from ulcer base, aspirate from an abscess or bone biopsy (results from superficial swabs do not represent organisms responsible for deeper infection)
- blood C&S if febrile
- assess for osteomyelitis by x-ray (although not sensitive in early stages)
  - if initial x-ray normal, repeat 2–4 wk after initiating treatment to increase test sensitivity
  - if initial x-ray equivocal, do MRI or bone biopsy (most reliable test)

### Treatment

- evaluate for early surgical debridement  $\pm$  revascularization or amputation
- eliminate/reduce pressure and provide regular local wound care
- mild: cephalexin or clindamycin
- moderate or severe: clindamycin + ciprofloxacin PO or pip/tazo IV  $\pm$  vancomycin if MRSA known or suspected
- encourage glycemic control

#### Does This Patient with Diabetes Have Osteomyelitis of the Lower Extremity?

JAMA 2008;299:806–813

**Study:** Systematic literature review. 21 studies.

**Population:** 1027 adult patients with diabetes mellitus being investigated for osteomyelitis.

**Intervention:** Various aspects of history, physical exam, laboratory tests, and diagnostic imaging studies versus bone biopsy.

**Primary outcome:** Diagnostic utility.

**Results:** No studies examined any part of history taking. Temperature, ulcer characteristics (erythema, swelling, purulence), elevated WBC, skin swabs, and soft tissue cultures were not useful. Nuclear imaging has poor specificity for osteomyelitis (62%–88.5%), and MRIs have greater accuracy in detecting osteomyelitis.

Finding	(+) LR	(–) LR
Visualization of bone	9.2	0.70
Ulcer area $>2\text{ cm}^2$	7.2	0.48
Probe-to-bone	6.4	0.39
Clinical judgment	5.5	0.54
ESR $>70\text{ mm/h}$	11	NS*
Plain radiographs	2.3	0.63
MRI	3.8	0.14

\*NS = not significant

## Osteomyelitis

- see [Orthopedics](#), OR10

# Cardiac Infections

## Infective Endocarditis (IE)

### Definition

- infection of cardiac endothelium, most commonly the valves
- classifications: acute vs. subacute, native valve vs. prosthetic valve, right sided vs. left sided
- leaflet vegetation = platelet-fibrin thrombi, WBCs and bacteria

### Risk Factors and Etiology

- predisposing conditions:
  - high risk: prosthetic cardiac valve, previous IE, congenital heart disease (unrepaired, repaired within 6 mo, repaired with defects), cardiac transplant with valve disease (surgically constructed systemic-to-pulmonary shunts or conduits)
  - moderate risk: other congenital cardiac defects, acquired valvular dysfunction, hypertrophic cardiomyopathy
  - low/no risk: secundum ASD or surgically repaired ASD < VSD, PDA, MV prolapse, IHD, previous CABG
  - opportunity for bacteremia: intravenous drug use (IVDU), indwelling venous catheter, hemodialysis, poor dentition, diabetes, HIV
- frequency of valve involvement MV >> AV > TV > PV
  - but in 50% of IVDU-related IE the tricuspid valve is involved

MV mitral valve  
AV aortic valve  
TV tricuspid valve  
PV pulmonic valve

### Etiology of Culture-negative Endocarditis

- HACEK (fastidious Gram-negative bacilli)**

*Haemophilus parainfluenzae*  
*Aggregatibacter aphrophilus*/  
*Aggregatibacter*  
*actinomycetemcomitans*  
*Cardiobacterium hominis*  
*Eikenella corrodens*  
*Kingella kingae*

- Coxiella burnetii*
- Bartonella species*
- Tropheryma whippelii*
- Fungi
- Mycobacteria

**Table 16. Microbial Etiology of Infective Endocarditis Based on Risk Factors**

Native Valve	IVDU	Prosthetic Valve (recent surgery <2 months)	Prosthetic Valve (remote surgery >2 months)
<b><i>Streptococcus</i><sup>1</sup> (36%)</b>	<b><i>S. aureus</i> (68%)</b>	<b><i>S. aureus</i> (36%)</b>	<b><i>Streptococcus</i> (20%)</b>
<b><i>S. aureus</i><sup>4</sup> (28%)</b>	<b><i>Streptococcus</i> (13%)</b>	<b><i>S. epidermidis</i> (17%)</b>	<b><i>S. aureus</i> (20%)</b>
<b><i>Enterococcus</i> (11%)</b>	<i>Enterococcus</i>	Other	<b><i>S. epidermidis</i> (20%)</b>
<i>S. epidermidis</i>	GNB	<i>Enterococcus</i>	<b><i>Enterococcus</i> (13%)</b>
GNB	<i>Candida</i>	GNB	Other <sup>2</sup>
Other <sup>2</sup>	Other <sup>3</sup>	Other <sup>2</sup>	

Organisms in bold are the most common isolates.

1. *Streptococcus* includes mainly Viridans group *streptococci*

2. Other includes less common organisms such as:

- Streptococcus bovis* (usually associated with underlying GI malignancy, cirrhosis)
- Culture-negative organisms including nutritionally-deficient *streptococci*, HACEK, *Bartonella*, *Coxiella*, *Chlamydia*, *Legionella*, *Brucella*
- Candida*

3. IVDU endocarditis pathogens depend on substance used to dilute the drugs (i.e. tap water = *Pseudomonas*, saliva = oral flora, toilet water = GI flora)

### Clinical Features

- systemic
  - fever (80-90%), chills, weakness, rigors, night sweats, weight loss, anorexia
- cardiac
  - dyspnea, chest pain, clubbing (subacute)
  - regurgitant murmur (new onset or increased intensity)
  - signs of CHF (secondary to acute MR, AR)
- embolic/vascular
  - petechiae over legs, splinter hemorrhages (linear, reddish-brown lesion within nail bed)
  - Janeway lesions (painless, 5 mm, erythematous, hemorrhagic pustular lesions on soles/palms)
  - focal neurological signs (CNS emboli), headache (mycotic aneurysm)
  - splenomegaly (subacute)
  - microscopic hematuria, flank pain (renal emboli) ± active sediment
- immune complex
  - Osler's nodes (painful, raised, red/brown, 3-15 mm on digits)
  - glomerulonephritis
  - arthritis
  - Roth's spots (retinal hemorrhage with pale centre)

### Diagnosis

- Modified Duke Criteria, see Table 17
  - definitive diagnosis if: 2 major, or 1 major + 3 minor, or 5 minor
  - possible diagnosis if: 1 major + 1 minor, or 3 minor

### Clinical Features of Infective Endocarditis

#### FROM JANE

Fever  
Roth's spots  
Osler's nodes  
Murmur  
Janeway lesions  
Anemia  
Nail-bed hemorrhages (aka splinter hemorrhages)  
Emboli

**Table 17. Modified Duke Criteria**

Major Criteria(2)
<ol style="list-style-type: none"> <li>Positive blood cultures for IE <ul style="list-style-type: none"> <li>Typical microorganisms for IE from 2 separate blood cultures (<i>Streptococcus viridans</i>, HACEK group (see ID17), <i>Streptococcus bovis</i>, <i>Staphylococcus aureus</i>, community-acquired <i>enterococci</i>) OR</li> <li>Persistently positive blood culture, defined as recovery of a microorganism consistent with IE from blood drawn &gt;12 h apart or all of 3 or a majority of 4 or more separate blood cultures, with first and last drawn &gt;1 h apart OR</li> <li>Single positive blood culture for <i>Coxiella burnetii</i> or antiphase I IgG antibody titer &gt;1:800</li> </ul> </li> <li>Evidence of endocardial involvement <ul style="list-style-type: none"> <li>Positive echocardiogram for IE (oscillating intracardiac mass on valve or supporting structures, or in the path of regurgitant jets, or on implanted material in the absence of an alternative anatomic explanation OR abscess OR new partial dehiscence of prosthetic valve)</li> <li>OR New valvular regurgitation (insufficient if increase or change in preexisting murmur)</li> </ul> </li> </ol>
Minor Criteria (5)
<ol style="list-style-type: none"> <li>Predisposing condition (abnormal heart valve, IVDU)</li> <li>Fever (38.0°C/100.4°F)</li> <li>Vascular phenomena: major arterial emboli, septic pulmonary infarcts, mycotic aneurysms, ICH, conjunctival hemorrhages, Janeway lesions</li> <li>Immunologic phenomena: glomerulonephritis, rheumatoid factor, Osler's nodes, Roth's spots</li> <li>Positive blood culture but not meeting major criteria OR serologic evidence of active infection with organism consistent with IE</li> </ol>

**Investigations**

- serial blood cultures: 3 sets (each containing one aerobic and one anaerobic sample) collected from different sites >1 h apart
  - persistent bacteremia is the hallmark of endovascular infection (such as IE)
- repeat blood cultures (at least 2 sets) after 48 to 72 h of appropriate antibiotics to confirm clearance
- blood work: CBC and differential (normochromic, normocytic anemia), ESR (increased), RF (+), BUN/Cr
- urinalysis (proteinuria, hematuria, red cell casts) and urine C&S
- ECG: prolonged PR interval may indicate perivalvular abscess
- ECHO findings: vegetations, regurgitation, abscess
  - TTE (poor sensitivity) inadequate in 20% (obesity, COPD, chest wall deformities)
  - TEE indicated if TTE is non-diagnostic in patients with at least possible endocarditis or if suspect prosthetic valve endocarditis or complicated endocarditis (e.g. paravalvular abscess/perforation) (~90% sensitivity)

TEE  
TTE

transesophageal echo  
transthoracic echo

**Treatment**

- medical
  - usually non-urgent and can wait for confirmation of etiology before initiating treatment
  - empiric antibiotic therapy if patient is unstable
    - first-line: vancomycin + gentamicin or ceftriaxone
  - targeted antibiotic therapy: antibiotic and duration (usually 4-6 wk) adjusted based on valve, organism and sensitivities
  - monitor for complications of IE (e.g. CHF, conduction block, new emboli) and complications for antibiotics (e.g. interstitial nephritis)
  - prophylaxis only for high risk individuals listed above with dental procedures that may lead to bleeding OR invasive procedure of the respiratory tract that involves incision or biopsy of the respiratory mucosa, such as tonsillectomy and adenoidectomy OR procedures on infected skin, skin structure or musculoskeletal tissue
    - dental/respiratory: amoxicillin single dose 30-60 min prior; clindamycin if penicillin-allergic
    - skin/soft tissue: cephalexin single dose 30-60 min prior ; clindamycin if penicillin-allergic (modify based on etiology of skin/soft tissue infection)
- surgical
  - most common indication is refractory CHF
  - other indications, include valve ring abscess, fungal etiology, valve perforation, unstable prosthesis, ≥2 major emboli, antimicrobial failure (persistently positive blood cultures), mycotic aneurysm, Staphylococci on a prosthetic valve

**Prognosis**

- adverse prognostic factors: CHF, prosthetic valve infection, valvular/myocardial abscess
- mortality: prosthetic valve IE (25-50%), non-IVDU *S. aureus* IE (30-45%), IVDU *S. aureus* or streptococcal IE (10-15%)

# Neurological Infections

## Meningitis

- see [Pediatrics](#), P62

### Definition

- inflammation of the meninges

### Etiology

**Table 18. Common Organisms in Meningitis**

Bacterial			Viral	Fungal	Other
Age 0-4 wk	Age 1-23 mo	Age >2 yr			
GBS <i>E. coli</i> <i>L. monocytogenes</i> <i>Klebsiella</i>	GBS <i>E. coli</i> <i>S. pneumoniae</i> <i>N. meningitidis</i> <i>H. influenzae</i>	<i>S. pneumoniae</i> <i>N. meningitidis</i> <i>L. monocytogenes</i> (age >50 and comorbidities)	HSV-1, 2 VZV Enteroviruses West Nile	<i>Cryptococcus</i> <i>Coccidioides</i>	Lyme disease Neurosyphilis TB

### Risk Factors

- lack of immunization against *S. pneumoniae*, *H. influenzae type b*
- hematogenous spread after invasion from a mucosal surface (nasopharynx)
- parameningeal focus (otitis media, infection, sinusitis)
- penetrating head trauma
- anatomical meningeal defects – CSF leaks
- previous neurosurgical procedures, shunts
- immunocompromise (corticosteroids, HIV, asplenia, hypogammaglobulinemia, complement deficiency)
- contact with colonized or infected persons

### Clinical Features

- neonates and children: fever, vomiting, lethargy, irritability, poor feeding
- older children and adults: fever, headache, neck stiffness, confusion, nausea and vomiting, lethargy, photophobia, altered level of consciousness, seizures, focal neurological signs, papilledema
- petechial rash on lower extremities with meningococcal meningitis

### Investigations

- bloodwork: CBC and differential, electrolytes (for SIADH), blood C&S
  - CSF: opening pressure, cell count + differential, glucose, protein, Gram stain, bacterial C&S
  - AFB, fungal C&S, cryptococcal antigen in immunocompromised patients, subacute illness, suggestive travel history or TB exposure
  - PCR for HSV, VZV, EBV, enteroviruses if viral cause suspected
- imaging/neurologic studies: CT, MRI, EEG if focal neurological signs present

**Table 19. CSF Profiles for Meningitis**

CSF Analysis	Bacterial	Viral
Glucose (mmol/L)	Decreased	Normal
Protein (g/L)	Markedly Increased	Increased
White blood cell	500-10,000/ $\mu$ L	10-500/ $\mu$ L
Predominant WBC	Neutrophils	Lymphocytes

### Treatment

- bacterial meningitis is a medical emergency: do not delay antibiotics before CT or LP
- empiric antibiotic therapy:
  - age <1 mo: ampicillin + cefotaxime  $\pm$  gentamicin IV
  - age >1 mo: vancomycin + ceftriaxone IV
    - ♦ add ampicillin IV (or TMP-SMX) if risk factors for infection with *L. monocytogenes* present: age >50, alcoholism, immunocompromised
- steroids in acute bacterial meningitis: dexamethasone IV within 20 min prior to or with first dose of antibiotics (see sidebar)
  - benefit in all adults (including with pneumococcal meningitis) now uncertain

#### Brudzinski's Sign

Passive neck flexion causes involuntary flexion of hips and knees.

#### Kernig's Sign

Resistance to knee extension when hip is flexed to 90°.

#### Jolt Accentuation of H/A

Headache worsens when head turned horizontally at 2-3 rotations/s.

#### CSF Gram Stain Findings

- *S. pneumoniae* – GP diplococci
- *N. meningitidis* – GN diplococci
- *H. influenzae* – Pleiomorphic GN coccobacilli
- *L. monocytogenes* – GP rods

#### Adjunctive Dexamethasone in Bacterial Meningitis: a Meta-analysis of Individual Patient Data

*Lancet Neurol* 2010;9:254-63

**Study:** Meta-analysis of randomized, double blind, placebo controlled trial.

**Population:** 2029 patients from 5 trials, 833 <15 yr, HIV in 580, bacterial meningitis confirmed in 1639.

**Intervention:** Antibiotics with vs. without dexamethasone (first dose given within 20 min prior to or with first dose of antibiotics).

**Outcome:** Death, death or any neurological sequelae, and death or severe bilateral hearing loss at first follow-up; death or severe neurological sequelae at 1 mo.

**Results:** There was no difference in death [OR 0.97 (95% CI, 0.79–1.19)], death or severe bilateral hearing loss [OR 0.89, (95% 0.73–1.09)]. Death or severe neurological sequelae or any hearing loss [OR 0.92 (95% CI, 0.76–1.11)], or death or any neurological sequelae or any hearing loss [OR 0.89 (95% CI, 0.74–1.07)]. However, among survivors, dexamethasone may reduce hearing loss [OR 0.77 (95% CI, 0.60–0.99,  $p=0.04$ )].

**Conclusion:** The benefit of dexamethasone in acute bacterial meningitis is questionable with seemingly little effect in death or neurological sequelae. There may be some benefit on prevention of hearing loss.

#### Does this Adult Patient Have Acute Meningitis? From The Rational Clinical Examination

*JAMA* 2009; http://www.jamaevidence.com/content/3482857

**Study:** Systematic review of articles assessing the sensitivity and specificity of clinical exam maneuvers for the diagnosis of adult meningitis.

**Results:** In retrospective studies, sensitivity for headache was 68%, and 52% for nausea and vomiting. Sensitivity for physical exam findings is similarly low (fever: 87%, neck stiffness: 80%, altered mental status: 69%). Sensitivity for the combination of the classic triad of fever, neck stiffness and altered mental status was 46%. In prospective studies, sensitivity of headache was 92%, while sensitivity of nausea and vomiting could not be pooled, and ranged from 32–70%. Brudzinski's and Kernig's signs had a sensitivity of 5% and Kernig's sign only 5–9%. Jolt accentuation had a sensitivity of 97%.

**Conclusions:** Data were heterogeneous, and lacked standardization of clinical exams. No single item on clinical history or physical exam was sufficient to rule out meningitis, including Kernig's and Brudzinski's signs. The absence of the classic triad of fever, neck stiffness and altered mental status is not sufficient to rule out meningitis. Jolt accentuation has high sensitivity, but further research is needed. LP may be performed safely without CT head in patients without altered LOC, no recent seizure, no history of CNS disease, not immunocompromised, and <60 yr.

## Prevention

- see [Pediatrics](#), P3
- immunization
  - children: immunization against *H. influenzae* (Pentacel®), *S. pneumoniae* (Synflorix®, Prevnar-13®), *N. meningitidis* (Menjugate®, Menactra®)
  - adult: immunization against *N. meningitidis* in selected circumstances (outbreaks, travel, epidemics) and *S. pneumoniae* (Pneumovax®) for high-risk groups
- prophylaxis: close contacts of patients infected with *H. influenzae* should be treated with rifampin if they live with an inadequately immunized or immunocompromised child <4 yr; ciprofloxacin, rifampin or ceftriaxone if close or household contact of a patient with *N. meningitidis*

## Prognosis

- complications
  - headache, seizures, cerebral edema, hydrocephalus, SIADH, residual neurological deficit (especially CN VIII), deafness, death
- mortality
  - *S. pneumoniae* 25%; *N. meningitidis* 5-10%; *H. influenzae* 5%
  - worse prognosis if: extremes of age, delays in diagnosis and treatment, stupor or coma, seizures, focal neurological signs, septic shock at presentation

### Public Health Agency of Canada Indications for Adult Immunization

#### Pneumococcal polysaccharide vaccine (i.e. Pneumovax®)

- >65 yr
- >2 yr, with chronic cardio/respiratory/hepatic/renal disorders, asplenia, sickle cell or immunosuppression

#### Meningococcal C-conjugate vaccine (i.e. Menjugate®)

- Young adults (not immunized in childhood)
- Asplenia\*
- Travellers to high-risk areas\*
- Military recruits\*
- Complement, factor D, or properdin deficiency\*

\*Quadrivalent vaccine (Menactra® or Menomune®) preferred

# Encephalitis

## Definition

- inflammation of brain parenchyma

## Etiology

- identified in only 40-70% of cases
  - when cause is identified, most common etiology is viral
  - e.g. HSV, VZV, EBV, enteroviruses, CMV, West Nile, HIV, mumps, measles, rabies, polio
  - bacteria: *L. monocytogenes*, *Mycobacteria*, spirochetes (Lyme, syphilis)
  - parasites: protozoa (e.g. *Toxoplasma*) and helminths (rare)
  - fungi: e.g. *Cryptococcus*
  - post-infectious (e.g. ADEM)

## Pathophysiology

- acute inflammatory disease of the brain due to direct invasion or pathogen-initiated immune response
- viruses may reach CNS via peripheral nerves (e.g. rabies, HSV)
- herpes simplex encephalitis
  - acute, necrotizing, asymmetrical hemorrhagic process with lymphocytic and plasma cell reaction which usually involves the medial temporal and inferior frontal lobes
  - associated with HSV-1, but can also be caused by HSV-2

## Clinical Features

- constitutional: fever, chills, malaise, nausea, vomiting
- meningeal involvement (meningoencephalitis): headache, nuchal rigidity
- parenchymal involvement: seizures, altered mental status, focal neurological signs
- herpes simplex encephalitis
  - acute onset (<1 wk) of focal neurological signs: hemiparesis, ataxia, aphasia, focal or generalized seizures
  - temporal lobe involvement: behavioural disturbance
  - usually rapidly progressive over several days and may result in coma or death
  - common sequelae: memory and behaviour disturbances

## Investigations

- CSF: opening pressure, cell count + differential, glucose, protein, Gram stain, bacterial C&S, PCR for HSV, VZV, EBV, enteroviruses, and other less common viral etiologies
- serology: may aid diagnosis of certain causes of encephalitis (e.g. West Nile virus)
- imaging/neurologic studies: CT, MRI, EEG to define anatomical sites affected
- invasive testing: brain tissue biopsy may be required for culture, histological examination, and immunocytochemistry (if diagnosis not clear via non-invasive means)
- findings in herpes simplex encephalitis (must rule out due to high mortality)
  - CT/MRI: medial temporal lobe necrosis
  - EEG: early focal slowing, periodic discharges

## Treatment

- general supportive care
- monitor vital signs carefully
- IV acyclovir empirically until HSV encephalitis ruled out

Meningitis and encephalitis patients can be distinguished based on their cerebral function. Cerebral function is abnormal in encephalitis patients (e.g. altered mental status, motor or sensory deficits, altered behavior, speech or movement disorders), but relatively normal in patients with meningitis. Note however, that there is considerable overlap between the two syndromes ("meningoencephalitis").

## Generalized Tetanus

- see [Family Medicine](#), FM3
- see [Pediatrics](#), P3

### Etiology and Pathophysiology

- caused by *Clostridium tetani*: motile, spore forming, anaerobic GP bacillus
- found in soil, splinters, rusty nails, GI tract (humans and animals)
- traumatic implantation of spores into tissues with low oxygenation (e.g. puncture wound, burns, nonsterile surgeries or deliveries)
- upon inoculation, spores transform into *C. tetani* bacilli that produce tetanus toxin
  - toxin travels via retrograde axonal transport to the CNS where it irreversibly binds presynaptic neurons to prevent the release of inhibitory neurotransmitters (e.g. GABA)
  - net effect is the disinhibition of spinal motor reflexes which results in tetany and autonomic hyperactivity

### Clinical Features

- generalized tetanus
  - initially present with painful spasms of masseters (trismus or "lockjaw")
  - sustained contraction of skeletal muscle with periodic painful muscle spasms (triggered by sensory stimuli, e.g. loud noises)
  - paralysis descends to involve large muscle groups (neck, abdomen)
  - apnea, respiratory failure, and death secondary to tonic contraction of pharyngeal and respiratory muscles
- autonomic hyperactivity
  - diaphoresis, tachycardia, hypertension, fever as illness progresses

### Investigations

- culture wounds, CK may be elevated, BUN usually normal

### Treatment

- stop toxin production
  - wound debridement to clear necrotic tissue and spores
  - antimicrobial therapy: IV metronidazole
- neutralize unbound toxin with TIG
- supportive therapy: intubation, spasmolytic medications (benzodiazepines), quiet environment, cooling blanket
- control autonomic dysfunction:  $\alpha$ - and  $\beta$ -blockade (e.g. labetalol), magnesium sulfate

Antimicrobial therapy (e.g. metronidazole) may fail to treat *C. tetani* unless adequate wound debridement is performed.

### Prevention

- infection with *C. tetani* does not produce immunity – vaccinate patients on diagnosis
- tetanus toxoid vaccination (see [Pediatrics](#), P3/[Emergency Medicine](#), ER17)

## Rabies

### Definition

- acute progressive encephalitis caused by RNA virus (family: *Rhabdoviridae*, genus *Lyssavirus*)

### Etiology and Pathophysiology

- any mammal can transmit the rabies virus
  - most commonly transmitted by raccoon, skunk, bat, fox, cat, and dog; monkeys also a risk in the developing world
- transmission: breaching of skin by teeth or direct contact of infectious tissue (saliva, neural tissue) with skin or mucous membranes
  - almost all cases due to bites
- virus travels via retrograde axonal transport from PNS to CNS
- virus multiplies rapidly in brain, then spreads to other organs, including salivary glands
- development of clinical signs occurs simultaneously with excretion of rabies virus in saliva
  - infected animal can transmit rabies virus as soon as it shows signs of disease

### Clinical Features

- 5 stages of disease:
  1. incubation period
    - 1-3 mo on average (can range from days to years)
  2. prodrome (<1 wk)
    - influenza-like illness: low-grade fever, malaise, anorexia, N/V, headache, sore throat
    - pain, pruritus, paresthesia may occur at wound site
    - once prodromal symptoms develop, there is rapid, irreversible progression to death
      - ♦ progression from prodrome to coma and death may occur without an intervening acute neurologic syndrome

3. acute neurologic syndrome: 3 types (<1 wk)
  - A. encephalitic (most common): hyperactivity, fluctuating LOC, hydrophobia, aerophobia, hypersalivation, fever, seizures
    - ♦ painful pharyngeal spasms on encountering gust of air or swallowing water cause aerophobia and hydrophobia, respectively
  - B. paralytic: quadriplegia, loss of anal sphincter tone, fever
  - C. atypical: rare
4. coma
  - complete flaccid paralysis, respiratory and cardiovascular failure
5. death (within days to weeks of initial symptoms)

### Investigations

- purpose of diagnosis by investigations is to limit patient contact with others and to identify others exposed to the infectious source
- ante-mortem: direct immunofluorescence or PCR on multiple specimens: saliva, skin biopsy, serum, CSF
- post-mortem: direct immunofluorescence in nerve tissue, presence of Negri bodies (inclusion bodies in neurons)

### Treatment

- post-exposure prophylaxis depends on regional prevalence (contact Public Health) and circumstances surrounding injury
- 3 general principles:
  - wound care: clean wound promptly and thoroughly with soap and running water
  - passive immunization: HRIG infiltrated into wound site, with any remaining volume administered IM in anatomical site distant from vaccine administration
  - active immunization: inactivated rabies virus vaccine (series of shots post-exposure)
- treatment is supportive once victim manifests signs and symptoms of disease

### Prevention

- pre-exposure vaccination
  - recommended for high risk persons: laboratory staff working with rabies, veterinarians, animal and wildlife control workers, long-term travellers to endemic areas

## Systemic Infections

### Sepsis and Septic Shock

- see [Respirology](#), R33

### Definitions

- systemic inflammatory response syndrome (SIRS): 2 or more of
  - (a) temperature  $<35^{\circ}\text{C}/95^{\circ}\text{F}$  or  $>38.5^{\circ}\text{C}/101.3^{\circ}\text{F}$
  - (b) heart rate  $>90$  beats per minute
  - (c) respiratory rate  $>20$  breaths per minute or  $\text{PaCO}_2 <32$  mmHg
  - (d) WBC  $<4 \times 10^9/\text{L}$  or  $>12 \times 10^9/\text{L}$  or  $>10\%$  bands
- sepsis: SIRS + proven or provable infection
- severe sepsis: sepsis + signs of end-organ dysfunction and hypoperfusion
- septic shock: severe sepsis + hypotension ( $<90$  mmHg sBP), despite adequate fluid resuscitation

### Pathophysiology

- causative agents are identified in only 50-70% of cases
- when organisms are identified, GP and GN organisms are the cause in 90% of cases (GP > GN > fungal)
- primary bloodstream infection or secondary bacteremia  $\rightarrow$  local immune response  $\rightarrow$  immune cells release pro-inflammatory cytokines that defend against pathogens  $\rightarrow$  immune response spreads beyond local environment  $\rightarrow$  unregulated, exaggerated systemic immune response  $\rightarrow$  vasodilation and hypotension  $\rightarrow$  involvement of tissues remote from the site of injury/infection resulting in multiple major organ dysfunction  $\rightarrow$  followed by a period immunoparalysis

### Clinical Features

- history: fever, chills, dyspnea, cool extremities, fatigue, malaise, anxiety, confusion
- physical: abnormal vitals (fever, tachypnea, tachycardia, hypotension), local signs of infection

### Investigations

- CBC and differential, electrolytes, BUN, creatinine, liver enzymes, ABG, lactate, INR, PTT, FDP, blood C&S x3, urinalysis, urine C&S and cultures of any wounds or lines
- CXR (other imaging depends on suspicion of focus of infection)

#### Types of SHOCK

Sepsis/Spinal cord trauma  
Hemorrhage  
Obstructive  
Cardiogenic  
Anaphylaxis

**Treatment** (also see [Respirology](#), R33)

- respiratory support: O<sub>2</sub> ± intubation
- cardiovascular support: IV fluids, ± norepinephrine + ICU
- IV antibiotics (empirical, depends on suspected source)
  - start with broad spectrum antibiotics (piperacillin-tazobactam or meropenem) ± additional agents depending on patient risk factors, suspected etiology of infection, and local microbial susceptibilities (± aminoglycoside or vancomycin)
  - if *Pseudomonas* unlikely: (ceftriaxone or piperacillin-tazobactam or meropenem) ± vancomycin
  - if drug-resistant GN (e.g. *Pseudomonas*) possible: ceftazidime or meropenem or piperacillin-tazobactam + gentamicin
  - narrow once susceptibilities are known
- hydrocortisone IV in patients with septic shock unresponsive to fluid resuscitation and vasopressors

## Tuberculosis (TB)

**Etiology, Epidemiology and Natural History**

- 1/3 of the world's population is infected with TB
- contracted by aerosolized inhalation of *Mycobacterium tuberculosis*, a slow growing aerobe (doubling time = 18 h) that can evade innate host defenses, survive and replicate in macrophages
- inhalation and deposition in the lung can lead one of the following outcomes:
  1. immediate clearance of the pathogen
  2. latent TB: asymptomatic infection contained by host immune defenses (represents 95% of infected people)
  3. primary TB: symptomatic, active disease (represents 5% of infected people)
  4. secondary TB: symptomatic reactivation of previously dormant TB (represents 5-10% of those with latent TB, most often within the first 2-3 yr of initial infection) at a pulmonary or extra-pulmonary site

**Tuberculous Polyserositis**

= pleural + pericardial + peritoneal effusions (usually from granuloma breakdown that spills TB into pleural cavity – very rare)

**Risk Factors**

- social and environmental factors
  - travel or birth in country with high TB prevalence (e.g. Asia, Latin America, Sub-Saharan Africa, Eastern Europe)
  - aboriginal, crowded living conditions, low SES/homeless
  - personal or occupational contact
- host factors
  - immunocompromised/immunosuppressed (including extremes of age)
  - silicosis
  - chronic renal failure requiring dialysis
  - malignancy and chemotherapy
  - substance abuse (e.g. drug use, alcoholism, smoking)

**Clinical Features**

- primary infection usually asymptomatic, although progressive primary disease may occur, especially in children and immunosuppressed patients
- secondary infection/reactivation usually produces constitutional symptoms (fatigue, anorexia, night sweats, weight loss) and site-dependent symptoms
  - i. pulmonary TB
    - chronic productive cough ± hemoptysis
    - CXR consolidation or cavitation, lymphadenopathy
    - non-resolving pneumonia despite standard antimicrobial therapy
  - ii. miliary TB
    - widely disseminated spread especially to lungs, abdominal organs, marrow, CNS
    - CXR: multiple small 2-4 mm millet seed-like lesions throughout lung
  - iii. extrapulmonary TB
    - lymphadenitis, pleurisy, pericarditis, hepatitis, peritonitis, meningitis, osteomyelitis (vertebral = Pott's disease), adrenal (causing Addison's disease), renal, ovary

**Investigations**

- screening for latent TB
  - PPD/Mantoux skin tests
    - ♦ both tests diagnose prior TB exposure; neither can diagnose or exclude active disease
  - IFN-γ release assay (IGRA):
    - ♦ in patients previously infected with TB, T-cells produce increased amounts of IFN-γ when re-exposed to TB antigen
    - ♦ detects antigen not present in the BCG vaccine or in most types of non-tuberculous-mycobacteria (NTM), therefore fewer false positives

**Positive PPD Test**

If induration at 48-72 h

> 5 mm if immunocompromised, close contact with active TB

> 10 mm all others; decision to treat depends on individual risk factors

**False(-):** poor technique, anergy, immunosuppression, infection <10 wk or remotely

**False(+):** BCG after 12 mo of age in a low-risk individual, NTM

**Booster effect:** initially false(-) result boost to a true(+) result by the testing procedure itself (usually if patient was infected long ago so had diminished delayed type hypersensitivity reaction or if history of BCG)

- Canadian TB guidelines recommend IGRA as a confirmatory test if false positive or false negative test results are suspected, while American guidelines treat IGRAs as equivalent to the TB skin test and preferable in patients with a history of BCG vaccination or who may not return for skin test reading
- diagnostic tests/investigations for active pulmonary TB:
  - morning sputum on 3 consecutive days for acid-fast bacilli smear and culture
  - BAL
  - CXR:
    - ♦ nodular or alveolar infiltrates with cavitation (middle/lower lobe if primary, apical if secondary)
    - ♦ pleural effusion (usually unilateral and exudative) may occur independently of other radiograph abnormalities
    - ♦ hilar/mediastinal adenopathy (especially in children)
    - ♦ tuberculoma (semi-calcified well-defined solitary coin lesion 0.5-4 cm that may be mistaken for lung CA)
    - ♦ miliary TB
    - ♦ evidence of past disease: calcified hilar and mediastinal nodes, calcified pulmonary focus, pleural thickening with calcification, apical scarring

### Prevention

- primary prevention
  - airborne isolation for active pulmonary disease
  - BCG vaccine
    - ♦ ~80% effective against pediatric miliary and meningeal TB
    - ♦ effectiveness in adults debated (anywhere from 0-80%)
    - ♦ routine use rarely recommended in Canadian population, however widely used in other countries
- secondary prevention (defer in pregnancy unless mother is high risk)
  - likely INH-sensitive: isoniazid (INH) + pyridoxine (vit B<sub>6</sub> to help prevent INH-associated neuropathy) x 9 mo
  - likely INH-resistant: rifampin x 4 mo

### Treatment of Active Infection

- empiric therapy: INH + rifampin + pyrazinamide + ethambutol + pyridoxine
- pulmonary TB: INH + rifampin + pyrazinamide + ethambutol + pyridoxine x 2 mo (initiation phase), then INH + rifampin + pyridoxine x 4 mo in fully susceptible TB (continuation phase), total 6 mo
- extrapulmonary TB: same regimen as pulmonary TB but increase to 12 mo in bone/joint, CNS, and miliary/disseminated TB + corticosteroids for meningitis, pericarditis
- empiric treatment of suspected MDR (multidrug resistant) or XDR (extensively drug-resistant) TB requires referral to a specialist
  - MDR = resistance to INH and rifampin ± others
  - XDR = resistance to INH + rifampin + fluoroquinolone + ≥1 of injectable, second-line agents
  - suspect MDR TB if previous treatment, exposure to known MDR index case, or immigration from a high-risk area
- note: TB is a reportable disease to Public Health (please see Public Health Agency of Canada website for more information: [www.publichealth.gc.ca](http://www.publichealth.gc.ca))

#### Anti-tuberculosis Drugs for Active Infection

##### RIPE for treatment

Rifampin  
Isoniazid (INH)  
Pyrazinamide  
Ethambutol

## Leprosy (Hansen's Disease)

### Etiology

- *Mycobacterium leprae*: obligate intracellular bacteria, slow-growing (doubling time 12.5 d), survives in macrophages
- bacteria transmitted from nasal secretions, potentially via skin lesions
- invades skin and peripheral nerves leading to chronic granulomatous disease

### Clinical Features

- lesions involve cooler body tissues (e.g. skin, superficial nerves, nose, eyes, larynx)
- spectrum of disease determined by host immune response to infection
  - paucibacillary "tuberculoid" leprosy (intact cell-mediated immune response)
    - ≤5 hypoesthetic lesions, usually hypopigmented, well-defined, dry
    - early nerve involvement, enlarged peripheral nerves, neuropathic pain
    - may be self-limited, stable, or progress over time to multibacillary "lepromatous" form
  - multibacillary "lepromatous" leprosy (weak cell-mediated immune response)
    - ≥6 lesions, symmetrical distribution
    - leonine facies (nodular facial lesions, loss of eyebrows, thickened ear lobes)
    - extensive cutaneous involvement, late and insidious nerve involvement causing sensory loss at the face and extremities
  - borderline leprosy
    - lesions and progression lies between tuberculoid and lepromatous forms

## Investigations

- skin biopsy down to fat or slit skin smears for AFB, PCR
- histologic appearance: intracellular bacilli in spherical masses (lepra cells), granulomas involving cutaneous nerves

## Treatment (WHO Treatment Regimens)

- paucibacillary: dapsone + rifampin monthly x 6 mo
- single skin lesion paucibacillary: single dose of rifampicin, ofloxacin, and minocycline
- multibacillary and borderline: dapsone + rifampin monthly + clofazimine monthly x 12 mo AND low dose clofazimine once daily x 12 mo
- treatment of leprosy can cause an immune reaction to killed bacteria (e.g. erythema nodosum leprosum and reversal reaction): symptomatic management with NSAIDs if mild, prednisone with 6-12 wk taper if severe; thalidomide for erythema nodosum leprosum

## Prognosis

- curable with WHO-approved treatment regimens
- complications: muscle atrophy, contractures, trauma/superinfection of lesions, crippling/loss of limbs, erythema nodosum leprosum
- long post-treatment follow-up warranted to monitor for relapse and immune reactions

# Syphilis

## Etiology

- *Treponema pallidum*: thick motile spirochetes historically detectable by dark-field microscopy (rarely done now)
- transmitted sexually, vertically, or parenterally (rare)

## Clinical Features

- see [Dermatology](#), D31 and [Gynecology](#), GY28
- multi-stage disease
  - primary syphilis (3-90 d post-infection)
    - painless chancre at inoculation site (any mucosal surface)
    - regional lymphadenopathy
    - acute disease lasts 3-6 wk, 25% progress to secondary syphilis without treatment
  - secondary syphilis = systemic infection (2-8 wk following chancre)
    - maculo-papular non-pruritic rash including palms and soles
    - generalized lymphadenopathy, low grade fever, malaise, headaches, aseptic meningitis, ocular/otic syphilis
    - condylomata lata: painless, wart-like lesion on palate, vulva or scrotum (highly infectious)
  - latent syphilis
    - asymptomatic infection that follows untreated primary/secondary syphilis
    - early latent (<1 yr post-infection) or late latent/unknown duration (>1 yr post-infection)
    - increased transmission risk with early latent; longer treatment duration required for late latent
  - tertiary syphilis (1-30 yr post-infection)
    - gummatous syphilis: nodular granulomas of skin, bone, liver, testes, brain
    - aortic aneurysm and aortic insufficiency
    - neurosyphilis: dementia, personality changes, Argyll-Robertson pupils, tabes dorsalis
  - congenital syphilis
    - causes spontaneous abortions, stillbirths, congenital malformations, developmental delay, deafness
    - infants may be asymptomatic until age 2-5 yr then present with rhinitis, lymphadenopathy, hepatosplenomegaly, bone and cartilage degeneration (including saddle nose, saber shins), CN VIII deafness

## Investigations

- screening tests: VDRL and RPR (non-treponemal), EIA (treponemal)
- confirmatory tests: FTA-ABS, MHA-TP, TPPA, TPI, dark field microscopy with silver stain
- LP for 3° syphilis if: seropositive and symptoms of neurosyphilis or treatment failure/other tertiary symptoms/RPR ≥1:32, or with HIV disease and late latent/unknown duration syphilis

## Treatment

- for 1°, 2°, early latent: benzathine penicillin G 2.4 million units IM x 1
- for 3°, late latent: benzathine penicillin G 2.4 million units IM weekly x 3
- if allergic to penicillin: doxycycline 100 mg PO bid x 14 d
- neurosyphilis: aqueous Penicillin G 18-24 million units/d IV x 14 d

## Generalized STI Workup

- see [Family Medicine](#), FM46

**Argyll Robertson Pupil**  
Accommodates but does not react to light.

**Those with Untreated 1° or 2° Syphilis**  
1/3 cure  
1/3 latent indefinitely  
1/3 3° syphilis

**Causes of False Positive VDRL and RPR Tests:**

Viruses (mononucleosis, hepatitis)  
Drugs and substance abuse  
Rheumatic fever  
Lupus and leprosy

Patients with 2° or 3° syphilis treated with penicillin may experience a Jarisch-Herxheimer reaction. Lysis of organisms release pyrogens thought to cause fever, chills, myalgia, flu-like symptoms may last up to 24 h.

**VDRL** Venereal Disease Research Laboratory  
**RPR** Rapid Plasma Reagin  
**EIA** Enzyme Immunoassay  
**TPI** *T. pallidum* Immobilization Assay  
**FTA-ABS** Fluorescent *Treponema* Antibody-Absorption  
**MHA-TP** Microhemagglutination Assay *T. pallidum*  
**TPPA** *T. pallidum* Particle Agglutination Assay

## Lyme Disease

### Etiology/Epidemiology

- spirochete bacteria: *Borrelia burgdorferi* (N. America), *B. garinii*, *B. afzelii* (Europe and Asia)
- transmitted by Ixodes tick
- reported in 49 of the 50 U.S. states, but most cases occur in the Northeast, the Midwest, and Northern California
- in Canada, reported in southern and southeastern Quebec, southern and eastern Ontario, southeastern Manitoba, New Brunswick and Nova Scotia as well as southern British Columbia
- small rodents (mice) serve as primary reservoir, while larger animals (white tailed deer) serve as hosts for ticks
- human contact usually May-August in fields with low brush near wooded areas
- infection usually requires >36 h tick attachment

### Clinical Features

- stage 1 (early localized stage: 7-14 d post-bite)
  - malaise, fatigue, headache, myalgias
  - erythema migrans (EM): expanding, non-pruritic bulls-eye (target) lesions (red with clear centre) on thigh/groin/axilla
- stage 2 (early disseminated stage): weeks post-infection
  - CNS: aseptic meningitis, CN palsies (CNVII palsy), peripheral neuritis
  - cardiac: transient heart block or myocarditis
- stage 3 (late persistent stage: months to years post-infection)
  - may not have preceding history of early stage infection
  - MSK: chronic monoarticular or oligoarticular arthritis
  - acrodermatitis chronica atrophicans (due to *B. afzelii*)
  - neurologic: encephalopathy, meningitis, neuropathy

#### BAKE a Key Lyme Pie

Bell's palsy  
Arthritis  
Kardiac block  
Lyme  
Erythema chronicum migrans

### Investigations

- serology: ELISA, Western Blot

### Prevention

- use of protective clothing (tuck pants into socks), insect repellent, inspection for ticks and prompt removal of tick
- prophylaxis within 72 h of finding engorged attached nymphal tick that has been attached  $\geq 36$  h (approximately) in hyperendemic area (local rate of infection of ticks  $\geq 20\%$ ): doxycycline

### Treatment

- stage 1: doxycycline/amoxicillin/cefuroxime
- stage 2-3: ceftriaxone

## Toxic Shock Syndrome (TSS)

### Etiology

- superantigens produced by some strains of *S. aureus* or GAS cause widespread T-cell activation and pro-inflammatory cytokine release (IL-1, IL-6, TNF). Course of disease is precipitous and leads to acute fever, shock, multiorgan failure
- Staphylococcal TSS involves the production of superantigen TSST-1 (toxic shock syndrome toxin 1)
- Streptococcal TSS involves the production of superantigens SPEA, SPEB, SPEC

### Risk Factors

- Staphylococcal: tampon use, nasal packing, wound infections (e.g. postpartum vaginal or caesarean or other surgical infections)
- Streptococcal: minor trauma, surgical procedures, preceding viral illness (chickenpox), use of NSAIDs

### Clinical Features and Investigations

- acute onset, fever, sBP <90 mmHg
- Staphylococcal TSS:
  - rash with subsequent desquamation, especially on palms and soles
  - involvement of 3 or more organ systems: GI (vomiting, diarrhea), muscular (myalgia, increased CK), mucous membranes (hyperemia), renal, hepatic, hematologic (thrombocytopenia), CNS (disorientation)
  - isolation of *S. aureus* is not required for diagnosis (*S. aureus* is rarely recovered from blood in TSS)
- Streptococcal TSS:
  - erythematous macular rash
  - isolation of GAS (e.g. blood, pleural, tissue biopsy, or surgical wound)
  - $\geq 2$  of coagulopathy, liver involvement, ARDS, soft tissue necrosis (necrotizing fasciitis, myositis, gangrene), renal impairment

**Treatment**

- supportive: fluid resuscitation
- Staphylococcal: for methicillin-susceptible *S. aureus*: clindamycin + cloxacillin (IV); for MRSA: vancomycin x 10-14 d
- Streptococcal: IV penicillin and clindamycin and IVIg

## Cat Scratch Disease

**Etiology**

- *Bartonella henselae*: intracellular bacteria
- cat-to-human transmission via cat scratch/bite

**Clinical Features**

- skin lesion appears 3-10 d post-inoculation
- may be followed by fever, tender regional lymphadenopathy
- in some patients, organism may disseminate causing hepatosplenomegaly, neurologic symptoms
- usually self-limited

**Investigations**

- serology, lymph node biopsy

**Treatment**

- supportive in most cases
- azithromycin x 10-14 d in patients with moderate-severe disease or immunocompromise

## Rocky Mountain Spotted Fever

**Etiology**

- *Rickettsia rickettsii*: obligate intracellular GN organism
- reservoir hosts: rodents, dogs
- vectors: *Dermacentor* ticks
- organisms cause inflammation of endothelial lining of small blood vessels, causing small hemorrhages and thrombi
- can cause widespread vasculitis leading to headache, CNS changes and can progress to death if treatment is delayed

**Clinical Features**

- usually occurs in summer following tick bite
- influenza-like prodrome: acute onset fever, headache, myalgia, nausea/vomiting, anorexia
- macular rash appearing on day 2-4 of fever
  - begins on wrists and ankles, then spreads centrally to arms/legs/trunk/palms/soles
  - occasionally "spotless" (10% of patients)

**Investigations**

- skin biopsy and serology (indirect fluorescent antibody test)

**Treatment**

- doxycycline, usually 5-7 d course

## West Nile Virus

**Epidemiology**

- virus has been detected throughout the United States and much of southern Canada
- overall case-fatality rates in severe cases are ~10%

**Transmission**

- primarily from mosquitoes that have fed on infected birds (crows, blue jays)
- transplacental, blood products (rare), organ transplantation

**Clinical Features**

- most are asymptomatic
- most symptomatic cases are mild (West Nile fever): acute onset of headache, back pain, myalgia, anorexia, maculopapular non-pruritic rash involving chest, back, arms
- severe complications: encephalitis, meningoencephalitis and acute flaccid paralysis (especially in those >60 yr)

**Investigations**

- IgM antibody in serum or CSF (cross reactivity with yellow fever and Japanese encephalitis vaccines, and with dengue Fever and St. Louis virus infection); may not reflect current illness as IgM antibody can last for >6 mo
- viral isolation by PCR from CSF, tissue, blood and fluids (all have low sensitivity)
- CSF: elevated lymphocytes and protein if CNS involvement

**Treatment and Prevention**

- treatment: supportive
- prevention: mosquito repellent (DEET), drain stagnant water, community mosquito control programs

## Fungal Infections

### Skin and Subcutaneous Infections

#### Superficial Fungal Infections

- see [Dermatology](#), D25

#### Dermatophytes

- see [Dermatology](#), D26

#### Subcutaneous Fungal Infection

**Pathophysiology**

- fungi that naturally reside in soil and enter skin via traumatic break
- *Sporothrix schenckii*: most commonly affects gardeners injured by a rose thorn or splinter
  - causes subcutaneous nodule at point of entry
  - fungi may migrate up lymphatic vessels creating nodules along the way – “nodular lymphangitis”

**Treatment**

- oral azole (e.g. itraconazole)
- IV amphotericin B for severe or disseminated infection

## Endemic Mycoses

**Basics**

- three major endemic mycoses in North America
  - histoplasmosis
  - blastomycosis
  - coccidioidomycosis
- thermally dimorphic organisms: mold in cold temperature (e.g. soil) and yeast at higher temperature (e.g. tissue)
- infection occurs through inhalation of spores (soil, bird droppings, vegetation) or inoculation injury
- all can cause pneumonia and may disseminate hematogenously
- may reactivate or disseminate during immunocompromise

**Treatment**

- common to all systemic mycoses
  - oral azole (e.g. itraconazole for mild-moderate local infection)
  - IV amphotericin B for systemic infection

Histoplasmosis is commonly associated with exposure to chicken coops, bird roosts and bat caves.

**High Risk for Dissemination**

- Immunocompromised (e.g. AIDS, steroids, TNF- $\alpha$  inhibitors)
- Pregnancy (3rd trimester)
- Diabetes

Table 20. Endemic Mycoses

Disease	Endemic Region	Clinical Features	Investigations
<i>Histoplasma capsulatum</i>	Ohio and Mississippi river valleys in central USA, Ontario, Quebec; widespread	Asymptomatic (in most people) Primary pulmonary <ul style="list-style-type: none"> <li>Fever, cough, chest pain, headache, myalgia, anorexia</li> <li>CXR (acute): pulmonary infiltrates <math>\pm</math> hilar lymphadenopathy</li> <li>CXR (chronic): pulmonary infiltrates, cavitary disease</li> </ul> Disseminated (rare) <ul style="list-style-type: none"> <li>Occurs primarily in immunocompromised patients</li> <li>Spread to bone marrow (pancytopenia), GI tract (ulcers), lymph nodes (lymphadenitis), skin, liver, adrenals, CNS</li> </ul>	Fungal culture, fungal stain Antigen detection (urine and serum)
<i>Blastomyces dermatitidis</i>	States east of Mississippi River, Northern Ontario and along the great lakes	May be asymptomatic Primary: acute or chronic pneumonia <ul style="list-style-type: none"> <li>Fever, cough, chest pain, chills, night sweats, weight loss</li> <li>CXR (acute): lobar or segmental pneumonia</li> <li>CXR (chronic): lobar infiltrates, fibronodular interstitial disease</li> </ul> Disseminated <ul style="list-style-type: none"> <li>Spread to skin (verrucous lesions that mimic skin cancer, ulcers, subcutaneous nodules), bones (osteomyelitis, osteolytic lesions), GU tract (prostatitis, epididymitis)</li> </ul>	Sputum smear and culture Direct examination of clinical specimens for characteristic broad-based budding yeast (sputum, tissue, purulent material)
<i>Coccidioides immitis</i>	Deserts in southwest USA, northwest Mexico	Primary <ul style="list-style-type: none"> <li>"Valley fever": subacute fever, chills, cough, chest pain, sore throat, fatigue that lasts for weeks to months</li> <li>Can develop hypersensitivity with arthralgias, erythema nodosum</li> </ul> Disseminated <ul style="list-style-type: none"> <li>Rare spread to skin (ulcers), joints (synovitis), bones (lytic lesions), meninges (meningitis)</li> <li>Common opportunistic infection in patients with HIV</li> </ul>	Sputum culture Direct examination of clinical specimens for characteristic yeast (sputum, tissue, purulent material)

## Opportunistic Fungi

### *Pneumocystis jiroveci* (formerly *P. carinii*)

#### Microbiology

- unicellular fungi
- previously classified as a protozoa

#### Transmission

- rarely person-to-person transmission
- most disease is due to reactivation of latent infection acquired by the respiratory route or reinfection by a different genotype
  - causes clinical disease in immunocompromised patients (steroid use, HIV)
  - 80% lifetime risk without prophylaxis in patients with CD4 count  $<200$  cells/mm<sup>3</sup>

#### Clinical Features

- symptoms of pneumonia: fever, nonproductive cough, progressive dyspnea
- classic CXR (see sidebar)

#### Investigations

- demonstration of organism in induced sputum, bronchoalveolar lavage, or endotracheal aspirate (if intubated)

#### Treatment and Prevention

- oxygen to keep SaO<sub>2</sub>  $>90\%$
- antimicrobial options:
  - TMP/SMX (PO or IV) \*First line
  - dapsone and TMP
  - clindamycin and primaquine
  - pentamidine (IV)
  - atovaquone
- corticosteroids used as adjuvant therapy in those with severe hypoxia (pO<sub>2</sub>  $<70$  mmHg or A-a gradient O<sub>2</sub>  $>35$  mmHg)
- prophylactic TMP/SMX for those at high risk of infection (HIV patients when CD4  $<200$  cells/mm<sup>3</sup> or non-HIV immunocompromised patients under specific conditions)

#### CXR in *P. jiroveci*

- Bilateral, diffuse opacities
- CXR may be normal (20-30% cases)
- CT shows cysts (hence the name "Pneumo" "cystis") but almost never pleural effusions

## ***Cryptococcus* spp.**

### **Microbiology**

- encapsulated yeast found worldwide
- 2 human pathogenic species: *C. gattii*, *C. neoformans*

### **Transmission**

- inhalation of airborne yeast from soil contaminated with pigeon droppings (*C. neoformans*) or certain tree species such as Eucalyptus or Douglas fir (*C. gattii*) → may cause local infection in lung → asymptomatic or pneumonia
- may also spread hematogenously to the CNS, skin, bones and other organs
- *C. neoformans* tends to affect immunocompromised hosts
- *C. gattii* tends to affect immunocompetent hosts

### **Clinical Features**

- pulmonary
  - usually asymptomatic or self-limited pneumonitis
  - only 2% of HIV+ patients present with pulmonary symptoms including productive cough, chest tightness, and fever
- disseminated
  - frequently disseminates in HIV+ population
  - CNS: meningitis (leading cause of meningitis in patients with HIV)
  - skin: umbilicated papules that resemble large lesions of *Molluscum contagiosum*

### **Investigations**

- serum cryptococcal antigen
- CSF for meningitis: India-ink stain, cryptococcal antigen test, culture to confirm
- blood C&S

### **Treatment**

- in patients with HIV who have cryptococcal meningitis or severe pulmonary disease:
  - amphotericin B (+ flucytosine) is used in the first 2 wk for induction therapy; limited duration due to side effects
  - switch to fluconazole for at least 8 wk as consolidation therapy, then continue at lower dose for prolonged maintenance

*C. gattii* sees limited geographical distribution including Vancouver Island, Northern Australia, and Papua New Guinea.

India-ink sensitivity for cryptococcus is only 50% (higher in HIV patients).

## ***Candida albicans***

### **Microbiology**

- yeast forms with pseudohyphae at 20°C and germ tube formation at 37°C

### **Transmission**

- normal flora of skin, mouth, vagina and GI tract
- risk factors for overgrowth:
  - immunocompromised state (diabetes, corticosteroids)
  - ICU patients (broad-spectrum antibiotic use, central venous catheters, TPN)

### **Clinical Features**

- mucocutaneous
  - oral thrush, esophagitis (chest pain, odynophagia), vulvovaginitis (see [Gynecology](#), GY24), balanitis, cutaneous (diaper rash, skin folds, folliculitis), chronic mucocutaneous
  - small satellite lesions beyond the margin of the rash distinguish it from tinea or other conditions
- invasive
  - candidemia, endophthalmitis, endocarditis, UTI (upper tract), hepatosplenic disease

### **Treatment**

- thrush: nystatin suspension or pastilles for mild disease, fluconazole for severe disease
- vulvovaginal candidiasis: topical agents (imidazole or nystatin), oral fluconazole for recurrent disease
- cutaneous infection: topical imidazole
- opportunistic infections in HIV, other systemic infections: fluconazole or echinocandin
- chronic mucocutaneous: azoles

## ***Aspergillus* spp.**

### **Microbiology**

- branching septate hyphae
- common species causing disease include *A. fumigatus*, *A. flavus*

### Transmission

- ubiquitous in the air and the environment
- *Aspergillus* produces a toxin called aflatoxin that contaminates nuts, grains and rice

### Clinical Features

- allergic bronchopulmonary aspergillosis (ABPA)
  - IgE-mediated asthma-type reaction with dyspnea, high fever and transient pulmonary infiltrates
  - occurs more frequently in patients with asthma and allergies
- aspergilloma (fungus ball)
  - ball of hyphae in a preexisting lung cavity
  - symptoms range from asymptomatic to massive hemoptysis
  - CXR: round opacity surrounded by a thin lucent rim of air, often in upper lobes ("air crescent" sign)
- invasive aspergillosis
  - associated with prolonged and persistent neutropenia
  - pneumonia – most common
  - may disseminate to other organs: brain, skin
  - severe symptoms with fever, cough, dyspnea, pleuritic pain, tends to cavitate; fatal if not treated early and aggressively
  - CXR: local or diffuse infiltrates ± pulmonary infarction, pulmonary nodules
- mycotoxicosis
  - aflatoxin produced by *A. flavus* (nuts, grains, rice)
  - results in liver hemorrhage, necrosis and hepatocellular carcinoma formation

### Treatment Options

- for invasive aspergillosis: voriconazole or amphotericin B
- surgical resection for aspergilloma and hemorrhage
- corticosteroids for ABPA

## Parasitic Infections

### Protozoa – Intestinal/Genitourinal Infections

#### *Entamoeba histolytica* (Amoebas)

### Transmission

- reservoir: infected humans
- cysts by fecal-oral and food/waterborne transmission in areas of poor sanitation
- seen in immigrants, travellers, institutionalized individuals, Aboriginal Canadians, MSM

### Clinical Features

- asymptomatic carriers
- amoebic dysentery
  - abdominal pain, cramping, colitis, dysentery, low grade fever with bloody diarrhea secondary to local tissue destruction and ulceration of large intestine
- amoebic abscesses
  - most common in liver (hematologic spread); presents with RUQ pain, weight loss, fever, hepatomegaly
  - can also occur in lungs and brain

### Investigations

- serology, fecal/serum antigen testing, stool exam (for cysts and trophozoites), colon biopsy
- *E. histolytica* indistinguishable microscopically from the non-pathogen *E. dispar* (distinguish by specific stool antigen detection)

### Treatment and Prevention

- metronidazole
- for invasive disease or cyst elimination: follow with iodoquinol or paromomycin
- aspiration of hepatic abscess if risk of cyst rupture, poor response to medical therapy, or diagnostic uncertainty
- asymptomatic cyst: iodoquinol or paromomycin alone
- good personal hygiene, purification of water supply by boiling, filtration (not chlorination)

Figure 8. *Entamoeba* life cycle

## ***Giardia lamblia***

### **Transmission**

- reservoir: infected humans and other mammals
- food/waterborne (especially in the Rockies) and fecal-oral transmission of infectious cysts
- risk factors: travel, camping, institutions, day care centres, MSM

### **Clinical Features**

- giardiasis (“beaver fever”)
  - symptoms vary from asymptomatic to self-limited mild watery diarrhea to malabsorption syndrome (chronic giardiasis where the parasite coats small intestine and thus prevents fat absorption)
  - nausea, malaise, abdominal cramps, bloating, flatulence, fatigue, weight loss, steatorrhea
  - no hematochezia (no invasion into intestinal wall), no mucus in stool

### **Investigations**

- multiple stool samples (daily x 3 d) for microscopy, stool antigen used occasionally
- occasionally small bowel aspirate or biopsy

### **Treatment and Prevention**

- metronidazole, nitazoxanide if symptomatic
- good personal hygiene and sanitation, water purification (iodine better than chlorination), outbreak investigation

## ***Trichomonas vaginalis***

### **Transmission**

- sexual contact

### **Clinical Features**

- often asymptomatic (10-50%), especially males (occasionally urethritis, prostatitis)
- trichomonas vaginitis (see [Gynecology](#), GY25)
  - vaginal discharge (profuse, malodorous, yellow-green or grey, frothy), pruritus, dysuria, dyspareunia

### **Investigations**

- wet mount (motile parasites), antigen detection, culture
- urine PCR to detect in males

### **Treatment**

- metronidazole for patient and partner(s)

Trichomonas causes 25% of vaginitis.

## ***Cryptosporidium* spp.**

### **Transmission**

- reservoir: infected humans and a wide variety of young animals
- fecal-oral transmission by ingestion of cysts, waterborne
- risk factors: summer and fall, young children (day care), MSM, contact with farm animals, immunocompromise, immune reconstitution

### **Clinical Features**

- range from self-limited watery diarrhea (immunocompetent) to chronic, severe, non-bloody diarrhea with nausea, vomiting, abdominal pain, and anorexia resulting in weight loss and death (immunocompromised)

### **Investigations**

- modified acid-fast stain of stool specimen, microscopic identification of oocysts in stool or tissue, stool antigen detection by direct fluorescent antibody

### **Treatment and Prevention**

- supportive care only for immunocompetent hosts
- in HIV, try HAART to restore immunity; if fails, try nitazoxanide
- good personal hygiene, water filtration

## Blood and Tissue Infections

### *Plasmodium* spp. (Malaria)

#### Microbiology

- species include: *P. falciparum* (most common and most lethal), *P. vivax*, *P. ovale*, *P. malariae*, *P. knowlesi* (new species isolated from primates in Malaysia, potentially fatal)
- complex life cycle: human host for asexual reproduction and mosquito for sexual reproduction
- sporozoite from mosquitos infect liver cells in which parasites multiply and are released as merozoites which infect RBCs causing disease
- P. ovale* and *P. vivax* can produce dormant hypnozoites in the liver that may cause relapsing malarial attacks by reactivating (entering the erythrocytic cycle) after many months

#### Transmission

- reservoir: infected human
- transmission by the night-biting female *Anopheles* mosquito, vertical transmission and blood transfusion
- occurs in tropical/subtropical regions (sub-Saharan Africa, Oceania, South Asia, Central America, Southeast Asia, South America)

#### Clinical Features

- flu-like prodrome
- paroxysms of high spiking fever and shaking chills (due to synchronous systemic lysis of RBCs) (lasts several hours)
  - P. vivax* and *P. ovale*: chills and fever q48h but can be variable
  - P. malariae*: chills and fever q72h but can be variable
  - P. falciparum*: less predictable fever interval, can be highly variable (>90% ill within 30 d)
- abdominal pain, diarrhea, myalgia, headache, and cough
- hepatosplenomegaly and thrombocytopenia without leukocytosis

#### Complications

- P. falciparum*: CNS involvement (cerebral malaria = seizures and coma), severe anemia, acute renal failure, ARDS, primarily responsible for fatal disease
- P. knowlesi*, and rarely *P. vivax* can be fatal

#### Investigations

- microscopy: blood smear q12-24h (x3) to rule out infection
  - thick smear (Giemsa stain) for presence of organisms
  - thin smear (Giemsa stain) for species identification and quantification of parasites
- rapid antigen detection tests

#### Treatment and Prevention

- P. vivax*, *P. ovale*: chloroquine (and primaquine to eradicate liver forms)
- P. vivax*, chloroquine resistant: primaquine with quinine and doxycycline or tetracycline or mefloquine
- P. malariae*, *P. knowlesi*: chloroquine
- P. falciparum*: most areas of the world show chloroquine resistance
  - artemisinin combination therapy (e.g. artesunate + doxycycline or clindamycin or atovaquone/proguanil)
  - atovaquone/proguanil combination (Malarone®)
  - quinine plus doxycycline, tetracycline or clindamycin
  - mefloquine and artemisinin resistance increasing in southeast Asia (check local resistance)
- prevented by antimalarial prophylaxis, bed nets, insect repellent

Malaria is the most common fatal infectious disease worldwide.

**Figure 9. Life cycle of *Plasmodium* spp.**

#### Drugs for Preventing Malaria in Travelers

Cochrane DB Syst Rev 2010;CD006491

Study: Cochrane Systematic Review. 8 RCTs.

**Population:** 4240 non-immune adults and children traveling to regions with *P. falciparum* resistance to chloroquine.

**Intervention:** Atovaquone-proguanil, doxycycline, mefloquine, chloroquine-proguanil, or primaquine used for malaria prophylaxis.

**Outcome:** Efficacy, safety, and tolerability.

**Results:** Atovaquone-proguanil and doxycycline had similar adverse events. Atovaquone-proguanil had fewer overall (RR 0.72), GI (RR 0.54), neuropsychiatric (RR 0.49) than mefloquine. Doxycycline also had fewer neuropsychiatric events than mefloquine (RR 0.84).

**Conclusion:** Atovaquone-proguanil or doxycycline as prophylaxis against malaria is best tolerated in terms of adverse effects and mefloquine is associated with adverse neuropsychiatric outcomes.

### *Trypanosoma cruzi*

#### Transmission

- found in Mexico, South America and Central America
- transmission by *Reduviid* insect vector ("Kissing Bug"), which defecate on skin and tryptomastigotes in the stool usually rubbed into bite site by host (majority of infections)
- also transmitted via placental transfer, organ donation, blood transfusion and ingestion of contaminated food containing *Reduviid* insects (especially cane juice)

#### Clinical Features

- American trypanosomiasis (Chagas disease)
  - acute: usually asymptomatic, local swelling at site of inoculation ("Romanas sign"; usually around one eye) with variable fever, lymphadenopathy, cardiomegaly and hepatosplenomegaly
  - intermediate phase: asymptomatic but increasing levels of parasite and antibody in blood; most infected persons remain in this phase
  - chronic: can lead to chronic dilated cardiomyopathy, esophagomegaly and megacolon 10-25 yr after acute infection in 30-40% of infected individuals

### Investigations

- wet prep and Giemsa stain of thick and thin blood smear, serology, PCR

### Treatment and Prevention

- acute: nifurtimox or benznidazole
- intermediate: increasing trend to treat as acute infection
- chronic: symptomatic therapy, surgery including heart transplant, or esophagectomy, colectomy, as necessary, may be a benefit to antiparasitic treatment
- insect control, bed nets

## Toxoplasma gondii

### Transmission

- acquired through exposure to cat feces (oocysts), ingestion of undercooked meat (tissue cysts), vertical transmission, organ transplantation, whole blood transfusions

### Clinical Features

- congenital
  - result of acute primary infection of mother during pregnancy (TORCH infection – see [Obstetrics](#), OB20)
  - stillbirth (rare), chorioretinitis, blindness, seizures, severe developmental delay, microcephaly
  - initially asymptomatic infant may develop reactivation of chorioretinitis as adolescent or adult → blurred vision, scotoma, ocular pain, photophobia, epiphora, hearing loss, developmental delay
- acquired
  - usually asymptomatic or mononucleosis-like syndrome in immunocompetent patient
  - infection remains latent for life unless reactivation due to immunosuppression
- immunocompromised (most commonly AIDS with CD4 <200)
  - encephalitis with focal CNS lesions seen as single or multiple ring-enhancing masses on CT (headache and focal neurological signs)
  - lymph node, liver and spleen enlargement and pneumonitis
  - chorioretinitis

### Investigations

- serology, CSF Wright-Giemsa stain, antigen or DNA detection (PCR); pathology provides definitive diagnosis
- immunocompromised patients: consider CT scan (ring-enhancing lesion in cortex or deep nuclei) and ophthalmologic examination
- negative serology in many AIDS patients (false negative due to decreased lymphocyte population)

### Treatment and Prevention

- no treatment if: immunocompetent, not pregnant, no severe organ damage
- pregnancy: spiramycin to prevent transplacental transmission or pyrimethamine + sulfadiazine (add folinic acid), avoid undercooked meat and refrain from emptying cat litter boxes
- HIV: pyrimethamine + sulfadiazine, AIDS prophylaxis: see HIV section
- eye disease, meningitis: corticosteroids
- proper hand hygiene, cook meat thoroughly

1/3 of Ontario's population is infected with *Toxoplasma gondii*.

#### Classic Triad of Congenital Toxoplasmosis:

- Chorioretinitis
- Hydrocephalus
- Intracranial calcifications

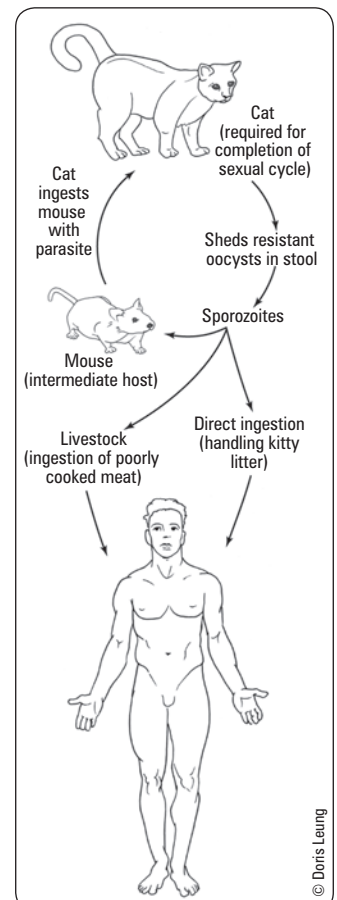

Figure 10. Life cycle of *Toxoplasma gondii*

## Helminths

### Roundworms – Nematodes

Table 21. Nematodes (roundworms)

Nematode	Epidemiology	Transmission	Medical Importance	Treatment
<i>Ascaris lumbricoides</i>	Tropics	Human feces, ingestion of contaminated food or water	Abdominal pain and intestinal obstruction from high worm burden Cough, dyspnea, pulmonary infiltrates from larval migration through lungs (Löfller's syndrome)	Mebendazole OR albendazole OR pyrantel pamoate
<i>Trichuris trichiura</i> (whipworm)	Tropics	Ingestion of eggs in soil	Diarrhea (± mucous, blood), abdominal pain, rectal prolapse, stunted growth	Mebendazole OR albendazole
<i>Onchocerca volvulus</i>	Africa, Latin America	Blackfly bite	River blindness (onchocerciasis), dermatitis	Ivermectin + doxycycline

**Table 21. Nematodes (roundworms) (continued)**

Nematode	Epidemiology	Transmission	Medical Importance	Treatment
<i>Wuchereria bancrofti</i>	Tropics	Mosquito bite	Damage to lymphatics resulting in lymphadenopathy, lymphedema, and elephantiasis Tropical pulmonary eosinophilia	Diethylcarbamazine + doxycycline
<i>Loa Loa</i>	Central Africa	Deer fly bite	Subcutaneous migration of worm, hyperresponsiveness in travelers	Diethylcarbamazine, removal of adult
<i>Enterobius vermicularis</i> (Pinworm)	Worldwide	Human host: fecal-oral self-inoculation and fomite person-to-person transfer Adult worms live in cecum and deposit eggs in perianal skin	Asymptomatic carriers or severe nocturnal perianal itching (pruritus ani) Occasional vaginitis Abdominal pain, nausea, vomiting with high worm burden	Sticky tape test: eggs adhere to tape applied to perianal skin (need 5-7 tests to rule out) Examination of perianal skin at night may reveal adult worms Usually no eosinophilia as no tissue invasion Mebendazole, albendazole; pyrantel in pregnancy Change underwear, bathe in morning, pajamas to bed, wash hands, trim fingernails Treat all family members simultaneously Reinfection common
<i>Strongyloides stercoralis</i> (Threadworm)	Subtropical, tropical and temperate (including southern US)	Fecal contamination of soil: transmission via unbroken skin, walking barefoot Autoinfection: penetration of larvae through GI mucosa or perianal skin Adult worms live in mucosa of small intestine	One of few worms able to multiple in human host Mostly asymptomatic infection or can have pruritic dermatitis at site of larval penetration Transient pulmonary symptoms during pulmonary migration of larvae (eosinophilic pneumonitis = Löffler's syndrome) Abdominal pain, diarrhea, pruritis ani, larva currens (itchy rash) Hyperinfection: occasional fatal cases caused by massive auto-infection in immunocompromised host; immunoblastic therapy, including high-dose corticosteroids, is the most common risk factor for disseminated infection	Ivermectin, 200 µg/kg/d PO x 2 doses (albendazole 40 mg PO bid x 7 d, less effective)

**Figure 11. Life cycle of *Enterobius***

## Flatworms

### Cestodes/Trematodes

**Table 22. Cestodes/Trematodes (flatworms)**

	Epidemiology	Transmission	Medical Importance	Treatment
<b>CESTODES</b>				
<i>Taenia solium</i>	Developing countries	Undercooked pork (larvae), human feces (eggs)	Taeniasis: mild abdominal symptoms Cysticercosis: mass lesions in CNS, eyes, skin, seizures	Corticosteroids + albendazole for cysticercosis Antiepileptics if seizures praziquantel for adult tapeworm in gut (taeniasis)
<i>Taenia saginata</i>	Developing countries	Undercooked beef (larvae)	Mild GI symptoms	Praziquantel
<i>Diphyllobothrium latum</i>	Europe, North America, Asia	Raw fish	B <sub>12</sub> deficiency leading to macrocytic anemia and posterior column deficits	Praziquantel
<i>Echinococcus granulosus</i>	Rural areas Sheep raising countries	Dog feces (eggs)	Liver/lung cysts (enlarge between 1-20 yr; may cause mass effect or rupture) Risk of anaphylaxis if cystic fluid released during surgical evacuation	Albendazole alone Surgery + perioperative albendazole Percutaneous aspiration + perioperative albendazole
<b>TREMATODES</b>				
<i>Clonorchis sinensis</i>	Japan, Taiwan, China, SE Asia	Raw fish	Exists in bile ducts, causes inflammation and sometimes cholangiocarcinoma	Praziquantel
<i>Schistosoma</i> spp.	Africa, SE Asia, focal in Western Hemisphere	Fresh water exposure	Chronic sequelae secondary to long-term infection (e.g. chronic liver disease, SCC of the bladder)	Praziquantel

## Trematodes/Flukes

### *Schistosoma* spp.

#### Species

- *S. mansoni*, *S. hematobium*, *S. japonicum*

#### Transmission

- larvae (cercariae), released from snails, penetrate unbroken skin in infested fresh water (see Figure 13)
- adult worms live in terminal venules of bladder/bowel passing eggs into urine/stool
- eggs must reach fresh water to hatch; schistosomes cannot multiply in or pass between humans

#### Clinical Features

- most asymptomatic; symptoms seen in travelers (nonimmune)
- Swimmer's itch: pruritic skin rash at site of penetration (cercarial dermatitis)
- acute schistosomiasis (Katayama fever): hypersensitivity to migrating parasites (4-8 wk after infection)
  - fever, hives, headache, weight loss, cough, abdominal pain, chronic diarrhea, eosinophilia

#### Complications of Chronic Infection

- caused by granulomatous response and fibrosis secondary to egg deposition by adults in the veins surrounding the intestine or bladder
- more common in individuals from sub-Saharan Africa, South America, Asia, Caribbean, Eastern Mediterranean/North Africa
- *S. mansoni*, *S. japonicum*
  - worms in mesenteric vein, eggs in portal tracts of liver and bowel
  - heavy infections: intestinal polyps, portal and pulmonary hypertension, splenomegaly (2° to portal HTN), hepatomegaly
- *S. hematobium*
  - worms in vesical plexus, eggs in distal ureter and bladder induce granulomas and fibrosis
  - hematuria and obstructive uropathy; associated with squamous cell bladder cancer
- neurologic complications: spinal cord neuroschistosomiasis (transverse myelitis), cerebral or cerebellar neuroschistosomiasis (increased ICP, focal CNS signs, seizures)
- pulmonary complications: granulomatous pulmonary endarteritis, pulmonary hypertension, cor pulmonale; especially in patients with hepatosplenic involvement

#### Investigations

- serology (high sensitivity and specificity), CBC (eosinophilia, anemia, thrombocytopenia)
- *S. mansoni*, *S. japonicum*: eggs in stool, liver U/S shows fibrosis, rectal biopsy
- *S. hematobium*: bladder biopsy, eggs in urine and occasionally stool, kidney and bladder U/S

#### Treatment and Prevention

- praziquantel
- add glucocorticoid if acute schistosomiasis or neurologic complications develop
- proper disposal of human fecal waste, molluscicide, avoidance of infested water

Figure 12. Life cycle of *Strongyloides*

Figure 13. Life cycle of *Schistosoma*

## Ectoparasites

- scabies, lice
- see [Dermatology](#), D27

## Travel Medicine

#### General Travel Precautions

- vector-borne: long-sleeves, long pants, hats, repellents (containing permethrin) applied to clothes, belongings and bed nets, repellents applied to skin (DEET)
- food/water: avoid eating raw meats/seafood, uncooked vegetables and milk/dairy products; drink only bottled beverages, chlorinated water, boiled water
- recreation: caution when swimming in schistosomiasis-endemic regions, fresh water rafting/kayaking, beaches that may contain human/animal waste products, near storm drains, after heavy rainfalls
- prophylaxis: malaria (chloroquine, mefloquine, atovaquone + proguanil, doxycycline), traveller's diarrhea (bismuth salicylate)

- standard vaccines up to date (HepB, MMR, tetanus/diphtheria, varicella, pertussis, polio)
- travel vaccines: Hepatitis A/B, Japanese encephalitis, typhoid fever, yellow fever, rabies, ETEC, cholera
- sexually transmitted and blood-borne infections: safe sex practices, avoidance of percutaneous injury through razors, tattoos, piercings

### Infectious Diseases to Consider

- vector borne: malaria, dengue fever, Chikungunya fever, yellow fever, *Rickettsia*, West Nile virus, trypanosomiasis, Japanese encephalitis, tick-borne encephalitis, spotted fever, leishmaniasis
- sexually transmitted: HIV, HBV, syphilis, usual STIs
- zoonotic: rabies, hantavirus, tularemia, Q fever, anthrax, brucellosis
- airborne: TB
- food/water: HAV, HEV, brucellosis, typhoid, paratyphoid, amoebiasis, dysentery, traveller's diarrhea, cholera, *Campylobacter* spp.
- soil/water: schistosomiasis, strongyloidiasis, leptospirosis, cutaneous larva migrans, histoplasmosis, paracoccidioidomycosis

For up to date information on geographic and seasonal patterns of disease and travel advisories, check the website for the United States Centers for Disease Control and Prevention ([wwwnc.cdc.gov/travel](http://wwwnc.cdc.gov/travel)) or Foreign Affairs Canada ([travel.gc.ca](http://travel.gc.ca)).

## Fever in the Returned Traveller

### Etiology

- commonly identified causes of fever in returning traveller
  - parasitic: malaria (20-30%)
  - viral: non-specific mononucleosis-like syndrome (4-25%), dengue (5%), viral hepatitis (3%)
  - bacterial: typhoid from *Salmonella* (2-7%), rickettsioses (3%)
  - diverse group of causative pathogens: traveller's diarrhea (10-20%), RTI (10-15%), UTI/STI (2-3%)
- febrile illness in travellers can be caused by routine infections that are common in nontravellers (e.g. URTI, UTI)
- less commonly, fever can be due to non-infectious causes: e.g. DVT, PE

### History

- pre-travel preparation
- travel itinerary: when, where, why, what, who, how?
  - dates of travel (determine incubation period)
  - season of travel: wet or dry
  - destination: country, region (urban or rural), environment (jungle, desert, etc.)
  - purpose of trip
- persons visiting friends and family more likely to be exposed to local population and pathogens
  - style of travel: lodgings, camping, adventure travelling
  - local population: sick contacts
  - transportation: use of animals
- exposure history
  - street foods, untreated water: increased risk of traveller's diarrhea, enteric fever
  - uncooked meat/unpasteurized dairy: increased risk of parasitic infection
  - body fluids (sexual contacts, tattoos, piercings, IVDU, other injections)
  - increased risk of HBV, HCV, HIV, GC, *C. trachomatis*, syphilis
  - animal/insect bites: increased risk of malaria, dengue, rickettsioses, rabies
- fever pattern
- incubation period: use the earliest and latest possible dates of exposure to narrow the differential diagnosis and exclude serious infections
  - <21 d: consider malaria, typhoid fever, dengue fever, rickettsioses; exclude HBV, TB
  - >21 d: consider malaria, TB; exclude dengue fever, travellers' diarrhea, rickettsioses
- body systems affected: GI, respiratory, CNS, skin

### Investigations

- all travellers with fever should undergo the following tests:
  - bloodwork: CBC and differential, liver enzymes, electrolytes, creatinine, thick and thin blood smears x3 (for malaria), blood C&S
  - urine: urinalysis, urine C&S
- special tests based on symptoms, exposure history, and geography
  - stool: C&S, O&P
  - CXR
  - dengue serology for IgM

Fever in traveller from malaria endemic area is malaria until proven otherwise.

#### Important Exposures

##### Insect Bites

Mosquito	<ul style="list-style-type: none"> <li>• <i>Plasmodium</i> spp. (Malaria)</li> <li>• Dengue</li> <li>• Lymphatic filariasis (Elephantiasis)</li> <li>• West Nile Encephalitis</li> <li>• Yellow Fever</li> <li>• Japanese Encephalitis</li> </ul>
Tick	<ul style="list-style-type: none"> <li>• <i>Borrelia burgdorferi</i> (Lyme Disease)</li> <li>• <i>Rickettsia rickettsii</i> (Rocky Mountain Spotted Fever)</li> </ul>
Fly	<ul style="list-style-type: none"> <li>• <i>Trypanosoma brucei</i> spp. (African sleeping sickness)</li> <li>• <i>Leishmania</i> spp. (Leishmaniasis)</li> <li>• <i>Bartonella bacilliformis</i> (Bartonellosis)</li> </ul>
Flea	<ul style="list-style-type: none"> <li>• <i>Yersinia</i> (Plague)</li> <li>• <i>Tunga penetrans</i> (Tungiasis)</li> </ul>

##### Mammal Bites

Dog/Cat	<ul style="list-style-type: none"> <li>• Rabies, Pasteurella, anaerobes, <i>Streptococcus</i>, <i>S. aureus</i></li> </ul>
Human	<ul style="list-style-type: none"> <li>• <i>Streptococcus</i>, <i>S. aureus</i>, oral anaerobes, <i>Eikenella</i></li> </ul>

##### Oral Exposures

Unpasteurized milk	<ul style="list-style-type: none"> <li>• <i>Brucella</i> spp., non-tuberculous mycobacteria, <i>Salmonella</i>, <i>E. coli</i>, <i>Listeria</i></li> </ul>
Undercooked meat/fish	<ul style="list-style-type: none"> <li>• Enteric bacteria, helminths, protozoa</li> </ul>
Water	<ul style="list-style-type: none"> <li>• Hep A/E, Norwalk, cholera, <i>Salmonella</i>, <i>Shigella</i>, <i>Giardia</i>, poliovirus, <i>Cryptosporidium</i>, <i>Cyclospora</i></li> </ul>

##### Environmental Exposures

Freshwater	<ul style="list-style-type: none"> <li>• <i>Leptospira</i> spp., schistosomes, <i>Acanthamoeba</i>, <i>Naegleria fowleri</i></li> </ul>
Soil	<ul style="list-style-type: none"> <li>• Hookworms, <i>Toxocara</i> spp. (visceral larva migrans), <i>Leptospira interrogans</i> (leptospirosis)</li> </ul>

Adapted with permission from *Lancet* 2003;361:1459-69

Table 23. Fever in the Returned Traveller

Illness	Geography/ Timing	Pathogen	Incubation Period	Clinical Manifestations	Diagnosis	Treatment
<b>Malaria</b>	Africa India C. and S. America SE Asia Usually rural, night-biting mosquitoes	<i>Plasmodium falciparum</i> <i>Plasmodium vivax</i> <i>P. malariae</i> <i>P. ovale</i> <i>P. knowlesi</i>	10 d to 40 yr	Fever and flu-like illness, (shaking chills, headache, muscle aches, and fatigue) Nausea, vomiting, and diarrhea Anemia and jaundice <i>Plasmodium falciparum</i> : (severe) kidney failure, seizures, mental confusion, prostration, coma, death, respiratory failure	Blood smear (thick and thin) x3 Antigen detection PCR (mostly a research tool)	Artesunate (for severe disease) + malarone, doxycycline, or clindamycin Quinine sulfate + doxycycline or clindamycin Chloroquine + primaquine
<b>Dengue</b>	South East Asia Caribbean Usually urban, day-biting mosquitoes	Dengue viruses	3 d to 2 wk	Sudden onset of fever, headache, retro-orbital pain, myalgias and arthralgias Leukopenia Thrombocytopenia Hemorrhagic manifestations (rare in travelers)	Anti-dengue IgM positivity	Symptom relief: Acetaminophen (avoid using NSAIDs because of anticoagulant properties)
<b>Typhoid (enteric fever)</b>	Global but mostly Indian subcontinent	<i>Salmonella typhi</i> <i>Salmonella paratyphi</i>	3 to 60 d	Sustained fever 39° to 40° C (103° to 104° F) Abdominal pain, headache, loss of appetite, cough, constipation	Stool, urine or blood sample positive for <i>S. typhi</i> or <i>S. paratyphi</i>	Quinolone antibiotic (e.g. ciprofloxacin), ceftriaxone or macrolide
<b>Tick typhus</b>	Mediterranean South Africa India	<i>Rickettsia</i>	1 to 2 wk	Fever, headache, fatigue, muscle aches, occasionally rash Eschar at site of tick bite Thrombocytopenia Elevated liver enzymes	Serology Presence of classic tick eschar	Doxycycline
<b>TB</b>	Global	<i>M. tuberculosis</i>	Variable	Fever, cough, hemoptysis	CXR Sputum culture and acid-fast stain	Ethambutol, isoniazid, pyrazinamide, rifampin
<b>Mononucleosis</b>	Caribbean, C. and S. America	EBV or CMV	30 to 50 d	Malaise, fatigue, pharyngitis, lymphadenopathy, splenomegaly	Atypical lymphocytes on blood smear and positive heterophilic antibody (monospot) test	Acetaminophen or NSAIDs, fluids

## Fever of Unknown Origin (FUO)

Table 24. Classification of Fever of Unknown Origin (FUO) – Temp &gt;38.3°C/101°F on several occasions

Classical FUO	Nosocomial FUO	Neutropenic FUO	HIV-associated FUO
Duration >3 wk	Hospitalized patient	Neutrophil count <500/mL or is expected to fall to that level in 1-2 d	HIV infections
Diagnosis uncertain after 3 outpatient visits or 3 d in hospital or 1 wk of intensive ambulatory investigation	Infection not present/ incubating on admission	Diagnosis uncertain after 3 d of investigation, including at least 2 d incubation of cultures	Duration >4 wk for outpatients, >3 d for hospitalized patients
	Diagnosis uncertain after 3 d of investigation, including at least 2 d incubation of cultures		Diagnosis uncertain after 3 d of investigation, including at least 2 d incubation of cultures

### Anti-Drugs that may Cause Fever:

- Anti-microbials (sulfonamides, penicillins, nitrofurantoin, antimalarials)
- Anti-hypertensives (hydralazine, methyldopa)
- Anti-epileptics (barbiturate, phenytoin)
- Anti-arrhythmics (quinine, procainamide)
- Anti-inflammatories (NSAIDs)
- Anti-thrombotic (ASA)
- Anti-histamines
- Anti-thyroid

### Etiology of Classic FUO

- infectious causes (~30%)
  - TB: extra-pulmonary (most common), miliary, pulmonary (if pre-existing disease)
  - abscess: subphrenic, liver, splenic, pancreatic, perinephric, diverticular, pelvis, psoas
  - osteomyelitis
  - bacterial endocarditis (culture negative)
  - uncommon: viral (CMV, EBV), fungal (histoplasmosis, cryptococcosis), parasitic (toxoplasmosis, leishmaniasis, amoebiasis, malaria)
- neoplastic causes (~20%)
  - most commonly lymphomas (especially non-Hodgkin's) and leukemias, also multiple myeloma, myelodysplastic syndrome
  - solid tumours: RCC (most common), also breast, liver (hepatoma), colon, pancreas or liver metastases
- collagen vascular diseases (~30%)
  - SLE, RA, rheumatic fever, vasculitis (temporal arteritis, PAN), JRA, Still's disease
- miscellaneous (~20%)
  - drugs, factitious fever
  - sarcoidosis, granulomatous hepatitis, IBD
  - hereditary periodic fever syndromes (such as familial Mediterranean fever)
  - venous thromboembolic disease: PE, DVT
  - endocrine: thyroiditis, thyroid storm, adrenal insufficiency, pheochromocytoma
- unknown despite investigations in 30-50% despite detailed work-up

### Causes of Nosocomial FUO

#### B, C, D, E

Bacterial and fungal infections of respiratory tract and surgical sites  
Catheters (intravascular and urinary)  
Drugs  
Emboli

### Approach to Classic FUO

- careful history: travel, environmental/occupational exposures, infectious contacts, medication history, immunizations, TB history, sexual history, past medical history, comprehensive review of systems (including symptoms that resolved before interview)
- thorough physical exam: fever pattern, rashes (skin, mucous membranes), murmurs, arthritis, lymphadenopathy, organomegaly
- initial investigations as appropriate
  - bloodwork: CBC and differential, electrolytes, BUN, Cr, calcium profile, LFTs, ESR, CRP, muscle enzymes, RF, ANA, serum protein electrophoresis (SPEP), blood smear
  - cultures: blood (x 2 sets), urine, sputum, stool C&S, O&P, other fluids as appropriate
  - serology: HIV, monospot, CMV IgM
  - imaging: CXR, abdominal imaging
- if there are diagnostic clues from any of the above steps, proceed with directed exam, biopsies or invasive testing as required, followed by directed treatment once a diagnosis is established
- if no diagnosis with the above, consider empiric therapy vs. watchful waiting
  - without intervention: patients that remain undiagnosed despite extensive work-up have good prognosis

## Infections in the Immunocompromised Host

- immunocompromised hosts have increased susceptibility to infections from pathogens that are typically low virulence, commensal, or latent
- type of immunosuppression predicts probable spectrum of agents

### Factors that Compromise the Immune System

- general: age (very young or elderly), malnutrition
- immune disease: HIV/AIDS, malignancies, asplenia (functional or anatomic), hypogammaglobulinemia, neutropenia
- DM
- iatrogenic: corticosteroids, chemotherapy, radiation treatment, anti-TNF therapy, other immunosuppressive drugs (e.g. in transplant patients)

Table 25. Types of Immunocompromise

Type	Conditions	Vulnerable To
Cell-Mediated Immunity	HIV, Hodgkin's, hairy cell leukemia, cytotoxic drugs, SCID, DiGeorge syndrome	Latent viruses Fungi Parasites
Humoral Immunity	CLL, lymphosarcoma, multiple myeloma, nephrotic syndrome, protein-losing enteropathy, burns, sickle cell anemia, asplenia, splenectomy, selective Ig deficiencies, Wiskott-Aldrich syndrome	Encapsulated organisms ( <i>S. pneumoniae</i> , <i>H. influenzae</i> , <i>N. meningitidis</i> , <i>Salmonella typhi</i> , GBS)
Neutrophil Function	Myelodysplasia, paroxysmal nocturnal hemoglobinuria, radiation, cytotoxic drug therapy, C3 or C5 deficiencies, chronic granulomatous disease	Catalase-producing organisms ( <i>Staphylococcus</i> , <i>Serratia</i> , <i>Nocardia</i> , <i>Aspergillus</i> )

#### Infections associated with Asplenia

- Hemophilus influenzae B*
- Streptococcus pneumoniae*
- Neisseria meningitidis*
- Salmonella*
- Babesiosis*
- Malaria*
- Capnocytophaga canimorsus* (dog bite)

ANC (absolute neutrophil count) = WBC x (%neutrophils + %bands)

Usual signs and symptoms of infection may be diminished because neutrophils are required for a robust inflammatory response. Exam and x-ray findings may be more subtle.

WBC is lowest between 5-10 d after last chemo cycle.

Prophylaxis against FN with G-CSF (granulocyte colony-stimulating factor) and GM-CSF (granulocyte-macrophage colony-stimulating factor) decreases hospitalization without affecting mortality (indicated if risk of FN 20% or if FN has occurred in a previous chemo cycle).

## Febrile Neutropenia (FN)

### Definition

- $\geq 38.3^{\circ}\text{C}/101^{\circ}\text{F}$  or  $\geq 38.0^{\circ}\text{C}/100.4^{\circ}\text{F}$  for  $\geq 1$  h) and one of:
  - ANC  $< 0.5$  OR
  - ANC  $< 1.0$  but trending down to 0.5

### Pathophysiology

- decreased neutrophil production
  - marrow: infection, aplastic/myelophthisic anemia, leukemia, lymphoma, myelodysplastic syndromes
  - iatrogenic: cancer chemotherapy, radiation, drugs
  - deficiencies: vitamin B<sub>12</sub>, folate
- increased peripheral neutrophil destruction
  - autoimmune: Felty's syndrome, SLE, antineutrophil antibodies
  - splenic sequestration

### Epidemiology/Etiology

- most common life-threatening complication of cancer therapy
- 8 cases per 1000 cancer patients per year in the US
- causative organism identified only 1/3 of the time
- GN (especially *Pseudomonas*) historically most common
- GP more common now
- fungal superinfection if neutropenia prolonged or if concurrent antibiotic use (especially *Candida*, *Aspergillus*)

### Investigations

- examine for potential sites of infection: mucositis and line infections are most common
- do NOT perform DRE; examine perianal region
- blood C&S (x2 sets), urine C&S, culture all indwelling catheter ports,  $\pm$  sputum C&S and NP swab for respiratory viruses
- CBC and differential, Cr, BUN, electrolytes, AST/ALT, total bilirubin

### Treatment

- most hospitals have their own specific protocol; one example is presented below

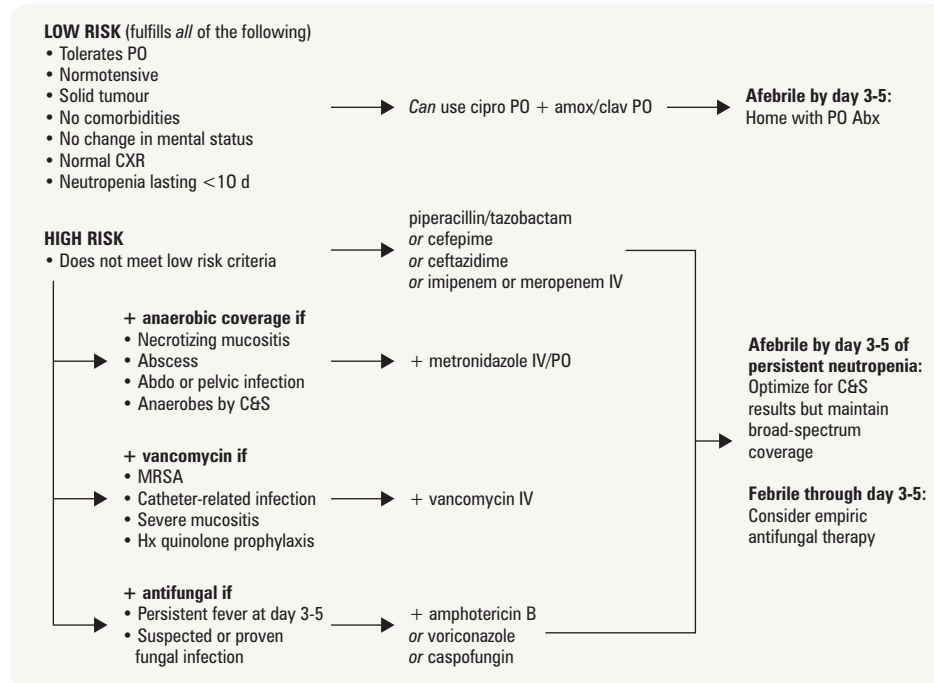

Figure 14. Example of treatment protocol for febrile neutropenia

## Infections in Solid Organ Transplant Recipients

- infection is a leading cause of early morbidity/mortality in transplant recipients
- infection depends on degree of immunosuppression
- common infections <1 mo post-transplant:
  - bacterial infection of wound/lines/lungs, herpetic stomatitis
- common infections >1 mo post-transplant:
  - viral (especially CMV, EBV, VZV)
  - fungal (especially *Aspergillus*, *Cryptococcus*, *P. jiroveci*)
  - protozoan (especially *Toxoplasma*)
  - unusual bacterial/mycobacterial infections (especially TB, *Nocardia*, *Listeria*)

### Prophylactic Vaccinations Given Before Transplant

- to all transplant patients: DTaP, pneumococcal, influenza, hepatitis A and B vaccines
- if low titre or poor documentation: MMR, polio, varicella vaccination (with booster 4-8 wk later)

## Immune Reconstitution Syndrome (IRS)

### Definition

- a harmful inflammatory response directed against a previously acquired infection following a recovery of the immune system

## Etiology

- paradoxical worsening of a successfully or partially treated opportunistic infection
- new onset response to a previously unidentified opportunistic infection
- the majority of cases are in HIV/AIDS or immunosuppressed patients starting anti-retroviral therapy or discontinuing immunosuppressive therapy; sudden recovery from an immunosuppressive state towards a pro-inflammatory state directed towards subclinical infection results in fever and inflammation
- can occur in response to multiple infections:
  - *Mycobacteria* (*tuberculosis*, *avium* complex)
  - *Cryptococcus*
  - *Pneumocystis*
  - *Toxoplasma*
  - HBV and HCV
  - Herpes viruses (VZV reactivation, HSV, CMV)
  - JC virus (progressive multifocal leukoencephalopathy)
  - *Molluscum contagiosum*
- clinical features are dependent on the type and location of the pre-existing infection
- thought to be worse with quick increase in CD4 count and with lower pre-treatment CD4 count
- non-HIV conditions with documented IRS: solid organ transplant recipients, post-partum women, neutropenic patients, anti-TNF therapy

## Epidemiology

- in HIV patients starting HAART, IRS reported to affect ~10%

## Investigations

- IRS is a diagnosis of exclusion
- rule out drug reaction, patient non-adherence, drug resistance

## Treatment

- continue HAART therapy in HIV patients with mild-moderate symptoms, but consider discontinuation if symptoms are life-threatening or potentially irreversible
- treat underlying infection; initiate treatment for some infections prior to HAART initiation
- consider starting corticosteroids/NSAIDs to decrease inflammatory response

HIV-1 is the predominant type in North America and most of the world.

HIV-2 is found mainly in West Africa.

Both lead to AIDS but HIV-2 is generally less virulent.

p24 = capsid protein

gp41 = fusion and entry

gp120 = attachment to host T cell

Homozygous CCR5 = immunity

Heterozygous CCR5 = slower course

# HIV and AIDS

## Epidemiology

### Canadian Situation (Public Health Agency of Canada, 2012)

- estimated 71,300 Canadians living with HIV infection at the end of 2011, 25% unaware of HIV-positive status
- estimated 3,175 new infections occurred in 2011: MSM account for 47% of cases, IVDU 17%

### Global Situation (WHO Global Summary of the HIV/AIDS Epidemic, December 2010)

- estimated 34.0 million people living with HIV/AIDS in 2010
- estimated 2.7 million newly infected in 2010
- estimated 1.8 million AIDS-related deaths in 2010

## Definition and Pathophysiology

- human immunodeficiency virus (HIV) is a retrovirus that causes progressive immune system dysfunction which predisposes patients to various opportunistic infections and malignancies
- HIV virion includes an envelope (gp41 and gp120 glycoproteins), matrix (p17) and capsid (p24) enclosing 2 single-stranded copies of RNA + enzymes in its core (see Figure 15)
- virion glycoproteins bind CD4 and CXCR4/CCR5 on CD4+ T lymphocytes (T-helper cells) to fuse and enter the cells
- RNA converted to dsDNA by reverse transcriptase; dsDNA is integrated into host genome
- virus DNA transcribed during host replication and new virions are produced
- virions bud out of host cell, incorporating host cell membrane
- exact mechanisms of CD4 depletion incompletely characterized but likely include direct viral cytopathic effects, apoptosis, increased cell turnover

©Stuart Jantzen 2012

Figure 15. HIV viral particle

Infection is NOT transmitted by casual contact, kissing, mosquitoes, toilet seats, shared utensils.

## Modes of Transmission

**Table 26. Modes of Transmission by Site and Medium**

HIV Invasion Site	Sub-location	Transmission Medium	Transmission Probability per Exposure Event
Female genital tract	Vagina, ectocervix, endocervix	Semen	1 in 200 to 1 in 2000
Male genital tract	Inner foreskin, penile urethra	Cervicovaginal and rectal secretions and desquamations	1 in 700 to 1 in 3000
Intestinal tract	Rectum Upper GI tract	Semen	1 in 20 to 1 in 300
		Semen	1 in 2500
		Maternal blood/genital secretions (intrapartum)	1 in 5 to 1 in 10
		Breastmilk	1 in 5 to 1 in 10
Placenta	Chorionic villi	Maternal blood (intrauterine)	1 in 10 to 1 in 20
Blood stream		Contaminated blood products	95 in 100
		Sharp/needlestick injuries	1 in 150

Adapted with permission from Macmillan Publishers Ltd. Nat Rev Immunology 2008;8:447-457.

## Natural History

**Figure 16. Relationships between CD4 T cell count, viral load, and anti-HIV antibodies**

### Acute (Infection) Retroviral Syndrome (ARS)

- 40-90% experience an acute "mononucleosis like" illness (fever, pharyngitis, lymphadenopathy, rash, arthralgias, myalgias, headaches, GI symptoms, oral ulcers, weight loss) 2-6 wk post-exposure lasting 10-15 d
- hematologic disturbances (lymphopenia, thrombocytopenia)
- 10-20% present with aseptic meningitis; HIV RNA and/or p24 may be detected in CSF
- associated with a high level of plasma viremia and therefore high risk of transmission

### Asymptomatic (Latent) Stage

- during latent phase, HIV infects and replicates in CD4+ T lymphocytes (lymph nodes)
- normal CD4 count: 500-1100 cells/mm<sup>3</sup>
- CD4 count drops 60-100 cells/mm<sup>3</sup> per year
- by 10 yr post-infection, 50% have AIDS, 30% demonstrate milder symptoms and <20% are asymptomatic if left untreated

### AIDS Definition in Canada

- HIV-positive AND
- one or more clinical illnesses that characterize AIDS, including: opportunistic infections (e.g. PJP (previously PCP), esophageal candidiasis, CMV, MAC, TB, toxoplasmosis), malignancy (Kaposi's sarcoma, invasive cervical cancer), wasting syndrome OR
- first CD4 <200 (or <15%)

**Table 27. Symptomatic Stage (CD4 count thresholds for classic clinical manifestations)**

CD4 Counts	Possible Manifestations
<500 cells/mm <sup>3</sup>	Constitutional symptoms: fever, night sweats, fatigue, weight loss Mucocutaneous lesions: seborrheic dermatitis, HSV, VZV (shingles), oral hairy leukoplakia (EBV), candidiasis (oral, esophageal, vaginal), Kaposi's sarcoma (KS) Recurrent bacterial infections, especially pneumonia Pulmonary and extrapulmonary tuberculosis Lymphoma
<200 cells/mm <sup>3</sup>	<i>Pneumocystis jiroveci</i> pneumonia (formerly PCP) KS Oral thrush Local and/or disseminated fungal infections: <i>Cryptococcus neoformans</i> , <i>Coccidioides immitis</i> , <i>Histoplasma capsulatum</i>
<100 cells/mm <sup>3</sup>	Progressive multifocal leukoencephalopathy (PML) – JC virus CNS toxoplasmosis
<50 cells/mm <sup>3</sup>	CMV infection: retinitis, colitis, cholangiopathy, CNS disease Mycobacterium avium complex (MAC) Bacillary angiomatosis (disseminated <i>Bartonella</i> ) Primary central nervous system lymphoma (PCNSL)

## Laboratory Diagnosis

- anti-HIV antibodies detectable after a median of 3 wk, virtually all by 3 mo
- initial screening test: enzyme linked immunosorbent assay (ELISA) detects serum antibody to HIV; sensitivity >99.5%
  - some jurisdictions (e.g. Ontario) use combination Ag/Ab test as screen (tests for p24 antigen and HIV antibody)
- confirmatory test: if positive screen, Western blot confirmation by detection of antibodies to at least two different HIV protein bands (p24, gp41, gp120/160); specificity >99.99%
- rapid (point of care) antibody tests: higher false positives, therefore need to confirm positive results with traditional serology
- p24 antigen: detection by ELISA may be positive during "window period" before antibodies become detectable; combined with standard antibody test in some jurisdictions

## Management of the HIV-Positive Patient

- verify positive HIV test
- complete baseline history and physical examination, then follow-up every 3 mo
- laboratory evaluation
  - routine CD4 count to measure status of the immune system
  - routine HIV-RNA levels (viral load)
    - ♦ also important indicator of effect of anti-retroviral (ARV) therapy
  - baseline HIV resistance testing to guide ARV therapy
  - HLA-B\*5701 to reduce risk of abacavir hypersensitivity
  - baseline tuberculin skin test (PPD): induration greater than 5 mm is positive
  - baseline serologies (hepatitis A, B and C, syphilis, toxoplasma, CMV, VZV)
  - routine biochemistry and hematology, CXR
  - annual fasting lipid profile and fasting glucose (due to HAART side effects)
- education
  - regular follow-up on CD4 counts and viral loads (q3-4mo) as well as strict adherence with ARVs improves prognosis
  - prevention of further transmission through safer sex and clean needles for injection drug use
  - HIV superinfection (transmission of different HIV strains from another HIV+ person) can rarely occur so barrier protection during sex is still recommended
- health care maintenance
  - assessment for counseling needs and referral for psychiatric or social concerns
  - vaccines: influenza annually, 23-valent pneumococcal every 5 yr, HBV (if not immune), HAV (if seronegative)
  - annual screening (PAP smear, STIs as applicable)
  - management of comorbid conditions (e.g. blood pressure monitoring, smoking cessation, alcohol/drug use)

**Table 28. Prophylaxis Against Opportunistic Infections in HIV-infected Patients**

Pathogen	Indication for Prophylaxis	Prophylactic Regimen
<i>Pneumocystis jiroveci</i>	CD4 count <200 cells/mm <sup>3</sup> or history of oral candidiasis	TMP-SMX 1 SS or DS OD
<i>Toxoplasma gondii</i>	IgG antibody to Toxoplasma and CD4 count <100 cells/mm <sup>3</sup>	As per prophylaxis for pneumocystis
<i>Mycobacterium tuberculosis</i>	PPD reaction >5 mm or contact with case of active TB	INH + pyridoxine daily x 9 mo
<i>Mycobacterium avium</i> complex	CD4 count <50 cells/mm <sup>3</sup>	Azithromycin 1200 mg q1wk

SS = single strength; DS = double strength

See 2002 USPHS/IDSA guidelines for preventing opportunistic infections among HIV-infected persons. Available from: <http://aidsinfo.nih.gov/>

**Seroconversion:** Development of detectable anti-HIV antibodies.

**Window Period:** Time between infection and development of anti-HIV antibodies; when serologic tests (ELISA, Western blot) are negative.

All infants born to HIV infected mothers have positive ELISA tests because of circulating maternal anti-HIV antibodies which disappear by 18 mo; early diagnosis is made by detection of HIV RNA in plasma.

### HIV Status

- CD4 count: progress and stage of disease
- Viral Load: rate of progression

1° and 2° prophylaxis may be discontinued if CD4 count is above threshold for ≥6 mo while on HAART.

### HLA-B\*5701 Testing

Abacavir hypersensitivity reactions usually only occur in individuals carrying this HLA allele (~5-7% of Caucasians, lower prevalence in other ethnic groups). Routine screening for HLA-B\*5701 prior to abacavir use.

### Reasons for Deterioration of a Patient with HIV/AIDS

- Opportunistic infections
- Neoplasms
- Medication-related toxicities
- Co-infections (e.g. HBV, HCV, STIs)
- Non-AIDS-related comorbidities (e.g. cardiovascular, renal, hepatic, neurocognitive, bone disease)

## Highly Active Antiretroviral Treatment (HAART)

### Overall Treatment Principles

- in asymptomatic patients: initiate HAART when CD4 <350; ongoing debate about when to initiate HAART when CD4 is between 350-500 or >500
  - current guidelines differ in various industrialized countries – see 2008 OARAC Guidelines for the Use of Antiretroviral Agents in HIV-1-Infected Adults and Adolescents <http://aidsinfo.nih.gov/contentfiles/AdultandAdolescentGL.pdf>
- other indications for initiating therapy include opportunistic infection/malignancy, pregnancy, HIV-associated nephropathy, HIV-associated thrombocytopenia, need for hepatitis B therapy in HBV co-infected patients
- consider starting treatment early if HCV co-infection, high HIV viral load, co-morbid conditions (e.g. cardiovascular disease)
- consider results of baseline resistance testing and complete ARV treatment history before (re-) initiating HAART
- goal: keep viral load <40 copies/mL; viral load should decrease 10-fold within 4-8 wk and be undetectable by 6 mo and restore immunological function
- secondary benefit of initiating therapy is 96% reduction in risk of transmitting HIV to sexual partners

### HAART Recommendations for Treatment of Naïve Patients

- 2 NRTIs + 1 NNRTI/PI (boosted with ritonavir)/INSTI

### Treatment Failure

- defined clinically (HIV progression), immunologically (failure to increase CD4 count by 25-50 over first year of treatment or CD4 decrease >100 over 1 yr), or virologically (failure to achieve viral load <40 copies/mL after 6 mo)
- ensure that viral load >40 is not just a transient viremia or 'blip'

**Table 29. Antiretroviral Drugs**

Class	Drugs	Mechanism	Adverse Effects
Nucleoside reverse transcriptase inhibitors (NRTIs)	zidovudine (AZT) lamivudine (3TC) stavudine (d4T) didanosine (ddI) abacavir (ABC) emtricitabine (FTC) <b>Combination Tablets:</b> AZT/3TC (Combivir®) AZT/3TC/ABC (Trizivir®) ABC/3TC (Kivexa®) TDF/FTC (Truvada®) tenofovir disoproxil fumarate (TDF)	Incorporated into the growing viral DNA chain, thereby competitively inhibiting reverse transcriptase and terminating viral DNA growth	Lactic acidosis Lipodystrophy Rash N/V/diarrhea Bone marrow suppression (AZT) Peripheral neuropathy (ddI, d4T) Drug-induced hypersensitivity (ABC) Pancreatitis (ddI/d4T) Myopathy (AZT)
Non-nucleoside reverse transcriptase inhibitors (NNRTIs)	efavirenz (EFZ) nevirapine (NVP) delavirdine (DLV) etravirine (ETR) rilpivirine (RPV)	Non-competitively inhibit function of reverse transcriptase, thereby preventing viral RNA replication	Rash, Stevens-Johnson syndrome CNS: dizziness, insomnia, somnolence, abnormal dreams (efavirenz) Hepatotoxicity (nevirapine – avoid in females with CD4 >250, men with CD4 >400) CYP3A4 interactions
Protease inhibitors (PIs)*	ritonavir (RTV) saquinavir (SQV) amprenavir (APV) nelfinavir (NFV) indinavir (IDV) atazanavir (ATV) fosamprenavir (FPV) lopinavir/ritonavir (Kaletra®) tipranavir (TPV) darunavir (DRV)	Prevent maturation of infectious virions by inhibiting the cleavage of polyproteins	Lipodystrophy, metabolic syndrome N/V/diarrhea Nephrolithiasis (indinavir) Rash (APV) Hyperbilirubinemia (atazanavir, indinavir) CYP3A4 interactions Hyperlipidemia
Fusion inhibitor	enfuvirtide (T-20)	Inhibit viral fusion with T-cells by inhibiting gp41, preventing cell infection	Injection site reactions, rash, infection, diarrhea, nausea, fatigue
CCR5 antagonist	maraviroc	Inhibit viral entry by blocking host CCR5 co-receptor	Fever, cough, dizziness
Integrase strand transfer inhibitors (INSTIs)	raltegravir elvitegravir	Inhibits integration of HIV DNA into the human genome thus preventing HIV replication	

\*Standard of care is to pharmacology boost most PIs with ritonavir to increase concentrations

#### SMART Study Group: CD4+ Count-Guided Interruption of Antiretroviral Treatment

*NEJM* 2006;355:2283-2296

**Rationale:** Given the viral resistance, drug toxicities, cost, and quality-of-life issues associated with lifelong ART, is there a difference between continuous and episodic therapy?

**Methods:** Persons with HIV with CD4+ count of <350 cc were randomly assigned to continuous ART [i.e. viral suppression (VS)] or episodic ART [i.e. drug conservation DC; deferral of therapy until CD4+ was <250 and use therapy until CD4+ count was <350]. Primary endpoint was development of an opportunistic disease or death from any cause. Secondary end point was major cardiovascular, renal, or hepatic disease.

**Results:** 5472 participants followed for 16 mo before protocol was modified for DC group. Opportunistic disease or death from any cause occurred in 120 and 47 participants in the DC and VS groups respectively (Hazard ratio 2.6; 95%CI 1.9 to 3.7; p<0.001). Hazard ratios for death from any cause and for major cardiovascular, renal, and hepatic disease were 1.8 (95%CI 1.2 to 2.9; p=0.007) and 1.7 (95%CI 1.1 to 2.5; p=0.009) respectively.

**Conclusions:** Episodic therapy significantly increased the risk of opportunistic disease or death from any cause and does not reduce the risk of adverse events that have been associated with ART, thus continuous therapy is recommended.

#### Treatment Failure

- Assess adherence
- Resistance testing
- Rule out opportunistic infections
- Rule out marrow suppression
- Construct new 3-drug regimen

#### Lactic Acidosis

- Occurs secondary to mitochondrial toxicity
- Symptoms include abdominal pain, fatigue, N/V, muscle weakness

#### Lipodystrophy

Body fat redistribution:

- Lipohypertrophy (e.g. dorsal fat pad, breast enlargement, increased abdominal girth) thought to be caused primarily by protease inhibitors
- Lipoatrophy (e.g. facial thinning, decreased adipose tissue in the extremities) is thought to be caused by thymidine analogue NRTIs such as ddI and AZT
- Metabolic abnormalities: lipids (increased LDL, increased TGs), glucose (insulin resistance, DM2), increased risk of CVD

#### Pharmacologic Boosting

- The goal of pharmacologic boosting is to increase the plasma exposure to the boosted drug
- PI boosting traditionally achieved by administering low-dose ritonavir along with the PI
- Ritonavir inhibits the metabolism of other PIs by inhibiting cytochrome P450 3A4 and p-glycoprotein, the enzyme systems responsible for metabolism of the PIs
- Cobicistat is a new non-ARV pharmacologic booster, presently co-formulate with the INSTI elvitegravir and alter to be co-formulated with some PIs

#### Tropism Testing

- In addition to CD4, HIV requires a co-receptor (either CCR5 or CXCR4) to enter cells
- CCR5 antagonists (e.g. Maraviroc) only work if virus is CCR5-tropic
- Tropism test required prior to initiating CCR5 antagonists

Figure 17. Mechanism of HIV replications

## Prevention of HIV Infection

- education, including harm-reduction:
  - safer sexual practices: condoms for vaginal and anal sex, barriers for oral sex
  - harm prevention for injection drug users: avoid sharing needles
- treatment of HIV+ women with HAART during the 2nd and 3rd trimester of pregnancy and AZT during delivery followed by AZT treatment of the infant for 6 wk (decreases maternal-fetal transmission from 25% to <3%)
- universal blood and body precautions for health care workers
  - post-exposure prophylaxis (PEP) after occupational (e.g. needle-stick injury) and non-occupational (e.g. consensual sex, sexual assault) exposure to HIV: 2- or 3-drug regimen initiated immediately (<72 h) after exposure and continuing for 4 wk
- recent data has demonstrated efficacy of pre-exposure prophylaxis (oral PrEP or topical microbicides) in preventing HIV although additional data needed
- HAART associated with 96% reduction in risk of transmitting HIV to sexual partners
- screening of blood and organ donation

## Types of Testing

### 1. Nominal/name-based HIV testing

- the person ordering the test knows the identity of the person being tested for HIV
- the HIV test is ordered using the name of the person being tested
- person ordering the test is legally obligated to notify Public Health officials if test results are positive for HIV
- the test result is recorded in the health care record of the person being tested

### 2. Non-nominal/non-identifying HIV testing

- similar to nominal/name-based testing on all points except:
  - the HIV test is ordered using a code or the initials of the person being tested

### 3. Anonymous testing

- available at specialized clinics
- the person ordering the HIV test does not know the identity of the person being tested
- the HIV test is carried out using a unique non-identifying code that only the person being tested for HIV knows
- test results are not recorded on the health care record of the person being tested

Early identification of HIV is essential for patients to receive the maximal benefit from ARVs.

## HIV Pre- and Post-test Counselling

- a diagnosis of HIV can be overwhelming and is often associated with stigma and discrimination
- consider pre- and post-test counselling, regardless of the results
- goals include: assessing risk, making informed decision to be tested, education to protect themselves and others from virus exposure, where to go for more information and support
- HIV+ patients should be connected with local support services

## A Simplified Look at Antibiotics

- general overview, see Table 30 for more details

### 1. Penicillins (most *Streptococcus*, *N. meningitidis*, many oral anaerobes except *B. fragilis*)

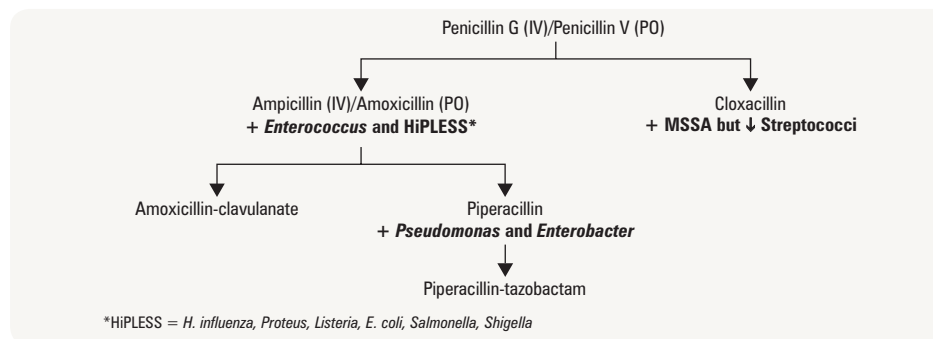

Figure 18. Penicillins

### 2. Cephalosporins (PO/IV)

- 1st generation: cephalexin/cefazolin (mostly GP, some GN)
- 2nd generation: cefuroxime/cefuroxime (some GP and some GN, \*anaerobes)
- 3rd generation: cefixime/cefotaxime, ceftriaxone (good *Streptococcal* coverage, mostly GN) and ceftazidime (no GP, mostly GN, *Pseudomonas*)
- 4th generation: --/cefepime (most GP, most GN, *Pseudomonas*)

### 3. Aminoglycosides (GN aerobic bacilli)

- gentamicin
- tobramycin
- amikacin

### 4. Macrolides [GP, *Hemophilus*, and atypical bacteria (*Legionella*, *Chlamydia*, *Mycoplasma*)]

- erythromycin
- clarithromycin
- azithromycin

**5. Fluoroquinolones (GN – although resistance becoming a huge problem)**

- ciprofloxacin (+ *Pseudomonas*)
- norfloxacin (for UTI only)
- respiratory fluoroquinolones (some GP, GN, "atypicals", *Legionella*, *Mycoplasma*, *Chlamydomphila*)
- levofloxacin
- moxifloxacin (+ anaerobes)

**6. Carbapenems (broad coverage: GP, GN and anaerobes)**

- imipenem (+ *Pseudomonas*)
- meropenem (+ *Pseudomonas*)
- ertapenem

**7. Others**

- doxycycline/tetracycline (GP, syphilis, *Chlamydomphila*, *Rickettsia*, *Mycoplasma*)
- vancomycin (all GP and *C. difficile* – the oral form)
- linezolid (for resistant GP infections)
- clindamycin (most GP, GN anaerobes)
- TMP/SMX (most *S. aureus* incl. MRSA, GN aerobes, *Pneumocystis*)
- nitrofurantoin (GN bacilli, *S. saprophyticus*, *Enterococcus*)
- metronidazole (anaerobes incl. *C. difficile*; *Trichomonas*, *Entamoeba*)
- treatment for *C. Difficile*: metronidazole OR oral vancomycin; consider both in serious infection

## Antimicrobials

### Antibiotics

- empiric antibiotic therapy
  - choose antibiotic(s) to cover for most likely and lethal organisms for the type of infection prior to obtaining laboratory results (usually reserved for serious infections)
  - adjust antibiotic(s) based on C&S
    - ♦ if causative organism identified, use antibiotic to which organism is sensitive
    - ♦ if causative organism not identified, re-evaluate need for ongoing antimicrobial therapy (and continue with empiric antibiotic(s) if indicated)

**Figure 19. Mechanism of action of antibiotics**

**Reasons for Combination Therapy**

- Polymicrobial infection
- Empiric therapy pending culture results
- Synergy for difficult to treat pathogens (e.g. *Enterococcus* spp. causing endocarditis)
- To prevent emergence of resistance

Bactericidal Antibiotics	Bacteriostatic Antibiotics
"Very Finely Proficient At CCCell Murder"	"ECSTaTiC"
Vancomycin	Erythromycin (and other macrolides)
Fluoroquinolones	Clindamycin
Penicillin	Sulfamethoxazole
Aminoglycosides	Trimethoprim
Cephalosporins	Tetracyclines
Carbapenems	Chloramphenicol
Metronidazole	

Table 30. Antibiotics

Class and Drugs		Coverage	Mechanism of Action		Adverse Effects	Indications	Contraindications
CELL WALL INHIBITORS							
Penicillins							
Benzyl penicillin - penicillin G IV/IM - penicillin V PO		GP <i>except Staphylococcus, Enterococcus</i> Oral anaerobes	Bactericidal: $\beta$ -lactam inhibits cell wall synthesis by binding penicillin binding protein (PBP) preventing cross-linking of peptidoglycan		Immediate allergy (IgE): anaphylaxis, urticaria Late-onset allergy (IgG): urticaria, rash, serum sickness Interstitial nephritis Dose related toxicity: seizures Diarrhea	Mild to moderately severe infections caused by susceptible organisms including actinomycosis, streptococcal pharyngitis, streptococcal skin and soft tissue infections, pneumococcal pneumonia, syphilis	Hypersensitivity to penicillin
Aminopenicillin - ampicillin IV - amoxicillin PO (Amoxil®)		Same as penicillin AND <i>Enterococcus</i> <i>Listeria</i>	See above		See above	Bacterial meningitis and endocarditis (IV ampicillin), acute otitis media (AOM), streptococcal pharyngitis, sinusitis, acute exacerbations of COPD, part of multidrug therapy for <i>H. pylori</i> treatment, Lyme disease, pneumococcal pneumonia; UTI (amoxicillin and ampicillin) for most enterococci and susceptible gram-negative pathogens	Hypersensitivity to penicillin or $\beta$ -lactam antibiotics
Isoxozoyl penicillin - cloxacillin - methicillin - nafcillin - oxacillin		Methicillin-sensitive <i>Staphylococcus aureus</i> ; streptococci	See above		See above	Bacterial infections caused by staphylococci and streptococci including skin soft-tissue infections	Hypersensitivity to cloxacillin or any penicillin
$\beta$ -lactam/ $\beta$ -lactamase Inhibitor combinations - amoxicillin clavulanate (Clavulin®, Augmentin®) - piperacillin/tazobactam (Tazocin®)		Same as penicillin AND <i>Staphylococcus</i> <i>H. influenzae</i> <i>Enterococcus</i> Anaerobes (oral and gut)	$\beta$ -lactamases produced by certain bacteria inactivate $\beta$ -lactams  Lactamase inhibitors prevent this process, preserving antibacterial effect of $\beta$ -lactams		See above	Various $\beta$ -lactamase producing bacteria, Clavulin® sensitive bacteria including RTI, sinusitis, AOM, skin and soft tissue infections, UTI, and severe intra-abdominal and pelvic infections	Hypersensitivity to penicillin or cephalosporin History of Clavulin®-associated jaundice or hepatic dysfunction
Cephalosporins							
PO 1° cephalexin (Keflex®)	IV cefazolin (Ancef®)	GP Good with the exception of <i>Enterococcus</i> and MRSA	GN <i>E. coli</i> , <i>Klebsiella</i> , <i>Proteus</i> , <i>H. influenzae</i> (not all isolates)	Bactericidal: $\beta$ -lactam inhibits PBP, prevents cross-linking of peptidoglycan, less susceptible to penicillinases	10% penicillin allergy cross-reactivity Nephrotoxicity	Skin and soft tissue infections, prevention of surgical site infections (cefazolin); infections caused by susceptible organisms (esp. <i>Staph.</i> and <i>Strep.</i> infections)	Hypersensitivity to cephalosporins or other $\beta$ -lactam antibiotic
2° cefuroxime (Ceftin®) cefprozil (Cefzil®)	cefuroxime (Zinacef®) cefoxitin <sup>A</sup>	Weaker activity than 1°	More coverage than 1° ( <sup>A</sup> includes anaerobes)	See above	See above	Upper and lower respiratory tract infections (there have been failures in bacteremia pneumococcal pneumonia; soft tissue	See above
3° cefixime (Suprax®)	ceftriaxone (Rocephin®) cefotaxime (Claforan®) ceftazidime <sup>B</sup> (Fortaz®)	<i>S. aureus</i> + <i>streptococcal</i> coverage (cefotaxime and ceftriaxone) especially <i>S. pneumoniae</i>	Broad coverage ( <sup>B</sup> includes <i>Pseudomonas</i> for ceftazidime only)	See above	~1% penicillin allergy cross-reactivity	Community-acquired pneumonia (cefotaxime, ceftriaxone), gonorrhea (use ceftriaxone), community-acquired bacterial meningitis (ceftriaxone, cefotaxime); abdominal and pelvic infections (cefotaxime or ceftriaxone in combination with metronidazole). Once-daily administration makes ceftriaxone convenient for outpatient IV therapy	Severe hypersensitivity (Type I) to other $\beta$ -lactam antibiotics
4°	cefepime (Maxipine®)	Broad spectrum	Broad coverage including <i>Pseudomonas</i>	See above	See above	Empiric therapy for febrile neutropenia	See above

Table 30. Antibiotics (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Indications	Contraindications
<b>CELL WALL INHIBITORS</b>					
<b>Carbapenems</b>					
imipenem (Primaxin®)	GP except MRSA GN including <i>Pseudomonas</i> + <i>Enterobacter</i> , ESBLs, anaerobes	β-lactam inhibits PBP and prevents cross-linking of peptidoglycan	Penicillin allergy cross- reactivity Seizures	Treatment of infections caused by GNB producing extended- spectrum β-lactamases, serious infections caused by susceptible organisms	Hypersensitivity to imipenem
meropenem (Merrem®)	See above. Does not cover <i>Enterococcus</i> .	See above	See above	See above	Hypersensitivity to β-lactams
ertapenem (Invanz®)	GP except <i>Enterococcus</i> , MRSA GN including <i>Enterobacter</i> (but not <i>Pseudomonas</i> ), anaerobes	See above	See above	See above. Once-daily administration makes it convenient for outpatient IV therapy	Hypersensitivity to β-lactams
<b>Glycopeptides</b>					
Vancomycin (Vancocin®)	GP including MRSA, not VRE <i>C. difficile</i> if PO	Glycopeptide sterically inhibits cell wall synthesis	Red Man Syndrome Nephrotoxicity Ototoxicity Thrombocytopenia	Severe or life-threatening GP infections, patients with β-lactam allergy May only be taken orally for severe <i>C. difficile</i> infection	Hypersensitivity to vancomycin
<b>PROTEIN SYNTHESIS INHIBITORS (50S RIBOSOME)</b>					
<b>Macrolides</b>					
erythromycin (Erybid®, Eryc®)	GP <u>except</u> <i>Enterococcus</i> GN: <i>Legionella</i> , <i>B. pertussis</i> "Atypicals": <i>Chlamydia</i> , <i>Mycoplasma</i>	Binds to 50S ribosomal subunit inhibiting protein synthesis	GI upset Acute cholestatic hepatitis Prolonged QT	Susceptible RTI, pertussis, diphtheria, Legionnaires' disease, skin and soft tissue infections	Hypersensitivity to erythromycin Concurrent therapy with astemizole, terfenadine
*This agent is rarely used due to GI upset					
clarithromycin (Biaxin®)	See above	See above	See above	Susceptible RTI, skin infections, non-tuberculous mycobacterial infections, part of multidrug therapy for <i>H. pylori</i> treatment	Hypersensitivity to macrolides
azithromycin (Zithromax®)	See above	See above	See above	Susceptible RTI, acute exacerbations of COPD, community-acquired pneumonia, skin infections, <i>Campylobacter</i> infections if treatment indicated, chlamydia	Hypersensitivity to macrolides
<b>Lincosamides</b>					
clindamycin (Dalacin®)	GP <u>except</u> <i>Enterococcus</i> , most community-acquired MRSA Anaerobes	Inhibits peptide bond formation at 50S ribosome	Pseudomembranous colitis GI upset	Treatment of suspected or proven infections caused by GP, anaerobes including skin and skin structure infections, oropharyngeal infections, in combination with GN coverage for intra-abdominal and pelvic infections	Hypersensitivity to clindamycin Infants <30 d
chloramphenicol	GP GN Anaerobes	Inhibits peptidyl transferase action of tRNA at 50S ribosome	Aplastic anemia Grey Baby Syndrome	Serious infections by susceptible organisms when suitable alternatives are not available including meningococcal disease in patients with anaphylaxis to β-lactams	Hypersensitivity to chloramphenicol
linezolid (Zyvoxam®)	GP including VRE + MRSA	Binds 50S ribosome and prevents functional 70S initiation complex	HTN (acts as MAOI) Risks with prolonged use: myelosuppression optic neuropathy, peripheral neuropathy	Vancomycin-resistant <i>Enterococcus faecium</i> infections including intra-abdominal, skin and skin-structure, and urinary tract infections, MRSA infections as out patient therapy	Hypersensitivity to linezolid

**Table 30. Antibiotics** (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Indications	Contraindications
<b>PROTEIN SYNTHESIS INHIBITORS (30S RIBOSOME)</b>					
<b>Aminoglycosides</b>					
gentamicin tobramycin amikacin (Amikin®)	GN (includes <i>Pseudomonas</i> )	Binds 30S subunit of ribosome inhibiting protein synthesis	Nephrotoxicity (reversible) Vestibular and ototoxicity (irreversible). Vestibular toxicity is the most important aminoglycoside toxicity	GN infections when alternatives do not exist, UTIs, used in low doses for synergy with $\beta$ -lactams or with vancomycin for the treatment of serious enterococcal infections	Pre-existing hearing loss and renal dysfunction
<b>Tetracyclines</b>					
tetracycline (Apo-Tetra®, Nu-TetraT®) minocycline (MinocinT®) doxycycline (Doxycin®)	GP Anaerobes "Atypicals": <i>Chlamydomphila</i> , <i>Mycoplasma</i> , <i>Rickettsia</i> , <i>Borrelia burgdorferi</i> <i>Treponema</i> Malaria prophylaxis (doxycycline)	Binds 30S subunit of ribosome inhibiting protein synthesis	GI upset Hepatotoxicity Fanconi's syndrome Photosensitivity Teratogenic Yellow teeth and stunted bone growth in children	Rickettsial infections, <i>Chlamydomphila</i> , acne (tetracycline, minocycline), PID (step-down), malaria prophylaxis (doxycycline)	Severe renal or hepatic dysfunction Pregnancy or lactation Children under 8 yr
<b>TOPOISOMERASE INHIBITORS</b>					
<b>Fluoroquinolones (FQs)</b>					
ciprofloxacin (Cipro®) norfloxacin (Apo-Norfloxx®) ofloxacin (Floxin®) Respiratory FQs: levofloxacin (Levaquin®) moxifloxacin (Avelox®)	Poor GP activity GN (includes <i>Pseudomonas</i> ) Atypicals Moxifloxacin also covers many anaerobes	Inhibits DNA gyrase	H/A, dizziness Allergy Seizures Prolonged QT Dysglycemia (levofloxacin, moxifloxacin)	Upper and lower RTI (not ciprofloxacin unless susceptible organism isolated), UTI, prostatitis (not moxifloxacin), bone and joint infections for susceptible organisms, skin and soft tissue infections (levofloxacin, moxifloxacin), infectious diarrhea, meningococcal prophylaxis, intra-abdominal infections (moxifloxacin, ciprofloxacin in combination with metronidazole or clindamycin), febrile neutropenia prophylaxis (ciprofloxacin, levofloxacin) or ciprofloxacin in combination with amoxicillin/clavulanate low management of "low-risk" febrile neutropenia	
<b>Rifampin</b>	GP cocci <i>N. meningitidis</i> <i>H. influenza</i> <i>Mycobacteria</i>	Inhibits RNA polymerase	Hepatic dysfunction, P450 enzyme induction Orange tears/saliva/urine	Part of multidrug treatment for active TB, alone for treatment of latent TB, part of multidrug treatment of other mycobacterial infections, endocarditis involving prosthetic valve or other prosthetic device infections in combination with other antibiotic agents, prophylaxis for those exposed to people with <i>N. meningitidis</i> or HiB meningitis	Jaundice Not to be used as monotherapy (except for prophylaxis)
<b>Metronidazole</b> (Flagyl®)	Anaerobes Protozoa	Forms toxic metabolites in bacterial cell which damage microbial DNA	Disulfiram-type reaction with EtOH Seizures Peripheral neuropathy	Protozoal infections (trichomoniasis, <i>amebiasis</i> , <i>giardiasis</i> ), bacterial vaginosis, anaerobic bacterial infections	
<b>ANTI-METABOLITE</b>					
<b>Trimethoprim-Sulfamethoxazole (TMP/SMX)</b> (Septra®, Bactrim®)	GP, esp. <i>S. aureus</i> (incl. most MRSA) GN: enteric <i>Nocardia</i> Other: <i>Pneumocystis</i> , <i>Toxoplasmosis</i>	Inhibits folic acid pathway (TMP inhibits DHFR and SMX competes with PABA)	Hepatitis Stevens Johnson syndrome Bone marrow suppression Hyperkalemia Drug toxicity (increases free levels of many drugs, including glyburide, warfarin)	Susceptible UTI, RTI, GI infections, skin and soft tissue infections caused by staphylococcal species, treatment and prophylaxis of <i>P. jiroveci</i> pneumonia	Hypersensitivity to TMP-SMX, sulfa drugs

**Table 30. Antibiotics** (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Indications	Contraindications
<b>ANTI-METABOLITE</b>					
<b>nitrofurantoin</b> (MacroBID®, (Macrochantin®))	<i>Enterococcus</i> , <i>S. saprophyticus</i> GN (coliforms)	Reactive metabolites inhibit ribosomal protein synthesis	Cholestasis, hepatitis Hemolysis if G6PD deficiency Interstitial lung disease with chronic use	Lower UTI; not pyelonephritis or bacteremia	Hypersensitivity to nitrofurantoin Anuria, oliguria or significant renal impairment Pregnant patients during labour and delivery or when labour imminent Infants < 1 mo of age
<b>ANTI-MYCOBACTERIALS</b>					
isoniazid (INH)	<i>Mycobacteria</i>	Inhibits mycolic acid synthesis	Hepatotoxicity Hepatitis Drug-induced SLE Peripheral neuropathy	Part of multidrug treatment for active TB, alone for treatment of latent TB	Drug-induced hepatitis or acute liver disease
rifampin (RIF)	<i>Mycobacteria</i>	Inhibits RNA polymerase	Hepatotoxicity P450 enzyme inducer Orange tears, saliva, urine	Part of multidrug treatment for active TB, alone for treatment of latent TB, part of multidrug treatment of other mycobacterial infections	Jaundice Not to be used monotherapy (except for prophylaxis)
ethambutol	<i>Mycobacteria</i>	Inhibits mycolic acid synthesis	Loss of central and colour vision	Part of multidrug treatment for active TB and other mycobacterial infections	Renal failure
pyrazinamide (PZA)	<i>Mycobacteria</i>	Unknown	Hepatotoxicity Gout Gastric irritation	Part of multidrug treatment for active TB	Severe hepatic damage or acute liver disease Patients with acute gout
<b>SULFONES</b>					
dapsone sulfoxone	<i>M. Leprae</i> , part of treatment for <i>P. jiroveci</i> pneumonia (with TMP), <i>P. jiroveci</i> pneumonia prophylaxis, toxoplasmosis prophylaxis with pyrimethamine	Inhibit folic acid synthesis by competition with PABA	Rash Drug fever Agranulocytosis		

**Table 31. Antibiotics for Selected Bacteria**

<i>Pseudomonas</i>	<i>S. aureus</i>	<i>Enterococcus</i>	<i>H. influenzae</i>	Anaerobes
ciprofloxacin	cloxacillin (MSSA)	ampicillin	amoxicillin-clavulanate	metronidazole
gentamicin, tobramycin	1° cephalosporin (MSSA)	amoxicillin	2°/3° cephalosporin	clindamycin
piperacillin/tazobactam	clindamycin	vancomycin	macrolides (clarithromycin, azithromycin)	amoxicillin- clavulanate
ceftazidime	vancomycin (incl. MRSA)	nitrofurantoin (lower UTI)	levofloxacin	cefoxitin
cefepime	linezolid (incl. MRSA)	linezolid for VRE	moxifloxacin	piperacillin-tazobactam
meropenem	daptomycin (incl. MRSA)	daptomycin for VRE		moxifloxacin
imipenem		tigecycline for VRE		ertapenem, imipenem, meropenem

**Rifampin**

- Good adjunct for treating prosthetic device infection (bacterial biofilm)
- Always used in combination with other antibiotics to reduce emergence of resistance

## Antivirals

**Table 32. Antivirals**

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
<b>ANTI-HERPESVIRUS</b>				
acyclovir valacyclovir (ValtrexT®) (prodrug of acyclovir)	HSV-1,2 VZV	Guanosine analog inhibits viral DNA polymerase	PO well-tolerated IV: nephrotoxicity, CNS	Hypersensitivity to acyclovir or valacyclovir
famciclovir (Famvir®) penciclovir	HSV-1,2 VZV	See above	H/A, nausea	Hypersensitivity to famciclovir or penciclovir
ganciclovir (Cytovene®) valganciclovir (prodrug of ganciclovir)	CMV HSV-1,2, VZV	See above	Heme: neutropenia, thrombocytopenia, anemia GI: N/V, diarrhea	Hypersensitivity to ganciclovir or valganciclovir Possible cross-hypersensitivity between acyclovir and valacyclovir
foscarnet	CMV Acyclovir-resistant HSV, VZV	Pyrophosphate analog inhibits viral DNA polymerase	Nephrotoxicity (reversible) Anemia, electrolyte disturbances	

Table 32. Antivirals (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
OTHER ANTIVIRALS				
interferon-PEG interferon-α 2a, 2b	Chronic hep B, hep C HPV	Inhibits viral protein synthesis	"Flu-like" syndrome Depression Bone marrow suppression	Hypersensitivity to any interferon Cannot use in combination with ribavirin if renal impairment
ribavirin (Virazole®)	Chronic hep C RSV Lassa fever	Guanosine analog with multiple postulated mechanisms of action	Hemolytic anemia Rash, conjunctivitis Highly teratogenic	Pregnancy or women who may become pregnant
lamivudine (3TC®, Heptovir®)	Chronic hep B HIV	See HIV/AIDS, ID41		Hypersensitivity to lamivudine
M2 inhibitors: amantadine (Endantadine®, Symmetrel®) rimantadine	Influenza A treatment	Inhibits viral uncoating after infection of cell	Anti-cholinergic effects CNS: anxiety, insomnia, H/A, dizziness, difficulty concentrating	
Neuraminidase inhibitors: zanamavir (Relenza®) oseltamavir (Tamiflu®)	Influenza A and B: treatment and prophylaxis	Inhibits neuraminidase, an enzyme required for release of virus from infected cells and prevention of viral aggregation	GI: N/V, diarrhea Bronchospasm in zanamavir	

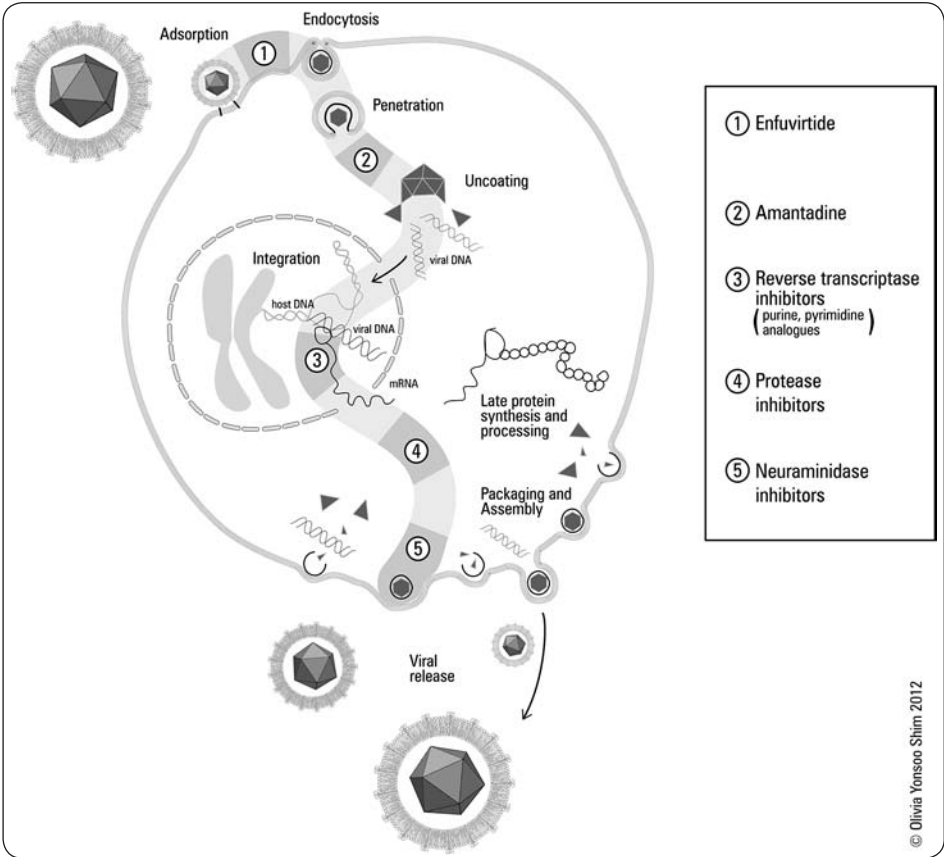

Figure 20. Mechanism of action of antivirals

# Antifungals

Table 33. Antifungals

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
<b>POLYENES</b>				
amphotericin B	Endemic mycoses: Histoplasmosis, blastomycosis, coccidiomycosis Pulmonary: Aspergillosis CNS: Cryptococcus	A polyene antimicrobial: inserts into fungal cytoplasmic membrane causing altered membrane permeability and cell death	Nephrotoxicity Hypo/hyperkalemia Infusion reactions: chills, fevers, H/A Peripheral phlebitis	Renal impairment
nystatin (oral, topical)	Candidiasis: mucocutaneous, GI, oral (thrush), vaginal	See above Not absorbed from the GI tract	GI: N/V, diarrhea Highly toxic if given IV	
<b>IMIDAZOLES</b>				
clotrimazole (Canesten®)	Oral and vulvovaginal candidiasis Dermatomycoses	All azoles: inhibit ergosterol synthesis and thereby alter fungal cell membrane permeability	Pruritis, skin irritation	
miconazole (Monistat®, Micozole®)	Vulvovaginal candidiasis Dermatomycoses		Vaginal burning Nausea and vomiting	
ketoconazole (Nizoral®)	Dermatomycoses Seborrheic dermatitis		Pruritis, skin irritation GI nonspecific Results in decreased androgen and testosterone synthesis	Cross-sensitivity with other azoles possible Hepatic dysfunction Pregnant women or those that may become pregnant
<b>TRIAZOLES</b>				
fluconazole (Diflucan®)	Candida infections (mucosal and invasive) Cryptococcal meningitis (step-down therapy)	All azoles: inhibit ergosterol synthesis and thereby alter fungal cell membrane permeability	Elevated liver enzymes GI nonspecific	Cross-sensitivity with other azoles unknown Concurrent use of terfenadine if dose of fluconazole >400 mg
itraconazole (Sporanox®)	Porotrichosis Onychomycoses Endemic mycoses: Histoplasmosis, blastomycosis, coccidiomycosis		Elevated liver enzymes Rash GI nonspecific	Cross-sensitivity with other azoles unknown Severe ventricular dysfunction
voriconazole (Vfend®)	Aspergillosis Candidiasis		Visual disturbance (30%) Hepatotoxicity Cutaneous photosensitivity Cutaneous squamous cell carcinoma long-term use in immunosuppressed patients	Cross-sensitivity with other azoles unknown May avoid or alter doses if co-administered with other CYP3A4 substrates, rifampin, carbamazepine, long-acting barbiturates, ritonavir, efavirenz, sirolimus, rifabutin, ergot alkaloids
posaconazole (Posanol®, Noxafil®)	Candidiasis Aspergillosis Mucormycosis		GI nonspecific Elevated liver enzymes Headache	Coadministration of cisapride, ergot alkaloids, pimozide, quinidine, or sirolimus
<b>ALLYLAMINES</b>				
terbinafine (Lamisil®)	Dermatomycoses Onychomycoses	Inhibits enzyme needed for ergosterol synthesis	Rash, local irritation GI nonspecific, transaminitis	Active liver disease
<b>ECHINOCANDINS</b>				
caspofungin micafungin anidulafungin	Refractory aspergillosis, candidemia (azole- resistant)	Inhibits 1-3 $\beta$ -glycan synthesis (needed for fungal cell wall)	Hepatotoxicity	

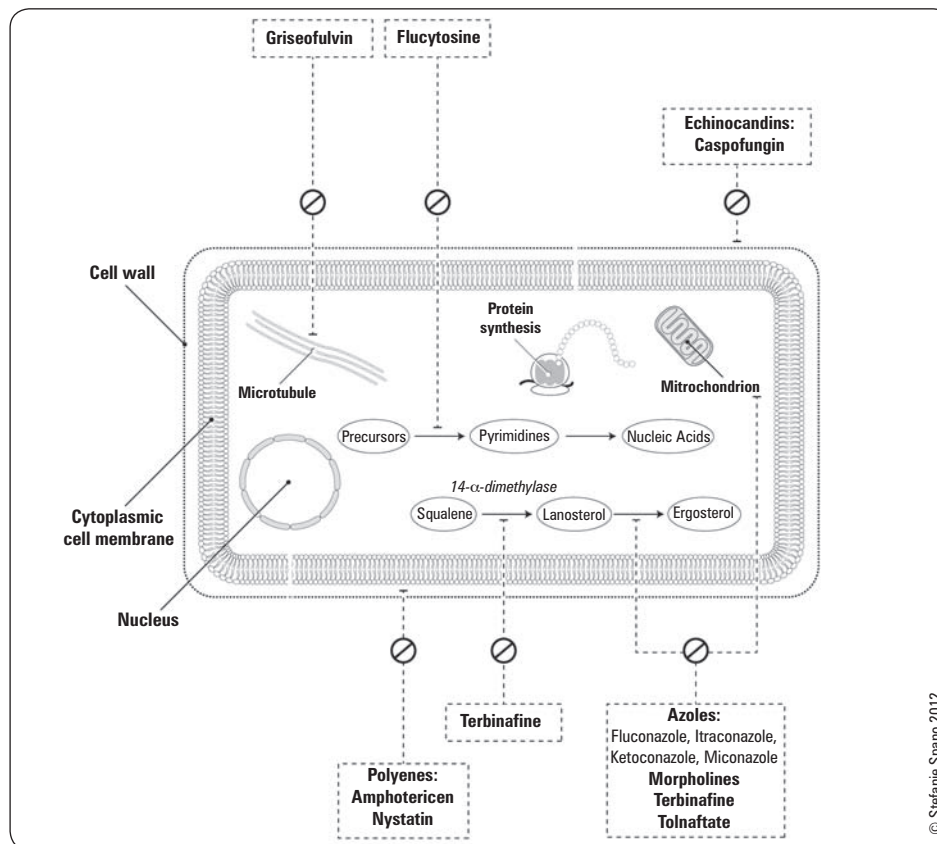

Figure 21. Mechanism of action of antifungals

## Antiparasitics

Table 34. Antiparasitics

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
<b>ANTIMALARIALS</b>				
chloroquine	Malaria: treatment of erythrocytic phase of all five species of <i>Plasmodium</i> that infect humans Note: High resistance of <i>P. falciparum</i> and <i>P. vivax</i> in certain geographic areas	Inhibits parasite heme polymerase	CNS: blurred vision, retinopathy, dizziness Nonspecific GI (rare with prophylaxis)	Hypersensitivity to chloroquine or other 4-aminoquinoline Retinal or visual field changes due to 4-aminoquinoline
quinine	Malaria: treatment of all five species of <i>Plasmodium</i> that infect humans, including chloroquine-resistant <i>P. falciparum</i>		Cinchonism: ears (tinnitus, vertigo), eyes (visual disturbance), GI (N/V, diarrhea), CNS (H/A, fever) Hypoglycemia	Hypersensitivity to quinine, may have cross-sensitivity with quinidine Patients with G6PD deficiency, tinnitus, optic neuritis, hypoglycemia, history of blackwater fever or thrombocytopenic purpura due to quinine use
mefloquine (Lariam®)	Malaria: treatment and prophylaxis of all four species of <i>Plasmodium</i> that infect humans		CNS/Psych: irritability, nightmares, psychoses, suicide, depression, seizures, H/A	History of seizures, psychosis, severe anxiety or depression
primaquine	Malaria: treatment of liver hypnozoites of <i>P. vivax</i> and <i>P. ovale</i> . Prophylaxis of all <i>Plasmodium</i> spp. <i>Pneumocystis jiroveci</i> (with clindamycin)	Interferes with mitochondrial function	Hemolytic anemia in G6PD deficient GI upset (take with food)	GI nonspecific G6PD deficiency Concurrent or recent use of quinacrine Pregnancy
atovaquone/proguanil (Malarone®)	Malaria: treatment and prophylaxis of <i>P. falciparum</i>	Inhibits mitochondrial electron transport and dihydrofolate reductase	N/V, anorexia, diarrhea, abdo pain (take with food)	Hypersensitivity to atovaquone or proguanil Severe renal impairment
artemisinin derivatives (artemeter, artesunate, etc.) Note: marketed primarily in endemic countries	Malaria: treatment of all <i>Plasmodium</i> species Severe malaria (IV artesunate) Typically used in combination with a longer-acting agent from above	Binds iron, leading to formation of free radicals that damage parasite proteins	Transient neurologic deficits (nystagmus, balance disturbance) Transient neuropenia (at high doses of oral artesunate)	Hypersensitivity to artemisinins

Table 34. Antiparasitics (continued)

Class and Drugs	Coverage	Mechanism of Action	Adverse Effects	Contraindications
<b>OTHER ANTI-PROTOZOAL</b>				
iodoquinol (Diodoquin®)	Amebiasis: <i>E. histolytica</i> , <i>Dientamoeba fragilis</i> , <i>Balantidium coli</i> , <i>Blastocystis hominis</i>	Contact amoebicide that acts in intestinal lumen by uncertain mechanism	GI: N/V, diarrhea, abdo pain CNS: H/A, seizures, encephalitis	Hypersensitivity to any 8-hydroxy-quinoline or iodine Patients with hepatic damage or optic neuropathy Pregnancy
metronidazole	Amebiasis, <i>T. vaginalis</i> , giardiasis	See <i>Antibiotics</i> , ID47		
nitazoxanide	<i>Cryptosporidium</i> , giardiasis	Interferes with parasite anaerobic metabolism	N/V, diarrhea, abdo pain, headache	Hypersensitivity to nitazoxanide
<b>ANTI-HELMINTHICS</b>				
praziquantel	<i>Schistosomiasis</i> and other flukes Tapeworms	Increases Ca <sup>2+</sup> permeability of helminth cell membrane, causing paralysis and detachment	N/V, fever, dizziness	Ocular cysticercosis
albendazole	Intestinal roundworms <i>Neurocysticercosis</i> <i>Microsporidiosis</i> <i>Echinococcus</i> → Hydatid disease	Inhibits glucose uptake into susceptible parasites	Elevated liver enzymes Alopecia GI nonspecific Agranulocytosis	Pregnancy Ocular cysticercosis or intraventricular cysticercosis
mebendazole (Vermox®)	Intestinal roundworms: - pinworm - whipworm - hookworm - roundworm (e.g. <i>Ascaris</i> )	Inhibits microtubule formation and glucose uptake	Nonspecific GI	Pregnancy, infants
ivermectin	<i>Strongyloidiasis</i> <i>Onchocerciasis</i> Scabies	Interferes with polarization of nerve and muscles cells in susceptible parasites leading to paralysis	Nausea, bloating, diarrhea, myalgias, lightheadedness, headache	Hypersensitivity to ivermectin Pregnancy
diethylcarbamazine	<i>Wuchereria bancrofti</i> <i>Loa loa</i>		Anorexia, N/V, headache, drowsiness, encephalitis, retinal hemorrhage Mazzotti reaction if coinfectd with onchocerciasis	Pregnancy

## Quick Reference: Common Infections and their Antibiotic Management

Table 35. Common Infections and their Empiric Antibiotic Management

Infection	Bacteria	Antibiotic
<b>RESPIRATORY</b>		
<b>Pneumonia</b>		
• Community-acquired	<i>S. pneumoniae</i> , <i>H. influenzae</i> , <i>M. catarrhalis</i> , <i>Mycoplasma</i> , <i>Chlamydia</i> , <i>Legionella</i> , <i>S. aureus</i>	Outpatient: amoxicillin-clavulanate OR doxycycline Hospitalized: antipseudomonal respiratory fluoroquinolone OR 3rd generation cephalosporin ± macrolide
• Hospital-acquired:	GNR (including <i>Pseudomonas</i> in special settings such as ICU)	ceftriaxone (if not at risk for <i>Pseudomonas</i> ) OR pip/tazo OR meropenem
<b>Tuberculosis</b>	<i>Mycobacterium tuberculosis</i>	isoniazid + rifampin + pyrazinamide + ethambutol + pyridoxine (for initial empiric therapy)
<b>UTI</b>		
<b>Cystitis</b>	KEEP <sup>2</sup> S	fluoroquinolone OR TMP/SMX OR nitrofurantoin
<b>Pyelonephritis</b>	KEEP <sup>2</sup> S	ciprofloxacin OR 3rd gen. cep
<b>Urethritis</b>	<i>Neisseria gonorrhoea</i> <i>Chlamydia</i>	ceftriaxone azithromycin OR doxycycline
<b>SOFT TISSUE</b>		
<b>Cellulitis</b>	β-hemolytic streptococci, MSSA	cephalexin OR cefazolin
<b>Necrotizing Fasciitis</b>	Type I: polymicrobial (GNR and anaerobes)	pip/tazo + clindamycin
	Type II: β-hemolytic streptococci Unknown organism	penicillin G + clindamycin

KEEP<sup>2</sup>S = *Klebsiella*, *E. Coli*, *Enterococci*, *Proteus mirabilis*, *Pseudomonas*, *S. saprophyticus*

**Table 35. Common Infections and their Empiric Antibiotic Management (continued)**

Infection	Bacteria	Antibiotic
<b>BONE</b>		
<b>Osteomyelitis</b>	MSSA	cloxacillin OR cefazolin
<b>Diabetic Foot</b>		
	• Mild	MSSA, <i>Streptococcus</i> spp.
• Moderate or severe	polymicrobial	cephalexin OR clindamycin clindamycin + ciprofloxacin OR pip/tazo ± vancomycin if MRSA suspected
<b>Septic Arthritis</b>	<i>N. gonorrhoeae</i> (sexually active adults) <i>S. aureus</i> , <i>S. pyogenes</i>	vancomycin + ceftriaxone
<b>OTHER</b>		
<b>Meningitis</b>	<i>S. pneumoniae</i> , <i>N. meningitidis</i> , <i>H. influenza</i>	ceftriaxone + vancomycin (+ ampicillin for <i>Listeria</i> in very young, old, immunocompromised)
<b>Bacterial Endocarditis</b>		
• Native valve	<i>S. viridans</i> , <i>S. aureus</i> , <i>Enterococcus</i>	Usually non urgent and can wait for confirmation of etiology Empiric therapy if patient unstable, vancomycin and gentamicin or ceftriaxone. Take multiple blood cultures prior to initiating therapy

## Acronyms

AXR	abdominal x-ray	FLAIR	fluid-attenuated inversion recover	PBD	percutaneous biliary drainage
CT	computed tomography	HIDA	hepatobiliary iminodiacetic acid	PET	positron emission tomography scan
CTA	computed tomographic angiogram	HSG	hysterosalpingogram	PTA	percutaneous transluminal angioplasty
DEXA	dual-energy x-ray absorptiometry	IVP	intravenous pyelogram	RAIU	radioactive iodine uptake
DSA	digital subtraction angiography	MRA	magnetic resonance angiogram	SPECT	single photon emission computed tomography
DWI	diffusion-weighted image	MRCP	magnetic resonance cholangiopancreatography	TRUS	transrectal ultrasound
ERCP	endoscopic retrograde cholangio-pancreatography	MRI	magnetic resonance imaging	TVUS	transvaginal ultrasound
		MUGA	multiple gated acquisition scan	VCUG	voiding cystourethrogram

# Imaging Modalities

## X-Ray Imaging

- x-rays, or Roentgen rays, are a form of electromagnetic energy of short wavelength
- as x-ray photons traverse matter, they can be absorbed (a process known as “attenuation”) and/or scattered
- the density of a structure determines its ability to attenuate or “weaken” the x-ray beam
  - air < fat < water < bone < metal
- structures that have high attenuation, e.g. bone, appear white on the resulting images

## Plain Films

- x-rays pass through the patient and interact with a detection device to produce a 2-dimensional projection image
- structures closer to the film appear sharper and less magnified
- contraindications: pregnancy (relative)
- advantages: inexpensive, non-invasive, readily available
- disadvantages: radiation exposure, generally poor at distinguishing soft tissues

## Fluoroscopy

- continuous x-rays allow real-time visualization
- used for guiding angiographic and interventional procedures, in contrast examinations of the GI tract, and in the OR for certain surgical procedures (e.g. orthopedic, urological)
- on the fluoroscopic image black and white are reversed so that bone and contrast agents appear dark and radiolucent structures appear light

## Computed Tomography (CT)

- x-ray beam opposite a detector moves in a continuous 360 degree arc as patient is advanced through the imaging system
  - subsequent computer assisted reconstruction of anatomical structures from the axial plane
- attenuation is quantified in Hounsfield units:
  - adjusting the “window width” (range of Hounsfield units displayed) and “window level” (midpoint value of the window width) can maximally visualize certain anatomical structures
    - e.g. CT chest can be viewed using “lung”, “soft tissue” and “bone” settings
- contraindications: pregnancy (relative), contraindications to contrast agents (e.g. allergy, renal failure)
- advantages: delineates surrounding soft tissues, excellent at delineating bones and identifying lung/liver masses, may be used to guide biopsies, spiral CT has fast data acquisition, helical CT allows 3D reconstruction, CT angiography is less invasive than conventional angiography
- disadvantages: high radiation exposure, IV contrast injection, anxiety of patient when going through scanner, higher cost and less available than plain film

## Ultrasound (U/S)

- high frequency sound waves are transmitted from a transducer and passed through tissues; reflections of the sound waves are picked up by the transducer and transformed into images
- reflection (or “echo”) occurs when the sound waves pass through tissue interfaces of different acoustic densities
- structures are described based on their echogenicity; hyperechoic structures appear bright whereas hypoechoic structures appear dark
- higher ultrasound frequencies result in greater resolution but greater attenuation (i.e. deeper structures more difficult to visualize)
- artifacts: acoustic shadowing refers to the echo-free area located behind an interface that strongly reflects (i.e. tissue/air) or absorbs (tissue/bone) sound waves; enhancement refers to the increase in reflection amplitude (increased brightness) from objects that lie below a weakly attenuating structure (e.g. cyst)
- Doppler: determines the velocity of blood flowing past the transducer based on the Doppler effect
- Duplex scan: Doppler + visual images
- advantages: relatively low cost, non-invasive, no radiation, real time imaging, may be used for guided biopsies, many different imaging planes (axial, sagittal), determines cystic versus solid
- disadvantages: highly operator-dependent, air in bowel may prevent imaging of midline structures in the abdomen, may be limited by patient habitus

### Typical Effective Doses from Diagnostic Medical Exposures (in adults)\*

Diagnostic Procedure	Equivalent Number of Chest X-rays	Approximate Equivalent Period of Natural Background Radiation** (~3 mSv/yr)
<b>X-ray examinations:</b>		
Skull	5	12 d
Cervical spine	10	3 wk
Thoracic spine	50	4 mo
Lumbar spine	75	6 mo
Chest (single PA film)	1	2 d
Shoulder	0.5	1 d
Mammography	20	7 wk
Abdomen	35	3 mo
Hip	35	3 mo
Pelvis	30	10 wk
Knee	0.25	<1 d
IVU	150	1 yr
Dual-energy x-ray absorptiometry (without/with CT)	0.5/2	<1 d/4 d
Upper GI series	300	2 yr
Small bowel series	250	20 mo
Barium enema	400	2.7 yr
<b>CT procedures:</b>		
Head	100	8 mo
Neck	150	1 yr
Spine	300	2 yr
Chest	350	2.3 yr
Chest (pulmonary embolism)	750	5 yr
Coronary angiography	800	5.3 yr
Abdomen	400	2.7 yr
Pelvis	300	2 yr
<b>Radionuclide studies:</b>		
Brain ( <sup>18</sup> F)FDG	705	4.7 yr
Bone ( <sup>99m</sup> Tc)	315	2.1 yr
Thyroid ( <sup>99m</sup> Tc)	240	1.6 yr
Thyroid ( <sup>123</sup> I)	95	8 mo
Cardiac rest-stress test ( <sup>99m</sup> Tc 1-d)	470	3 yr
( <sup>99m</sup> Tc 2-d)	640	4 yr
Lung ventilation ( <sup>133</sup> Xe)	25	2 mo
Lung perfusion ( <sup>99m</sup> Tc)	100	8 mo
Renal ( <sup>99m</sup> Tc)	90-165	7-13 mo
Liver-spleen ( <sup>99m</sup> Tc)	105	8.4 yr
Biliary tract ( <sup>99m</sup> Tc)	155	1 yr

\*Source: *Radiology* 2008;248:254-263

\*\*Calculated using average natural background exposure in Canada (Health Canada: <http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/environ/expos-eng.php>)

Substance	Hounsfield Unit
Air	-1000
Fat	-120
Water	0
Blood	+30 to +45
Muscle	+40
Contrast	+130
Bone	+400 or more

### Attenuation

Bone (= bright) > grey matter > white matter (“fatty” myelin) > CSF > air (= dark)

## Magnetic Resonance Imaging (MRI)

- non-invasive technique that does not use ionizing radiation
- able to produce images in virtually any plane
- patient is placed in a magnetic field; protons (H+) align themselves along the plane of magnetization due to intrinsic polarity. A pulsed radiofrequency beam is subsequently turned on which deflects all the protons off their aligned axes due to absorption of energy from the radiofrequency beam. When the radiofrequency beam is turned off, the protons return to their pre-excitation axis, giving off the energy they absorbed. This energy is measured with a detector and interpreted by a computer to generate MR images.
- the MR image reflects the signal intensity picked up by the receiver. This signal intensity is dependent on:
  1. hydrogen density: tissues with low hydrogen density (e.g. cortical bone, lung) generate little to no MR signal compared to tissues with high hydrogen density (e.g. water)
  2. magnetic relaxation times (T1 and T2): reflect quantitative alterations in MR signal strength due to intrinsic properties of the tissue and its surrounding chemical and physical environment (see Table 1)

Remember that water is “white” on T2 as “World War II”

**Table 1. Differences between Diffusion, T1- and T2-Weighted MR Imaging**

Imaging Techniques	Contrast Enhancements	Main Application	Advantages
Diffusion Weighted Imaging	Contrast dependent on the molecular motion of water. Decreased diffusion is hyperintense (bright), whereas increased diffusion is hypointense (dark)	Neuroradiology	Sensitive for detection of acute ischemic stroke and differentiating an acute stroke from other neurologic pathologies. An acute infarction will appear hyperintense
T1-Weighted	Fluid is hypointense (dark) and fat is hyperintense (bright)	Body soft tissues	Often considered an anatomic scan since they provide a reference for functional imaging
T2-Weighted	Fluid is hyperintense (bright) and fat is hypointense (dark)	Body soft tissues	Often considered a pathologic scan since they will highlight edematous areas associated with certain pathologies

**Recommended Premedication Protocol to Reduce the Frequency and/or Severity of Reactions to Contrast Media**

- Prednisone 50 mg PO at 13 h, 7 h, 1 h before contrast media injection plus diphenhydramine (Benadryl®) 50 mg IV, IM by 1 h before contrast medium

## Positron Emission Tomography Scans (PET)

- non-invasive technique that involves exposure to ionizing radiation (~7 mSv)
- nuclear medicine imaging technique that produces images of functional processes in the body
- current generation models integrate PET and CT technologies into a single imaging device (PET-CT) that collects both anatomic and functional information during a single acquisition
- positron-producing radioisotope, such as 18-fluorodeoxyglucose (18-FDG) is chemically incorporated into a metabolically active molecule (glucose), injected into patient, which travels to target organ, accumulates in tissues of interest, and as radioactive substance begins to decay, gamma rays are produced which are detected by PET scanner
- advantages: shows metabolism and physiology of tissues (not only anatomic), in oncology allows diagnosis, staging, restaging (lung, breast, colorectal, lymphoma, melanoma, esophageal, head and neck), has predictive and prognostic value (breast, lymphoma), can evaluate cardiac viability
- disadvantages: cost, ionizing radiation
- contraindications: pregnancy

**Contraindications to IV Contrast**

**MAD Failure**  
Multiple myeloma  
Adverse reaction previously  
Diabetes, Dehydration  
**Failure** (renal, severe heart)

**Acute Reactions to IV Contrast**

**Hot BUNS**  
Hypotension  
Bradycardia  
Urticaria  
Nausea/vomiting  
Seizures

## Contrast Enhancement

**Table 2. Contrast Agents**

Imaging Modality	Types	Advantages	Disadvantages	Contraindications
X-ray/CT	1. Barium (oral or rectal)	Radiopaque substance which helps to delineate intraluminal anatomy, may demonstrate patency, lumen integrity, or large filling defects	Risk of nephrotoxicity	Previous adverse reaction to contrast; barium enema is contraindicated in toxic megacolon, acute colitis, and suspected perforation
	2. Iodine (IV injection)	Delineates intraluminal anatomy, may demonstrate patency, lumen integrity, or large filling defects; under fluoroscopy, may also give information on function of an organ		Previous adverse reaction to contrast, renal failure, diabetes, pregnancy, multiple myeloma, severe heart failure and dehydration
MRI	1. Gadolinium-Chelates (IV injection)	Shortens T1 relaxation time, thereby increasing signal intensity in T1-weighted sequences; gadolinium has some effect on T2-relaxation time; highlights highly vascular structures (i.e. tumours)	Risk of nephrogenic systemic fibrosis in patients with end-stage renal disease	Previous adverse reaction to contrast or if end-stage renal disease (relative contraindication)
U/S	1. Microbubbles (IV injection)	Since gas is highly echogenic, the microbubbles allow for echo-enhancement of a tissue		Contraindicated in individuals with right-to-left cardiac shunts or people with known hypersensitivity reactions

# Chest Imaging

## Chest X-Ray (CXR)

### Standard Views

- posteroanterior (PA): anterior chest against film plate to minimize magnification of the heart size
- lateral: better visualization of retrocardiac space and thoracic spine (more sensitive at picking up pleural effusions)
  - helps localize lesions when combined with PA view
- anteroposterior (AP): for bedridden patients (generally a lower quality film than PA)
  - enlarged cardiac silhouette
- lateral decubitus: to assess for pleural effusion and pneumothorax in bedridden patients
- lordotic: angled beam allowing better visualization of apices normally obscured by the clavicles and anterior ribs

Figure 1. CXR views

### Approach to CXR

#### Basics

- ID: patient name, MRN, sex, age
- date of exam
- markers: Right and/or Left
- technique: view (e.g. PA, AP, lateral), supine or erect
- indications for the study
- comparison: date of previous study for comparison (if available)
- quality of film: inspiration (6th anterior and 10th posterior ribs should be visible), penetration (thoracic spine should be visible) and rotation (clavicles vs. spinous process)

#### Analysis

- tubes and lines: check position and be alert for pneumothorax or pneumomediastinum
- soft tissues: neck, axillae, pectoral muscles, breasts/nipples, chest wall
  - nipple markers can help identify nipples (may mimic lung nodules)
  - amount of soft tissue, presence of masses and air (subcutaneous emphysema)
- abdomen (see *Abdominal Imaging*, MI10):
  - free air under the diaphragm, air-fluid levels, distention in small and large bowels
  - herniation of abdominal contents (i.e. diaphragmatic hernia)
- bones: C-spine, thoracic spine, shoulders, ribs, sternum, clavicles
  - lytic and blastic lesions and fractures
- mediastinum: trachea, heart, great vessels, mediastinum
  - cardiomegaly (cardiothoracic ratio >0.5), tracheal shift, tortuous aorta, widened mediastinum
- hila: pulmonary vessels, mainstem bronchi, and segmental bronchi, lymph nodes
- lungs: lung parenchyma, pleura, diaphragm
  - spine sign: on lateral films, vertebral bodies should appear progressively radiolucent as one moves down the thoracic vertebral column. If they appear more radioopaque, it is an indication of pathology (i.e. consolidation in overlying left lower lobe)
  - comment on abnormal lung opacity, pleural effusions or thickening
  - right hemidiaphragm usually higher than left due to liver
  - right vs. left hemidiaphragm can be discerned on lateral CXR due to heart resting directly on left hemidiaphragm

#### Sodium Bicarbonate plus N-acetylcysteine

##### Prophylaxis: A Meta-analysis

*JACC Cardiovasc Interv* 2009;2:1116-1124

**Study:** A meta-analysis of 10 RCTs.

**Objective:** To compare N-acetylcysteine (NAC) + sodium bicarbonate ( $\text{NaHCO}_3$ ) to NAC + normal saline hydration in prevention of acute kidney injury (AKI) from IV contrast.

**Patients:** Those receiving IV contrast for various indications (PCI, angiography, catheterization)

**Results:** Combination treatment of NAC with intravenous  $\text{NaHCO}_3$  reduced contrast-induced AKI by 35% (relative risk: 0.65; 95% confidence interval: 0.40 to 1.05). However, the combination of N-acetylcysteine plus  $\text{NaHCO}_3$  did not significantly reduce renal failure requiring dialysis.

**Conclusion:** Combination prophylaxis should be considered for all high-risk patients (emergent cases or patients with chronic kidney disease).

Anatomy

Localizing Lesions

- silhouette sign: loss of normal interfaces due to lung pathology (consolidation, atelectasis, mass), which can be used to localize disease in specific lung segments (see Table 3)
  - note that pleural or mediastinal disease can also produce the silhouette sign

Table 3. Localization Using the Silhouette Sign

Interface Lost	Location of Lung Pathology
Superior vena cava/right superior mediastinum	RUL
Right heart border	RML
Right hemidiaphragm	RLL
Aortic knob/left superior mediastinum	LUL
Left heart border	Lingula
Left hemidiaphragm	LLL

Figure 2. Location of fissures, mediastinal structures and bony landmarks

Figure 3. Location of lobes of the lung

Chest X-Ray Interpretation

Basics ABCDEF:

- AP, PA or other view
- Body position/rotation
- Confirm name
- Date
- Exposure/quality
- Films for comparison

Analysis ABCDEF:

- Airways, and hilar Adenopathy
- Bones and Breast shadows
- Cardiac silhouette and Costophrenic angle
- Diaphragm and Digestive tract
- Edges of pleura
- Fields (lung fields)

## Computed Tomography (CT) Chest

### Approach to CT Chest

- soft tissue window
  - thyroid, chest wall, pleura
  - heart: chambers, coronary artery calcifications, pericardium
  - vessels: aorta, pulmonary artery, smaller vasculature
  - lymph nodes: mediastinal, axillary
- bone window
  - look at vertebrae, sternum, manubrium, ribs for fractures, lytic lesions, sclerosis
- lung window
  - central-trachea: patency, secretions
  - bronchial trees: anatomic variants, mucus plugs, airway collapse
  - lung parenchyma: fissures, nodules, fibrosis/interstitial changes
  - pleural space: effusions

Table 4. Types of CT Chest

	Standard	High Resolution	Low Dose	CT Angiography
<b>Advantage</b>	Scans full lung very quickly (<1 min)	Thinner slices provide high definition of lung parenchyma	1/5th the radiation	Iodinated contrast highlights vasculature
<b>Disadvantage</b>	Poor at evaluating diffuse disease	Only 5-10% lung is sampled	Decreased detail	Contrast can cause severe allergic reaction and is nephrotoxic
<b>Contrast</b>	±	No	No	Yes
<b>Indication</b>	CXR abnormality Pleural and mediastinal abnormality Lung cancer staging Follow up metastases Empyema vs. abscess	Hemoptysis Diffuse lung disease (e.g. sarcoidosis, hypersensitivity pneumonitis, pneumoconiosis) Pulmonary fibrosis Normal CXR but abnormal PFTs Characterize solitary pulmonary nodule	Screening Follow up infections, lung transplant, metastases	Pulmonary embolism Aortic aneurysms Aortic dissection

Figure 4. CT thorax windows

### DDx of Airspace Disease

- Pus (e.g. infections such as pneumonia, non-infectious inflammatory process)
- Fluid (e.g. pulmonary edema)
- Blood (e.g. pulmonary hemorrhage)
- Cells (e.g. bronchioalveolar carcinoma, lymphoma)
- Protein (e.g. alveolar proteinosis)

## Lung Abnormalities

### Atelectasis

- pathogenesis: collapse of alveoli due to restricted breathing, blockage of bronchi, external compression or poor surfactant
- findings:
  - increased opacity of involved segment/lobe, vascular crowding, silhouette sign, air bronchograms
  - volume loss: fissure deviation, hilar/mediastinal displacement, diaphragm elevation
  - compensatory hyperinflation of remaining normal lung
- differential diagnosis:
  - obstructive (most common): air distal to obstruction is reabsorbed causing alveolar collapse
    - ♦ endobronchial lesion, foreign body, inflammation (granulomatous infections, pneumoconiosis, sarcoidosis, radiation injury) or mucous plug (cystic fibrosis)
  - compressive:
    - ♦ tumour, bulla, effusion, enlarged heart, lymphadenopathy
  - traction (cicatization): due to scarring, which distorts alveoli and contracts the lung
  - adhesive: due to lack of surfactant
    - ♦ hyaline membrane disease, prematurity
  - passive (relaxation): a result of air or fluid in the pleural space
    - ♦ pleural effusion, pneumothorax
- management: in the absence of a known etiology, persisting atelectasis must be investigated (CT thorax) to rule out a bronchogenic carcinoma

### Consolidation

- pathogenesis: fluid (water, blood), inflammatory exudates, protein, or tumour in alveoli
- findings:
  - air bronchograms: lucent branching bronchi visible through opacification
  - airspace nodules: fluffy, patchy, poorly defined margins with later tendency to coalesce, may take on lobar or segmental distribution
  - silhouette sign

Figure 5. Atelectasis: RML collapse

- differential diagnosis:
  - fluid: pulmonary edema, blood (trauma, vasculitis, bleeding disorder, pulmonary infarct)
  - inflammatory exudates: bacterial infections, TB, allergic hypersensitivity alveolitis, bronchiolitis obliterans organizing pneumonia (BOOP), allergic bronchopulmonary aspergillosis (ABPA), aspiration, sarcoidosis
  - protein: pulmonary alveolar proteinosis
  - tumour: bronchioalveolar carcinoma, lymphoma
- management: varies depending on the pattern of consolidation, which can suggest different etiologies. Management should also be done in the context of clinical picture

### Interstitial Disease

- pathogenesis: pathological process involving the interlobular connective tissue (i.e. “scaffolding of the lung”)
- findings:
  - linear: fine lines caused by thickened connective tissue septae
    - ♦ Kerley A: long thin lines in upper lobes
    - ♦ Kerley B: short horizontal lines extending from lateral lung margin
    - ♦ Kerley C: diffuse linear pattern throughout lung
    - ♦ seen in pulmonary edema, lymphangitic carcinomatosis and atypical interstitial pneumonias
  - nodular: 1-5 mm well-defined nodules distributed evenly throughout lung
    - ♦ seen in malignancy, pneumoconiosis and granulomatous disease (sarcoidosis, miliary TB)
  - reticular (honeycomb): parenchyma replaced by thin-walled cysts suggesting extensive destruction of pulmonary tissue and fibrosis (see Figures 7 and 8)
    - ♦ seen in interstitial pulmonary fibrosis (IPF), asbestosis and CVD
    - ♦ NOTE: watch for pneumothorax as a complication
  - reticulonodular: combination of reticular and nodular patterns
  - may also see signs of airspace disease (atelectasis and consolidation)
- differential diagnosis:
  - occupational/environmental exposure
    - ♦ inorganic: asbestosis, coal miner's pneumoconiosis, silicosis, berylliosis, talc pneumoconiosis
    - ♦ organic: hypersensitivity pneumonitis, bird fancier's lung, farmer's lung (moldy hay), and other organic dust
  - autoimmune: CVD (e.g. rheumatoid arthritis, scleroderma, SLE, polymyositis, mixed connective tissue disease), IBD, celiac disease, vasculitis
  - drug-related: antibiotics (cephalosporins, nitrofurantoin), NSAIDs, phenytoin, carbamazepine, fluoxetine, amiodarone, chemotherapy (e.g. methotrexate), heroin, cocaine, methadone
  - infections: non-tuberculous mycobacteria, certain fungal infections
  - idiopathic: hypersensitivity pneumonitis, IPF, BOOP
  - for *Causes of Interstitial Lung Disease Classified by Distribution*, see [Respirology](#), R12
- management: high resolution CT thorax and biopsy

### Pulmonary Nodule (see Table 5)

- findings: round opacity ± silhouette sign
  - note: do not mistake nipple shadows for nodules; if in doubt, repeat CXR with nipple markers
- differential diagnosis:
  - extrapulmonary density: nipple, skin lesion, electrode, pleural mass, bony lesion
  - solitary nodule:
    - ♦ tumour: carcinoma, hamartoma, metastasis, bronchial adenoma
    - ♦ inflammation: histoplasmosis, tuberculoma, coccidioidomycosis
    - ♦ vascular: AV fistula, pulmonary varix (dilated pulmonary vein), infarct, embolism
  - multiple nodules: metastases, abscess, granulomatous lung disease [TB, fungal, sarcoid, rheumatoid nodules, silicosis, granulomatosis with polyangiitis (GPA)]
- management: clinical information and CT appearance determine level of suspicion of malignancy
  - if high probability of malignancy, invasive testing (fine needle aspiration, transbronchial/transsthoracic biopsy) is indicated
  - if low probability of malignancy, repeat CXR or CT in 1-3 mo and then every 6 mo for 2 yr; if no change, then >99% chance benign

**Figure 6. Consolidation: bacterial pneumonia**

**Figure 7. Interstitial disease: fine reticular pattern**

**Figure 8. Interstitial disease: medium reticular pattern**

#### DDx of Interstitial Lung Disease

**FASSTEN** (upper lung disease)  
 Farmer's lung (hypersensitivity pneumonitis)  
 Ankylosing spondylitis  
 Sarcoidosis  
 Silicosis  
 TB  
 Eosinophilic granuloma (Langerhans cell histiocytosis)  
 Neurofibromatosis

**BAD RASH** (lower lung disease)  
 Bronchiolitis obliterans with organizing pneumonia (BOOP)  
 Asbestos  
 Drugs (nitrofurantoin, hydralazine, INH, amiodarone, many chemo drugs)  
 Rheumatological disease  
 Aspiration  
 Scleroderma  
 Hamman Rich (interstitial pulmonary fibrosis) and idiopathic pulmonary fibrosis

#### DDx for Cavitating Lung Nodule

**WEIRD HOLES**  
 GPA (Wegener's)  
 Embolic (pulmonary, septic)  
 Infection (anaerobes, pneumocystis, TB)  
 Rheumatoid (necrobiotic nodules)  
 Developmental cysts (sequestration)  
 Histiocytosis  
 Oncological  
 Lymphangioleiomyomatosis  
 Environmental, occupational  
 Sarcoidosis

**Table 5. Characteristics of Benign and Malignant Pulmonary Nodules**

	Malignant	Benign
<b>Margin</b>	Ill-defined/spiculated ("corona radiata")	Well-defined
<b>Contour</b>	Lobulated	Smooth
<b>Calcification</b>	Eccentric or stippled	Diffuse, central, popcorn, concentric
<b>Doubling Time</b>	20-460 d	<20 d or >460 d
<b>Other Features</b>	Cavitation, collapse, adenopathy, pleural effusion, lytic bone lesions, smoking history	
<b>Size</b>	>3 cm	<3 cm
<b>Cavitation</b>	Yes, especially with wall thickness >15 mm, eccentric cavity and shaggy internal margins	No
<b>Satellite Lesions</b>	No	Yes

**Figure 9. Pulmonary nodule: bronchogenic carcinoma****Figure 10. Pleural effusion in lateral view****Pulmonary Edema**

- pathogenesis: fluid accumulation in the airspaces of the lungs
- findings:
  - vascular redistribution/enlargement, cephalization, pleural effusion, cardiomegaly (may be present in cardiogenic edema and fluid overloaded states)
  - fluid initially collects in interstitium:
    - ♦ loss of definition of pulmonary vasculature
    - ♦ peribronchial cuffing
    - ♦ Kerley B lines
    - ♦ reticulonodular pattern
    - ♦ thickening of interlobar fissures
  - as pulmonary edema progresses, fluid begins to collect in alveoli causing diffuse air space disease often in a "bat wing" or "butterfly" pattern in perihilar regions with tendency to spare the outermost lung fields
- differential diagnosis: cardiogenic (CHF), renal failure, volume overload, non-cardiogenic (ARDS)

**Pulmonary Embolism**

- pathogenesis: arterial blockage in the lungs
- findings: Westermark sign (localized pulmonary oligemia), Hampton's hump (triangular peripheral infarct), enlarged RV and RA, atelectasis, pleural effusion, and rarely pulmonary edema
- management: V/Q scan, CT angiography (look for filling defect)

**Figure 11. Pneumothorax****Elevated Hemidiaphragm Suggests:**

**PAL DIP**  
 Pregnancy  
 Atelectasis  
 Lung resection  
 Diaphragmatic paralysis  
 Intra-abdominal process  
 Pneumectomy

Pleural effusion also may result in apparent elevation.

**Depressed Hemidiaphragm Suggests**

**TALC**  
 Tumour  
 Asthma  
 Large pleural effusion  
 COPD

**Pulmonary Vascular Abnormalities****Pleural Effusion****Table 6. Sensitivity of Plain Film Views for Pleural Effusion**

X-ray Projection	Minimum Volume to Visualize
Lateral decubitus	25 mL: most sensitive
Upright lateral	50 mL: meniscus seen in the posterior costophrenic sulcus
PA	200 mL
Supine	Diffuse haziness

- a horizontal fluid level is seen only in a hydropneumothorax (both fluid and air within pleural cavity)
- effusion may exert mass effect, shift trachea and mediastinum to opposite side, or cause atelectasis of adjacent lung
- U/S is superior to plain film for detection of small effusions and may also aid in thoracentesis

**Pneumothorax**

- pathogenesis: gas/air accumulation within the pleural space resulting in separation of the lung from the chest wall
- findings:
  - upright chest film allows visualization of visceral pleura as curvilinear line paralleling chest wall, separating partially collapsed lung from pleural air
  - more obvious on expiratory (increased contrast between lung and air) or lateral decubitus films (air collects superiorly)
  - more difficult to detect on supine film; look for the "deep (costophrenic) sulcus" sign, "double diaphragm" sign (dome and anterior portions of diaphragm outlined by lung and pleural air, respectively), hyperlucent hemithorax, sharpening of adjacent mediastinal structures
  - mediastinal shift may occur if air is under tension (i.e. tension pneumothorax)

- differential diagnosis: spontaneous (tall and thin males, smokers), iatrogenic (lung biopsy, ventilation, CVP line insertion), trauma (associated with rib fractures), emphysema, malignancy, honeycomb lung
- management: needle decompression or chest tube insertion, repeat CXR to ensure resolution

### Asbestos

- asbestos exposure may cause various pleural abnormalities including benign plaques (most common) that may calcify, diffuse pleural fibrosis, effusion, and malignant mesothelioma

## Mediastinal Abnormalities

### Mediastinal Mass

- the mediastinum is divided into three compartments; this provides the approach to the differential diagnosis of a mediastinal mass
- anterior (anterior border formed by anterior trachea and posterior border by the heart and great vessels)
  - 4 Ts: see sidebar
  - cardiophrenic angle mass differential: thymic cyst, epicardial fat pad, foramen of Morgagni hernia
- middle (extending behind anterior mediastinum to a line 1 cm posterior to the anterior border of the thoracic vertebral bodies)
  - esophageal carcinoma, esophageal duplication cyst
  - metastatic disease
  - lymphadenopathy (all causes)
  - hiatus hernia
  - bronchogenic cyst
- posterior (posterior to the middle line described above)
  - neurogenic tumour (e.g. neurofibroma, schwannoma)
  - multiple myeloma
  - pheochromocytoma
  - neurenteric cyst
  - thoracic duct cyst
  - lateral meningocele
  - Bochdalek hernia
  - extramedullary hematopoiesis
- in addition, any compartment may give rise to lymphoma, lung cancer, aortic aneurysm or other vascular abnormalities, abscess, and hematoma

#### DDx Anterior Mediastinal Mass

##### 4 Ts

Thyroid  
Thymic neoplasm  
Teratoma  
Terrible lymphoma

#### DDx of Increased Cardiothoracic Ratio

- Cardiomegaly (myocardial dilatation or hypertrophy)
- Pericardial effusion
- Poor inspiratory effort/low lung volumes
- Pectus excavatum
- Antero-posterior view

#### Mediastinal Masses

Approximately 60% of anterior, 30% of middle, and 15% of posterior mediastinal masses are malignant.

### Enlarged Cardiac Silhouette

- heart borders
  - on PA view, right heart border is formed by right atrium; left heart border is formed by left atrium and left ventricle
  - on lateral view, anterior heart border is formed by right ventricle; posterior border is formed by left atrium (superior to left ventricle) and left ventricle
- cardiothoracic ratio = greatest transverse dimension of the central shadow relative to the greatest transverse dimension of the thoracic cavity
  - using a good quality erect PA chest film in adults, cardiothoracic ratio of >0.5 is abnormal
  - differential of ratio >0.5
    - ♦ cardiomegaly (myocardial dilatation or hypertrophy)
    - ♦ pericardial effusion
    - ♦ poor inspiratory effort/low lung volumes
    - ♦ pectus excavatum
  - ratio <0.5 does not exclude enlargement (e.g. cardiomegaly + concomitant hyperinflation)
- pericardial effusion
  - globular heart with loss of indentations on left mediastinal border
- right atrial enlargement
  - increase in curvature of right heart border and enlargement of SVC
- left atrial enlargement
  - straightening of left heart border
  - increased opacity of lower right side of cardiovascular shadow (double heart border)
  - elevation of left main bronchus (specifically, the upper lobe bronchus on the lateral film), distance between left main bronchus and “double” heart border >7 cm, splayed carina (late sign)
- right ventricular enlargement
  - elevation of cardiac apex from diaphragm
  - anterior enlargement leading to loss of retrosternal air space on lateral
  - increased contact of RV against sternum
- left ventricular enlargement
  - displacement of cardiac apex inferiorly and posteriorly – “boot-shaped” heart

## Tubes, Lines, and Catheters

- ensure appropriate placement and assess potential complications of lines and tubes
- avoid mistaking a line/tube for pathology (e.g. oxygen rebreather mask for pneumothoraces)

### Central Venous Catheter

- used for fluid and medication administration, vascular access for hemodialysis, and central venous pressure (CVP) monitoring
- tip must be located distal to (above) right atrium to prevent inducing arrhythmias or perforating wall of atrium
  - if monitoring CVP, catheter tip must be proximal to venous valves
- tip of well positioned central venous catheter projects over silhouette of SVC in a zone demarcated superiorly by the anterior first rib end and clavicle and inferiorly by top of RA
- course should parallel course of SVC – if appears to bend as it approaches wall of SVC or appears perpendicular, catheter may damage and ultimately perforate wall of SVC
- complications: pneumothorax, bleeding (mediastinal, pleural), air embolism

**Figure 12. Well positioned central venous catheter (CXR)**

### Endotracheal Tube

- frontal chest film: tube projects over trachea and shallow oblique or lateral chest radiograph will help determine position in 3 dimensions
- progressive gaseous distention of stomach on repeat imaging is concerning for esophageal intubation
- tip should be located 4 cm above tracheal carina – avoids bronchus intubation and vocal cord irritation
- maximum inflation diameter <3 cm to avoid necrosis of tracheal mucosa and rupture – ensure diameter of balloon is less than tracheal diameter above and below balloon
- complications: aspiration (parenchymal opacities), pharyngeal perforation (subcutaneous emphysema, pneumomediastinum, mediastinitis)

### Nasogastric Tube (NG Tube)

- tip and sideport of NG tube should be positioned distal to esophagogastric junction and proximal to gastric pylorus
- radiographic confirmation of tube is mandatory because clinical techniques for assessing tip position may be unreliable
- complications: aspiration (parenchymal opacities), intracranial perforation (trauma patients), pneumothorax

### Swan-Ganz Catheter

- to monitor pulmonary capillary wedge pressure and to measure cardiac output for suspected left ventricular dysfunction
- tip should be positioned within right or left main pulmonary arteries or in one of their large, lobar branches
- if tip is located more distally, increased risk of prolonged pulmonary artery occlusion resulting in pulmonary infarction or, rarely, pulmonary artery rupture
- complications: pneumothorax, bleeding (mediastinal, pleural), air embolism

### Chest Tube

- in dorsal and caudal portion of pleural space to evacuate fluid usually
- in ventral and cephalad portions of pleural space to evacuate pneumothoraces
- tube may lie in fissure as long as functioning
- complications: lung perforation (mediastinal opacities)

## Abdominal Imaging

### Abdominal X-Ray (AXR)

- indications:
  - acute abdomen: bowel perforation, toxic megacolon, bowel ischemia, small bowel obstruction (SBO), large bowel obstruction (LBO)
  - chronic symptoms: constipation, calcifications (gallstones, renal stones, urinary bladder stones, etc.)
  - not useful in: GI bleeds, chronic anemia, vague GI symptoms
- AXR 3 most common views: left lateral decubitus (LLD), supine, erect upright

#### 3 Views of AXR

- Left lateral decubitus
- Supine
- Erect/Upright

## Anatomy

- abdomen divided into 2 cavities:
  - peritoneal cavity: lined by peritoneum that wraps around most of the bowel, the spleen, and most of the liver; forms a recess lateral to both the ascending and descending colon (paracolic gutters)
  - retroperitoneal cavity: contains several organs situated posterior to the peritoneal cavity; the contour of these can often be seen on radiographs

**Table 7. Differentiating Small and Large Bowel**

Property	Small Bowel	Large Bowel
Mucosal Folds	Uninterrupted valvulae conniventes (or plicae circularis)	Interrupted haustra extend only partway across lumen
Location	Central	Peripheral (picture frame)
Maximum diameter	3 cm	6 cm (9 cm at cecum)
Maximum fold thickness	3 mm	5 mm
Other	Rarely contains solid fecal material	Commonly contains solid fecal material

### What's in the Retroperitoneum?

- Duodenum (2nd, 3rd, 4th part)
- Ascending and descending colon
- Rectum
- Kidneys, ureters, bladder, adrenals
- Psoas, quadratus lumborum
- Aorta, inferior vena cava

## Approach to Abdominal X-Ray (AXR)

- mnemonic: "Free ABDO"
- Free = free fluid
  - small amounts of fluid: increased distance between lateral fat stripes and adjacent colon may indicate free peritoneal fluid in the paracolic gutters
  - large amounts of fluid: diffuse increased opacification on supine film; bowel floats to centre of anterior abdominal wall
  - ascites and blood (hemoperitoneum) are the same density on the radiograph and therefore cannot be differentiated
- A = air
  - volvulus – twisting of the bowel upon itself; from most to least common:
    - ♦ sigmoid: "coffee bean" sign (massively dilated sigmoid projects to right or mid-upper abdomen) with proximal large bowel dilation
    - ♦ cecal: massively dilated bowel loop projecting to left or mid-upper abdomen with small bowel dilation
    - ♦ gastric: rare
    - ♦ small bowel: "corkscrew sign" (rarely diagnosed on plain films, seen best on CT)
  - toxic megacolon
    - ♦ manifestation of fulminant colitis
    - ♦ extreme dilatation of colon (>6.5 cm) with mucosal changes including foci of edema, ulceration and pseudopolyps, loss of normal haustral pattern
- B = bowel wall thickening
  - increased soft tissue density in bowel wall, thumb-like indentations in bowel wall ("thumb-printing"), or a picket-fence appearance of the valvulae conniventes ("stacked coin" appearance)
  - may be seen in IBD, infection, ischemia, hypoproteinemic states, and submucosal hemorrhage
- D = densities
  - bones: look for gross abnormalities of lower ribs, vertebral column, and bony pelvis
  - abnormal calcifications: approach by location
    - ♦ RUQ: renal stone, adrenal calcification, gallstone, porcelain gallbladder
    - ♦ RLQ: ureteral stone, appendicolith, gallstone ileus
    - ♦ LUQ: renal stone, adrenal calcification, tail of pancreas
    - ♦ LLQ: ureteral stone
    - ♦ central: aorta/aortic aneurysm, pancreas, lymph nodes
    - ♦ pelvis: phleboliths (calcified veins), uterine fibroids, bladder stones
- O = organs
  - kidney, liver, gallbladder, spleen, pancreas, urinary bladder, psoas shadow
  - outlines can occasionally be identified because they are surrounded by more lucent fat, but all are best visualized with other imaging modalities (CT, MRI)

### Approach to AXR

#### Free ABDO

Free fluid

Air

Bowel wall thickening

Densities (bones, calcifications)

Organs

**Figure 13. Normal AXRs: (left) supine anteroposterior AXR, (middle) upright anteroposterior AXR, and (right) left lateral decubitus AXR**

**Table 8. Abnormal Air on Abdominal X-Ray**

Air	Appearance	Common Etiologies
<b>Extraluminal</b>		
Intraperitoneal (pneumoperitoneum)	Upright film: air under diaphragm LLD film: air between liver and abdominal wall Supine film: gas outlines of structures not normally seen: • Inner and outer bowel wall (Rigler's sign) • Falciform ligament • Peritoneal cavity ("football" sign)	Perforated viscus Postoperative (up to 10 d to be resorbed)
Retroperitoneal	Gas outlining retroperitoneal structures allowing increased visualization: • Psoas shadows • Renal shadows	Perforation of retroperitoneal segments of bowel: duodenal ulcer, post-colonoscopy
<b>Intramural</b> (pneumatosis intestinalis)	Lucent air streaks in bowel wall, 2 types: 1. Linear 2. Rounded (cystoides type)	1. Linear: ischemia, necrotizing enterocolitis 2. Rounded/cystoides (generally benign): primary (idiopathic), secondary to COPD
<b>Intraluminal</b>	Dilated loops of bowel, air-fluid levels	Adynamic (paralytic) ileus, mechanical bowel obstruction (see Table 9)
<b>Loculated</b>	Mottled, localized in abnormal position without normal bowel features	Abscess (evaluate with CT)
<b>Biliary</b>	Air centrally over liver	Sphincterotomy, gallstone ileus, erosive peptic ulcer, cholangitis, emphysematous cholecystitis
<b>Portal Venous</b>	Air peripherally over liver in branching pattern	Bowel ischemia/infarction

#### Biliary vs. Portal Venous Air

"Go with the flow": air follows the flow of bile or portal venous blood. Biliary air is most prominent centrally over the liver. Portal venous air is most prominent peripherally.

**Table 9. Adynamic Ileus vs. Mechanical Obstruction**

Feature	Adynamic Ileus	Mechanical Obstruction
<b>Calibre of Bowel Loops</b>	Normal or dilated	Usually dilated
<b>Air-Fluid Levels</b> (erect and LLD films only)	Same level in the same single loop	Multiple air fluid levels giving "step ladder" appearance, dynamic (indicating peristalsis present), "string of pearls" (row of small gas accumulations in the dilated valvulae conniventes)
<b>Distribution of Bowel Gas</b>	Air throughout GI tract is generalized or localized • In a localized ileus (e.g. pancreatitis, appendicitis): dilated "sentinel loop" remains in the same location on serial films, usually adjacent to the area of inflammation	Dilated bowel up to the point of obstruction (i.e. transition point) No air distal to obstructed segment "Hairpin" (180°) turns in bowel

#### Ileocecal Valve (ICV) Function in Large Bowel Obstruction

##### Competent ICV

Distention of large bowel between obstruction and ICV; small bowel unaffected. Higher risk of perforation, especially with cecal distention > 10 cm.

##### Incompetent ICV

Distention of large and small bowel.

## Abdominal CT

- indications for plain CT: renal colic, hemorrhage
- indications for CT with contrast:
  - IV contrast given immediately before or during CT to allow identification of arteries and veins
    - ♦ portal venous phase: indicated for majority of cases
    - ♦ biphasic (arterial and portal venous phases): liver, pancreas, bile duct tumours
  - oral contrast: barium or water soluble (water soluble if suspected perforation) given in most cases to demarcate GI tract
  - rectal contrast: given for investigation of colonic lesions
  - caution: contrast allergy (may premedicate with steroids and antihistamine)
  - contraindication: impaired renal function, based on eGFR

## Approach to Abdominal Computed Tomography (CT)

- look through all images in gestalt fashion to identify any obvious abnormalities
- look at each organ/structure individually, from top to bottom evaluating size and shape of each area of increased or decreased density
- evaluate the following
  - soft tissue window
    - ♦ liver, gallbladder, spleen and pancreas
    - ♦ adrenals, kidneys, ureters and bladder
    - ♦ stomach, duodenum, small bowel mesentery and colon/appendix
    - ♦ retroperitoneum: aorta, vena cava and mesenteric vessels; look for adenopathy in vicinity of vessels
    - ♦ peritoneal cavity for fluid or masses
    - ♦ abdominal wall and adjacent soft tissue
  - lung window
    - ♦ visible lung (bases)
  - bone window
    - ♦ vertebrae, spinal cord, and bony pelvis

### CT and Bowel Obstruction

- cause of bowel obstruction rarely found on plain films – CT is best choice for imaging
- the “3,6,9” rule is a very useful guide to determining when the bowel is dilated. The maximum diameter of the bowel is 3 cm for small bowel, 6 cm for large bowel and 9 cm for cecum. This can also be useful in distinguishing between small and large bowel and when assessing for ‘impending’ cecal perforation (post-untreated Ogilvie’s syndrome)

### CT Colonography (virtual colonoscopy)

- emerging imaging technique for evaluation of intraluminal colonic masses (i.e. polyps, tumours)
- two CT scans of the abdomen (prone and supine) after the instillation of carbon dioxide into a prepped colon
- computer reconstruction of 2D CT images into a 3D intraluminal view of the colon in order to look for masses
- lesions seen on 3D images correlated with 2D axial images
- indications: surveillance in low-risk patients, incomplete colonoscopy, staging of obstructing colonic lesions

#### Colorectal Cancer: CT Colonography and Colonoscopy for Detection- Systematic Review and Meta-Analysis

*Radiology* 2011;259:393-405

**Study:** Systematic review and meta-analysis.

**Population:** 49 studies on 11,151 patients undergoing diagnostic study for detection of colorectal cancer (CRC).

**Intervention:** CT colonography (CTC) and optical colonoscopy (OC).

**Main outcome measure:** Sensitivity of CTC and OC for CRC.

**Results:** CTC has a sensitivity of 96.1% (CI: 93.8%, 97.7%) and OC has a sensitivity of 94.7% (CI: 90.4%, 97.2%) for the detection of CRC.

**Authors' Conclusion:** CTC is highly sensitive for the detection of CRC and may be a better modality for the initial investigation of suspected CRC, assuming reasonable specificity.

Figure 14. Barium enema

## Contrast Studies

Table 10. Types of Contrast Studies

Study	Description	Indications	Assessment	Findings
<b>Cine Esophagogram</b>	Contrast agent swallowed Recorded for later playback and analysis	Dysphagia, swallowing incoordination, recurrent aspiration, post-op cleft palate repair	Cervical esophagus	Aspiration, webs (partial occlusion), Zenker's diverticulum, cricopharyngeal bar, laryngeal tumour
<b>Barium Swallow</b>	Contrast agent swallowed under fluoroscopy, selective images captured	Dysphagia, r/o GERD, post esophageal surgery	Thoracic esophagus	Achalasia, hiatus hernia, esophagitis, cancer, esophageal tear
<b>Upper GI Series</b>	Double contrast study: 1. Barium to coat mucosa, then 2. Gas pills for distention Patient NPO after midnight	Dyspepsia, investigate possible UGI bleed, weight loss/anemia, post gastric surgery	Thoracic esophagus, stomach, or duodenum	Ulcers, neoplasms, filling defects
<b>Barium Enema</b>	Colon filled retrograde with barium and air or CO <sub>2</sub> Bowel prep the night before procedure	Altered bowel habits, suspected LGI bleed, weight loss/anemia, r/o large bowel obstruction, suspected perforation, check surgical anastomosis, history of polyps	Large bowel Rectum may be obscured by tube – therefore must do sigmoidoscopy to exclude rectal lesions	Diverticulosis, neoplasms, IBD, intussusception (can be reduced with barium or air enema), volvulus
<b>Small Bowel Follow Through</b>	Single contrast images following UGI series	GI bleed with nondiagnostic upper GI series/barium enema, weight loss/anemia, diarrhea, IBD, malabsorption, abdominal pain, post small bowel surgery	Entire small bowel	Neoplasms, IBD, malabsorption, infection
<b>Small Bowel Enema (enteroclysis)</b>	Duodenal intubation: 1. Barium/methyl cellulose infusion and fluoroscopic evaluation 2. CT enteroclysis with water infusion	IBD, malabsorption, weight loss/anemia, Meckel's diverticulum	Entire small bowel	Neoplasms, IBD, malabsorption, infection

## Specific Visceral Organ Imaging

### Liver

- U/S: assessment of cysts, abscesses, tumours, biliary tree
- CT ± IV: most popular procedure for imaging the liver parenchyma (primary liver tumours, metastases, cysts, abscesses, trauma, cirrhosis)
- MR: also excellent in evaluation of primary liver tumours, liver metastases, and other parenchymal conditions. It is particularly helpful in differentiating common benign hepatic hemangiomas from primary liver tumours and metastases
- findings:
  - altered liver size, contour, density
  - advanced cirrhosis: liver small and irregular (fibrous scarring, segmental atrophy, regenerating nodules)
  - portal hypertension: increased portal vein diameter, collateral veins, splenomegaly ( $\geq 12$  cm), portal vein thrombosis, recanalization of the umbilical vein
  - varices (caput medusa, esophageal varices, porto-systemic shunts, dilated splenic vein)
  - splenomegaly and ascites
  - U/S: cirrhosis appears nodular and hyperechoic with irregular areas of atrophy of the right lobe and hypertrophy of the caudate or left lobes
  - CT: fatty infiltration appears hypodense
- investigation of liver masses
  - require contrast to visualize certain hepatic masses

**Table 11. Phases of Enhancement Following IV Contrast Bolus**

Phase	Time Frame	Uses
Arterial Phase	20-30 s	<ul style="list-style-type: none"> <li>• Early and late arterial phase possible on multidetector CT</li> <li>• Late arterial phase best for discriminating hypervascular HCC</li> </ul>
Portal Venous Phase	60-70 s	<ul style="list-style-type: none"> <li>• Provides maximum enhancement of hepatic tissue</li> <li>• Most tumours supplied by hepatic artery are relatively hypovascular, therefore appear as low-attenuation masses in portal venous phase</li> </ul>
Equilibrium Phase	120-180 s	<ul style="list-style-type: none"> <li>• Hypervascular tumours wash out (HCC)</li> <li>• Persistent enhancement suggests blood pool (hemangioma) or fibrous/scar tissue (HCC capsule, focal nodular hyperplasia, cholangiocarcinoma)</li> </ul>

**Table 12. Imaging of Liver Masses**

Mass	U/S	CT
Metastases	Multiple masses of variable echotexture	Usually low attenuation on contrast enhanced scan
HCC	Single/multiple masses, or diffuse infiltration	Hypervascular enhances in arterial and washes out venous phase with portal venous tumour thrombus
Abscess	Poorly defined, irregular margin, hypoechoic contents	Low-attenuation lesion with an irregular enhancing wall
Hydatid Cyst	Simple/multiloculated cyst	Low-attenuation simple or multiloculated cyst; calcification
Hemangioma	Homogenous hyperechoic mass	Peripheral globular enhancement in arterial phase scans; central-filling and persistent enhancement on delayed scans
Focal Nodular Hyperplasia	Well-defined mass, central scar seen in 50%	Hypervascular mass in arterial phase and iso-attenuation to liver in portal venous phase
Hepatic Adenoma	Most common in young women taking oral contraceptives. Well-defined mass with hyperechoic areas due to hemorrhage	Well-defined hypervascular lesion with enlarged central vessel becoming slightly isoattenuating in venous phase

### Spleen

- U/S, CT, and/or nuclear medicine scan
- CT for splenic trauma (hemorrhage)

### Biliary Tree

- U/S
  - bile ducts usually visualized only if dilated, secondary to obstruction (e.g. choledocholithiasis, benign stricture, mass)
- CT
  - dilated intrahepatic ductules seen as branching, tubular structures following pathway of portal venous system
- ERCP, MRCP, PTC: further evaluation of obstruction and possible intervention

Normal liver appears more dense than spleen on CT. If less dense, suspect fatty infiltration.

#### Liver Mass DDx

5 Hs  
HCC  
Hydatid cyst  
Hemangioma  
Hepatic adenoma  
Hyperplasia (focal nodular)

#### Revised Estimates of Diagnostic Test Sensitivity and Specificity in Suspected Biliary Tract Disease

*Arch Intern Med* 1998;154:2573-2581

**Purpose:** To assess the sensitivity and specificity of tests used to diagnose cholelithiasis and acute cholecystitis, including ultrasonography, oral cholecystography, radionuclide scanning with Technetium, MRI, CT.

**Study Characteristics:** Meta-analysis of 30 studies evaluating the use of different imaging modalities in the diagnosis of biliary tract disease.

**Participants:** No limits.

**Main Outcomes:** Sensitivity and specificity of the different imaging modalities, using the gold standard of surgery, autopsy, or 3 mo clinical follow-up for cholelithiasis. For acute cholecystitis, pathologic findings, confirmation of an alternate disease, or clinical resolution during hospitalization for cholecystitis were used as the standard.

**Results:** For evaluating cholelithiasis, U/S had the best unadjusted sensitivity (0.97; 95% CI, 0.95 to 0.99) and specificity (0.95, 95% CI, 0.88 to 1.00) and adjusted (for verification bias) sensitivity (0.84; 95% CI, 0.76 to 0.92) and specificity (0.99; 95% CI, 0.97 to 1.00). For evaluating acute cholecystitis, radionuclide scanning has the best sensitivity (0.97; 95% CI, 0.96 to 0.98) and specificity (0.90; 95% CI, 0.86 to 0.95).

**Conclusions:** U/S is the test of choice for diagnosing cholelithiasis and radionuclide scanning is the superior test for diagnosing acute cholecystitis.

**Figure 15. ERCP: biliary tree**

## Pancreas

- tumours
  - U/S: mass is more echogenic than normal pancreatic tissue
  - CT: preferred modality for diagnosis/staging
- ductal dilation secondary to stone/tumour
  - MRCP: imaging of ductal system using MRI cholangiography
  - ERCP: endoscope to inject dye into the biliary tree and X-ray imaging to assess pancreatic and biliary ducts; therapeutic potential (stent placement, stone retrieval); acute pancreatitis is a complication in 5% of diagnostic procedures and 10% of therapeutic procedures
- pancreatitis and/or its complications: pseudocyst, abscess, necrosis, splenic artery aneurysm (see "itis" Imaging below)

## "itis" Imaging

### Acute Cholecystitis

- pathogenesis: inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or, in the case of acalculous cholecystitis, due to gallbladder ischemia or cholestasis (see [General Surgery](#), GS46)
- best imaging modality: U/S (best sensitivity and specificity), nuclear medicine (HIDA scan) can help diagnose cases of acalculous or chronic cholecystitis
- findings: thick wall, pericholecystic fluid, gallstones, dilated gallbladder, positive sonographic Murphy's sign
- management: cholecystectomy

### Acute Appendicitis

- pathogenesis: luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess or peritonitis (see [General Surgery](#), GS28)
- best imaging modality: U/S or CT
- findings:
  - U/S: thick-walled appendix, appendicolith, dilated fluid-filled appendix, non-compressible
  - U/S may also demonstrate other causes of RLQ pain (e.g. ovarian abscess, IBD, ectopic pregnancy)
  - CT: enlargement of appendix (>6 mm in outer diameter), enhancement of appendiceal wall, adjacent inflammatory stranding, appendicolith; also facilitates percutaneous abscess drainage
- management: appendectomy

### Acute Diverticulitis

- pathogenesis: erosion of the intestinal wall (most commonly rectosigmoid) by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro or macroscopic perforation (see [General Surgery](#), GS31)
- best imaging modality: CT is modality of choice, although U/S is sometimes used
- contrast: oral and rectal contrast given before CT to opacify bowel
- findings:
  - cardinal signs: thickened wall, mesenteric infiltration, gas-filled diverticula, abscess
  - CT can be used for percutaneous abscess drainage before or in lieu of surgical intervention
  - sometimes difficult to distinguish from perforated cancer (therefore send abscess fluid for cytology and follow up with colonoscopy)
  - if chronic, may see fistula (most common to bladder) or sinus tract (linear or branching structures)
- management: ranges from antibiotic treatment to surgical intervention. Can use imaging to follow progression

### Acute Pancreatitis

- pathogenesis: activation of proteolytic enzymes within pancreatic cells leading to local and systemic inflammatory response (see [Gastroenterology](#), G44). Clinical/biochemical diagnosis
- best imaging modality imaging used to support diagnosis and evaluate for complications (diagnosis cannot be excluded by imaging alone)
  - U/S good for screening and follow-up
  - CT is useful in advanced stages and in assessing for complications (1st line imaging test)
- findings:
  - U/S: hypoechoic enlarged pancreas (however if ileus present, gas obscures pancreas)
  - CT: enlarged pancreas, edema, stranding changes in surrounding fat with indistinct fat planes, mesenteric and Gerota's fascia thickening, pseudocyst in lesser sac, abscess (gas or thick-walled fluid collection), pancreatic necrosis (low attenuation gas-containing non-enhancing pancreatic tissue), hemorrhage
  - CT-guided needle aspiration and/or drainage done for abscess when clinically indicated
  - pseudocyst may be followed by CT and drained if symptomatic
- management: supportive therapy

**Figure 16. Ultrasound: inflamed gallbladder**

**Figure 17. Ultrasound: inflamed appendix**

#### Computed Tomography and Ultrasonography to Detect Acute Appendicitis in Adults and Adolescents

*Ann Intern Med* 2004;141:537-546

**Purpose:** To review the diagnostic accuracy of CT and ultrasonography in the diagnosis of acute appendicitis.

**Study Characteristics:** Meta-analysis of 22 prospective studies evaluating the use of CT or ultrasonography, followed by surgical or clinical follow-up in patients with suspected appendicitis.

**Participants:** Age 14 and older with a clinical suspicion of appendicitis.

**Main Outcomes:** Sensitivity and specificity using surgery or clinical follow-up as the gold standard. Results: CT (12 studies) had an overall sensitivity of 0.94 (95% CI, 0.91 to 0.95) and a specificity of 0.95 (95% CI, 0.93 to 0.96). Ultrasonography (14 studies) had an overall sensitivity of 0.86 (95% CI, 0.83 to 0.88) and a specificity of 0.81 (95% CI, 0.78 to 0.84).

**Conclusions:** CT is more accurate for diagnosing appendicitis in adults and adolescents, although verification bias and inappropriate blinding of reference standards were noted in the included studies.

Angiography requires active blood loss 1-1.5 mL/min under optimal conditions for a bleeding site to be visualized in cases of lower GI bleeding.

### Chronic Pancreatitis

- pathogenesis: (see [Gastroenterology](#), G46)
- best imaging modality: MRCP
- findings: U/S, CT scan and MRI may show calcifications, ductal dilatation, enlargement of the pancreas and fluid collections (e.g. pseudocysts) adjacent to the gland. However, magnetic resonance cholangiopancreatography (MRCP) is becoming the diagnostic test of choice since it can show calcification and pancreatic duct obstruction

## Angiography of GI Tract

- anatomy of the GI tract arterial blood supply branches
  - celiac artery: hepatic, splenic, gastroduodenal, left/right gastric
  - superior mesenteric artery (SMA): jejunal, ileal, ileo-colic, right colic, middle colic
  - inferior mesenteric artery (IMA): left colic, superior rectal
- imaging modalities
  - conventional angiogram: invasive (usual approach via femoral puncture), catheter used
    - ♦ flush aortography: catheter injection into abdominal aorta, followed by selective arteriography of individual vessels
  - CT angiogram: non-invasive using IV contrast (no catheterization required)

## Genitourinary System and Adrenal

### Urological Imaging

#### KUB (kidneys, ureters, bladder)

- a frontal supine radiograph of the abdomen
- **indication:** useful in evaluation of radio-opaque renal stones (all stones but uric acid and indinavir), as well as indwelling ureteric stents or catheters
- **findings:** addition of intravenous contrast excreted by the kidney (intravenous urogram) allows greater visualization of the urinary tract, but has been largely replaced by CT urography

#### Abdominal CT

##### Renal Masses

- Boznik classification for cystic renal masses
- classes I-II are benign and can be disregarded
- class IIF should be followed
- classes III-IV are suspicious for malignancy, requiring additional workup

**Table 13. Boznik Classification for Cystic Renal Masses**

Classes	Definition
<b>Simple renal cysts</b>	
Class I	Fluid-attenuating well-defined lesion, no septation, no calcification, no solid components, hair thin wall
Class II	Same as class I + fine calcification or moderately thickened calcification in septae or walls; also includes hyperdense cysts (<3 cm) that do not enhance with contrast
<b>Complex renal cysts</b>	
Class III	Thick irregular walls, ± calcifications, ± septated, enhancing walls or septa with contrast
<b>Renal cell carcinoma</b>	
Class IV	Same as class III + soft tissue enhancement with contrast (defined as >10 Hounsfield unit increase, characterizing vascularity) with de-enhancement in venous phase ± areas of necrosis

- **plain CT**
  - indications: general imaging of renal anatomy, although specific study types have supplanted plain CT for many indications, including CT urography (upper tract uroepithelial malignancies and renal calculi) and triphasic CT (renal masses)
- **CT urography**
  - indications: excretory phase imaging allows detailed assessment of urinary tracts, high sensitivity (95%) for uroepithelial malignancies of the upper urinary tracts, useful for assessment of renal calculi
- **triphase CT**
  - indications: standard imaging for renal masses, allows accurate assessment of renal arteries and veins and better characterization of suspicious renal masses, with particular utility in differentiating renal cell carcinoma from more benign masses
  - phases: unenhanced, nephrographic, and excretory

#### Imaging Modality Based on Presentation

- Acute testicular pain = Doppler, U/S
- Amenorrhea = U/S, MRI (brain)
- Bloating = U/S, CT
- Flank pain = U/S, CT
- Hematuria = U/S, Cystoscopy, CT
- Infertility = Hysterosalpingogram, MRI
- Lower abdominal mass = U/S, CT
- Lower abdominal pain = U/S, CT
- Renal colic = U/S, KUB, CT
- Testicular mass = U/S
- Urethral stricture = Urethrogram

**Figure 18. Triphasic CT of an angiomyolipoma:** showing fat density with non-contrast scan, mildly enhancing with contrast

**Figure 19. Triphasic CT of a renal cell carcinoma:** showing arterial enhancing right renal lesion with venous washout (shunting)

## U/S

- indications: initial study for evaluation of kidney size and nature of renal masses (solid vs. cystic renal masses vs. complicated cysts); technique of choice for screening patients with suspected hydronephrosis (no intravenous contrast injection, no radiation to patient, and can be used in patients with renal failure); transrectal U/S (TRUS) useful to evaluate prostate gland and guide biopsies; doppler U/S to assess renal vasculature
- findings: solid renal masses are echogenic (bright on U/S), cystic renal masses have smooth well-defined walls with anechoic interior (dark on U/S), and complicated cysts have internal echoes within a thickened, irregular-wall

## Retrograde Pyelography

- indications: visualize the urinary collecting system via a cystoscope, ureteral catheterization, and retrograde injection of contrast medium, ordered when the intrarenal collecting system and ureters cannot be opacified using intravenous techniques (patient with impaired renal function, high grade obstruction)
- findings: only yields information about the collecting systems (renal pelvis and associated structures)
  - no information regarding the parenchyma of the kidney

## Voiding Cystourethrogram (VCUG)

- bladder filled with contrast to the point where voiding is triggered
- fluoroscopy (continuous, real-time) to visualize bladder
- indications: children with recurrent UTIs, hydronephrosis, hydroureter, suspected lower urinary tract obstruction or vesicoureteral reflux
- findings: contractility and evidence of vesicoureteric reflux

## Retrograde Urethrogram

- a small Foley catheter placed into penile urethral opening
- indications: used mainly to study strictures or trauma to the male urethra (Figure 20)

## MRI

- advantages: high spatial and tissue resolution, lack of exposure to ionizing radiation and nephrotoxic contrast agents
- indications: indicated over CT for depiction of renal masses in patients with previous nephron sparing surgery, patients requiring serial follow-ups (less radiation dosage), patients with reduced renal function, and patients with solitary kidneys

## Renal Nuclear Scan

Table 14. Renal Scan Tests

Type of Test	Uses	Radionuclide
<b>Renogram</b>	To assess renal function and collecting system: evaluation of renal failure, workup of urinary tract obstruction and hypertension, investigation of renal transplant	IV $^{99m}\text{Tc}$ -pentetate (DTPA) or mertiatide (MAG3), and imaged at 1-3 s intervals with a gamma camera over the first 60 s to assess perfusion
<b>Morphological</b>	Assess renal anatomy: investigation of pyelonephritis and cortical scars	$^{99m}\text{Tc}$ -DMSA $^{99m}\text{Tc}$ -glucoheptonate

Figure 20. Retrograde urethrogram: demonstrating stricture in the membranous urethra

Figure 21. Transabdominal ultrasound: pregnancy, 18 wk fetus

Figure 22. Hysterosalpingogram: left hydrosalpinx

Pregnancy should always be ruled out by  $\beta$ -HCG before CT of a female pelvis (or any organ system) is performed.

## Gynecological Imaging

### U/S

- transabdominal and transvaginal are the primary modalities, and are indicated for different scenarios
- transabdominal requires a full bladder to push out air containing loops of bowel
  - indication: good initial investigation for suspected pelvic pathology
- transvaginal approach provides enhanced detail of deeper/smaller structures by allowing use of higher frequency sound waves at reduced distances
  - indication: improved assessment of ovaries, first trimester development, and ectopic pregnancies

### Hysterosalpingogram

- indications: useful for assessing pathology of the uterine cavity and fallopian tubes, evaluating uterine abnormalities (e.g. bicornuate uterus), or evaluation of fertility (absence of flow from tubes to peritoneal cavity indicates obstruction)
- performed by x-ray images of the pelvis after cannulation of the cervix and subsequent injection of opacifying agent

### CT/MRI

- indications: evaluating pelvic structures, especially those adjacent to the adnexa and uterus
- invaluable for staging gynecological malignancies

## Sonohysterogram

- saline infusion sonohysterogram involves instilling fluid into the uterine cavity transcervically to provide enhanced endometrial visualization during transvaginal ultrasound examination.
- indications: abnormal uterine bleeding, uterine cavity abnormalities that are suspected or noted on transvaginal sonography (i.e. leiomyomas, polyps, synechiae), congenital abnormalities of the uterine cavity, infertility, recurrent pregnancy loss
- contraindications: pregnancy, pelvic infection

**Table 15. Typical and Atypical Findings on a Sonohysterogram**

Finding	Typical	Atypical
<b>Polyps</b>	A well-defined, homogenous, polypoid lesion isoechoic to the endometrium with preservation of the endometrial-myometrial interface	Atypical features include cystic components, multiple polyps, broad base, hypoechogenicity or heterogeneity
<b>Leiomyoma</b>	Well-defined, broad-based, hypoechoic, solid masses with shadowing. Overlying layer of endometrium is echogenic and distorts the endometrial-myometrial interface	Pedunculation or multilobulated surface
<b>Hyperplasia and Cancer</b>	Diffuse echogenic endometrial thickening without focal abnormality, although focal lesions can occur. Endometrial cancer is typically a diffuse process, but early cases can be focal and appear as a polypoid mass	
<b>Adhesions</b>	Mobile, thin, echogenic bands that cut across the endometrial cavity	Thick, broad-based bands that can completely obliterate the endometrial cavity, as in Asherman's syndrome

## Adrenal Mass

- imaging modality: most often identified on CT scan, can use MR to distinguish benign from malignant masses

**Table 16. Adrenal Mass Findings on CT and MRI**

Factors	Adrenocortical Adenoma	Adrenocortical Carcinoma	Pheochromocytoma	Metastasis
Diameter (CT)	Usually $\leq 3$ cm	Usually $\geq 4$ cm	Usually $> 3$ cm	Variable around $< 3$ cm
Shape (CT)	Smooth margins and round/oval	Irregular with unclear margins	Round/oval with clear margins	Oval/irregular with unclear margins
Texture (CT)	Homogenous	Heterogeneous with mixed densities	Heterogeneous with cystic areas	Heterogeneous with mixed densities
Vascularity (CT)	Not highly vascular	Usually vascular	Usually vascular	Usually Vascular
Washout of Contrast Medium on CT	$\geq 50\%$ at 10 min	$< 50\%$ at 10 min	$< 50\%$ at 10 min	$< 50\%$ at 10 min
Growth	Stable or very slow ( $< 1$ cm/yr)	Usually rapid ( $> 2$ cm/yr)	Slow (0.5-1 cm/yr)	Variable
Other Findings	None	Necrosis, calcifications, and hemorrhage	Hemorrhage	Occasionally hemorrhage
MRI on T2 weighted imaging	Isointense in relation to liver	Hyperintense in relation to liver	Markedly hyperintense in relation to liver	Hyperintense in relation to liver

## Neuroradiology

### Modalities

- CT is the modality of choice for most neuropathology; even under circumstances when MRI is preferred, CT is frequently the initial study because of its speed, availability and lower cost
- CT is preferred for
  - acute head trauma: CT is best for visualizing "bone and blood"; MRI is used in this setting only when CT fails to detect an abnormality in the presence of strong clinical suspicion
  - acute stroke: MRI ideal, CT most frequently used
  - suspected subarachnoid or intracranial hemorrhage
  - meningitis: rule out mass effect (e.g. cerebral herniation, shift) prior to lumbar puncture
  - tinnitus and vertigo: CT and MRI are used in combination to detect bony abnormalities and CN VIII tumours, respectively

#### Modality Based on Neuropathology Presentation

- Cognitive decline = CT
- Cord compression = MRI
- Decreased LOC = CT
- Fish bone/other swallowed foreign body = CT
- LBP, radiculopathy = MRI
- Multiple sclerosis = MRI
- Neck infection = CT
- Orbital infection = CT
- R/O bleed = CT
- R/O aneurysm = CTA, MRA
- Seizure = CT
- Sinusitis = CT
- Stroke = CT, MRI
- Trauma = CT
- Weakness, systemically unwell = CT

#### DDx for Ring Enhancing Lesion on CT with Contrast

- MAGICAL DR**
- \*Metastases
  - \*Abscess
  - \*Glioblastoma (high grade astrocytoma)
  - Infarct
  - Contusion
  - AIDS
  - Lymphoma
  - Demyelination
  - Resolving hematoma

[\*the 3 most common Dx's]

**Figure 23. Epidural hematoma**

### Skull Films

- rarely performed as CT is the modality of choice
- indications: include screening for destructive bony lesions (e.g. metastases), metabolic disease, skull anomalies, post-operative changes and confirmation of hardware placement, skeletal surveys
- generally not indicated for non-penetrating head trauma

### CT

- excellent study for evaluation of bony abnormalities
- often done first without and then with intravenous contrast to show vascular structures or anomalies
- vascular structures and areas of blood-brain barrier impairment are opaque (e.g. hyperattenuating or white/show enhancement) with contrast injection
  - when in doubt, look for circle of Willis or confluence of sinuses to determine presence of contrast enhancement
- posterior fossa can be obscured by extensive bony artifact
- rule out skull fracture, epidural hematoma (lenticular shape), subdural hematoma (crescentic shape), subarachnoid hemorrhage, space occupying lesion, hydrocephalus, and cerebral edema
- multiplanar imaging can be performed with newer generation of multidetector CT scanners

### Myelography

- introduction of water-soluble, low-osmotic-contrast media into subarachnoid space using lumbar puncture followed by x-ray or CT scan
- indications: excellent study for disc herniations, traumatic nerve root avulsions, patients with contraindication to MRI

### MRI

- indications: shows brain and spinal soft tissue anatomy in fine detail, clearly distinguishes white from grey matter (especially T1-weighted series), multiplanar reconstruction helpful in pre-op assessment

### Cerebral Angiography/CT Angiography/MR Angiography

- indications: evaluation of vascular lesions such as atherosclerotic disease, aneurysms, vascular malformations, arterial dissection
- conventional digital subtraction angiography (DSA) remains the gold standard for the assessment of neck and intracranial vessels; however, it is an invasive procedure requiring arterial (femoral) puncture; catheter manipulation has risk of vessel injury (e.g. dissection, occlusion, vasospasm, emboli)
- MR angiography (MRA) methods (phase contrast, time of flight, gadolinium-enhanced) and CT angiography (CTA) are much less invasive without actual risk to intracranial or neck vessels
- MRA and CTA are often used first as 'screening tests' for the assessment of subarachnoid hemorrhage, vasospasm, aneurysms

**Figure 28. Hydrocephalus:** ventricular dilatation (may see periventricular low attenuation due to transependymal CSF flow)

**Table 17. Two Types of Hydrocephalus**

Type	Cause
Communicating/extra-ventricular	Obstruction distal to the ventricles e.g. at the level of the arachnoid granulations; imaging shows all ventricles dilated
Non-communicating	Obstruction within the ventricular system e.g. mass obstructing the aqueduct or foramen of Monro; imaging shows dilatation of ventricles proximal to the lesion

### Nuclear Medicine

- SPECT using  $^{99m}\text{Tc}$ -exametazime (HMPAO) and  $^{99m}\text{Tc}$ -bicisate (ECD) imaging assesses cerebral blood flow by diffusing rapidly across the blood brain barrier and becoming trapped within cells
- $^{18}\text{F}$ FDG PET imaging assesses cerebral metabolic activity

**Figure 24. Subdural hematoma**

**Figure 25. Subarachnoid hemorrhage**

**Figure 26. Intraparenchymal hemorrhage**

**Figure 27. Vertebrobasilar circulation**

## Approach to CT Head

- think anatomically, work from superficial to deep
- scan: confirm that the imaging is of the correct patient, whether contrast was used, if the patient is aligned properly, if there is artifact present
- skin/soft tissue: examine the soft-tissue superficial to the skull, looking for thickening suggestive of hematoma or edema; also investigate: ear, orbital contents (globe, fat, muscles), parotid, muscles of mastication (masseter, temporalis, pterygoids), visualized pharynx
- bone and airspace (use the bone window): check calvarium, visualized mandible, visualized C-spine (usually C1 and maybe part of C2) for fractures, absent bone, lytic/sclerotic lesions; inspect sinuses and mastoid air cells for opacity that may suggest fluid, pus, blood, tumour, or fracture
- dura and subdural space: look for crescent-shaped hyperdensity in the subdural space as evidence of subdural hematoma; look for a lentiform hyperdensity in epidural space as evidence of epidural hematoma; check symmetry of dural thickness, where increased thickness may suggest the presence of blood
- parenchyma: look for symmetry of the parenchyma for evidence of midline shift; look for poor contrast between grey and white matter as evidence of possible infarction, tumour, edema, infection, or contusion; look for hyperdensities in the parenchyma suggestive of enhancing lesions, intracerebral hemorrhage, or calcification; central grey matter nuclei should be visible, including globus pallidus, putamen, and internal capsule, otherwise suspect infarct, tumour, or infection
- ventricles/sulci/cisterns: examine position of ventricles for evidence of midline compression/shift; look for hyperdensities in the ventricles indicative of ventricular/subdural hemorrhage; look at ventricular size for evidence of hydrocephalus; obliteration of sulci may suggest presence of edema causing effacement, possible blood filling in the sulci, or tumour; cistern hyperdensities may suggest blood, pus, or tumour

### Approach to the CT Head

**Some** = Scan  
**Sore** = Skin/Soft Tissue  
**Brains** = Bone/Airspace  
**Demonstrate** = Dura/Subdural space  
**Pushed** = Parenchyma  
**Ventricles** = Ventricles/Sulci/Cisterns

Transient ischemic attacks are not associated with radiological findings.

### Early Signs of Brain Infarction at CT: Observer Reliability and Outcome after Thrombolytic Treatment – Systematic Review

*Radiology* 2005;235:444-453

**Study:** Systematic review of 15 studies between 1990-2003 that investigated inter-observer agreement of early CT signs of acute ischemic stroke, and prognostic value of early CT signs in patient outcome. There was a median of 30 CTs and 6 raters per study.

**Patients:** 3468 adult patients who underwent CT within 6 h of stroke.

**Main Outcome:** Degree of inter-observer agreement between stroke signs on CT, and risk of death or dependency (using validated stroke scales) based on CT signs used after 1-3 mo.

**Results:** Prevalence of all early infarction signs was  $61\% \pm 21$ , and interobserver agreement was 0.14-0.78 (K statistic) for any early infarct sign. Average sensitivity of detecting early ischemic stroke was 66% (range 20%-87%) and average specificity was 87% (range 56%-100%). Experience improved detection, but knowledge of patient history did not. An increased risk of poor outcome (death or dependency) was associated with any early infarction sign, with an odds ratio of 3.11 (95%CI, 2.77-3.49).

**Conclusion:** Further work is required to determine which signs are most reliably detected and whether any early infarction sign should influence decisions concerning thrombolysis.

## Selected Pathology

- see [Neurosurgery](#), NS4-23 for intracranial mass lesions
- see [Neurosurgery](#), NS30-35 and [Plastic Surgery](#), PL28 for head trauma
- see [Emergency Medicine](#), ER7 for vertebral trauma
- see [Neurosurgery](#), NS24-29 and [Orthopedics](#), OR21 for degenerative spinal abnormalities

### Cerebrovascular Disease (see [Neurology](#), N43-46 and [Neurosurgery](#), NS18-23)

- pathogenesis of stroke: see [Neurology](#), N43
- best imaging modality ischemic strokes usually cause infarcts which can be detected by both CT and MR
- findings of infarction:
  - early changes
    - ♦ CT
      - usually normal within 6 h of infarction
      - edema (loss of grey-white matter differentiation – “insular ribbon” sign, effacement of sulci, mass effect)
      - within 24 h, development of low-density, wedge-shaped area of infarction extending to periphery (correlating to vascular territory distal to affected artery)
      - refer to Functional Neuroanatomy software online ([www.torontonotes.ca](http://www.torontonotes.ca))
      - in case of ischemic stroke, may see hyperattenuating (bright) artery (hyperdense MCA sign) representing intravascular thrombus or embolus
      - in case of hemorrhagic stroke or transformation (common in basal ganglia and cortex), may see bright acute blood surrounded by edema
    - ♦ MRI
      - edema with high signal on T2-weighted images and FLAIR image (loss of grey-white matter differentiation, effacement of sulci, mass effect)
      - diffusion-weighted image (DWI) shows acute high signal changes demonstrating restricted movement of water indicative of cytotoxic edema. DWI usually indicates stroke damage before CT
      - apparent diffusion coefficient (ADC) image shows low signal intensity in acute ischemia (nadir 3-5 d, returns to baseline 1-4 wk)
  - subacute changes on CT and MRI
    - ♦ edema and mass effect more prominent
    - ♦ gyral enhancement with contrast indicative of blood-brain barrier breakdown
  - chronic changes on CT and MRI
    - ♦ encephalomalacia (parenchymal volume loss) with dilatation of adjacent ventricles

**Figure 29. CT images of early infarct: (A) absence of left insular ribbon (B) hyperdense artery**

- carotid artery disease
  - best imaging modality: Duplex Doppler U/S
  - other modalities: MR angiography or CT angiography if carotid angioplasty or endarterectomy is under consideration (conventional angiography reserved for inadequate MRA or CTA)

### Multiple Sclerosis (MS) (refer to [Neurology](#), N46)

- best imaging modality: MRI has high sensitivity in diagnosing MS (>90%) but low specificity (71-74%)
- findings:
  - characteristic lesion on MRI is cerebral or spinal plaque
  - plaques typically found in periventricular region, corpus callosum (arranged at right angles to the corpus callosum), centrum semiovale, and to a lesser extent in deep white matter structures and basal ganglia
  - “Dawson’s fingers” refers to perivenular regions of demyelination that are seen to radiate outwards into the deep periventricular region
  - plaques usually have ovoid appearance, hyperintense on T2 and hypointense on T1
  - conventional T2 may underestimate plaque size and overall plaque burden – advanced techniques (diffusion tensor imaging and magnetic resonance spectroscopy) can be of use
  - perivascular and interstitial edema may be prominent
- acute vs. chronic
  - acute lesions: larger, ill-defined margins and become smaller with sharper margins with resolution of edema and inflammation present at time of acute plaque formation
  - gadolinium enhancing lesions on T1-weighted MRI: accumulation of gadolinium in plaques is associated with new or newly active plaques and with pathologically confirmed acute inflammation in MS; gadolinium enhancement is transient and can persist up to 8 wk in acute plaques (persistence of enhancement should caution against diagnosis of MS)
  - enhancement patterns: concentric ring-enhancing lesions with central contrast pallor arise in previously damaged areas or areas of accelerated local inflammation; ring-enhancing lesions weakly predict the development of persisting hypointense lesions on T1 MRI and are thought to be related to accelerated disease activity and extensive tissue damage, marking inflammation associated with aggressive disease
  - most MS lesions are isointense to white matter on T1-weighted MRI, some are hypointense or “black holes” (especially in the supratentorial region). Nearly half of black holes revert to normal in a few months, presumably due to remyelination and resolution of edema. Persistent black holes may be markers of severe demyelination and axonal loss
  - spinal cord lesions typical of MS:
    - ♦ little or no cord swelling
    - ♦ unequivocal hyperintensity on T2-weighted sequences
    - ♦ size at least 3 mm but less than 2 vertebral segments in length
    - ♦ occupy only part of the cord in cross-section
    - ♦ focal (i.e. clearly delineated and circumscribed on T2-weighted sequences)

### CNS Infections

- **leptomeningitis**
  - pathogenesis: inflammation of the pia or arachnoid mater, most often secondary to hematogenous spread from infection or via organisms gaining access across areas not protected by the blood brain barrier (choroid plexus or circumventricular organs)
    - ♦ pathogens include: *S. pneumoniae*, *H. influenza*, *N. meningitidis*, *L. monocytogenes*
  - best imaging modality: best visualized with MRI (T2-weighted/FLAIR) over CT
  - findings:
    - ♦ meningeal enhancement (following the gyri/sulci, and/or basal cisterns), hydrocephalus (communicating), cerebral swelling, subdural effusion
    - ♦ a normal MRI does not rule out leptomeningitis
- **herpes simplex encephalitis** (see [Infectious Diseases](#), ID20)
  - pathogenesis: inflammation of the brain parenchyma secondary to HSV infection, asymmetrically affects the limbic regions of the brain – temporal lobes, orbitofrontal region, insula, and cingulate gyrus
  - best imaging modality: best imaged with MRI (T1- and T2-weighted imaging)
  - findings:
    - acute (within 4-5 d): high intensity lesions on T2 MRI in temporal and inferior frontal lobes, asymmetric
    - strongly suggestive of HSV encephalitis
    - DDx: infarct, tumour, status epilepticus, limbic encephalitis
    - ♦ CT may show low density in temporal lobe and insula; rarely basal ganglia involvement
    - ♦ long term may show parenchymal loss to affected areas

**Figure 30. Diffusion weighted imaging of patient with normal CT: right frontotemporal infarct**

#### DDx Suspected MS lesion

- Vasculopathy: ischemia, vasculitis, hypertension, migraine
- Demyelinating disease: progressive multifocal leukoencephalopathy, age-related
- Inflammatory process: sarcoid, lyme, primary/metastatic cancer

**Figure 31. T2-weighted FLAIR: (A) sagittal (B) axial images of multiple sclerosis with periventricular “Dawson’s Fingers”**

**Figure 32. T2-weighted (FLAIR) coronal image of HSV encephalitis affecting temporal lobes**

- **cerebritis/cerebral abscess**

- pathogenesis: an infection of the brain parenchyma (cerebritis) which can progress to a collection of pus (abscess), most frequently due to hematogenous spread of infectious organisms, commonly located in the distribution of the middle cerebral artery
  - ♦ pathogens include: *S. aureus* (often in IVDU, nosocomial), GN bacteria, *Streptococcus*, *Bacteroides*
- best imaging modality: MRI including diffusion (DWI) imaging series – an abscess will be DWI positive; CT is still used as a viable alternative but overall MRI > CT
- findings according to one of four stages of abscess formation:
  - ♦ early cerebritis (1-3 d): inflammatory infiltrate with necrotic centre, low intensity on T1, high intensity on T2
  - ♦ late cerebritis (4-9 d): ring enhancement may be present
  - ♦ early capsule (10-13 d): ring enhancement
  - ♦ late capsule (14 d or greater): well demarcated ring-enhancing lesion, low intensity core, with mass effect; considerable edema around the lesion, seen as hyperdensity on T2

## Musculoskeletal System (MSK)

### Modalities

#### Plain Film/X-Ray

- usually initial study used in evaluation of bone and joint disorders
- indications: fractures and dislocations, arthritis, assessment of malalignment, assessment of orthopedic hardware, initial assessment of bone tumours
- minimum of two films orthogonal to each other (usually AP and lateral) to rule out a fracture
- image proximal and distal joints (particularly important with paired bones, e.g. radius/ulna)
- not very effective in evaluating soft tissue injury
- advantages: fast, inexpensive, readily available, reproducible

#### CT

- evaluation of fine bony detail
- indications: assessment of complex, comminuted, intra-articular or occult fractures including distal radius, scaphoid, skull, spine, acetabulum, calcaneus, and sacrum
- evaluation of soft tissue calcification/ossification
- advantages: fast, reproducible, excellent bone evaluation, and spatial resolution
- disadvantages: radiation dose, relatively poor soft tissue characterization in comparison with U/S and MRI

#### MRI

- indications: evaluation of internal derangement of joints (ligaments, joint capsule, menisci, labrum, cartilage), assessment of tendons and muscle injuries, characterization and staging of soft tissue and bony masses
- advantages: excellent soft tissue contrast, multiplanar imaging, no radiation
- disadvantages: long imaging times, expensive, claustrophobia, contraindications (e.g. pacemakers, orbital metallic bodies), artifact around metal hardware

#### Ultrasound

- indications: tendon injury (e.g. rotator cuff, Achilles tendon), detection of soft tissue masses and to determine whether cystic or solid, detection of foreign bodies, ultrasound guided biopsy and injections
- Doppler determines vascularity of structures
- advantages: good soft tissue evaluation, easy contralateral comparison, dynamic imaging
- disadvantages: operator dependent, poor for bone evaluation

#### Nuclear Medicine (Bone Scintigraphy)

- determine the location and extent of bony lesions
- <sup>99m</sup>Tc-methylene diphosphonate (MDP) localize to areas of increased bone turnover or calcification – growth plate in children, tumours, infections, fractures, metabolic bone disease (e.g. Paget's), sites of reactive bone formation, and periostitis
- very sensitive, not specific (trauma, infection, inflammation look similar)

### Approach to Interpretation of Bone X-Rays

- identification: name, MRN, age of patient, type of study, region of investigation
- soft tissues: swelling, calcification/ossification
- joints: alignment, joint space, presence of effusion, osteophytes, erosions, bone density, overall pattern, and symmetry of affected joint
- bone: periosteum, cortex, medulla, trabeculae, density, articular surfaces, bone destruction, bone production, appearance of the edges or borders of any lesions (Figure 34)

#### Approach to Fractures

##### BONES

Black lines/Breaks in cortex

Osteoporosis

Not aligned (angulation, translation, rotation)

Extension into joint

Soft tissue swelling/Sclerosis (past fracture)

See [Orthopedics](#), OR5

## Trauma

### Fracture/Dislocation

- description of fractures
- site of fracture (bone, region of bone, intra-articular vs. extra-articular)
- pattern of fracture line (simple vs. comminuted)
- displacement (distal fragment with reference to the proximal fragment)
- soft tissue involvement (calcification, gas, foreign bodies)
- type of fracture (stress vs. pathologic)
- for specific fracture descriptions and characteristics of fractures, see [Orthopedics](#), OR5

## Arthritis

### Radiographic Hallmarks of OA

- joint space narrowing – typically non-uniform
- subchondral sclerosis
- subchondral cyst formation
- osteophytes

### Radiographic Hallmarks of RA

- joint space narrowing – typically uniform
- soft tissue swelling
- erosions
- periarticular osteopenia

## Bone Tumour

### Approach

- metastatic tumours to bone are much more common than primary bone tumours, particularly if age >40 yr
  - diagnosis usually requires a biopsy if primary not located
  - few benign tumours/lesions have potential for malignant transformation
  - MRI is good for tissue delineation and preoperative assessment of surrounding soft tissues, neurovascular structures, and medullary/marrow involvement
  - plain film is less sensitive than other modalities but useful for assessing aggressiveness and constructing differential diagnosis

### Considerations and Tumour Characteristics

- age – most common tumours by age group
  - <1 yr of age: metastatic neuroblastoma
  - 1-20 yr of age: Ewing's tumour in tubular bones
  - 10-30 yr of age: osteosarcoma and Ewing's tumour in flat bones
  - >40 yr of age: metastases, multiple myeloma, and chondrosarcoma
- multiplicity: metastases, myeloma, lymphoma, fibrous dysplasia, enchondromatosis
- location within bone
  - epiphysis: giant cell tumour, chondroblastoma, geode, eosinophilic granuloma, infection
  - metaphysis: simple bone cyst, aneurysmal bone cyst, enchondroma, chondromyxoid fibroma, nonossifying fibroma, osteosarcoma, chondrosarcoma
  - diaphysis: fibrous dysplasia, aneurysmal bone cyst, brown tumours, eosinophilic granuloma, Ewing's sarcoma
- expansile
  - aneurysmal bone cyst, giant cell tumour, enchondromas, brown tumours, metastases (especially renal and thyroid), plasmacytoma
- matrix mineralization
  - chondroid (popcorn calcification) or osseous
- margin/zone of transition: area between lesion and normal bone
- cortex: intact, disturbed
- periosteal reaction
- soft tissue mass
- see Figure 34 and Table 18

Figure 34. Radiographic appearance of bone remodelling and destruction processes

### Types of Fractures

- Transverse
- Oblique
- Spiral
- Avulsion
- Impacted

### Types of Displacements

- Translation
- Angulation
- Rotation
- Impaction
- Dislocation

Figure 33. X-ray of first carpometacarpal joint: normal image (left side) and osteoarthritis (right side) with joint space narrowing and subchondral sclerosis

### Benign Lesions which may have Aggressive Features

- Osteomyelitis
- Osteoblastoma
- Aneurysmal bone cyst
- Langerhans cell histiocytosis
- Myositis ossificans

### Periosteal Reaction

- "Onion skinning" = Ewing's sarcoma
- "Sunburst", "hair on end" = osteosarcoma
- "Codman's triangle" = osteosarcoma, Ewing's sarcoma, subperiosteal abscess

Lytic = decreased density  
Sclerotic = increased density

**Table 18. Characteristics of Benign and Malignant Bone Lesions**

Benign	Malignant
Thin sclerotic margin/sharp delineation of lesion	Poor delineation of lesion – wide zone of transition
Overlying cortex intact	Loss of overlying cortex/bony destruction
No or simple periosteal reaction	Periosteal reaction
No soft tissue mass	Soft tissue mass
Note: for specific bone tumours see <a href="#">Orthopedics</a> , OR42	

**Metastatic Bone Tumours**

- all malignancies have potential to metastasize to bone
- metastases are 20-30x more common than primary bone tumours
- metastasis can cause a lytic or a sclerotic reaction when seeding to bone
- when a primary malignancy is first detected, a bone scan is often part of the initial work-up
- may present with pathological fractures or pain
- biopsy or determination of primary is the only way to confirm the diagnosis
- most common metastatic bone tumours: breast, prostate, lung, see [Orthopedics](#), OR45

**Table 19. Characteristic Bone Metastases of Common Cancers**

Lytic	Sclerotic	Expansile	Peripheral
Breast	Prostate	Thyroid	Kidney
Lung	Breast	Renal	Lung
Thyroid	Lymphoma		Melanoma
Kidney	Lung		(KLM: flies to the periphery)
Multiple myeloma	Bowel		
	Medulloblastoma		
	Treated tumours		

## Infection

**Osteomyelitis**

- MRI is the imaging modality of choice for demonstrating bone, bone marrow, and soft tissue abnormalities
- $^{99m}\text{Tc}$ , followed by  $^{111}\text{In}$  labeled white cell scan or gallium radioisotope scan
- plain film
  - visible 8-10 d after process has begun
  - osteomyelitic changes on plain film
    - ♦ soft tissue swelling
    - ♦ local periosteal reaction
    - ♦ pockets of air (from anaerobes) may be seen in the tissues, may also suggest necrotizing fasciitis
    - ♦ mottled and nonhomogeneous with a classic “moth-eaten” appearance
    - ♦ cortical destruction

**Bone Abscess**

- overlying cortex has periosteal new bone formation
- sharply outlined radiolucent area with variable thickness in zone of transition
- variable thickness periosteal sclerosis
- sequestrum: a piece of dead bone within a Brodie’s abscess
- a sinus tract or cloaca may communicate between the abscess through the cortex to the surface of the bone

## Metabolic Bone Disease

**Osteoporosis**

- reduction in amount of normal bone mass; fewer and thinner trabeculae; diffuse process affecting all bones
- dual energy x-ray absorptiometry (DEXA): gold standard for measuring bone mineral density
  - T-score: the number of standard deviations from the young adult mean, most clinically valuable
    - ♦ osteopenia:  $-2.5 < \text{T-score} < -1$
    - ♦ osteoporosis:  $\text{T-score} \leq -2.5$
  - Z-score: the number of standard deviations from the age-matched mean
  - risk of fracture: related to bone mineral density, age, history of previous fractures, steroid therapy

Diagnostic sensitivity of DEXA highest when BMD measured at lumbar spine and proximal femur.

- appearance on plain film
  - osteopenia: reduced bone density on plain films
    - ♦ may also be seen with osteomalacia, hyperparathyroidism, and disuse
  - compression of vertebral bodies
  - biconcave vertebral bodies ("codfish" vertebrae)
  - long bones have appearance of thinned cortex and increased medullary cavity
  - look for complications of osteoporosis
    - ♦ e.g. insufficiency fractures: hip, vertebrae, sacrum, pubic rami
- see [Endocrinology](#), E42

### Osteomalacia/Rickets

- reduction in bone mineral density, usually due to vitamin D deficiency, resulting in softening and bowing of long bones
- similar to osteoporosis, initial radiological appearance of osteopenia (coarse and poorly defined bone texture)
- "fuzzy", ill-defined trabeculae
- Looser's zones (pseudofracture)
  - characteristic radiologic feature
  - fissures or clefts at right angles to long bones and extending through cortex
  - DDx: osteomalacia, chronic renal disease, fibrous dysplasia, hyperthyroidism, Paget's, osteodystrophy, X-linked hypophosphatemia

#### Osteoporosis

Reduced amount of bone

#### OsteoMalacia

Normal amount of bone, but reduced mineralization of normal osteoid

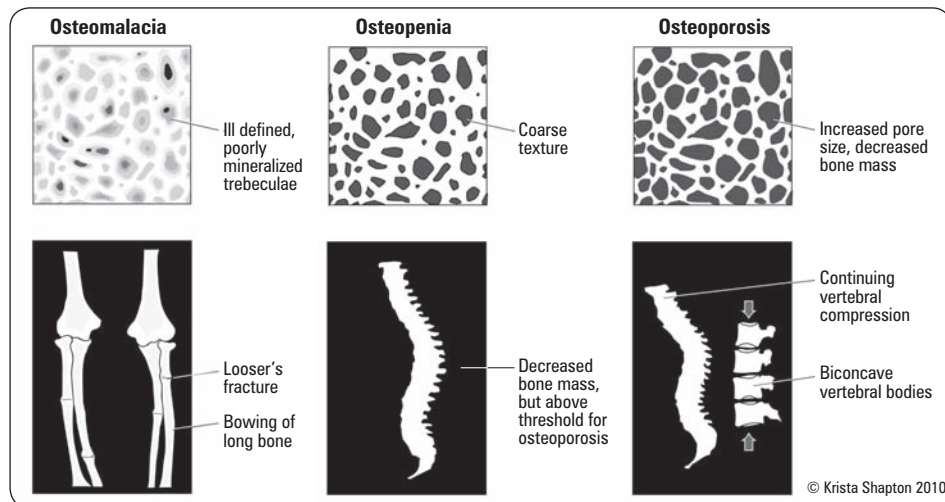

Figure 35. Osteomalacia, osteopenia and osteoporosis

### Hyperparathyroidism

- most common cause is renal failure (secondary hyperparathyroidism)
- chondrocalcinosis
  - calcium crystal deposition in hyaline cartilage or fibrocartilage (including arteries and peri-articular soft tissue)
  - resorption of bone typically in hands (subperiosteal and at tufts), SI joints (subchondral), skull ("salt and pepper" appearance), osteoclastoma (brown tumours)
  - "rugger jersey spine": band-like osteosclerosis at superior/inferior margins of vertebral bodies
- see [Endocrinology](#), E38

### Paget's Disease

- abnormal remodeling involving single or multiple bones – especially skull, spine, pelvis
- 3 phases: 1st phase = lytic, 2nd phase = mixed (lytic/sclerotic), 3rd phase = sclerotic
- features
  - coarsening of the trabeculae with bone expansion
  - bone softening/bowing
  - bone scan will reveal high activity, especially at bone ends
  - thickened cortex
- see [Endocrinology](#), E46

# Nuclear Medicine

## Brain

- $^{99m}\text{Tc}$ -exametazime (HMPAO) and  $^{99m}\text{Tc}$ -bicisate (ECD) imaging to assess cerebral blood flow, taken up in cortical and subcortical grey matter; used for dementia, traumatic brain injury and to a lesser extent vasculitis, neuropsychiatric disorders and stroke
- PET imaging assesses metabolic activity by using  $^{18}\text{F}$ FDG
- CSF imaging, intrathecal administration of  $^{111}\text{In}$  DTPA to evaluate CSF leak or to differentiate normal pressure hydrocephalus from other causes of hydrocephalus
- ventricular shunt evaluation for obstruction (most commonly ventricular peritoneal) with  $^{99m}\text{Tc}$  or  $^{111}\text{In}$ -DTPA

## Thyroid

### Radioactive Iodine Uptake (see [Endocrinology](#), E22)

- index of thyroid function (trapping and organification of iodine)
- radioactive  $^{131}\text{I}$  or  $^{123}\text{I}$  given PO to fasting patient
- measure percentage of administered iodine taken up by thyroid
- increased RAIU: toxic multinodular goiter, toxic adenoma, Graves' disease
- decreased RAIU: subacute thyroiditis, late Hashimoto's disease, hormone suppression
- falsely decreased in patient with recent radiographic contrast studies, high dietary iodine (e.g. seaweed)

### Thyroid Imaging (Scintiscan)

- $^{99m}\text{Tc}$  pertechnetate IV or radioactive iodine ( $^{123}\text{I}$ )
- provides functional anatomic detail
- hot (hyperfunctioning) lesions
  - adenoma, toxic multinodular goiter
  - usually benign, cancer very unlikely (less than 1%)
- cold (hypofunctioning) lesions
  - cancer must be considered until biopsy negative even though only 6-10% are cancerous
- isointense lesions
  - cancer must be considered as an isointense lesion may represent cold nodules superimposed on normal tissue
  - if cyst suspected, correlate with U/S
- serum thyroglobulin to detect recurrent thyroid cancer post-treatment

### Radioiodine Ablation

- $^{123}\text{I}$  for Graves' disease, multinodular goiter, thyroid cancer

## Respiratory

### V/Q Scan

- examine areas of lung in which ventilation and perfusion do not match
- ventilation scan
  - patient breathes radioactive gas ( $^{99m}\text{Tc}$ -DTPA,  $^{133}\text{Xe}$ , Technegas) through a closed system, filling alveoli proportionally to ventilation
  - ventilation scan defects indicate: airway obstruction, chronic lung disease, bronchospasm, tumour mass obstruction
- perfusion scan
  - radiotracer injected IV ( $^{99m}\text{Tc}$ -MAA) → trapped in pulmonary capillaries (1 in 1500 arterioles occluded) according to blood flow
  - gives a map of pulmonary circulation
  - relatively contraindicated in severe pulmonary HTN and right-to-left shunt
- with PE
  - areas of lung are well ventilated but not perfused (unmatched defect)
  - defects are wedge-shaped, extend to periphery, usually bilateral and multiple
  - reported as high probability, intermediate, low, very low, or normal
  - V/Q scans for PE have been largely replaced by CT scan with contrast (see [Respirology](#), R18)
- not valid for assessment of PE when patients have intrinsic lung diseases and ventilatory problems

#### V/Q Scan

For PE investigation: normal scan makes PE unlikely.  
Probability of PE: high 80-100%, intermediate 20-80%, low <20%, very low <10%.

#### Ventilation Scan Defects indicate:

Airway obstruction, chronic lung disease, bronchospasm, tumour mass obstruction.

#### Perfusion Scan Defects indicate:

Reduced blood flow due to PE, COPD, asthma, bronchogenic carcinoma, inflammatory lung diseases (pneumonia, sarcoidosis), mediastinitis, mucous plug, vasculitis.

## Cardiac

### Myocardial Perfusion Scanning

- for investigation of angina, atypical chest pain, coronary artery disease, and follow-up post-bypass
- thallium-201 (a radioactive analogue of potassium),  $^{99m}\text{Tc}$  sestamibi (MIBI), or  $^{99m}\text{Tc}$  tetrofosmin
- injected at peak exercise (physical stress) or after persantine challenge (vasodilator) and again later at rest
- persistent defect (at rest and stress) suggests infarction; reversible defect (only during stress) suggests ischemia
- used to discriminate between reversible (ischemia) vs. irreversible (infarction) changes when other investigations are equivocal
- see [Cardiology and Cardiovascular Surgery](#), C10 for more details

### Radionuclide Ventriculography

- $^{99m}\text{Tc}$  tagged to red blood cells
- first pass through right ventricle  $\rightarrow$  pulmonary circulation  $\rightarrow$  left ventricle; provides information about RV function
- cardiac MUGA scan (Multiple GAted acquisition scan) sums multiple cardiac cycles
  - evaluation of LV function
  - images are obtained by gating (synchronizing) the count acquisitions to the ECG signal
  - MUGA scan can be used to study the function of the heart at a particular stage of contraction
- provides information on ejection fraction (normal = 50-65%), ventricular volume, and wall motion

Active uptake of radiolabel by myocardium is proportional to regional blood flow.

Persistent defect (at rest and stress) suggests infarction; reversible defect (only during stress) suggests ischemia.

**MUGA Scan** can be used to study the function of the heart at a particular stage of contraction. Superior to ECHO only in its reproducibility in EF measurement (precise).

## Abdomen and Genitourinary System

### HIDA (Hepatobiliary IminoDiacetic Acid) Scan

- IV injection of  $^{99m}\text{Tc}$ -disofenin (DISIDA) or  $^{99m}\text{Tc}$ -mebrofenin (BRIDA) which is bound to protein, taken up, and excreted by hepatocytes into biliary system
- can be performed in non-fasting state but prefer NPO after midnight
- gallbladder visualized when cystic duct is patent, usually seen by 30 min to 1 h
- if gallbladder is not visualized, suspect obstructed cystic duct (acute or chronic cholecystitis)
- acute cholecystitis: no visualization of gallbladder at 4 h or after administration of morphine at 30 min
- chronic cholecystitis: no visualization of gallbladder at 1 h but seen at 4 h or after morphine administration
- differential diagnosis of obstructed cystic duct: acute cholecystitis, decreased hepatobiliary function (commonly due to alcoholism), bile duct obstruction, parenteral nutrition, fasting less than 4 h or more than 24 h
- filling of gallbladder rules out cholecystitis (<1% probability)
- assess bile leaks post-operatively

### RBC Scan

- IV injection of radiotracer with sequential images of the abdomen ( $^{99m}\text{Tc}$  RBCs)
- GI bleed
  - if bleeding acutely at <0.5 mL/min, the focus of activity in the images generally indicates the site of the acute bleed, look for a change in shape and location on sequential image
  - if bleeding acutely at >0.5 mL/min, use angiography (more specific)
  - RBC scan is more sensitive for lower GI bleed
- liver lesion evaluation
  - hemangioma has characteristic appearance: cold early, fills in later

### Renal Scan

- see [Genitourinary System](#), MI16

### Scrotal Scintigraphy

- scrotal scintigraphy has now been replaced by Doppler U/S

## Bone

### Bone Scan

- isotopes
  - $^{99m}\text{Tc}$ -diphosphonate
    - triphasic bone scan: flow → blood pool → delayed bone images
    - uptake can distinguish bone vs. soft tissue infection and septic arthritis vs. osteomyelitis vs. peripheral cellulitis
    - acute osteomyelitis: increased activity in flow, blood pool, and delayed bone images; usually does not cross joint
    - septic arthritis and cellulitis: increased activity in blood pool and normal or slightly increased activity in delayed images; may cross joint
  - $^{111}\text{In}$  WBC: tracks the active migration of the WBC, more specific for infection
  - $^{67}\text{Ga}$  citrate: may see uptake in some tumours, also more specific for infection
- radioactive tracer binds to hydroxyapatite of bone matrix
- increased binding when increased blood supply to bone and/or high bone turnover (active osteoblasts)
- indications:
  - bone pain of unknown origin
  - AVN
  - suspected malignancy
  - staging malignancy (cancer of breast, prostate, kidney or lung)
  - follow up after treatment
  - detection and follow up of primary bone disease
  - assessment of skeletal trauma
  - detection of soft tissue calcification
  - renal failure
- differential diagnosis of positive bone scan:
  - bone metastases from breast, prostate, lung, thyroid
  - primary bone tumour
  - arthritis
  - fracture
  - infection
  - anemia
  - Paget's disease
- multiple myeloma: typically normal or cold (false negative); need a skeletal survey
- "superscan": increased bone uptake and poor renal uptake due to diffuse metastases or metabolic causes (renal osteodystrophy)

## Interventional Radiology

### Vascular Procedures

#### Angiography

- injection of contrast material through a catheter placed directly into an artery or vein to delineate vascular anatomy
- catheter can be placed into a large vessel (e.g. aorta, vena cava) for a "flush" or selectively placed into a branch vessel for more detailed examination of smaller vessels and specific organs
- indications: diagnosis of primary occlusive or stenotic vascular disease, aneurysms, coronary, carotid and cerebral vascular disease, PE, trauma, bleeding (GI, hemoptysis, hematuria), vascular malformations, as part of endovascular procedures (EVAR, thrombolysis, stenting and angioplasties)
- complications: puncture site hematoma, infection, pseudoaneurysm, AV fistula, dissection, thrombosis, embolic occlusion of a distal vessel
- significant complications occur in <5% of patients
- due to improved technology, non-invasive evaluation of vascular structures is being performed more frequently (colour Doppler U/S, CT angiography and MR angiography)
- see *Neuroradiology*, MI18

#### Percutaneous Transluminal Angioplasty (PTA) and Stents

- introduction and inflation of a balloon into a stenosed vessel to restore distal blood supply
- common alternative to surgical bypass grafting with five year patency rates similar to surgery, depending on site
- renal, iliac, femoral, mesenteric, subclavian, coronary and carotid artery stenoses are amenable to treatment

On U/S, veins are compressible, arteries are not.

#### Thrombolytic Therapy for Pulmonary Embolism

*Cochrane DB Syst Rev 2009;3:CD004437*

**Study:** Systematic review of randomized controlled trials comparing thrombolytic therapy with placebo, heparin, or surgical intervention.

**Patients:** 679 patients with acute PE.

**Intervention:** Thrombolytics vs. heparin or placebo.

**Outcome:** Death rate, recurrence of PE, major and minor hemorrhagic events.

**Results:** Non-significant difference between thrombolytics and heparin or placebo in all measured outcomes. Rt-PA and heparin together reduced need for treatment for in-hospital events. Thrombolytics improved hemodynamic outcome, lung VQ scans, pulmonary angio assessment and echocardiograms greater than heparin. Need for further double-blinded RCTs.

**Conclusion:** We cannot conclude whether thrombolytic therapy is better than heparin for pulmonary embolism based on limited evidence found.

- vascular stents may help improve long term results by keeping the vessel wall patent after PTA
- stents are also used for angioplasty failure or complications
- stent grafts (metal mesh covered with durable fabric) may provide an alternative treatment option for aneurysms and AV fistulas
- complications: similar to angiography, but also includes vessel rupture

### Thrombolytic Therapy

- may be systemic (IV) or catheter directed
- infusion of a fibrinolytic agent (urokinase, streptokinase, TNK, tPA – used most commonly) via a catheter inserted directly into a thrombus
- can restore blood flow in a vessel obstructed with a thrombus or embolus
- indications: treatment of ischemic limb (most common indication), early treatment of MI or stroke to reduce organ damage, treatment of venous thrombosis (DVT or PE)
- complications: bleeding, stroke, distal embolus, reperfusion injury with myoglobinuria and renal failure if advanced ischemia present

### Embolization

- injection of occluding material into vessels
- permanent agents: amplatzer plugs, coils, glue and onyx
- temporary: gel foam, autologous blood clots
- indications: management of hemorrhage (epistaxis, trauma, GI bleed, GU bleed), treatment of AVM, pre-operative treatment of vascular tumours (bone metastases, renal cell carcinoma), varicocele embolization for infertility, symptomatic uterine fibroids
- complications
  - post embolization syndrome (pain, fever, leukocytosis)
  - unintentional embolization of a non-target organ with resultant ischemia

### Inferior Vena Cava Filter

- insertion of metallic “umbrellas” to mechanically trap emboli and prevent PE
- may be temporary (retrievable) or permanent
- inserted via femoral vein, jugular vein, or antecubital vein
- usually placed infrarenally to avoid renal vein thrombosis
- indications: contraindication to anticoagulation, failure of adequate anticoagulation (e.g. recurrent PE despite therapeutic anticoagulant levels), complication of anticoagulation

### Central Venous Access

- variety of devices available
- peripherally inserted central catheter (PICC), external tunneled catheter (Hickman or dialysis catheters), subcutaneous port (Portacath®)
- indications: chemotherapy, TPN, long-term antibiotics, administration of fluids and blood products, blood sampling
- complications: venous thrombosis and central venous stenosis, infection including sepsis, pneumothorax

Advanced ischemia patients should receive surgery rather than thrombolysis.

Chemoembolization delivers chemotherapy directly into the tumour through its feeding blood supply and traps the drug in place by embolization.

#### Indications for Central Venous Access

##### FAT CAB

Fluids  
Antibiotics  
TPN  
Chemotherapy  
Administration of blood  
Blood sampling

Figure 36. Retrievable IVC filter

Figure 37. Femoral arteriogram: distal occlusion of superficial femoral artery

ERCP is the primary modality for distal common bile duct obstructions.

## Nonvascular Interventions

### Percutaneous Biopsy

- replaces open surgical procedure
- many sites are amenable to biopsy using U/S, fluoroscopy or CT guidance
- complications:
  - false negative biopsies due to sampling error or tissue necrosis
  - pneumothorax in 30% of lung biopsies, chest tube required in approximately 5%
  - pancreatic biopsies are associated with risk of inducing acute pancreatitis
  - transjugular liver biopsies can be performed to minimize bleeding complications in patients with uncorrectable coagulopathies or ascites

### Abscess Drainage

- placement of a drainage catheter into an infected fluid collection
- administer broad spectrum IV antibiotics prior to procedure
- routes: percutaneous (most common), transgluteal, transvaginal, transrectal
- complications:
  - hemorrhage
  - injury to intervening structures (e.g. bowel)
  - bacteremia, sepsis

**Percutaneous Biliary Drainage (PBD)/Cholecystostomy**

- placement of drainage catheter ± metallic stent into obstructed biliary system (PBD) or gallbladder (cholecystostomy) for relief of jaundice or infection
- percutaneous gallbladder access can be used to crush or remove stones
- indications:
  - cholecystitis: acute cholecystitis
  - percutaneous biliary drainage: biliary obstruction secondary to stone or tumour, cholangitis
- complications:
  - acute: sepsis, hemorrhage
  - long-term: tumour overgrowth and stent occlusion

**Percutaneous Nephrostomy**

- placement of catheter into renal collecting system
- indications: hydronephrosis (urinary obstruction as a result of a stone or tumour), pyonephrosis, ureteric injury with or without urinary peritonitis (traumatic or iatrogenic)
- complications: bacteria and septic shock, hematuria due to pseudoaneurysm or AV fistulas, injury to adjacent organs

**Gastrostomy/Gastrojejunostomy**

- percutaneous placement of catheter directly into either stomach (gastrostomy) or through stomach into small bowel (transgastric jejunostomy)
- indications:
  - feeding: inability to eat (most commonly CNS lesion, e.g. stroke) or esophageal obstruction
  - decompression: gastric outlet obstruction
- complications: gastroesophageal reflux with aspiration, peritonitis, hemorrhage, bowel or solid organ injury

**Radiofrequency (RF) Ablation**

- U/S or CT guided probe is inserted into tumour, RF energy delivered through probe causes heat deposition and tissue destruction
- indications: hepatic tumours (HCC and metastases), renal tumours
- complications: destruction of neighbouring tissues and structures, bleeding

## Breast Imaging

### Modalities

**Mammography****Description**

- x-ray imaging of the breasts for screening in asymptomatic patients, or diagnosis of clinically-detected or screening-detected abnormalities (see [General Surgery](#), GS54)

**Indications**

- screening
  - begin screening from age 50 q1-2 yr
  - if over the age of 70, continue screening mammography if in good general health
  - not routinely recommended if under the age of 50 unless strong family history
  - if positive family Hx, begin screening 5-10 yr younger than the first degree relative who developed breast cancer
- diagnostic
  - signs and symptoms suggestive of breast cancer include a lump or thickening, localized nodularity, dimpling or contour deformity, a persistent focal area of pain, and spontaneous serous or sanguinous nipple discharge from a single duct
  - women with abnormal screening mammograms
  - follow-up of women with previous breast cancer
  - suspected complications of breast implants

**Table 20. Breast Imaging Reporting and Data System (BI-RADS®) Mammography Categories**

Assessment Categories	Imaging Findings	Follow-up Recommendations
BI-RADS 0	Incomplete	Additional imaging Comparison to prior films
BI-RADS 1	Negative	Routine screening
BI-RADS 2	Benign	Routine screening
BI-RADS 3	Probably benign Likelihood of malignancy is <2%	Unilateral mammogram at 6 mo
BI-RADS 4	Suspicious abnormality	Biopsy
BI-RADS 5	Highly suspicious of malignancy Likelihood of malignancy is 95%	Biopsy
BI-RADS 6	Malignancy confirmed by biopsy	Definitive therapy

## Breast MRI

### Description

- breast MRI should be used only after mammography and ultrasound investigation
- sensitive for detecting invasive breast cancer (95-100%) but specificity variable (37-97%)
- use as a screening modality has been limited to high risk patients

### Indications

- evaluation of previously diagnosed breast cancer: positive margins, recurrence, response to chemotherapy
- post-surgical resection of breast cancer
- known BRCA1 or BRCA2 mutation, or other gene predisposing to breast cancer
- untested first-degree relative of a carrier of such a gene mutation
- family history consistent with a hereditary breast cancer syndrome and estimated personal lifetime cancer risk >25%
- high-risk marker on prior biopsy (atypical ductal hyperplasia, atypical lobular hyperplasia, lobular carcinoma in situ)
- radiation therapy to chest (before age 30)
- NOTE: MRI should not be used to screen the general population or to differentiate between benign and malignant lesions

## Ultrasound

### Definition

- ultrasound can determine if a mass is cystic or solid and is commonly used during biopsy

### Indications

- identification and characterization of palpable abnormalities
- evaluation of ambiguous mammographic findings in the determination of cystic versus solid characteristics
- evaluation of patients with suspected silicone implant rupture and problems associated with breast implants
- guidance for interventional procedures
- breast sonography is the initial imaging technique to evaluate palpable masses in women under 30 and in lactating and pregnant women

## Breast Interventional Procedures

### Description

- breast interventional procedures include fine needle aspirate biopsy, core needle biopsy, abscess drainage, and cyst aspiration (see [General Surgery](#), GS56)

### Indications

- cystic mass: complex cyst, symptomatic, suspected abscess
- solid mass: confirm diagnosis of a lesion suspicious for malignancy (BI-RADS® Category 4 or 5) or confirm diagnosis of a probable benign mass (BI-RADS® Category 3)
- initial percutaneous biopsy procedure that was insufficient or discordant with imaging
- presurgical ultrasound-guided localization of a lesion

## Breast Findings

### Breast Masses

- definition: a space occupying lesion seen in two different projections; if seen in only a single projection it should be called a “density” until its three-dimensionality is confirmed

**Table 21. Mammographic Features of Benign and Malignant Breast Masses**

	Benign	Malignant
<b>Shape</b>	Oval, round, lobular	Irregular
<b>Margin</b>	Circumscribed, well-defined	Indistinct, microlobulated, speculated
<b>Density</b>	Radiolucent (oil cyst, lipoma, fibrolipoma, galactocoele, hamartoma)	Radiodense
<b>Calcifications (± mass)</b>	Popcorn (hyalinizing fibroadenoma), lucent centred (oil cyst/fat necrosis), layering (milk of calcium), vascular, round, scattered	Pleomorphic (vary in size and shape), amorphous (indistinct), fine linear, coarse heterogenous, regional, segmental, clustered

### Other Findings

- tubular density/dilated duct: branching tubular structures usually represent enlarged ducts (milk ducts); if they are clearly identified as such, these densities are of little concern
- intramammary lymph node: typical lymph nodes are circumscribed, reniform and often have a fatty notch and centre; usually less than 1 cm, and usually seen in the outer, often upper part of the breast; when these characteristics (particularly fatty centre or notch) are well seen, the lesion is almost always benign and insignificant
- focal asymmetric density: area of breast density with similar shape on two views, but completely lacking borders and conspicuity of a true mass; must be carefully evaluated with focal compression to exclude findings of a true mass or architectural distortion
  - if focal compression shows mass-like character, or if the area can be palpated, biopsy must be considered

## Basic Anatomy Review

### Anatomy of the Kidney

- see [Urology](#), U2

### Renal Structure and Function

#### The Nephron

- basic structural and functional unit of the kidney, approximately 1 million per kidney
- 2 main components: glomerulus and attached renal tubule
- direction of blood flow: afferent arteriole → glomerular capillaries → efferent arteriole → vasa recta (the capillaries surrounding the tubules) → renal venules

**Table 1. Major Functions of the Kidneys**

Function	Mechanism	Affected Elements
1. Waste Excretion	Glomerular filtration	Excretion of nitrogenous products of protein metabolism (urea, Cr)
	Tubular secretion	Excretion of organic acids (urate) and organic bases (Cr)
	Tubular catabolism	Breakdown and excretion of drugs (antibiotics, diuretics) and peptide hormones (most pituitary hormones, insulin, glucagon)
2. Electrolyte Balance	Tubular NaCl and water reabsorption	Controls volume status and osmolar balance
	Tubular K <sup>+</sup> secretion	Controls potassium concentration
	Tubular H <sup>+</sup> secretion	Acid-base balance
	HCO <sub>3</sub> <sup>-</sup> synthesis and reabsorption	Acid-base balance
	Tubular Ca <sup>2+</sup> , Mg <sup>2+</sup> , PO <sub>4</sub> <sup>3-</sup> transport	Alters Ca <sup>2+</sup> , Mg <sup>2+</sup> , PO <sub>4</sub> <sup>3-</sup> homeostasis
3. Hormonal Synthesis	Erythropoietin production (cortex)	Red blood cell production
	Vitamin D activation [25(OH) <sub>2</sub> D, 1,25(OH) <sub>2</sub> D]	Calcium homeostasis
	Renin production (JG apparatus)	Alters vascular resistance and aldosterone secretion
4. Blood Pressure Regulation	Na <sup>+</sup> excretion	Alters ECF volume
	Renin production	Alters vascular resistance
5. Glucose Homeostasis	Gluconeogenesis (from lactate, pyruvate and amino acids)	Glucose supply maintained in prolonged starvation

#### The Glomerulus

- site where blood constituents are filtered through to the kidney tubules for excretion or reabsorption
- consists of following cell types:
  1. Mesangial cells
    - structural cells that support the vascular tree. They are also contractile and produce vasoactive substances to help control blood flow
  2. Capillary endothelial cells
    - one of the cells of the glomerular filtration barrier and help form the plasma filtration apparatus due to their sinusoidal nature and glycocalyx. Contribute to the production of the glomerular basement membrane (GBM)
  3. Visceral epithelium (podocytes)
    - one of the cells of the glomerular filtration barrier and help form the plasma filtration apparatus due to their interdigitated foot process that form slit diaphragms. Contribute to the production of the glomerular basement membrane (GBM)
  4. Parietal epithelium
    - lines the interior of Bowman's capsule and contains a podocyte progenitor population
- filtration occurs across the glomerular filtration barrier (endothelium, GBM, podocytes) into Bowman's space (Figure 1)
- particles are selectively filtered by size (<60 kDa) and charge (negative charge repelled)

## Acronyms

ACEI	angiotensin converting enzyme inhibitor
ACR	albumin to Cr ratio
ADH	antidiuretic hormone
AG	anion gap
AIN	acute interstitial nephritis
AKI	acute kidney injury
ANA	antinuclear antibody
Anti-GBM	anti-glomerular basement membrane
ARB	angiotensin receptor blocker
ARF	acute renal failure
ASA	acetylsalicylic acid
ATN	acute tubular necrosis
AVM	arteriovenous malformation
c-ANCA	cytoplasmic antineutrophil cytoplasmic antibody
C&S	culture and sensitivity
CHF	congestive heart failure
Cr	creatinine
CrCl	creatinine clearance
CRF	chronic renal failure
D5W	5% dextrose in water
DDAVP	1-desamino-8-d-arginine vasopressin
DI	diabetes insipidus
DIC	disseminated intravascular coagulation
DKA	diabetic ketoacidosis
DM	diabetes mellitus
EGFR	estimated glomerular filtration rate
ESR	erythrocyte sedimentation rate
ESRD	end-stage renal disease
GFR	glomerular filtration rate
GN	glomerulonephritis
HCTZ	hydrochlorothiazide
HSP	Henoch-Schönlein Purpura
HTN	hypertension
HUS	hemolytic uremic syndrome
IVP	intravenous pyelogram
LOC	level of consciousness
MDRD	modification of diet in renal disease
NS	normal saline
NSAIDs	nonsteroidal anti-inflammatory drugs
p-ANCA	perinuclear anti-neutrophil cytoplasmic antibody
PCKD	polycystic kidney disease
PTH	parathyroid hormone
R&M	routine and microscopy
RAAS	renin-angiotensin-aldosterone system
RBF	renal blood flow
RCC	renal cell carcinoma
RPGN	rapidly progressive glomerulonephritis
RRT	renal replacement therapy
RTA	renal tubular acidosis
SIADH	syndrome of inappropriate antidiuretic hormone
SLE	systemic lupus erythematosus
TIN	tubulointerstitial nephritis
TTP	thrombotic thrombocytopenic purpura
UTI	urinary tract infection

Figure 1. The glomerulus

### The Renal Tubules

- reabsorption and secretion occur between the renal tubules and vasa recta forming urine for excretion
- each segment of the nephron selectively transports various solutes and water and is targeted by specific diuretics

Figure 2. Tubular segments of the nephron

## Renal Hemodynamics

- Glomerular Filtration Rate (GFR)
  - the rate of fluid transfer between glomerular capillaries and Bowman's space
  - 180 L/d, of which 99% is reabsorbed, giving a daily urine output of 1.0-1.5 L
  - normal urine output is >0.5 ml/kg/h in adults
  - GFR is highest in early adulthood, decreasing thereafter
- renal autoregulation maintains constant GFR over mean arterial pressures of 70-180 mmHg
- 2 mechanisms of autoregulation:
  - myogenic mechanism: release of vasoactive factors in response to changes in perfusion pressure (e.g. ↑ perfusion pressure → afferent arteriolar constriction → ↓ GFR)
  - tubuloglomerular feedback: changes in  $[Na^+]$  delivery to macula densa lead to afferent arteriolar tone (e.g. increased delivery causes afferent constriction)
- Filtration Fraction (FF)
  - percentage of RPF filtered across the glomeruli
  - expressed as a ratio:  $FF = GFR/RPF$ ; normal = 0.2 or 20%
  - angiotensin II ( $A_{II}$ ) constricts renal efferent arterioles which increases FF thereby maintaining GFR
- renin is released from juxtaglomerular apparatus in response to decreased RPF

### Glomerular Filtration Rate

$$GFR = K_f (\Delta P - \Delta \Pi)$$

$K_f$  = ultrafiltration coefficient

$\Delta P$  = hydrostatic pressure difference between glomerular capillaries and Bowman's space

$\Delta \Pi$  = osmotic pressure difference between glomerular capillaries and Bowman's space

$\Delta P - \Delta \Pi$  = Net outward pressure

© Frances Yeung 2005

Figure 3. Stimuli for renin release

## Assessment of Renal Function

### Measurement of Renal Function

- glomerular filtration rate (GFR) = rate of filtration of plasma by the glomeruli
- most renal functions decline in parallel with a decrease in GFR
- inulin clearance is the gold standard for measuring GFR, but very rarely used clinically
- clinically, GFR is estimated using serum creatinine concentrations  $[Cr]$
- creatinine (Cr) is a metabolite of creatine (intermediate in muscle energy metabolism)
- Cr is freely filtered at the glomerulus with no tubular reabsorption
- tubular secretion varies based on level of renal function (10% to >50%)
- rate of production determined by muscle mass
- Cr filtered  $\approx$  Cr excreted (at steady state)

### Ways to Estimate GFR Using Serum Creatinine Concentration

1. Calculate creatinine clearance (CrCl)
  - calculation provides reasonable estimate of GFR
  - measure plasma  $[Cr]$ , 24-h urine volume and urine  $[Cr]$ 
    - $GFR/d = (urine [Cr] \times urine volume/d) / (plasma [Cr])$
    - must use same units for urine  $[Cr]$  and plasma  $[Cr]$
2. Cockcroft-Gault formula
  - serum Cr used along with age, gender and weight (kg) to estimate GFR (see sidebar)
  - normal range is >90 mL/min (>1.5 mL/s)

$$Cr_{filtered} = Cr_{excreted}$$

$$[Cr]_{plasma} \times GFR = [Cr]_{urine} \times \text{urine flow rate (mL/min)}$$

$$GFR = \frac{[Cr]_{urine} \times \text{urine flow rate}}{[Cr]_{plasma}}$$

At steady state  $[Cr]_{serum} \propto 1/CrCl$

### Cockcroft-Gault Formula

$$CrCl \text{ (mL/min)} = \frac{(\text{weight in kg}) (140 - \text{age}) \times 1.23}{\text{serum creatinine (umol/L)}}$$

Multiply above by 0.85 for females.

**3. MDRD (Modification of Diet in Renal Disease) formula**

- most common way in which GFR is estimated (MDRD 7 equation)
- complex formula incorporating age, gender, serum Cr, African descent, but does not include weight
- GFR is reported as mL/min/1.73 m<sup>2</sup> body surface area

**4. CKD-EPI equation**

- the best current equation
- calculated using serum Cr, age, sex and race

**Limitations of Using Serum Cr Measurements**

1. must be in steady state
  - constant GFR and rate of production of Cr from muscles
  - sudden injury may reduce GFR substantially, but it takes time for Cr to accumulate and then re-establish steady state
  - clinical correlation: in acute kidney injury, the rise in creatinine is often delayed
2. GFR must fall substantially before plasma [Cr] rises above normal laboratory range
  - with progressive renal failure, remaining nephrons compensate with hyperfiltration
  - GFR is relatively preserved despite significant structural damage
3. plasma [Cr] is influenced by the rate of Cr production
  - lower production with smaller muscle mass (i.e. female, elderly, low weight)
  - e.g. consider plasma [Cr] of 100 µmol/L (1.13 mg/dL) in both of these patients
    - ♦ 20 yr-old man who weighs 100 kg, GFR = 144 mL/min
    - ♦ 80 yr-old woman who weighs 50 kg, GFR = 30.6 mL/min
  - clinical correlation: GFR decreases with age but would not be reflected as a rise in serum creatinine due to the age-associated decline in muscle mass
4. tubular secretion of creatinine increases as GFR decreases
  - serum creatinine and CrCl overestimate low GFR
  - certain drugs (cimetidine, trimethoprim) interfere with Cr secretion
5. errors in Cr measurement
  - very high bilirubin level causes [Cr] to be falsely low
  - acetoacetate (a ketone body) and certain drugs (cefexitin) create falsely high [Cr]

**Measurement of Urea Concentration**

- urea is the major end product of protein metabolism
- plasma urea concentration reflects renal function but should not be used alone as it is modified by a variety of other factors
- urea production reflects dietary intake of protein and catabolic rate; increased protein intake or catabolism (sepsis, trauma, GI bleed) cause urea level to rise
- ECF volume depletion causes a rise in urea independent of GFR or plasma [Cr]
- in addition to filtration, a significant amount of urea is reabsorbed along the tubule
- reabsorption is increased in sodium-avid states such as ECF volume depletion
- typical ratio of urea to [Cr] in serum is 1:12 in SI units (using mmol/L for urea and µmol/L for Cr), and 14:1 in MKS units (urea expressed as BUN in mg/dL and Cr in mg/dL)

**Cystatin C**

Cystatin C is a protease which is completely filtered by the glomerulus and is not affected by muscle mass. It is not currently used in clinical practice but may be a more accurate way to measure renal function in the future, particularly in diabetes.

**Clinical Settings in which Urea Level is Affected Independent of Renal Function****Disproportionate Increase in Urea**

- Volume depletion (prerenal azotemia)
- GI hemorrhage
- High protein diet
- Sepsis
- Catabolic state with tissue breakdown
- Corticosteroid or cytotoxic agents

**Disproportionate Decrease in Urea**

- Low protein diet
- Liver disease

## Urinalysis

- use dipstick in freshly voided urine specimen to assess the following:

**1. Specific Gravity**

- ratio of the mass of equal volumes of urine/H<sub>2</sub>O
- range is 1.001 to 1.030
- values <1.010 reflect dilute urine, values >1.020 reflect concentrated urine
- value usually 1.010 in end stage renal disease (isosthenuria)

**2. pH**

- urine pH is normally between 4.5-7.0; if persistently alkaline, consider:
  - renal tubular acidosis
  - UTI with urease-producing bacteria (e.g. *Proteus*)

**3. Glucose**

- freely filtered at glomerulus and reabsorbed in proximal tubule
- causes of glucosuria include
  1. hyperglycemia >9-11 mmol/L (>160-200 mg/dL) leads to filtration that exceeds tubular resorption capacity
  2. increased GFR (e.g. pregnancy)
  3. proximal tubule dysfunction (e.g. Fanconi's syndrome)

**4. Protein**

- dipstick only detects albumin; other proteins (e.g. Bence-Jones, Ig, Tamm-Horsfall) may be missed
- microalbuminuria (defined as ≥2.0 mg/mmol creatinine in males and ≥2.8 mg/mmol creatinine in females) is not detected by standard dipstick (see *Diabetes and the Kidney*, NP28)
- sulfosalicylic acid detects all protein in urine by precipitation
- gold standard: 24-h timed urine collection for total protein

**24 h Urine Collection**

- Discard first morning specimen
- Collect all subsequent urine for the next 24 h
- Refrigerate between voids
- Collect second morning specimen

**Clarity:** Cloudiness may indicate infection

**Colour:** usually pale yellow or amber, but may be colourless (diabetes insipidus, excess water intake), bright yellow (due to riboflavin ingestion or vitamin tablets), or dark yellow (concentrated urine in intravascular volume depletion)

**Estimating Urine Osmolality**

Last 2 digits of the specific gravity x 30  
= urine osmolality approximately  
e.g. specific gravity of 1.020  
= 600 mOsm

### 5. Leukocyte Esterase

- enzyme found in WBC and detected by dipstick
- presence of WBCs indicates infection (e.g. UTI) or inflammation (e.g. AIN)

### 6. Nitrites

- nitrates in urine are converted by bacteria to nitrites
- high specificity, low sensitivity for UTI

### 7. Ketones

- positive in alcoholic/diabetic ketoacidosis, prolonged starvation, fasting

### 8. Hemoglobin

- positive in hemoglobinuria (hemolysis), myoglobinuria (rhabdomyolysis) and true hematuria (RBCs seen on microscopy)

## Urine Microscopy

- centrifuge urine specimen for 3-5 min, discard supernatant, resuspend sediment and plate on slide
- shaking tube vigorously may disrupt casts

**Table 2. Comparison of Urinary Sediment Findings**

	Active Sediment	Bland Sediment
<b>Any one or more of the following seen on microscopy</b>	Red cell casts White cell casts Muddy-brown granular or epithelial cell casts >2 red cells per high power field (HPF) >4 white cells per HPF	Only hyaline casts <2 red cells per HPF <4 white cells per HPF Small quantities of crystals Small amount of bacteria
<b>Significance</b>	Highly suggestive of significant pathology, casts specifically suggest renal pathology	Reduced likelihood of significant pathology, but not ruled out

### 1. CELLS

#### Erythrocytes

- normal range = up to 2-3 RBCs per high power field (HPF)
- hematuria = greater than 2-3 RBCs/HPF
- dysmorphic RBCs and/or RBC casts suggest glomerular bleeding (e.g. proliferative glomerulonephritis)
- isomorphic RBCs, no casts suggest extraglomerular bleeding (e.g. bladder Ca)

#### Leukocytes

- normal range = up to 3 WBCs/HPF
- pyuria = greater than 3 WBCs/HPF
- indicates inflammation or infection
- if persistent sterile pyuria present (i.e. negative culture), consider: chronic urethritis, prostatitis, interstitial nephritis, calculi, papillary necrosis, renal TB, viral infections

#### Eosinophils

- detected using Wright's or Hansel's stain (not affected by urine pH)
- consider allergic interstitial nephritis, atheroembolic disease

#### Oval Fat Bodies

- renal tubular cells filled with lipid droplets
- seen in heavy proteinuria (e.g. nephrotic syndrome)

### 3. CASTS

- cylindrical structures formed by intratubular precipitation of Tamm-Horsfall mucoprotein; cells may be trapped within the matrix of protein

**Table 3. Interpretation of Casts**

Hyaline casts	Physiologic (concentrated urine, fever, exercise)
Red blood cell casts	Glomerular bleeding (glomerulonephritis, vasculitis)
White blood cell casts	Infection (pyelonephritis) Inflammation (interstitial nephritis)
Pigmented granular casts (heme granular casts, muddy brown)	Acute tubular necrosis Acute glomerulonephritis
Fatty casts	Heavy proteinuria (>3.5 g/d)

Positive dipstick for leukocyte esterase and nitrites is 94% specific for diagnosing a UTI.

### 3. CRYSTALS

- uric acid: consider acid urine, hyperuricosuria
- calcium phosphate: alkaline urine
- calcium oxalate: consider hyperoxaluria, ethylene glycol poisoning
- sulfur: sulfa-containing antibiotics

## Urine Electrolytes

- commonly measure:  $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Cl}^-$ , osmolality and pH
- no 'normal' values; electrolyte excretion depends on intake and current physiological state
- results must be interpreted in the context of a patient's current state, e.g.:
  1. ECF volume depletion: expect low urine  $[\text{Na}^+]$  (kidneys should be retaining  $\text{Na}^+$ )
    - ♦ urine  $[\text{Na}^+] > 40 \text{ mmol/L}$  suggests a renal problem or the action of a diuretic
    - ♦ urine  $[\text{Na}^+] < 20 \text{ mmol/L}$  suggests the patient is pre-renal
  2. daily urinary potassium excretion rate should be decreased ( $< 20 \text{ mmol/d}$ ) in hypokalemia
    - ♦ if higher than  $20 \text{ mmol/d}$ , suggests renal contribution to hypokalemia
- osmolality is useful to estimate the kidney's concentrating ability
- $\text{FE}_{\text{Na}}$  refers to the fractional excretion of  $\text{Na}^+$ 
  - $\text{FE}_{\text{Na}} = \frac{\text{Urine } [\text{Na}^+] \times \text{Plasma } [\text{Cr}]}{\text{Plasma } [\text{Na}^+] \times \text{Urine } [\text{Cr}]}$
  - $\text{FE}_{\text{Na}} < 1\%$  suggests the pathology is pre-renal

### Examples of Common Urine Electrolyte Abnormalities

- high urine  $[\text{Na}^+] (> 40 \text{ mmol/L})$  in the setting of acute renal failure: indicates renal disease
- high urine  $[\text{Na}^+] (> 40 \text{ mmol/L})$  in the setting of hyponatremia: generally from causes such as diuretics, tubular disease (e.g. Bartter's syndrome), SIADH
- additionally, urine pH is useful to grossly assess renal acidification
- "low" pH ( $< 5.5$ ) in the presence of low serum pH is an appropriate renal response
- a high pH in this setting might indicate a renal acidification defect (e.g. RTA)

#### Fractional Excretion of Sodium

$$\text{FE}_{\text{Na}} = \frac{[\text{Na}^+]_{\text{Urine}} \times [\text{Cr}]_{\text{Plasma}}}{[\text{Na}^+]_{\text{Plasma}} \times [\text{Cr}]_{\text{Urine}}} \times 100$$

Many formulas used in nephrology are derived from the division of two fractions, each of which compare a urine and plasma concentration (e.g.  $\text{U}_1/\text{P}_1 \div \text{U}_2/\text{P}_2$ ). In the case of  $\text{FE}_{\text{Na}}$ , it is  $\text{U}_{\text{Na}}/\text{P}_{\text{Na}} \div \text{U}_{\text{Cr}}/\text{P}_{\text{Cr}}$ , which then gives the above equation.

## Electrolyte Disorders

### Sodium Homeostasis

- hyponatremia and hypernatremia are disorders of water balance
  - hyponatremia usually suggests too much water in the extracellular fluid relative to  $\text{Na}^+$
  - hypernatremia usually suggests too little water in the extracellular fluid relative to  $\text{Na}^+$
- solutes (such as  $\text{Na}^+$ ,  $\text{K}^+$ , glucose) that cannot freely traverse the plasma membrane contribute to effective osmolality and induce transcellular shifts of water
  - water moves out of cells in response to increased ECF osmolality
  - water moves into cells in response to decreased ECF osmolality
- ECF volume is determined by  $\text{Na}^+$  content rather than concentration
  - $\text{Na}^+$  deficiency leads to ECF volume contraction
  - $\text{Na}^+$  excess leads to ECF volume expansion
- clinical signs and symptoms of hyponatremia and hypernatremia are secondary to cells (especially in the brain) shrinking (hypernatremia) or swelling (hyponatremia)

#### Common Electrolytes

- Sodium ( $\text{Na}^+$ ) 135-145 mmol/L
- Potassium ( $\text{K}^+$ ) 3.5-5 mmol/L
- Chloride ( $\text{Cl}^-$ ) 95-105 mmol/L
- Bicarbonate ( $\text{HCO}_3^-$ ) 18-23 mmol/L

**Table 4. Clinical Assessment of ECF Volume (Total Body  $\text{Na}^+$ )**

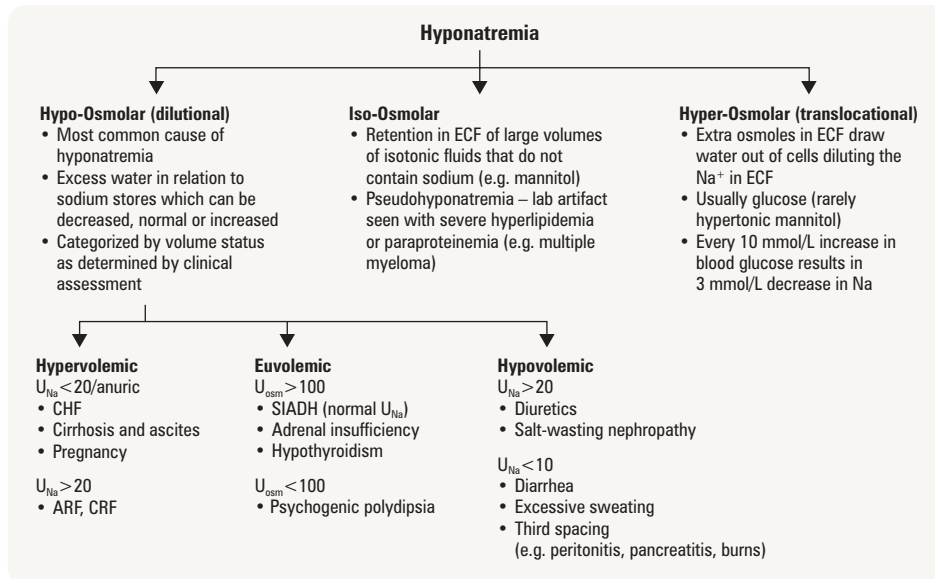

Fluid Compartment	Hypovolemic	Hypervolemic
<b>Intravascular</b>		
JVP	Decreased	Increased
Blood pressure	Orthostatic drop	Normal to increased
Auscultation of heart	Tachycardia	S3
Auscultation of lungs	Normal	Inspiratory crackles
<b>Interstitial</b>		
Skin turgor	Decreased	Normal/increased
Edema (dependent)	Absent	Present
<b>Other</b>		
Urine output	Decreased*	Variable
Body weight	Decreased	Increased
Hct, serum protein	Increased	Decreased

\*If there is a renal abnormality (e.g. osmotic diuresis), the urine output may be increased despite the presence of hypovolemia

## Hyponatremia

- hyponatremia: serum  $[\text{Na}^+]$   $<136$  mmol/L
- can be associated with hypo-osmolality (most common), iso-osmolality, or hyperosmolality

If the urine osmolality is unknown, assume the urine is hypo-osmolar/dilute.

Figure 4. Approach to hyponatremia

### Signs and Symptoms

- depend on degree of hyponatremia and more importantly, velocity of progression from onset
- acute hyponatremia ( $<24$ -48 h) more likely to be symptomatic
- chronic hyponatremia ( $>24$ -48 h) less likely to be symptomatic due to adaptation
  - adaptation: normalization of brain volume through loss of cellular electrolytes (within hours) and organic osmolytes (within days)
  - adaptation is responsible for the risks associated with overly rapid correction
- neurologic symptoms predominate (secondary to cerebral edema): headache, nausea, malaise, lethargy, weakness, muscle cramps, anorexia, somnolence, disorientation, personality changes, depressed reflexes, decreased level of consciousness (LOC)

### Complications

- seizures, coma, respiratory arrest, permanent brain damage, brainstem herniation, death
- risk of brain cell shrinkage with rapid correction of hyponatremia
  - can develop osmotic demyelination of pontine and extrapontine neurons; may be irreversible (e.g. central pontine myelinolysis: cranial nerve palsies, quadriplegia, decreased LOC)

### Risk Factors for Osmotic Demyelination

- rise in serum  $[\text{Na}^+]$  with correction  $>8$  mmol/L/d if chronic hyponatremia
- associated hypokalemia and/or malnutrition (i.e. low muscle mass)
- if patient with hyponatremia and hypovolemia is given large volume of isotonic fluid (ADH is stimulated by hypovolemia; when hypovolemia is corrected, the ADH level falls suddenly causing sudden brisk water diuresis, and therefore rapid rise in serum  $\text{Na}^+$  level)
- patient with psychogenic polydipsia, deprived of water

### Investigations

- ECF volume status assessment
- serum electrolytes, glucose, Cr
- serum osmolality, urine osmolality
- urine  $\text{Na}^+$  (urine  $\text{Na}^+ <10$ -20 mmol/L suggests volume depletion as the cause of hyponatremia)
- assess for causes of SIADH (see Table 6)
- TSH, free T4, and cortisol levels
- consider CXR and possibly CT chest if suspect pulmonary cause of SIADH (e.g. small cell lung Ca)
- consider CT head if suspect CNS cause

**Central Pontine Myelinolysis**

- CN palsies
- Quadriplegia
- Decreased LOC

### Treatment of Hyponatremia

- general measures for all patients
  - water restriction to <1 L/d (unless hypovolemic give normal saline)
  - treat underlying cause
  - monitor serum  $\text{Na}^+$  frequently to ensure correction is not occurring too rapidly
  - monitor urine output frequently: high output of dilute urine is the first sign of dangerously rapid correction of hyponatremia

**Table 5. Treatment of Acute and Chronic Hypoosmolar Hyponatremia**

Onset	Symptomatic	Treatment
Acute (<48 h)	Yes	Rapid correction (Hypertonic 3% saline)
	No	Rapid correction only if marked drop in $\text{Na}^+$
Chronic (>48 h)	Yes	Slow correction (Hypertonic 3% saline)
	No	Water restriction, NS, NaCl tablet

#### A. Definitely Acute (known to have developed over <24-48 h)

- commonly occurs in hospital (dilute IV fluid, post-operative increased ADH)
- less risk from rapid correction since adaptation has not fully occurred
- if symptomatic
  - correct rapidly with 3% NaCl 1-2 cc/kg/h up to serum  $[\text{Na}^+] = 125-130 \text{ mmol/L}$
  - may need furosemide to address volume overload
- if asymptomatic, treatment depends on severity
  - if marked fall in plasma  $[\text{Na}^+]$ , treat as symptomatic

#### B. Chronic or Unknown

1. if severe symptoms (seizures or decreased LOC)
  - must partially correct acutely
  - aim for increase of  $\text{Na}^+$  by 1-2 mmol/L/h for 4-6 h
  - limit total rise to 8 mmol/L in 24 h
  - IV 3% NaCl at 1-2 cc/kg/h
  - may need furosemide
2. if asymptomatic
  - water restrict to <1 L/d fluid intake
  - consider IV 0.9% normal saline (NS) + furosemide (reduces urine osmolality, augments excretion of  $\text{H}_2\text{O}$ )
  - consider NaCl tablet or Oxocubes® as a source of  $\text{Na}^+$
3. refractory
  - furosemide and IV NS
  - demeclocycline 300-600 mg PO bid (antagonizes effect of ADH on collecting duct; avoid if cirrhosis or congestive heart failure as nephrotoxic in these settings)
  - extra osmoles – give oral urea (increases loss of water without  $\text{Na}^+$ ; 30-60 g/d)
  - slow rate of IV 3% NaCl (e.g. 10 cc/h = 120 mmol/d of sodium which will increase serum  $[\text{Na}^+]$  by about 3 mmol/L/d)
4. always pay attention to patient's ECF volume status – if already volume-expanded, unlikely to give NaCl; if already volume-depleted, almost never appropriate to give furosemide

#### C. Options if overly rapid correction occurs

- give water (IV D5W)
- give ADH to stop water diuresis (DDAVP 1-2 µg IV)

#### Impact of IV Solution on Plasma $\text{Na}^+$

- formula to estimate the change in serum  $\text{Na}^+$  caused by retention of 1 L of any infusate  
 $[\text{TBW} = (\text{for men}) 0.6 \times \text{wt(kg)}; (\text{for women}) 0.5 \times \text{wt(kg)}]$

$$\text{change in serum } [\text{Na}^+] = \frac{\text{infusate } [\text{Na}^+] - \text{serum } [\text{Na}^+]}{\text{TBW} + 1 \text{ L}}$$

- formula assumes there are no losses of water or electrolytes

### SYNDROME OF INAPPROPRIATE ANTIDIURETIC HORMONE SECRETION (SIADH)

1. urine that is inappropriately concentrated for the serum osmolality
2. high urine sodium (>20-40 mmol/L)
3. high  $\text{FE}_{\text{Na}}$

#### Beware of Rapid Correction of Hyponatremia

- Inadvertent rapid correction of hyponatremia can easily occur
  - e.g. patient with hyponatremia due to SIADH from nausea
  - Anti-emetic given for relief of hyponatremia-induced nausea
  - ADH quickly turned off in the absence of nausea, the kidneys rapidly excrete the excess free water, and the serum  $[\text{Na}^+]$  rises rapidly
- Patient at risk of osmotic demyelination
- High output dilute urine (>100 cc/h, <100 mOsm/L) in the setting of hyponatremia is usually the first sign of dangerously rapid correction of serum sodium

Correction of  $\text{Na}^+$  in hyponatremia should not exceed 8 mmol/L/24 h unless definitely known to be <24-48 h duration. Frequent monitoring of serum  $\text{Na}^+$  and urine output is essential.

#### Concentration of $\text{Na}^+$ in Common Infusates

- $\text{Na}^+$  in 0.45% NaCl = 77 mmol/L
- $\text{Na}^+$  in 0.9% NaCl = 154 mmol/L
- $\text{Na}^+$  in 3% NaCl = 513 mmol/L
- $\text{Na}^+$  in 5% NaCl = 855 mmol/L
- $\text{Na}^+$  in Ringer's lactate = 130 mmol/L
- $\text{Na}^+$  in D5W = 0

**Table 6. Disorders Associated with SIADH**

Tumour	Pulmonary	CNS	Drugs	Miscellaneous
Small cell Ca Bronchogenic Ca Pancreatic AdenoCa Hodgkin's disease Thymoma	Pneumonia Lung abscess TB Acute respiratory failure Positive pressure ventilation	Mass lesion Encephalitis Subarachnoid hemorrhage Stroke Head trauma Acute psychosis Acute intermittent porphyria	<b>Antidepressants</b> TCAs SSRIs <b>Antineoplastics</b> Vincristine Cyclophosphamide <b>Other</b> DDAVP Oxytocin Nicotine Carbamazepine Barbiturates Chlorpropamide ACE inhibitors	Post-op state Pain Severe nausea HIV

## Hypernatremia

- hypernatremia: serum  $[Na^+] > 145$  mmol/L
- too little water relative to total body  $Na^+$ ; always a hyperosmolar state
- usually due to net water loss, rarely due to hypertonic  $Na^+$  gain
- results from problems with water intake (access, thirst) and/or site of increased water loss (renal or extrarenal)
- less common than hyponatremia because patients are protected against hypernatremia by thirst and release of ADH

### Signs and Symptoms

- with acute hypernatremia no time for adaptation, therefore more likely to be symptomatic
- adaptive response: cells import and generate new osmotically active particles to normalize size
- due to brain cell shrinkage: altered mental status, weakness, neuromuscular irritability, focal neurologic deficits, seizures, coma, death
- $\pm$  polyuria, thirst, signs of hypovolemia

### Complications

- increased risk of vascular rupture resulting in intracranial hemorrhage
- rapid correction may lead to cerebral edema due to ongoing brain hyperosmolarity

**Table 7. Treatment Hypovolemic and Hypervolemic Hypernatremia**

Volume Status	Treatment
Hypovolemic	Give free water PO or by NG tube Give IV D5W, 0.45%NS, or 3.3% dextrose with 0.3% NaCl ("2/3 and 1/3")
Hypervolemic	Diuresis or dialysis (D5W once fluid deficit)

### Treatment of Hypovolemic Hypernatremia

- general measures for all patients
  - give free water (oral or IV)
  - treat underlying cause
  - monitor serum  $Na^+$  frequently to ensure correction is not occurring too rapidly
- if evidence of hemodynamic instability, must first correct volume depletion with NS bolus
- loss of water is often accompanied by loss of  $Na^+$  but a proportionately larger water loss
- in patients with presumed normal total body  $Na^+$  content, use formula to calculate  $H_2O$  deficit (see sidebar)
- replace free water deficit
- encourage patient to drink pure water, as oral route is preferred for fluid administration
- if unable to replace PO or NG, correct  $H_2O$  deficit with hypotonic IV solution
- use formula (see *Hyponatremia*, NP9) to estimate expected change in serum  $Na^+$  with 1L infusate
- aim to lower  $[Na^+]$  by no more than 12 mmol/L in 24 h (0.5 mmol/L/h)
- must also provide maintenance fluids and replace ongoing losses
- rule of thumb: give 2 cc/kg/h of free water to correct serum  $[Na^+]$  by about 0.5 mmol/L/h or 12 mmol/L/d

### Treatment of Hypervolemic Hypernatremia

- general measures as above
- hypervolemic hypernatremia: remove excess total body  $Na^+$  with diuresis or dialysis (if renal failure present), then replace water deficit using D5W

#### **$H_2O$ Deficit and TBW Equations**

- TBW =  $0.6 \times \text{wt (kg) men}$ ;  
TBW =  $0.5 \times \text{wt (kg) women}$
- $H_2O$  deficit =  $TBW \times ([Na^+]_{\text{plasma}} - 140) / 140$

Correction of serum  $[Na^+]$  in hypernatremia should not exceed 12 mmol/L/24 h.

1 L D5W approximately equals 1 L of free water  
1 L 0.45% NS approximately equals 500 mL of free water

**DIABETES INSIPIDUS (DI)**

- collecting tubule is impermeable to water due to absence of ADH or impaired response to ADH
- central defect in release of ADH (central DI) or renal response to ADH (nephrogenic DI)

**Etiology**

- central DI: neurosurgery, granulomatous diseases, trauma, vascular events, and malignancy
- nephrogenic DI: lithium (most common), hypokalemia, hypercalcemia, and congenital

**Diagnosis**

- urine osmolality inappropriately low in patient with hypernatremia ( $U_{\text{osm}} < 300 \text{ mOsm/kg}$ )
- serum vasopressin concentration may be absent or low (central), or elevated (nephrogenic)
- dehydration test:  $\text{H}_2\text{O}$  deprivation until loss of 3% of body weight or until urine osmolality rises above plasma osmolality; if fails to concentrate urine, most likely DI
- administer DDAVP (exogenous ADH) ( $10 \mu\text{g}$  intranasally or  $2 \mu\text{g}$  SC or IV):
  - central DI: diagnosed if there is rise in urine osmolality, fall in urine volume
    - treat with DDAVP
  - nephrogenic DI: exogenous ADH fails to concentrate urine as kidneys do not respond
    - treat with water (IV D5W or PO water), thiazides may help as well (reduced ECF volume stimulates proximal tubular reabsorption of sodium and water, leading to less delivery of glomerular filtrate to ADH sensitive parts of renal tubule, and therefore lower urine volume results)

**Potassium Homeostasis**

- approximately 98% of total body  $\text{K}^+$  stores are intracellular
- normal serum  $\text{K}^+$  ranges from 3.5-5.0 mEq/L
- in response to  $\text{K}^+$  load, rapid removal from ECF is necessary to prevent life-threatening hyperkalemia
- insulin, catecholamines, and acid-base status influence  $\text{K}^+$  movement into cells
  - aldosterone has a minor effect
- potassium excretion is regulated at the distal nephron
  - $\text{K}^+$  excretion = urine flow rate  $\times$  urine  $[\text{K}^+]$

$\text{Na}^+$  = predominating ion extracellular  
 $\text{K}^+$  = predominating ion intracellular

**Factors which Increase Renal  $\text{K}^+$  Loss**

- hyperkalemia
- increased distal tubular urine flow rate and  $\text{Na}^+$  delivery (thiazides and loop diuretics)
- increased aldosterone activates epithelial sodium channel (eNaC) in cortical collecting duct, causing  $\text{Na}^+$  reabsorption and  $\text{K}^+$  excretion
- metabolic alkalosis
- hypomagnesemia
- increased non-reabsorbable anions in tubule lumen:  $\text{HCO}_3^-$ , penicillin, salicylate

**Hypokalemia**

- serum  $[\text{K}^+] < 3.5 \text{ mEq/L}$

**Signs and Symptoms**

- usually asymptomatic, particularly when mild (3.0-3.5 mmol/L)
- nausea, vomiting, fatigue, generalized weakness, myalgia, muscle cramps, and constipation
- if severe: arrhythmias, muscle necrosis, and rarely paralysis with eventual respiratory impairment
- arrhythmias occur at variable levels of  $\text{K}^+$ ; more likely if digoxin use, hypomagnesemia, or CAD
- ECG changes are more predictive of clinical picture than serum  $[\text{K}^+]$ 
  - U waves most important (low amplitude wave following a T wave)
  - flattened or inverted T waves
  - depressed ST segment
  - prolongation of Q-T interval
  - with severe hypokalemia: P-R prolongation, wide QRS, arrhythmias; increases risk of digitalis toxicity

**Figure 5. ECG changes in hypokalemia**

### Approach to Hypokalemia

1. emergency measures: obtain ECG; if potentially life threatening, begin treatment immediately
2. rule out transcellular shifts of  $K^+$  as cause of hypokalemia
3. assess contribution of dietary  $K^+$  intake
4. spot urine K:Cr (should be less than 1 in setting of hypokalemia)
  - if  $<1$  consider GI loss
  - if  $>1$  consider a renal loss
5. consider 24-h  $K^+$  excretion
6. if renal  $K^+$  loss, check BP and acid-base status
7. may also assess plasma renin and aldosterone levels, serum  $[Mg^{2+}]$

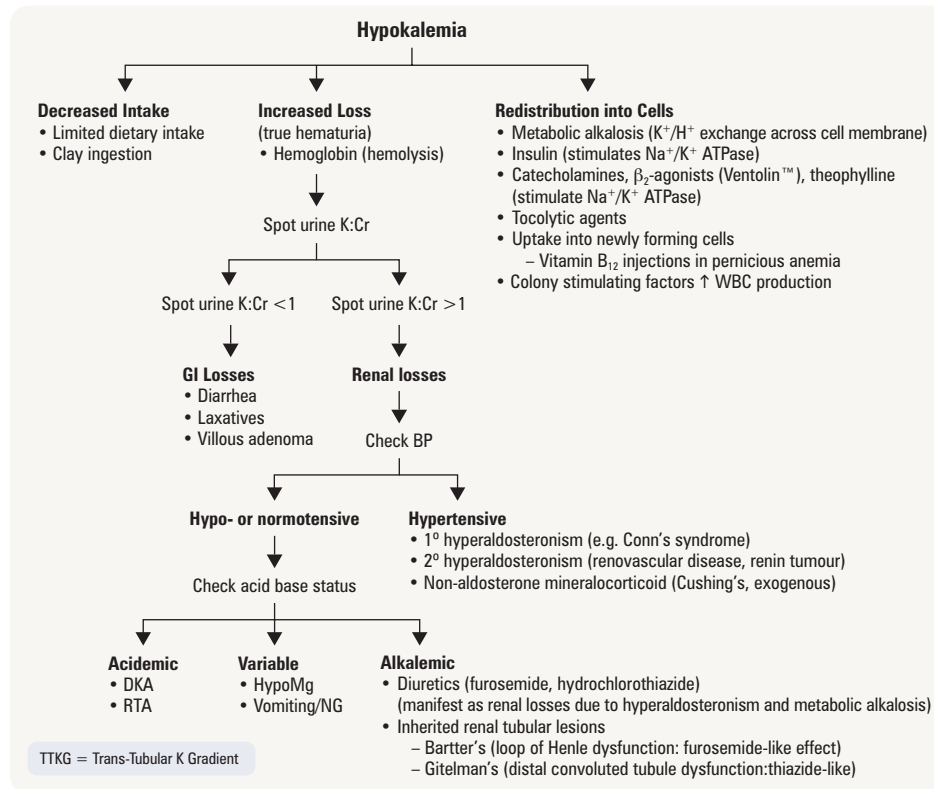

Figure 6. Approach to hypokalemia

### Treatment

- treat underlying cause
- if true  $K^+$  deficit, potassium repletion (decrease in serum  $[K^+]$  of 1 mEq is very roughly 100-200 mEq of total body loss)
  - oral sources – food, tablets (K-Dur®), KCl liquid solutions. Preferable route if the patient tolerates PO medications
  - IV – usually KCl in saline solutions, avoid dextrose solutions (may exacerbate hypokalemia via insulin release)
  - max 40 mmol/L via peripheral vein, 60 mmol/L via central vein, max infusion 20 mmol/h
- $K^+$ -sparing diuretics (triamterene, spironolactone, amiloride) can prevent renal  $K^+$  loss
- restore  $Mg^{2+}$  if necessary
- if urine output and renal function are impaired, correct with extreme caution
- risk of hyperkalemia with potassium replacement especially high in elderly, diabetics, and patients with decreased renal function
- beware of excessive potassium repletion, especially if transcellular shift caused hypokalemia

## Hyperkalemia

- serum  $[K^+] > 5.0$  mEq/L

### Signs and Symptoms

- usually asymptomatic but may develop nausea, palpitations, muscle weakness, muscle stiffness, paresthesias, areflexia, ascending paralysis, and hypoventilation
- impaired renal ammoniogenesis and metabolic acidosis

- ECG changes and cardiotoxicity (do not correlate well with serum  $[K^+]$ )
  - peaked and narrow T waves
  - decreased amplitude and eventual loss of P waves
  - prolonged PR interval
  - widening of QRS and eventual merging with T wave (sine-wave pattern)
  - AV block
  - ventricular fibrillation, asystole

Figure 7. ECG changes in hyperkalemia

Table 8. Causes of Hyperkalemia

Factitious	Increased Intake	Cellular Release	Decreased Excretion
Sample hemolysis* Sample taken from vein where IV KCl is running Prolonged use of tourniquet Leukocytosis (extreme) Thrombocytosis (extreme)	Diet KCl tabs IV KCl Salt substitute	Intravascular hemolysis Rhabdomyolysis Insulin deficiency Hyperosmolar states (e.g. hyperglycemia) Metabolic acidosis (except for keto-and lactic acidosis) Tumour lysis syndrome Drugs <ul style="list-style-type: none"> <li><math>\beta</math>-blockers</li> <li>Digitalis overdose (blocks <math>Na^+/K^+</math> ATPase)</li> <li>Succinylcholine</li> </ul>	Decreased GFR <ul style="list-style-type: none"> <li>Renal failure</li> <li>Low effective circulating volume</li> <li>NSAIDs in renal insufficiency</li> </ul> Normal GFR but hypoaldosteronism (see Table 9)

\*Most common

**Drugs that Cause Hyperkalemia**

- $\beta$ -blockers
- Digitalis
- Succinylcholine

Table 9. Causes of Hyperkalemia with Normal GFR

Decreased Aldosterone Stimulus (low renin, low aldosterone)	Decreased Aldosterone Production (normal renin, low aldosterone)	Aldosterone Resistance (decreased tubular response)
Hyporeninemic, hypoaldosteronism <ul style="list-style-type: none"> <li>Associated with DM2, NSAIDs, chronic interstitial nephritis, HIV</li> </ul>	<ul style="list-style-type: none"> <li>Adrenal insufficiency of any cause (e.g. Addison's disease, AIDS, metastatic cancer)</li> <li>ACE inhibitors</li> <li>Angiotensin II receptor blockers</li> <li>Heparin</li> <li>Congenital adrenal hyperplasia with 21-hydroxylase deficiency</li> </ul>	<ul style="list-style-type: none"> <li><math>K^+</math>-sparing diuretics               <ul style="list-style-type: none"> <li>Spironolactone</li> <li>Amiloride</li> <li>Triamterene</li> </ul> </li> <li>Renal tubular disease</li> <li>Other <math>K^+</math>-sparing drugs               <ul style="list-style-type: none"> <li>Pentamidine</li> <li>Trimethoprim</li> <li>Cyclosporine, tacrolimus</li> <li>Pseudohypoaldosteronism (rare inherited tubular disorders)</li> </ul> </li> </ul>

**Approach to Hyperkalemia**

- emergency measures: obtain ECG, if life threatening begin treatment immediately
- rule out factitious hyperkalemia; repeat blood test
- hold exogenous  $K^+$  (PO and IV), and any  $K^+$  retaining medications
- assess potential causes of transcellular shift
- estimate GFR (calculate CrCl using Cockcroft-Gault)

**Treatment**

- acute therapy is warranted if ECG changes are present, or if patient is symptomatic
- tailor therapy to severity of increase in  $[K^+]$  and ECG changes
  - $[K^+] < 6.5$  and normal ECG
    - treat underlying cause, stop  $K^+$  intake, increase the loss of  $K^+$  via urine and/or GI tract (see below)
  - $[K^+] \text{ between } 6.5 \text{ and } 7.0$ , no ECG changes: add insulin to above regimen
  - $[K^+] > 7.0$  and/or ECG changes: first priority is to protect the heart, add calcium gluconate to above

**1. Protect the Heart**

- calcium gluconate 1-2 amps (10 mL of 10% solution) IV
- antagonizes cardiac toxicity of hyperkalemia, protects cardiac conduction system, no effect on serum  $[K^+]$
- onset within minutes, lasts 30-60 min (N.B. May require repeat doses during treatment course of hyperkalemia)

In patients with diabetes and increased  $[K^+]$  and hyperglycemia, often just giving insulin to restore euglycemia is sufficient to correct the hyperkalemia.

**Treatment of Hyperkalemia****SEE BIG K DROP**

SEE – Calcium gluconate

BIG –  $\beta$ -agonist, Bicarb, Insulin, Glucose

K – Kayexalate®

DROP – Diuretics, Dialysis

## 2. Shift $K^+$ into Cells

- regular insulin (Insulin R) 10-20 units IV, with 1-2 amp D50W (give D50W before insulin)
  - onset of action 15-30 min, lasts 1-2 h
  - monitor capillary blood glucose q1h because of risk of hypoglycemia
  - can repeat every 4-6 h
  - caution giving D50W before insulin if hyperkalemia is severe as it can cause a serious arrhythmia
- $NaHCO_3$  1-3 ampules (given as 3 ampules of 7.5% or 8.4%  $NaHCO_3$  in 1L D5W)
  - onset of action 15-30 min, transient effect, drives  $K^+$  into cells in exchange for  $H^+$
  - more effective if patient has metabolic acidosis
- $\beta_2$ -agonist (Ventolin®) in nebulized form (dose = 2 cc or 10 mg inhaled) or 0.5 mg IV
  - onset of action 30-90 min, stimulates  $Na^+/K^+$  ATPase
  - caution if patient has heart disease as tachycardia may result from this high dose of  $\beta_2$ -agonist

## 3. Enhance $K^+$ Removal from Body

- via urine (preferred approach)
  - furosemide ( $\geq 40$  mg IV), may need IV NS to avoid hypovolemia
  - fludrocortisone (synthetic mineralocorticoid) if suspect aldosterone deficiency
- via gastrointestinal tract
  - cation-exchange resins: calcium resonium or sodium polystyrene sulfonate (Kayexalate®) (increasingly falling out of favor due to risk of colonic necrosis; works by binding  $Na^+$  in exchange for  $K^+$ , and controversial how much  $K^+$  is actually removed – main benefit may be the diarrhea it causes) plus lactulose PO to avoid constipation (must ensure that patient has a bowel movement after resin is administered)
  - Kayexalate® enemas with tap water (and definitely not with sorbitol as rectal sorbitol can cause colonic necrosis)
- dialysis (renal failure, life threatening hyperkalemia unresponsive to therapy)

# Acid-Base Disorders

- acid-base homeostasis influences protein function and can critically affect tissue and organ function with consequences to cardiovascular, respiratory, metabolic and CNS function
- see [Respirology](#), R5 for more information on respiratory acidosis/alkalosis
- normal concentration of  $HCO_3^-$  = 24 mEq/L (range: 22-30)
- normal  $pCO_2$  = 40 mmHg (range: 36-44)
- each acid base disorder has an appropriate compensation
  - inadequate compensation or overcompensation can indicate the presence of a second acid-base disorder
  - e.g. in metabolic acidosis, inadequate compensation means there is also respiratory acidosis; overcompensation means there is also respiratory alkalosis

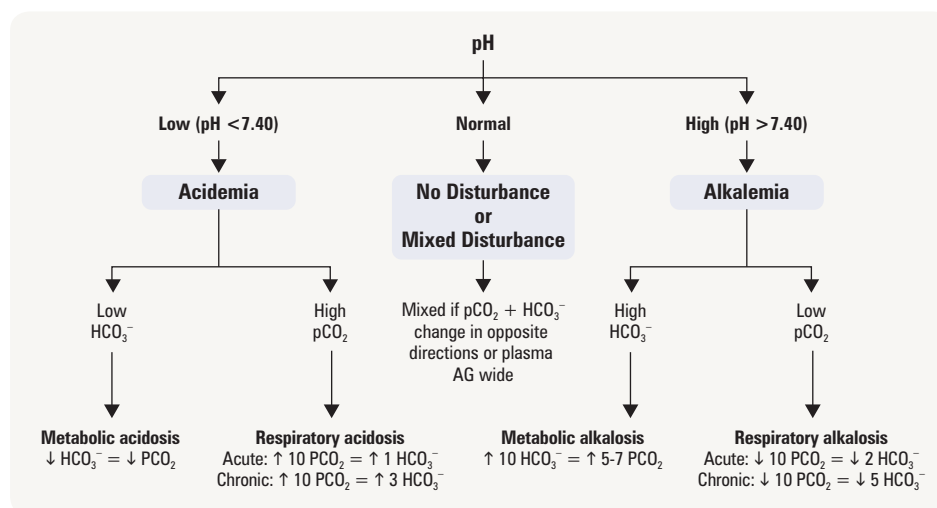

Figure 8. Approach to acid-base disorders

## Approach

### 1. Identify the primary disturbance (Figure 8)

- respiratory acidosis, metabolic acidosis, respiratory alkalosis, metabolic alkalosis

### 2. Evaluate compensation. If compensation is not appropriate, a second acid-base disorder is likely present

- compensation occurs in the same direction as the primary disturbance
- metabolic acidosis: for every 1 mmol/L decrease in  $\text{HCO}_3^-$ ,  $\text{pCO}_2$  should decrease by 1 mmHg
- metabolic alkalosis: for every 10 mmol/L increase in  $\text{HCO}_3^-$ ,  $\text{pCO}_2$  should increase by 5-7 mmHg
- respiratory acidosis: for every 10 mmHg increase in  $\text{pCO}_2$ ,  $\text{HCO}_3^-$  should increase by 1 (acute) or 3 (chronic) mmol/L
- respiratory alkalosis: for every 10 mmHg decrease in  $\text{pCO}_2$ ,  $\text{HCO}_3^-$  should decrease by 2 (acute) or 5 (chronic) mmol/L

### 3. Calculate Plasma Anion Gap (AG)

- $\text{AG} = [\text{Na}^+] - ([\text{HCO}_3^-] + [\text{Cl}^-])$
- baseline = 12, range 10-14
- AG can be altered by plasma albumin level: for each 10 g/L fall in albumin, lower baseline AG by 3 (e.g. if plasma [albumin] = 20 g/L, expect AG = 6)

### 4. If AG elevated, compare increase in AG with decrease in $\text{HCO}_3^-$

- if increase in AG < decrease in  $\text{HCO}_3^-$ , there is a coexisting non-AG metabolic acidosis
- if increase in AG > decrease  $\text{HCO}_3^-$ , there is a coexisting metabolic alkalosis

### 5. Calculate Osmolar Gap

- osmolar gap = measured osmolality – calculated osmolality
  - calculated osmolality =  $(2 \times [\text{Na}^+]) + [\text{urea}] + [\text{glucose}]$  (all units are in mmol/L)
  - normal osmolar gap <10
  - if AG >10, consider: methanol poisoning, ethylene glycol poisoning, OR another cause of acidosis plus ethanol ingestion

#### Useful Equations

- $\text{AG} = [\text{Na}^+] - [\text{Cl}^-] - [\text{HCO}_3^-]$  (normal range = 10-14)
- Osmolar Gap = measured osmolality – calculated osmolality (normal <10)
- Calculated Osmolality =  $2[\text{Na}^+] + [\text{Urea}] + [\text{Glucose}]$

## Metabolic Acidosis

### Etiology and Pathophysiology

#### 1. Increased AG Metabolic Acidosis (4 types)

- Lactic acidosis (2 types)
  - L-lactic acid
    - Type A: due to tissue hypoperfusion (any cause of shock), ischemic bowel, profound hypoxemia
    - Type B: non-hypoxic – multiple causes. The most common is failure to metabolize normally produced lactic acid in the liver due to severe liver disease. Other causes include: excessive alcohol intake, thiamine deficiency, metformin accumulation (metformin interferes with electron transport chain), certain antiretrovirals, large tumours, mitochondrial myopathies
  - D-lactic acid: rare syndrome characterized by episodes of encephalopathy and metabolic acidosis
    - occurs in the setting of carbohydrate malabsorption (e.g. short bowel syndrome), colonic bacteria that produce D-lactic acid, a carbohydrate load, diminished colonic motility and impaired D-lactate metabolism
- Ketoacidosis
  - diabetic
  - starvation
  - alcoholic (decreased carbohydrate intake and vomiting)
- Toxins
  - methanol (toxic to brain and retina, can cause blindness and brain death): metabolized to formic acid
  - ethylene glycol (toxic to brain and kidneys): metabolized to oxalic acid (envelope shaped crystals in urine) and multiple other acids
  - salicylate (e.g. ASA) overdose, causes acidosis due to salicylic acid, and also accumulation of lactic acid (salicylate at toxic levels impairs electron transport chain) and ketoacid (salicylate activates fat breakdown)
- Advanced renal failure (i.e. serum Cr increased at least 5x above baseline – a very low GFR causes anion retention, and renal disease leads to impaired bicarbonate production)

#### Causes of Increased Anion Gap Metabolic Acidosis

##### MUDPILES

Methanol  
Uremia  
Diabetic/alcoholic/starvation ketoacidosis  
Paraldehyde  
Isopropyl alcohol/Iron  
Lactic acidosis  
Ethylene glycol  
Salicylates

or

##### KARMEL

Ketoacidosis  
ASA  
Renal Failure  
Methanol  
Ethylene Glycol  
Lactic Acidosis

## 2. Normal AG Metabolic Acidosis (Hyperchloremic Acidosis)

- diarrhea ( $\text{HCO}_3^-$  loss from GI tract)
- RTA (renal tubular acidosis)
  - type I RTA (distal): inability to secrete  $\text{H}^+$  in collecting duct, leading to impaired excretion of ammonium into urine
  - type II RTA (proximal): impaired  $\text{HCO}_3^-$  reabsorption
  - type IV RTA: defective ammoniogenesis due to decreased aldosterone, hyporesponsiveness or hyperkalemia
- to help distinguish renal causes from non-renal causes, use Urine Anion Gap =  $(\text{Na}^+ + \text{K}^+) - \text{Cl}^-$
- calculation establishes the presence or absence of unmeasured positive ions (e.g.  $\text{NH}_4^+$ ) in urine
  - if  $<0$ , suggests adequate  $\text{NH}_4^+$  in urine (likely nonrenal cause: diarrhea)
  - if  $>0$ , suggests problem is lack of  $\text{NH}_4^+$  in urine (e.g. distal RTA)

## Treatment of Metabolic Acidosis

- treat underlying cause
  - insulin for DKA
  - restore tissue perfusion for Type A lactic acidosis
  - ethanol + dialysis for methanol or ethylene glycol poisoning
  - alkaline diuresis  $\pm$  dialysis if ASA overdose
- correct coexisting disorders of  $\text{K}^+$  (see *Hyperkalemia*, NP12)
- consider treatment with exogenous alkali (e.g.  $\text{NaHCO}_3$ ) if:
  - severe reduction in  $[\text{HCO}_3^-]$  e.g.  $<8$  mmol/L, especially with very low pH ( $<7$ )
  - no metabolizable anion (e.g. salicylate, formate, oxalate, sulphate, since these cannot be further metabolized)
- note: lactate and ketoacid anions can be metabolized to  $\text{HCO}_3^-$
- risks of sodium bicarbonate therapy
  - hypokalemia: causes  $\text{K}^+$  to shift into cells (correct  $\text{K}^+$  deficit first)
  - ECF volume overload:  $\text{Na}^+$  load given with  $\text{NaHCO}_3$ , can exacerbate pulmonary edema
  - overshoot alkalosis: abrupt, poorly tolerated transition from overly aggressive alkali loading, partial conversion of accumulated organic anions to  $\text{HCO}_3^-$  and persisting hyperventilation

### Causes of Non-Anion Gap Metabolic Acidosis

#### HARDUP

Hyperalimentation  
Acetazolamide  
RTA\*  
Diarrhea\*  
Ureteroenteric fistula  
Pancreaticoduodenal fistula increased

\*Most common

### 3 Clinical Scenarios that Produce a Mixed Disorder with Near Normal pH

(i.e. increased PAG metabolic acidosis + resp. alkalosis)

- Cirrhosis
- ASA overdose
- Sepsis

## Metabolic Alkalosis

### Pathophysiology

- requires initiating event and maintenance factors
- precipitating factors
  - GI (vomiting, NG tube) or renal loss of  $\text{H}^+$
  - exogenous alkali (oral or parenteral administration), milk alkali syndrome
  - diuretics (contraction alkalosis): decreased excretion of  $\text{HCO}_3^-$ , decreased ECF volume, therefore increased  $[\text{HCO}_3^-]$
  - post-hypercapnia: renal compensation for respiratory acidosis is  $\text{HCO}_3^-$  retention, rapid correction of respiratory disorder results in transient excess of  $\text{HCO}_3^-$
- maintenance factors
  - volume depletion: increased proximal reabsorption of  $\text{NaHCO}_3^-$  and increased aldosterone
  - hyperaldosteronism ( $1^\circ$  or  $2^\circ$ ): distal  $\text{Na}^+$  reabsorption in exchange for  $\text{K}^+$  and  $\text{H}^+$  excretion leads to  $\text{HCO}_3^-$  generation; aldosterone also promotes hypokalemia
  - hypokalemia: transcellular  $\text{K}^+/\text{H}^+$  exchange, stimulus for ammoniogenesis and  $\text{HCO}_3^-$  generation

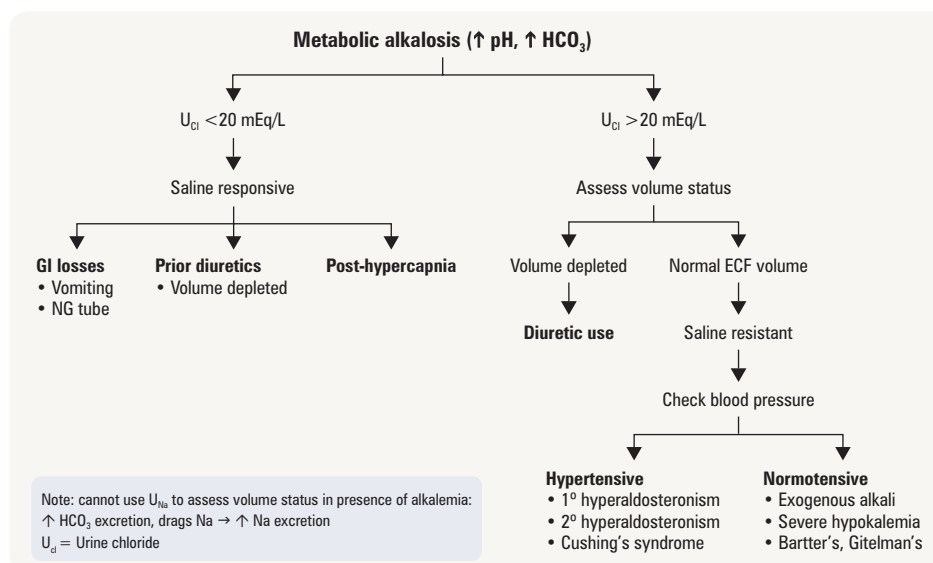

Figure 9. Approach to metabolic alkalosis

**Evaluate Compensation (identify co-existing respiratory acid-base disorders)**

- hypoventilation (an upper limit to compensation exists – breathing cannot be stopped; see Figure 9)

**Treatment**

- treat underlying cause
- correct underlying disease, replenish  $K^+$  and  $Mg^{2+}$  deficits, and possibly  $K^+$ -sparing diuretic
- saline sensitive metabolic alkalosis (most common)
  - treatment: volume repletion
  - $\pm$  carbonic anhydrase inhibitor (e.g. acetazolamide) to facilitate loss of  $HCO_3^-$  in urine
- saline resistant metabolic alkalosis
  - ECF volume normal or high
  - usually aldosterone or glucocorticoid excess
  - remove source of aldosterone or glucocorticoid  $\pm$  spironolactone

## Vascular Diseases of the Kidney

### Large Vessel Disease

**Table 10. Summary of Vascular Diseases**

Large Vessel Disease	Small Vessel Disease
Acute renal artery occlusion (infarct)	Hypertensive nephrosclerosis
Renal artery stenosis (ischemia)	Atheroembolic renal disease
Renal vein thrombosis	Thrombotic microangiopathy
	Scleroderma
	Calcineurin inhibitor nephropathy

**1. RENAL INFARCTION (ACUTE RENAL ARTERY OCCLUSION)**

- important, potentially reversible cause of renal failure

**Etiology**

- abdominal trauma, surgery, embolism, vasculitis, extra-renal compression, hypercoagulable state, aortic dissection
- kidney transplant more vulnerable

**Signs and Symptoms (depend on presence of collateral circulation)**

- fever, nausea, vomiting, flank pain
- leukocytosis, elevated AST, ALP
- marked elevated LDH (LDH  $>4$  times upper limit of normal with minimal elevations in AST/ALT strongly suggestive)
- acute onset hypertension (activation of RAAS) or sudden worsening of long-standing hypertension
- renal dysfunction, i.e. elevated Cr (if bilateral, or solitary functioning kidney)

**Investigations**

- renal arteriography (more reliable but risk of atheroembolic renal disease)
- contrast-enhanced CT or magnetic resonance angiography, duplex Doppler studies (operator dependent)

**Treatment**

- prompt localization of occlusion and restoration of blood flow
- anticoagulation, thrombolysis, percutaneous angioplasty or clot extraction, surgical thrombectomy
- medical therapy in the long-term to reduce risk (e.g. antihypertensives)

**2. ISCHEMIC RENAL DISEASE (RENAL ARTERY STENOSIS)**

- chronic renal impairment secondary to hemodynamically significant renal artery stenosis or microvascular disease
- significant cause of ESRD: 15% in patients over 50 yr old (higher prevalence if significant vascular disease)
- usually associated with large vessel disease elsewhere
- causes of renal artery stenosis:
  - atherosclerotic plaques (90%): proximal 1/3 renal artery, usually males  $>55$  yr, smokers
    - ♦ electrolytes, osmolality (gently rehydrate when needed, i.e. CHF)
  - fibromuscular dysplasia (10%): distal 2/3 renal artery or segmental branches, usually young females (typical onset  $<30$  yr) (gently rehydrate when needed, i.e. CHF)
- when there is decreased renal blood flow (RBF), GFR is dependent on angiotensin II-induced efferent arteriolar constriction which raises the filtration fraction (GFR/RBF)

- most common cause of secondary hypertension ("renovascular hypertension"), 1-2% of all hypertensive patients
  - etiology
    - ♦ decreased renal perfusion of one or both kidneys leads to increased renin release and subsequent angiotensin production
    - ♦ increased angiotensin raises blood pressure in two ways
      1. causes generalized arteriolar constriction
      2. release of aldosterone increases  $\text{Na}^+$  and water retention
  - elevated blood pressure can in turn lead to further damage of kidneys and worsening HTN

**Risk Factors**

- >50 yr old
- smoking
- other atherosclerotic disease (dyslipidemia, diabetes, diffuse atherosclerosis)

**Signs and Symptoms**

- severe/refractory HTN and/or hypertensive crises, with negative family history of HTN
- asymmetric renal size
- epigastric or flank bruits
- spontaneous hypokalemia (renin activation in under-perfused kidney)
- increasing Cr with ACEI/ARB
- flash pulmonary edema with normal LV function

**Investigations**

- must establish presence of renal artery stenosis and prove it is responsible for renal dysfunction
- duplex Doppler U/S (kidney size, blood flow): good screening test (operator dependent)
- digital subtraction angiography (risk of contrast nephropathy)
- CT or MR angiography (effective noninvasive tests to establish presence of stenosis, for MR avoid gadolinium contrast if eGFR <30 mL/min because of risk of systemic dermal fibrosis)
- ACEI renography (i.e. captopril renal scan)
- renal arteriography (gold standard)

**Treatment**

- surgical: percutaneous angioplasty  $\pm$  stent, surgical revascularization, occasionally surgical bypass
- medical: BP lowering medications (ACEI is drug of choice if unilateral renal artery disease but contraindicated if bilateral renal artery disease)
- little or no benefit if therapy is late i.e. kidney is already shrunk (however, therapy can be considered to save the opposite kidney if normal)

**3. RENAL VEIN THROMBOSIS****Etiology**

- hypercoagulable states (e.g. nephrotic syndrome, especially membranous), ECF volume depletion, extrinsic compression of renal vein, significant trauma, malignancy (e.g. RCC), sickle cell disease
- clinical presentation determined by rapidity of occlusion and formation of collateral circulation

**Signs and Symptoms**

- acute: nausea/vomiting, flank pain, hematuria, elevated plasma LDH,  $\pm$  rise in Cr, sudden rise in proteinuria
- chronic: PE (typical first presenting symptom), increasing proteinuria and/or tubule dysfunction

**Investigations**

- renal venography (gold standard), CT or MR angiography, duplex Doppler U/S

**Treatment**

- thrombolytic therapy  $\pm$  percutaneous thrombectomy for acute RVT
- anticoagulation with heparin then warfarin (1 yr or indefinitely, depending on risk factors)

**Revascularization versus Medical Therapy for Renal-Artery Stenosis**

NEJM 2009;361:1953-1962

**Study:** Multicentre, un-blinded RCT, median follow-up of 34 mo.

**Patients:** 806 patients (mean age 70) with atherosclerotic stenosis in at least one renal artery and uncertain clinical benefit of revascularization.

**Intervention:** Percutaneous revascularization (angioplasty and/or stenting) with medical therapy (i.e. statins, antiplatelet, BP control) versus medical therapy alone.

**Outcomes:** Primary outcome was change in renal function (slope of creatinine concentration over time). Secondary outcomes include BP, time to first renal event, time to first CV event, and mortality.

**Results:** No significant difference in change of renal function between intervention and medical therapy control. No significant differences in any secondary outcomes were found between revascularization and medical therapy control. 31 patients (9%) experienced a periprocedural complication, and 55 patients (20%) experienced a post-procedural complication.

**Conclusion:** Renal artery revascularization carries significant risks without any benefit to renal function or secondary outcomes compared to medical therapy.

## Small Vessel Disease

**1. HYPERTENSIVE NEPHROSCLEROSIS**

- see *Hypertension*, NP30

**2. ATHEROEMBOLIC RENAL DISEASE**

- progressive renal insufficiency due to embolic obstruction of small and medium-sized renal vessels by atheromatous emboli
- spontaneous or after renal artery manipulation (surgery, angiography, percutaneous angioplasty)

- anticoagulants and thrombolytics interfere with ulcerated plaque healing and can worsen disease
- investigations:
  - eosinophilia, eosinophiluria and hypocomplementia
  - renal biopsy: needle-shaped cholesterol clefts (due to tissue-processing artifacts) with surrounding tissue reaction in small/medium-sized vessels
- treatment:
  - no effective treatment; avoid angiographic and surgical procedures in patients with diffuse atherosclerosis, medical therapy for concomitant cardiovascular disease
- prognosis: poor overall, at least a third will develop ESRD

### 3. THROMBOTIC MICROANGIOPATHY

- etiologies include the spectrum of TTP-HUS, DIC, severe preeclampsia
- renal involvement more common in HUS than TTP
- renal involvement characterized by fibrin thrombi in glomerular capillary loops ± arterioles
- treatment:
  - depends on cause
  - supportive therapy
  - TTP-HUS: plasma exchange, corticosteroids (splenectomy and rituximab if refractory)
- avoid platelet transfusions and ASA

### 4. CALCINEURIN INHIBITOR NEPHROPATHY

- cyclosporine and tacrolimus
- causes both acute reversible and chronic, largely irreversible nephrotoxicity
- major cause of kidney failure in other solid organ transplant (e.g. heart)
- acute: due to afferent and efferent glomerular capillary constriction leading to decreased GFR (tubular vacuolization)
  - pre-renal azotemia
  - treatment: calcium channel blockers or prostaglandin analogs, reduce dose of cyclosporine or switch to another immunosuppressive drug
- chronic: result of obliterative arteriopathy causing interstitial nephritis and CRF (striped fibrosis), less frequent now due to lower doses of calcineurin inhibitors

#### Reduced Exposure to Calcineurin Inhibitors in Renal Transplantation (ELITE-Symphony Trial) *NEJM* 2007;257:2562-2575

**Study:** Multicentre, randomized controlled trial with 12 mo follow-up.

**Patients:** 1645 patients scheduled to receive a single organ kidney transplant.

**Intervention:** Mycophenolate mofetil, corticosteroids and either: 1) standard dose cyclosporine; 2) low dose cyclosporine with daclizumab induction; 3) low dose tacrolimus with daclizumab induction; 4) low dose sirolimus with daclizumab induction.

**Primary Outcome:** Estimated Cockcroft-Gault GFR 12 mo after transplantation.

**Results:** the Tacrolimus arm showed significantly higher eGFR at 12 mo compared to all other arms (65.4 mL/min vs. 57.1, 59.4, 56.7 for arms 1, 2, 4 respectively,  $p < 0.001$ ). The Tacrolimus arm also showed decreased rates of acute rejection at 6 mo and 12 mo vs. all arms ( $p < 0.001$ ); improved allograft survival against standard dose cyclosporine and sirolimus; and decreased treatment failure against all other arms. There was no difference in overall patient survival between groups. Sirolimus has the highest incidence of lymphoceles, delayed wound healing, and serious adverse events; tacrolimus has significantly higher rates of new-onset diabetes; and cyclosporine regimes had the lowest incidence of diarrhea but highest opportunistic infection rates.

**Conclusion:** Immunosuppression regimens using low dose tacrolimus and daclizumab induction decrease nephrotoxicity while maintaining therapeutic immunosuppression in renal transplant patients.

## Glomerular Disease

### Histological Terms of Glomerular Changes

#### Extent of Changes

- terms used to describe histologically the number of glomeruli affected in a given condition:
  - diffuse: majority of glomeruli abnormal (>50%)
  - focal: some glomeruli affected
- terms used to describe histologically the extent to which individual glomeruli are affected in a given condition:
  - global: entire glomerulus abnormal
  - segmental: only part of the glomerulus abnormal

#### Types of Changes

- proliferation: hyperplasia of one of the glomerular cell types (mesangial, endothelial, parietal epithelial), with or without inflammatory cell infiltration
- membranous changes: capillary wall thickening due to immune deposits or alterations in basement membrane
- crescent formation: parietal epithelial cell proliferation and mononuclear cell infiltration form crescent-shape in Bowman's space

### Clinical Presentation of Glomerular Disease

#### Important Points to Remember

- glomerular disease has diverse clinical presentations including hematuria, proteinuria, hypertension, edema and decreased GFR
  - each glomerulopathy presents as one of four major glomerular syndromes (these are NOT diagnoses):
    - ♦ acute nephritis
    - ♦ rapidly progressive glomerulonephritis
    - ♦ nephrotic
    - ♦ asymptomatic urinary abnormalities

- glomerulopathies can be caused by a primary disease OR can occur secondary to a systemic disease
- some glomerulopathy can present as more than one syndrome at different times

### The Nephritic-Nephrotic Spectrum

- glomerular pathology can present with a clinical picture anywhere on a spectrum with pure nephritic and pure nephrotic syndromes at the extremes (see Figure 10)

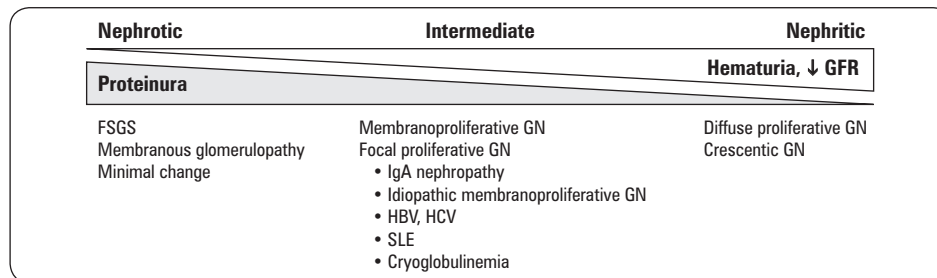

Figure 10. Spectrum of glomerular pathology

### PROTEINURIA

- hallmark of nephrotic syndromes
- 24-h urine protein: gold standard to assess degree of proteinuria
- urine albumin-to-creatinine ratio (ACR): used to screen for diabetic nephropathy
  - microalbuminuria
    - defined as ACR  $\geq 2.8$  mg/mmol (female) or  $\geq 2.0$  mg/mmol (male)
    - marker of vascular endothelial function
    - an important prognostic marker for kidney disease in diabetes and hypertension (see *Diabetes*, NP28)
  - an elevated ACR  $\geq 2.0$  or 2.8 mg/mmol is the earliest sign of diabetic nephropathy
- composition of normal total urine protein
  - upper limit of normal daily excretion of total protein is 150 mg/d
  - upper limit of normal daily excretion of albumin is 30 mg/d
  - the other normally excreted proteins are either filtered low molecular weight proteins (such as immunoglobulin, light chains or  $\beta$ -2 microglobulin) or proteins secreted by the tubular epithelial cells (e.g. Tamm-Horsfall mucoprotein)

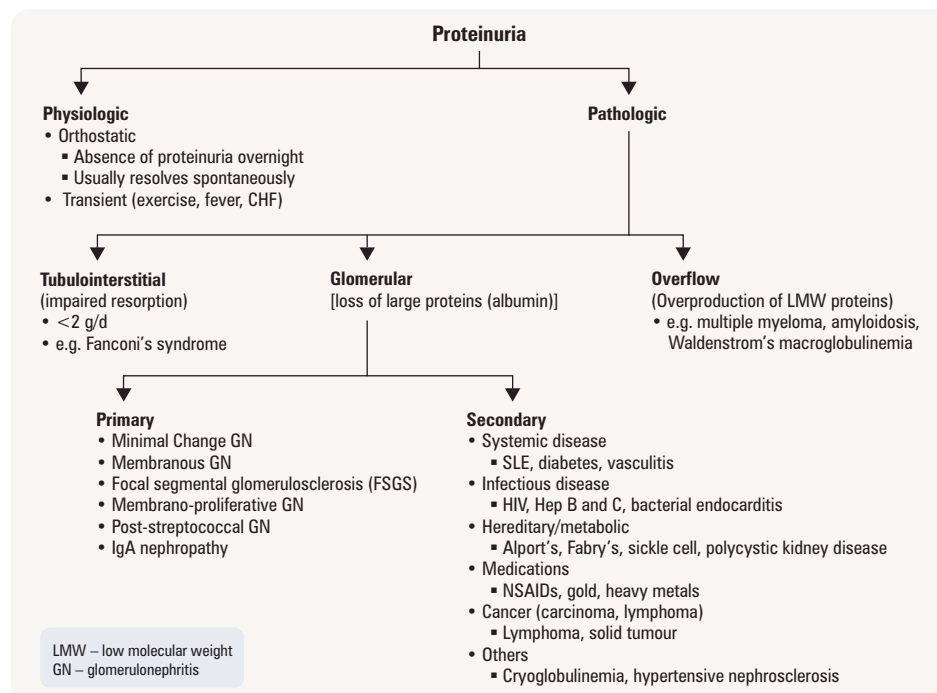

Figure 11. Classification of proteinuria

### PATHOLOGIC PROTEINURIA

#### Tubulointerstitial

- Normally low molecular weight (LMW) proteins (<60 kD) pass through glomerular filtration barrier and are reabsorbed in proximal tubule
- Proximal tubule dysfunction causes impaired reabsorption and increased excretion of LMW proteins
- Albumin (>60 kD) is NOT affected. Thus, edema is partly secondary to salt and water retention

#### Glomerular

- Normally, the filtration barrier is selectively permeable to SIZE (<60 kD) and CHARGE (repels negative particles). Thus, albumin is filtered to a very limited extent through a normal glomerulus
- Damage to any component of the glomerular filtration barrier results in loss of albumin and other high MW proteins. Thus, edema is secondary to hypoalbuminemia (low oncotic pressure), but also due to enhanced renal tubular reabsorption of filtered sodium and water (possibly due to filtered proteins stimulating the action of cortical collecting duct epithelial sodium channel)

#### Overflow

- Increased production of LMW proteins which exceeds the reabsorptive capacity of the proximal tubule
- Plasma cell dyscrasias: produce light chain Ig (multiple myeloma, Waldenstrom's macroglobulinemia, monoclonal gammopathy of undetermined significance)

**Table 11. Daily Excretion of Protein**

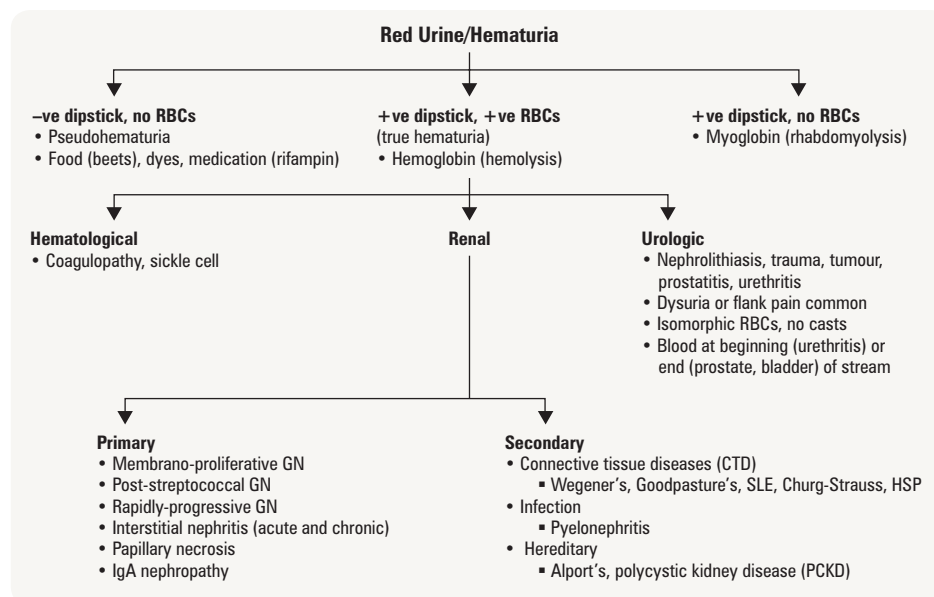

Daily Excretion	Meaning
<150 mg total protein (and <30 mg albumin)	Normal
30-300 mg albumin	Microalbuminuria
>3500 mg total protein /1.73m <sup>2</sup> BSA	Nephrotic range proteinuria
Variable amount of proteinuria	Can be seen with glomerular disease; i.e. mild glomerular disease can lead to a mild degree of proteinuria, proliferative lesions may also be associated with some degree of proteinuria
Up to 2000 mg per d	Possible tubular disease because of failure to reabsorb filtered proteins

**Investigations**

- urine R&M, C&S, urea, Cr
- further workup (if degree of proteinuria >0.5 g/d, casts and/or hematuria)
  - CBC, glucose, electrolytes, 24-h urine protein and Cr
  - urine and serum immunoelectrophoresis, abdominal/pelvic ultrasound
  - serology: ANA, RF, p-ANCA (MPO), c-ANCA, (PR3) Hep B, Hep C, HIV, Anti-steptolysin-O (ASOT)
- indications for nephrology referral
  - generally, if there is “heavy” proteinuria, should refer to nephrologist
  - heavy proteinuria is ACR >30 mg/mmol
- definitely if there is nephrotic syndrome: marked proteinuria >3.5 g/1.73m<sup>2</sup>/d with hypoalbuminemia (<35 g/L)

**HEMATURIA**

- hallmark of nephritic syndromes
- presence of blood or RBCs in urine
  - gross hematuria: pink, red, or tea-coloured urine
    - ♦ in gross hematuria, the urine should be centrifuged:
      - if the sediment is red, true hematuria.
      - if the supernatant is red, test for heme with a dipstick
        - if supernatant +ve for heme: myoglobinuria or hemoglobinuria
        - if –ve for heme: pseudohematuria. Consider medications (e.g. rifampin), food dyes (e.g. beets) or metabolites (e.g. porphyria)
- microscopic hematuria: normal coloured urine, >2-3 RBCs/HPF on microscopy

**Figure 12. Approach to red urine****Investigations for Hematuria**

- Hx and Px: family history of nephrolithiasis, hearing loss (Alport's), cerebral aneurysm (PCKD), diet, recent URTI, irritative and obstructive urinary symptoms (UTI)
- urine R&M, C&S, urea, Cr
- renal ultrasound
- 24-h urine stone workup if there is a history of stone formation or if there is a stone noted on imaging: calcium, oxalate, citrate, magnesium, uric acid, cysteine

- further workup (if casts and/or proteinuria): CBC, electrolytes, 24-h urine protein and Cr, serology (ANA, RF, C3, C4, p-ANCA, c-ANCA, ASOT)
- consider urology consult and possible cystoscopy if not clearly a nephrologic source for hematuria or if >50 yr of age

## Glomerular Syndromes

### 1. Acute NEPHRITIC SYNDROME

- a subset of nephritic syndrome in which the clinical course proceeds over days

#### Etiology

- etiology can be divided into low and normal complement levels (Figure 13)
- frequently immune-mediated, with Ig and C3 deposits found in GBM
- outcome dependent on etiology

#### Clinical/Lab Features

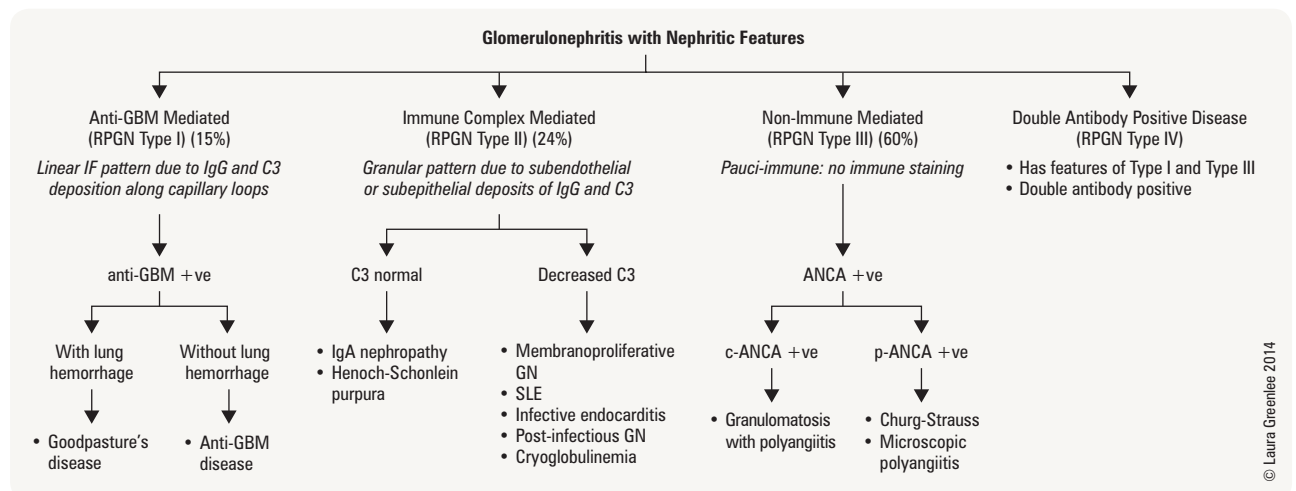

- proteinuria (but <3.5 g/1.73 m<sup>2</sup>/d), abrupt onset hematuria (microscopic or macroscopic, azotemia (increased Cr and urea), RBC casts and/or dysmorphic RBCs in urine, oliguria, HTN (due to salt and water retention), peripheral edema/puffy eyes, smoky urine (see sidebar)

Hypertension

© Laura Greenlee 2014

Figure 13. Approach to nephritic syndrome

### 2. RAPIDLY PROGRESSIVE GLOMERULONEPHRITIS (Rpgn)/ CRESCENTIC GLOMERULONEPHRITIS

- a subset of nephritic syndrome in which the clinical course proceeds over weeks to months
- clinical diagnosis, not histopathological
- any cause of glomerulonephritis can present as RPGN (except minimal change disease)
- additional etiologies seen only as RPGN: Goodpasture's syndrome and granulomatosis with polyangiitis (previously called Wegener's granulomatosis)

#### Clinical/Lab Features

- fibrous crescents typically present on renal histopathology
- RBC casts and/or dysmorphic RBCs in urine
- classified by immunofluorescence staining (see Figure 13)
- Type I: Anti-GBM mediated (15% of cases)
- Type II: Immune Complex Mediated (24% of cases)
- Type III: Non-Immune Mediated (60% of cases)
- Type IV: Double Antibody Positive (see Figure 13)
- treatment: underlying cause for postinfectious; corticosteroids + cyclophosphamide or other cytotoxic agent + plasmaphoresis in select cases
- prognosis: 50% recovery with early treatment, depends on underlying cause

### 3. NEPHROTIC SYNDROME

#### Clinical/Lab Features

- heavy proteinuria (>3.5 g/1.73m<sup>2</sup>/d)
- hypoalbuminemia
- edema

- hyperlipidemia (elevated LDL cholesterol), lipiduria (fatty casts and oval fat bodies on microscopy)
- hypercoagulable state (due to antithrombin III, Protein C and Protein S urinary losses)
- patient may report frothy urine
- glomerular pathology on renal biopsy:
  - minimal change disease (or minimal lesion disease or nil disease) – i.e. glomeruli appear normal on light microscopy
  - membranous glomerulopathy
  - focal segmental glomerulosclerosis (FSGS)
  - membranoproliferative glomerulonephritis
  - nodular glomerulosclerosis
- each can be idiopathic or secondary to a systemic disease or drug (sirolimus can cause proteinuria without obvious glomerular pathology)

#### Presentation of Nephrotic Syndrome

##### HELP

Hypoalbuminemia  
Edema  
Lipid abnormalities  
Proteinuria

**Table 12. Nephrotic Syndrome**

	Minimal Change	Membranous Glomerulopathy	Focal Segmental Glomerulosclerosis	Membranoproliferative Glomerulonephritis	Nodular Glomerulosclerosis
<b>Secondary Causes</b>	Hodgkin's lymphoma	HBV, SLE, solid tumours (lung, breast, GI)	Reflux nephropathy, HIV, HBV, obesity	HCV, malaria, SLE, leukemia, lymphoma, infected shunt	Diabetes mellitus, amyloidosis
<b>Drug Causes</b>	NSAIDs	Gold, penicillamine	Heroin		
<b>Therapy</b>	Steroids	Reduce BP, ACEI, steroids	Steroids, ACEI/ARB for proteinuria	Aspirin <sup>®</sup> , ACEI, dipyridamole (Persantine <sup>®</sup> ) – controversial	Treat underlying cause

## 4. ASYMPTOMATIC URINARY ABNORMALITIES

### Clinical/Lab Features

- proteinuria (usually <2 g/d) and/or microscopic or macroscopic hematuria
  - isolated proteinuria
    - ♦ can be postural
    - ♦ occasionally can signal beginning of more serious GN (e.g. FSGS, IgA nephropathy, amyloid, diabetic nephropathy)
  - hematuria with or without proteinuria
    - ♦ IgA nephropathy (Berger's disease): most common type of primary glomerular disease worldwide, usually presents after viral URTI
    - ♦ hereditary nephritis (Alport's disease): X-linked nephritis often associated with sensorineural hearing loss; proteinuria <2 g/d
    - ♦ thin basement membrane disease: usually autosomal dominant, without proteinuria; benign
    - ♦ benign recurrent hematuria: hematuria associated with febrile illness, exercise or immunization; a diagnosis of exclusion after other possibilities are ruled out

IgA nephropathy is the most common type of primary glomerular disease worldwide.

## Investigations for Glomerular Disease

- blood work
  - first presentation: electrolytes, Cr, urea, albumin, fasting lipids
  - determining etiology: CBC, ESR, serum immunoelectrophoresis, anti-GBM, C3, C4, ANA, p-ANCA, c-ANCA, cryoglobulins, HBV and HCV serology, ASOT (anti-streptolysin titres), VDRL, HIV
- urinalysis: RBCs, WBCs, casts, protein
- 24-h urine for protein and CrCl
- radiology
  - CXR (infiltrates, CHF, pleural effusion)
  - renal ultrasound
- renal biopsy (percutaneous or open) if heavy proteinuria or renal insufficiency, and cause not obviously diabetic nephropathy
- urine immunoelectrophoresis
  - for Bence-Jones protein if proteinuria present

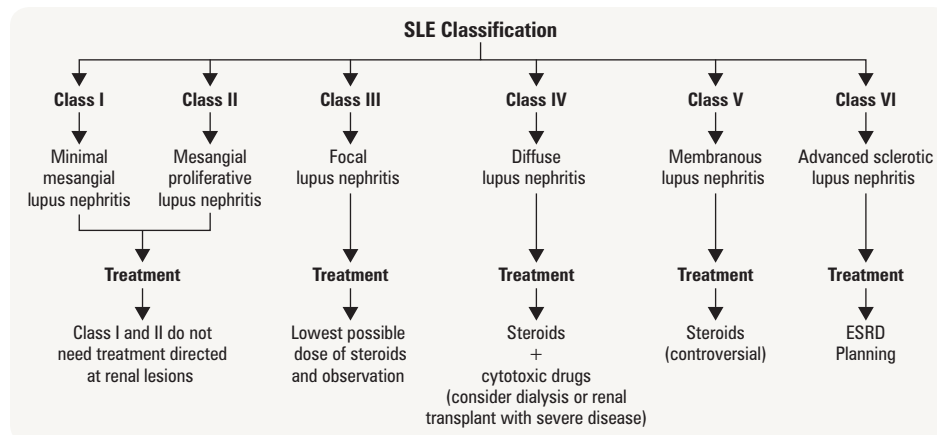

## Secondary Causes of Glomerular Disease

### Amyloidosis

- nodular deposits of amyloid in mesangium, usually related to amyloid light chain (AL)
- presents as nephrotic range proteinuria with progressive renal insufficiency
- can be primary or secondary
- secondary causes: multiple myeloma, TB, rheumatoid arthritis, malignancy

## Systemic Lupus Erythematosus (SLE)

- lupus nephritis can present as any of the glomerular syndromes
- nephrotic syndrome with an active sediment is most common presentation
- glomerulonephritis caused by immune complex deposition in capillary loops and mesangium with resulting renal injury
- serum complement levels are usually low during periods of active renal disease
- children and males with SLE are more likely to develop nephritis

**Figure 14. International Society of Nephrology/Renal Pathology Society classification of lupus nephritis 2003**

## Henoch-Schönlein Purpura (HSP)

- seen more commonly in children
- purpura on buttocks and legs, abdominal pain, arthralgia and fever
- glomeruli show varying degrees of mesangial hypercellularity
- IgA and C3 staining of mesangium
- usually benign, self-limiting course, 10% progress to CKD

## Goodpasture's Disease

- antibodies against type IV collagen present in lungs and GBM
- more common in 3rd and 6th decades of life, men slightly more affected than females
- present with RPGN type I and hemoptysis/dyspnea
- pulmonary hemorrhage more common in smokers and males
- treat with plasma exchange, cyclophosphamide, prednisone

## ANCA Associated Vasculitis [i.e. Granulomatosis with Polyangiitis and Microscopic Polyangiitis (formerly Wegener's Granulomatosis)]

- pr3-ANCA (c-ANCA) most commonly associated with the clinical picture of granulomatosis with polyangiitis (previously called Wegener's granulomatosis)
- mpo-ANCA (p-ANCA) most commonly associated with the clinical picture of microscopic polyangiitis
- renal involvement very common
- focal segmental necrotizing RPGN with no immune staining
- may be indolent or fulminant in progression
- vasculitis and granulomas rarely seen on renal biopsy
- treating typically involves cyclophosphamide and prednisone

## Cryoglobulinemia

- cryoglobulins: monoclonal IgM and polyclonal IgG
- presents as purpura, fever, Raynaud's phenomenon and arthralgias
- at least 50% of patients have hepatitis C
- renal disease seen in 40% of patients (isolated proteinuria/hematuria progressing to nephritic syndrome)
- most patients have decreased serum complement (C4 initially)
- treat hepatitis C, plasmapheresis
- overall prognosis: 75% renal recovery

## Shunt Nephritis

- immune-complex mediated nephritis associated with chronically infected ventriculoatrial shunts inserted for treatment of hydrocephalus
- presents as acute nephritic syndrome with decreased serum complement
- nephrotic range proteinuria in 25% of patients

### EULAR Recommendations for the Management of Systemic Lupus Erythematosus (SLE)

*Ann Rheum Dis* 2008;67:195-205

#### Lupus Nephritis Recommendations

**Monitoring:** Renal biopsy, urine sediment analysis, proteinuria, and kidney function may have independent predictive ability for clinical outcome in therapy of lupus nephritis but need to be interpreted in conjunction. Changes in immunological tests (anti-dsDNA, serum C3) have only limited ability to predict the response to treatment and may be used only as supplemental information.

**Treatment:** In patients with proliferative lupus nephritis, glucocorticoids in combination with immunosuppressive agents are effective against progression to end-stage renal disease. Long-term efficacy has been demonstrated only for cyclophosphamide-based regimens, which are however associated with considerable adverse effects. In short- and medium-term trials, mycophenolate mofetil has demonstrated at least similar efficacy compared with pulse cyclophosphamide and a more favourable toxicity profile: failure to respond by 6 mo should evoke discussions for intensification of therapy. Flares following remission are not uncommon and require diligent follow-up.

**End-stage renal disease:** Dialysis and transplantation in SLE have long-term patient and graft-survival rates comparable with those observed in non-diabetic non-SLE patients, with transplantation being the method of choice.

**HIV-Associated Renal Disease**

1. direct nephrotoxic effect of HIV infection, antiretroviral drugs (e.g. tenofovir, indinavir) and other drugs used to treat HIV-associated infections
2. HIV-associated nephropathy (HIVAN)
  - histology: focal and segmental glomerular collapse with mesangial sclerosis, “collapsing FSGS”
  - tubular cystic dilation and tubulo-reticular inclusions
  - clinical features: predominant in black men, heavy proteinuria, progressive renal insufficiency
  - prognosis: kidney failure within 1 yr without treatment
  - therapy: short-term, high dose steroids, ACEI, HAART

**Infective Endocarditis**

- manifests as mild form of acute nephritic syndrome with decreased serum complement
- *S. aureus* is most common infecting agent
- treatment with appropriate antibiotics usually resolves GN

**Hepatitis B**

- can result in membranous nephropathy, polyarteritis nodosa, membranoproliferative GN

**Hepatitis C**

- can result in membranoproliferative GN, cryoglobulinemia and membranous nephropathy

**Syphilis**

- can result in membranous GN

## Tubulointerstitial Disease

### Tubulointerstitial Nephritis (TIN)

**Definition**

- cellular infiltrates affecting primarily the renal interstitium and tubular cells
- functional tubule defects are disproportionately greater than the decrease in GFR
- classified as acute or chronic

**Signs and Symptoms**

- manifestation of disease depends on site of tubule affected
  1. proximal tubule (e.g. multiple myeloma, heavy metals)
    - ♦ Fanconi syndrome: decreased reabsorption in proximal tubule causing glycosuria, aminoaciduria, phosphaturia, hypouricemia
    - ♦ proximal RTA (decreased bicarbonate absorption): Type II RTA
  2. distal tubule (e.g. amyloidosis, obstruction)
    - ♦ distal RTA (Type I RTA), usually hypokalemic
    - ♦  $\text{Na}^+$ -wasting nephropathy
    - ♦  $\pm$  hyperkalemia leading to type IV RTA (where reduced renal bicarbonate production is caused by hyperkalemia)
  3. collecting duct (e.g. sickle cell anemia, analgesics, PCKD)
    - ♦ urinary concentrating defect leading to mild nephrogenic DI
    - ♦ polyuria

**1. ACUTE TUBULOINTERSTITIAL NEPHRITIS (TIN)****Definition**

- rapid (days to weeks) decline in renal function
- 10-20% of all acute kidney injury

**Etiology**

- hypersensitivity
  1. antibiotics:  $\beta$ -lactams, sulfonamides, rifampin, quinolones, cephalosporins
  2. other: NSAIDs, allopurinol, furosemide, thiazides, triamterene, PPIs, acyclovir, phenytoin, cimetidine
- infections
  - bacterial pyelonephritis, *Streptococcus*, brucellosis, *Legionella*, CMV, EBV, toxoplasmosis, leptospirosis
- immune
  - SLE, acute allograft rejection, Sjögren's syndrome, sarcoidosis, mixed essential cryoglobulinemia
- idiopathic

**Pathophysiology**

- acute inflammatory cell infiltrates into renal interstitium

**Signs and Symptoms**

- AKI
- if hypersensitivity reaction: may see fever, skin rash, arthralgia, serum sickness-like syndrome (particularly rifampin)
- if pyelonephritis: flank pain and costo-vertebral angle (CVA) tenderness
- other signs and symptoms based on underlying etiology
- hypertension and edema are uncommon

**Investigations**

- mild, non-nephrotic range proteinuria and microscopic hematuria
- urine
  - sterile pyuria, WBC casts, mild proteinuria, hematuria
  - eosinophils if allergic interstitial nephritis
- blood
  - increased Cr and urea
  - eosinophilia if drug reaction
  - normal AG metabolic acidosis (RTA)
  - hypophosphatemia, hyperkalemia, hyponatremia
- gallium scan often shows intense signal due to inflammatory infiltrate
- renal biopsy definitive

**Treatment**

- treat underlying cause (e.g. stop offending medications, antibiotics if pyelonephritis)
- corticosteroids (may be indicated in allergic or immune disease)

**Prognosis**

- recovery within 2 wk if underlying insult can be eliminated
- the longer the patient is in renal failure, the less likely full renal recovery becomes

**2. CHRONIC TUBULOINTERSTITIAL NEPHRITIS****Definition**

- characterized by slowly progressive renal failure, moderate proteinuria and signs of abnormal tubule function

**Etiology**

- persistence or progression of acute TIN
- urinary tract obstruction: most important cause of chronic TIN (tumours, stones, bladder outlet obstruction, vesicoureteral reflux)
- chronic pyelonephritis due to vesicoureteral reflux or UTI with obstruction
- nephrotoxins
  - exogenous
    - ♦ analgesics: NSAIDs (common), acetaminophen
    - ♦ cisplatin, lithium, cyclosporine, tacrolimus
    - ♦ heavy metals (lead, cadmium, copper), lithium, mercury, arsenic
    - ♦ radiation
    - ♦ chinese herbs
  - endogenous
    - ♦ hypercalcemia, hypokalemia, oxalate, uric acid nephropathy
- vascular disease: ischemic nephrosclerosis, atheroembolic disease
- malignancies: multiple myeloma, lymphoma
- granulomatous: TB, sarcoidosis, granulomatosis with polyangiitis
- immune: SLE, Sjögren's, cryoglobulinemia, Goodpasture's, amyloidosis, renal graft rejection, vasculitis
- hereditary: cystic diseases of the kidney, sickle cell disease
- others: radiation, Balkan (endemic) nephropathy

**Pathophysiology**

- fibrosis of interstitium with atrophy of tubules, mononuclear cell inflammation

**Signs and Symptoms**

- tubular dysfunction (e.g. acidosis, electrolyte disturbances)
- progressive renal failure with azotemia and uremia
- dependent on underlying etiology

**Treatment**

- stop offending agent or treat underlying disease
- supportive measures: correct metabolic disorders ( $\text{Ca}^{2+}$ ,  $\text{PO}_4^{3-}$ ) and anemia

### Findings which Suggest Chronic Tubulointerstitial Nephritis

- normal AG metabolic acidosis
- hyperkalemia (out of proportion to degree of renal insufficiency)
- polyuria, nocturia
- partial or complete Fanconi's syndrome
- urine: mild proteinuria, few RBCs and WBCs, no RBC casts
- ultrasound: shrunken kidneys with irregular contours

## Acute Tubular Necrosis (ATN)

### Definition

- abrupt and sustained decline in GFR within minutes to days after ischemic/nephrotoxic insult
- GFR reduced (this serves the purpose of avoiding life-threatening urinary loss of fluid and electrolytes from non-functioning tubules)

### Etiology

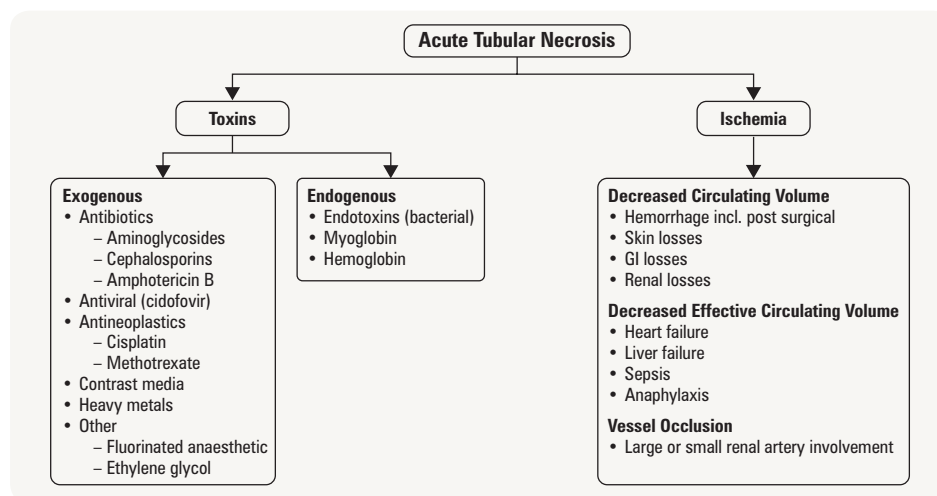

Figure 15. Etiology of ATN

### Clinical Presentation

- typically presents as an abrupt rise in urea and Cr after a hypotensive episode, sepsis, rhabdomyolysis, or administration of nephrotoxic drug
- urine: high  $\text{FE}_{\text{Na}^+}$ , pigmented-granular casts

### Complications

- hyperkalemia: can occur rapidly and cause serious arrhythmias
- metabolic acidosis, decreased  $\text{Ca}^{2+}$ , increased  $\text{PO}_4^{3-}$ , hypoalbuminemia

### Investigations

- blood: CBC, electrolytes, Cr, urea,  $\text{Ca}^{2+}$ ,  $\text{PO}_4^{3-}$ , blood gases
- urine: R&M, electrolytes, osmolality, microscopic urinalysis searching for pigmented granular casts
- ECG
- abdominal ultrasound
- rule out other causes of pre-renal/post-renal azotemia and intrinsic AKI (GN, AIN, vasculitis)

### Therapy

- largely supportive once underlying problem is corrected
- loop diuretics may help manage volume overload and reduce tubular metabolic requirements to allow for recovery (controversial)
- consider early dialysis in severe/rapidly progressing cases to prevent uremic syndrome

### Prevention

- correct fluid balance before surgical procedures
- for patients with chronic renal disease requiring radiographic contrast:
  - give N-acetylcysteine 600-1200 mg PO bid day before and day of procedure, give intravenous isotonic fluid (either NaCl or  $\text{NaHCO}_3$ )
  - isotonic  $\text{NaHCO}_3$  at 3 mL/kg over 1h before procedure and 1 mL/kg/h for 6 h post-procedure if not contraindicated
  - avoid giving diuretics, ACEI, cyclosporine on morning of procedure if possible
- use renal-adjusted doses of nephrotoxic drugs in patients with renal insufficiency

#### Meta-analysis: Effectiveness of Drugs for Preventing Contrast-induced Nephropathy

*Ann Intern Med* 2008;148:284-294

**Purpose:** To determine the effectiveness of N-acetylcysteine, theophylline, fenoldopam, dopamine, iloprost, statin, furosemide, or mannitol on preventing nephropathy.

**Study Selection:** Only randomized, controlled trials that used these agents in patients receiving iodinated contrast.

**Results:** In the 41 RCTs included N-acetylcysteine ( $\text{RR} = 0.62$  [0.44-0.88]) and Theophylline ( $\text{RR} = 0.49$  [0.23-1.06]) reduced the risk of nephropathy more than saline alone. Furosemide increased the risk ( $\text{RR} = 3.27$  [1.49-7.26]). Other agents did not affect risk of nephropathy.

**Conclusion:** N-acetylcysteine is more renoprotective than hydration alone.

## Analgesic Nephropathies

### 1. Vasomotor Acute Kidney Injury (AKI)

- normally prostaglandins vasodilate afferent renal arteriole to maintain blood flow
- NSAIDs act by blocking cyclooxygenase enzyme, thereby preventing prostaglandin synthesis and causing renal ischemia
- more common in elderly, underlying renal disease, hypovolemia (diuretics, CHF, cirrhosis, nephrotic syndrome)
- clinically: develop prerenal azotemia within a few days of starting NSAID
- treatment: discontinue NSAID, dialysis rarely needed

### 2. Acute Interstitial Nephritis (AIN)

- fenoprofen (60%), ibuprofen, naproxen
- may be associated with minimal change glomerulopathy and nephrotic range proteinuria
- resolves eventually with discontinuation of NSAID, may require interval dialysis
- short term high dose steroids (1 mg/kg/d of prednisone) may hasten recovery

### 3. Chronic Interstitial Nephritis

- due to excessive consumption of antipyretics (phenacetin or acetaminophen) in combination with NSAIDs
- seen in patients who also have emotional stress, psychiatric symptoms and GI disturbance
- papillary necrosis
  - gross hematuria, flank pain, declining renal function
  - calyceal filling defect seen with IVP – “ring sign”
- increased risk of transitional cell carcinoma of renal pelvis
- good prognosis if discontinue analgesics

### 4. Acute Tubular Necrosis (ATN)

- can be caused by acetaminophen
  - incidence of renal dysfunction is related to the severity of acetaminophen ingestion
- vascular endothelial damage can also occur
- both direct toxicity and ischemia contribute to the tubular damage
- renal function spontaneously returns to baseline within 1-4 wk
- dialysis may be required during the acute episode of ingestion

### 5. Other Effects of NSAIDs

- sodium retention (2° to reduced GFR)
- hyperkalemia, HTN (2° to hyporeninemic hypoaldosteronism)
- excess water retention (due to elimination of ADH – antagonistic effect of prostaglandins)

## Systemic Disease with Renal Manifestation

### Diabetes

- diabetic nephropathy: presence of microalbuminuria or overt nephropathy (i.e. macroalbuminuria) in patients with DM who lack indicators of other renal diseases
- most common cause of end-stage renal failure in North America
- 35-50% of patients with Type 1 DM will develop nephropathy, unknown percentage of Type 2
- at diagnosis up to 30% of patients with Type 2 DM have albuminuria (75% microalbuminuria, 25% overt nephropathy)
- microalbuminuria is a risk factor for progression to overt nephropathy and cardiovascular disease
- once macroalbuminuria is established, renal function declines, 50% patients reach ESRD within 7-10 yr
- associated with HTN and diabetic retinopathy (especially Type 1 DM) and/or neuropathy (especially Type 2 DM)
- indication of possible nondiabetic cause of renal disease in patients with DM:
  - rising Cr with little/no proteinuria
  - lack of retinopathy or neuropathy (microvascular complications)
  - persistent hematuria (microscopic or macroscopic)
  - signs or symptoms of systemic disease
  - inappropriate time course; rapidly rising Cr, renal disease in a patient with short duration of DM
  - family history of nondiabetic renal disease (e.g. PCKD, Alport's)

DM is one of the causes of ESRD that does not result in small kidneys at presentation of ESRD. The others are amyloidosis, HIV nephropathy, PCKD and multiple myeloma.

Abnormal Urine ACR Values from 2008 Canadian Diabetes Association CPG  
>2.0 mg/mmol in males  
>2.8 mg/mmol in females

ACEI can cause hyperkalemia. Therefore, be sure to watch serum K<sup>+</sup>, especially if patient has DM and renal insufficiency.

## DIABETIC RENAL COMPLICATIONS

### 1. Progressive Glomerulosclerosis

- classic diabetic glomerular lesion: Kimmelstiel-Wilson nodular glomerulosclerosis (15-20%)
- more common lesion is diffuse glomerulosclerosis with a uniform increase in mesangial matrix

**Table 13. Stages of Diabetic Progressive Glomerulosclerosis**

Stage 1	Stage 2	Stage 3	Stage 4
<ul style="list-style-type: none"> <li>• ↑ GFR (120-150%)</li> <li>– compensatory hyperfiltration</li> <li>• ± slightly increased mesangial matrix</li> </ul>	<ul style="list-style-type: none"> <li>• Detectable microalbuminuria (0-300 mg/24 h)</li> <li>• Albumin-Creatinine ratio (ACR) 2.0–20 mg/mmol in men (18-180 mg/d),</li> <li>• ACR 2.8-28 mg/mmol in women (25-250 mg/d)</li> <li>• ↑ mesangial matrix</li> </ul>	<ul style="list-style-type: none"> <li>• Macroalbuminuria (&gt;300 mg/24 h)</li> <li>• ACR in men &gt;20 mg/mmol, (&gt;180 mg/d)</li> <li>• ACR in women &gt;28 mg/mmol (&gt;250 mg/d)</li> <li>• Proteinuria (+ve urine dipstick)</li> <li>• Normal GFR</li> <li>• ↑↑↑ mesangial matrix</li> </ul>	<ul style="list-style-type: none"> <li>• ↑ proteinuria (&gt;500 mg/24 h)</li> <li>• ↓ GFR</li> <li>• &lt;20% glomerular filtration surface area present</li> <li>• Sclerosed glomeruli</li> </ul>

### 2. Accelerated Atherosclerosis

- common finding
- decreased GFR
- may increase Angiotensin II production resulting in increased BP
- increased risk of ATN secondary to contrast media

### 3. Autonomic Neuropathy

- affects bladder leading to functional obstruction and urinary retention
- residual urine promotes infection
- obstructive nephropathy

### 4. Papillary Necrosis

- Type 1 DM susceptible to ischemic necrosis of medullary papillae
- sloughed papillae may obstruct ureter
- can present as renal colic or with obstructive features ± hydronephrosis

## 2013 Canadian Diabetics Association Clinical Practice Guidelines on Chronic Kidney Disease in Diabetes

- screen for microalbuminuria with a random urine test for albumin to Cr ratio (ACR) and eGFR with a serum creatinine (e.g. using MDRD equation)
  - Type 1 DM: annually In post-pubertal individuals after 5 yr of diagnosis
  - Type 2 DM: at diagnosis, then annually
  - If eGFR >60 mL/min or ACR <2.0 mg/mmol: there is no CKD, re-screen in 1 yr
  - If urine ACR >20.0 mg/mmol: diagnose CKD.
  - If ACR <20.0 mg/mmol but >2.0 mg/mmol: order serum Cr for eGFR in 3 mo and 2 repeats of random urine ACRs over the next 3 mo. At 3 mo: If eGFR ≤60 mL/min or if >2/3 ACRs are >2.0 mg/mmol, diagnose CKD
  - if CKD diagnosed, ordered urine R+M and dipstick, if negative then diagnose CKD in Diabetes
  - with CKD in Diabetes: urine ACR and serum Cr (for eGFR) every 6 mo
  - delay screening if transient cause of albuminuria or low eGFR
- evaluate for other causes of proteinuria, rule out nondiabetic renal disease
- avoid unnecessary potential nephrotoxins (NSAIDs, aminoglycosides, dye studies)

## Priorities in the Management of Patients with DM

1. vascular protection for all patients with diabetes
  - ACEI, antiplatelet therapy (as indicated)
  - BP control, glycemic control, lifestyle modification, lipid control
2. optimization of BP in patients who are hypertensive
  - treat according to hypertension guidelines
3. renal protection for DM patients with nephropathy (even in absence of HTN)
  - Type 1 DM: ACEI
  - Type 2 DM: CrCl >60 mL/min: ACEI or ARB – CrCl <60 mL/min: ARB
  - 2<sup>nd</sup> line agents: nondihydropyridine calcium channel blockers (diltiazem, verapamil)
  - ACEI and ARB can be safely used together if needed for control of significant proteinuria (monitor for hyperkalemia and acute rise in Cr)
- check serum Cr and K<sup>+</sup> levels within 1 wk of initiating ACEI or ARB and at time of acute illness
- serum Cr can safely be allowed to rise up to 30% with initiation of ACEI or ARB, usually stabilizes after 2-4 wk, monitor for significant worsening of renal function or hyperkalemia
- if >30% rise in serum Cr or hyperkalemia, discontinue medication and consider 2<sup>nd</sup> line agent
- consider holding ACEI, ARB and/or diuretic with acute illness and in women before becoming pregnant
- consider referral to nephrologist if ACR >60 mg/mmol, eGFR <30 mL/min, progressive kidney function loss, unable to achieve BP targets or unable to stay on ACEI or ARB

**Figure 16. GFR and urine protein over time in diabetes**

### Renoprotective Effect of Angiotensin-Receptor Antagonist Irbesartan in Patients with Nephropathy Due to Type 2 Diabetes.

NEJM 2001;345:851-860

**Study:** Multicentre, RCT, mean follow-up of 2.6 yr.  
**Patients:** 806 patients (mean age 70) with T2DM, HTN, and nephropathy (24hr proteinuria >900 mg, serum Creatinine (Cr) 88(Male)/106(Female)-265 µmol/L)

**Intervention:** BP control with irbesartan vs. amlodipine vs. placebo, with use of adjuncts (not including ACEs, ARBs, or CCI) as needed.

**Outcomes:** Primary composite endpoint included doubling of serum Cr, ESRD, or death. Secondary composite endpoint included morbidity and mortality from CVD causes.

**Results:** BP control was similar in all three arms. Irbesartan had a relative risk reduction of 20% vs. placebo and 23% vs. amlodipine for the primary end point. The irbesartan group had a 33% risk reduction vs. placebo and 37% reduction vs. amlodipine for risk of doubling serum Cr. Serum Cr increased more slowly in the Irbesartan group versus placebo or amlodipine. No difference in absolute mortality or secondary end point.

**Conclusion:** Irbesartan conferred significant renoprotective benefits in patients with type 2 diabetes and nephropathy, independent of blood pressure lowering effects.

### Renal Outcomes with Telmisartan, Ramipril, or Both in People at High Vascular Risk (ONTARGET Study)

Lancet 2008;372:547-553

**Study:** Prospective, multicentre, double-blind, randomized controlled trial.

**Participants:** 25,620 patients with median follow-up of 56 mo.

**Intervention:** Patients received either ramipril (10 mg/d; N=8576), telmisartan (80 mg/d; N=8542) or a combination of both drugs (N=8502).

**Primary Outcome:** Composite of dialysis, doubling of creatinine level, and death.

**Results:** The number of outcome events was similar for telmisartan (n=1147) and ramipril (1150; HR 1.00, CI 0.92-1.09), but was increased with combination therapy (1233; HR 1.09, 1.01-1.18, p=0.037). The need for dialysis or doubling of serum creatinine, was similar with telmisartan (189) and ramipril (174; HR 1.09, 0.89-1.34) and more frequent with combination therapy (212; HR 1.24, 1.01-1.51, p=0.038). Estimated GFR declined least with ramipril compared with telmisartan or combination therapy (p<0.001). The increase in urinary albumin excretion was less with telmisartan (p=0.004) and combination therapy (p=0.001) than with ramipril.

**Conclusion:** Renal outcomes were similar in both telmisartan and ramipril monotherapy. Combination therapy reduced proteinuria to a greater extent than monotherapy, but was associated with poorer renal outcomes.

## Scleroderma

- 50% of scleroderma patients have renal involvement (mild proteinuria, high Cr, HTN)
- histology: media thickened, "onion skin" hypertrophy of small renal arteries, fibrinoid necrosis of afferent arterioles and glomeruli
- 10-15% scleroderma patients have a "scleroderma renal crisis" (occurs in first few years of disease): malignant HTN, ARF, microangiopathy, volume overload, visual changes, HTN encephalopathy
- renal involvement usually occurs early in the course of illness
- treatment: BP control with ACEI slows progression of renal disease

## Multiple Myeloma

- see [Hematology](#), H47
- malignant proliferation of plasma cells in the bone marrow with the production of immunoglobulins
- patients may present with severe bone disease and renal failure
- light chains are filtered at the glomerulus and appear as Bence-Jones proteins in the urine (monoclonal light chains)
- kidney damage can occur by several mechanisms:
  - hypercalcemia
  - light chain cast nephropathy (LCCN, see below) or "myeloma kidney"
  - hyperuricemia
  - infection
  - secondary amyloidosis
  - monoclonal Ig deposition disease (MIDD)
  - diffuse tubular obstruction
- LCCN
  - large tubular casts in urine sediment (light chains + Tamm-Horsfall protein)
  - proteinuria and renal insufficiency, can progress rapidly to kidney failure
- MIDD
  - deposits of monoclonal Ig in kidney, liver, heart and other organs
  - mostly light chains (85-90%)
  - causes nodular glomerulosclerosis (similar to diabetic nephropathy)
- lab features: increased BUN, increased Cr, urine protein immunoelectrophoresis positive for Bence-Jones protein (not detected on urine dipstick)
- poor candidates for kidney transplantation

## Malignancy

- cancer can have many different renal manifestations
- kidney transplantation cannot be performed unless malignancy is cured
  - solid tumours: mild proteinuria or membranous GN
  - lymphoma: minimal change GN (Hodgkin's) or membranous GN (non-Hodgkin's)
  - renal cell carcinoma
  - tumour lysis syndrome: hyperuricemia, diffuse tubular obstruction
  - chemotherapy (especially cisplatin): ATN or chronic TIN
  - pelvic tumours/mets: post-renal failure secondary to obstruction
  - 2° amyloidosis
  - radiotherapy (radiation nephritis)

## Hypertension (HTN)

- HTN occurs in about 20% of population
- etiology classified as primary ("essential"; makes up 90% of cases) or secondary
- primary: hypertension due to other factors that cause renal disease (hypertensive nephrosclerosis) or worsen pre-existing renal disease
- secondary: diseases of renal parenchyma or renal vasculature that cause hypertension

### Effects of Losartan on Renal and Cardiovascular Outcomes in Patients with Type 2 DM and Nephropathy

NEJM 2001;345:861-869

**Study:** Randomized, double-blind, placebo-controlled trial with mean follow-up of 3.4 yr.

**Patients:** 1513 patients (mean age 60, 63% male, multi-ethnicity) with NIDDM and nephropathy (urinary albumin:Cr  $\geq 300$  and serum Cr 115-265  $\mu\text{mol/L}$ ) on conventional antihypertensives (CCB, diuretics,  $\beta$ -blockers, centrally acting agents).

**Intervention:** Losartan 50 mg PO OD (could be doubled after 4 wk) vs. placebo.

**Outcomes:** Primary endpoints included doubling of serum Cr, ESRD, or death. Secondary endpoints included morbidity and mortality from CVD causes.

**Results:** Losartan reduced incidence of doubling of serum Cr (RR 25%) and ESRD (RR 28%), but had no effect on risk of death. Benefit exceeded that attributable to BP changes alone. Secondary endpoints were similar, although rate of hospitalization for heart failure was significantly lower with losartan (RR 32%).

**Conclusion:** Losartan conferred significant renal benefits in patients with type 2 diabetes and nephropathy, and was generally well tolerated.

### Protein Restriction for Diabetic Renal Disease

Cochrane DB Syst Rev 2007;4:CD002181

**Purpose:** To review the effects of dietary protein restriction on the progression of diabetic nephropathy.

**Study Selection:** Randomized controlled trials (RCTs) and before and after studies of the effects of restricted protein diet on renal function in subjects with diabetes. 12 studies were reviewed.

**Results:** The risk of end-stage renal disease or death was lower in patients on low-protein diet. In patients with Type 1 diabetes no effect on GFR was noted in the low-protein diet group.

### Long-term Outcomes of Scleroderma Renal Crisis

Ann Intern Med 2000;133:600-603

**Study:** Prospective observational cohort study with follow up of 5-10 yr.

**Patients:** 145 patients with scleroderma renal crisis who received ACE inhibitors and 662 patients with scleroderma who did not have renal crisis.

**Primary Outcome:** The need for dialysis and early death among patients with renal crisis.

**Results:** Sixty-one percent of patients with renal crisis had good outcomes (55 had no dialysis and 34 received temporary dialysis); only 4 of these patients progressed to chronic renal failure and permanent dialysis. Greater than 50% of the patients who initially required dialysis discontinued it 3 to 18 mo later. Permanent dialysis or early death occurred in 39% of the patients.

**Conclusion:** Renal crisis can be managed when hypertension is aggressively controlled with ACE inhibitors.

### Features of Multiple Myeloma

#### CARLI

Calcium (elevated)

Anemia

Renal Failure

Lytic Bone Lesions

Infections

## Hypertensive Nephrosclerosis

Table 14. Chronic vs. Malignant Nephrosclerosis

	Chronic Nephrosclerosis	Malignant Nephrosclerosis
<b>Histology</b>	Slow vascular sclerosis with ischemic changes affecting intralobular and afferent arterioles	Fibrinoid necrosis of arterioles, disruption of vascular endothelium
<b>Clinical Picture</b>	African American, underlying chronic kidney disease, chronic hypertensive disease	Acute elevation in BP (dBP >120 mmHg) HTN encephalopathy
<b>Urinalysis</b>	Mild proteinuria, normal urine sediment	Proteinuria and hematuria (RBC casts)
<b>Therapy</b>	Blood pressure control, (target <140/90) with frequent follow-up	Lower dBP to 100-110 mmHg within 6-24 h More aggressive treatment can cause ischemic event Identify and treat underlying cause of HTN
<b>Prognosis</b>	Can progress to renal failure despite patient adherence	Lower survival if renal insufficiency develops

## Renovascular Hypertension

- see *Vascular Diseases of the Kidney*, NP17

## Renal Parenchymal Hypertension

- HTN secondary to GN, AIN, diabetic nephropathy, or any other chronic renal disease
- mechanism of HTN not fully understood but may include
  - excess RAAS activation due to inflammation and fibrosis in multiple small intra-renal vessels
  - production of unknown vasopressors, lack of production of unknown vasodilators, or lack of clearance of endogenous vasopressor
  - ineffective sodium excretion with fluid overload

### Investigations

- as well as investigations for renovascular HTN, additional tests may include
  - 24-h urinary estimations of Cr clearance and protein excretion
  - imaging (U/S, CT)
  - serology for collagen-vascular disease
  - renal biopsy

### Treatment

- most chronic renal disease is irreversible, but treatment of HTN can slow the progression of renal insufficiency
- control ECF volume: Na<sup>+</sup> restriction (88 mmol/d intake), diuretic, dialysis with end-stage disease
- ACEI or ARB may provide added benefit (monitor K<sup>+</sup> and Cr) if there is significant proteinuria (>300 mg/d)

## Cystic Diseases of the Kidney

- characterized by epithelium-lined cavities filled with fluid or semisolid debris within the kidneys
- includes: simple cysts (present in 50% of population over 50), medullary cystic kidney, medullary sponge kidney, polycystic kidney disease (autosomal dominant and recessive) and acquired cystic kidney disease (in chronic hemodialysis patients)

Hypercalcemia complicates many cancers and can cause multiple kinds of renal disorders (renal vasoconstriction with reduced OTR; salt-wasting with volume depletion; risk of calcium kidney stones).

## Adult Polycystic Kidney Disease

- autosomal dominant; at least 2 genes: *PKD1* (chr 16p) and *PKD2* (chr 4q)
- *PKD1* (1:400), *PKD2* (1:1000) accounts for about 10% of cases of renal failure
- patients generally heterozygous for mutant polycystin gene but accumulate a series of second 'somatic hits' precipitating the condition
- *PKD1* encodes a protein that is responsible for cell-cell and cell-matrix interaction and sensing fluid flow by associating with cilia
- *PKD2* encodes a protein that is a Ca<sup>2+</sup> permeable nonselective cation channel that associates with cilia and is thought to control intracellular Ca<sup>2+</sup> in response to flow
- defect leads to abnormal proliferation and apoptosis of tubular epithelial cells leading to cyst growth
- extrarenal manifestations: most common; multiple asymptomatic hepatic cysts (33%), cerebral aneurysm (10%), diverticulosis and mitral valve prolapse (25%)
- polycystic liver disease rarely causes liver failure
- less common: cysts in pancreas, spleen, thyroid, ovary, seminal vesicles, and aorta

**Signs and Symptoms**

- often asymptomatic; discovered incidentally on imaging or by screening those with FHx
- acute abdominal flank pain/dull lumbar back pain
- hematuria (microscopic frequently initial sign, gross)
- nocturia (urinary concentrating defect)
- rarely extra-renal presentation (e.g. ruptured berry aneurysm, diverticulitis)
- HTN (increased renin due to focal compression of intrarenal arteries by cysts) (60-75%)
- $\pm$  palpable kidneys

**External Manifestations of PKD**

- Hepatic cysts
- Cerebral aneurysms
- Diverticulosis
- Mitral valve prolapse

**Common Complications**

- urinary tract and cyst infections, HTN, CRF, nephrolithiasis (5-15%), flank and chronic back pain

**Clinical Course**

- polycystic changes are always bilateral and can present at any age
- clinical manifestations rare before age 20-25
- kidneys are normal at birth but may enlarge to 10 times normal size
- variable progression to renal functional impairment (ESRD in up to 50% by age 60)

**Investigations**

- radiographic diagnosis: best accomplished by renal U/S (enlarged kidneys, multiple cysts throughout renal parenchyma, increased cortical thickness, splaying of renal calyces)
- CT abdo with contrast (for equivocal cases, occasionally reveals more cystic involvement)
- gene linkage analysis for PKD1 for asymptomatic carriers
- Cr, BUN, urine R&M (to assess for hematuria)

**Treatment**

- goal: to preserve renal function by prevention and treatment of complications
- educate patient and family about disease, its manifestations and inheritance pattern
- genetic counselling: transmission rate 50% from affected parent
- prevention and early treatment of urinary tract and cyst infections (avoid instrumentation of GU tract)
- TMP/SMX, ciprofloxacin: able to penetrate cyst walls, achieve therapeutic levels
- adequate hydration to prevent stone formation
- avoid contact sports due to greater risk of injury to enlarged kidneys
- screen for cerebral aneurysms if family history of aneurysmal hemorrhages
- monitor blood pressure and treat hypertension with ACEI
- dialysis or transplant for ESRD (disease does not recur in transplanted kidney)
- may require nephrectomy to create room for renal transplant

## Medullary Sponge Kidney

- common, autosomal dominant, usually diagnosed in 4th-5th decades
- multiple cystic dilatations in the collecting ducts of the medulla
- renal stones, hematuria and recurrent UTIs are common features
- an estimated 10% of patients who present with renal stones have medullary sponge kidney
- nephrocalcinosis on abdominal x-ray in 50% patients, often detect asymptomatic patients incidentally
- diagnosis: contrast filled medullary cysts on IVP, characteristic radial pattern ("bouquet of flowers"), "swiss cheese" appearance on morphology
- treat UTIs and stone formation as indicated
- does not result in renal failure

## Autosomal Recessive Polycystic Kidney Disease

- 1:20,000 incidence
- prenatal diagnosis by enlarged kidneys
- perinatal death from respiratory failure
- patients who survive perinatal period develop CHF, HTN, chronic kidney disease
- treated with kidney and/or liver transplant

# Acute Kidney Injury (AKI)

## Definition

- abrupt decline in renal function leading to increased nitrogenous waste products normally excreted by the kidney
- formerly known as Acute Renal Failure (ARF)

## Clinical Features

- azotemia (increased BUN, Cr)
- abnormal urine volume (anuria, oliguria, polyuria)

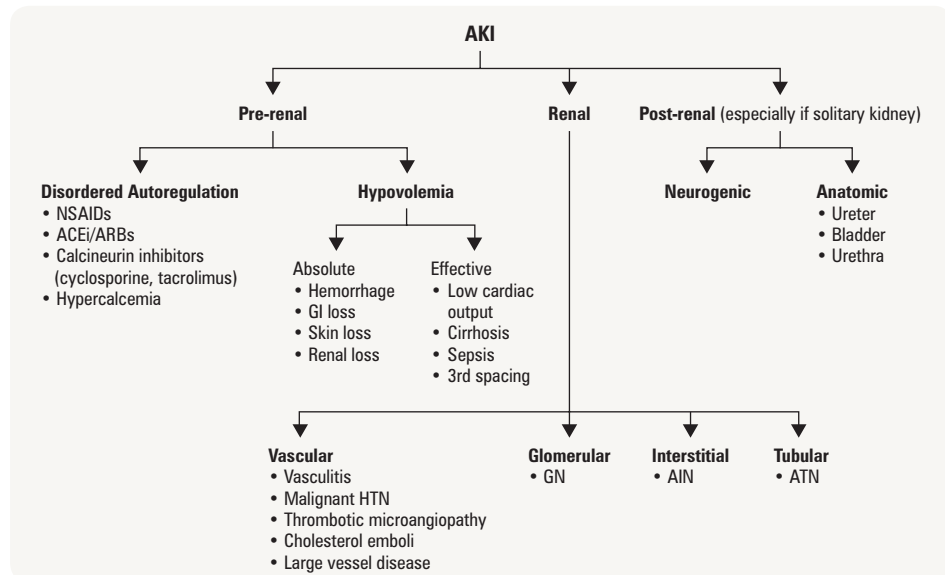

Figure 17. Approach to acute kidney injury

## Approach to AKI

### Investigations

- blood: CBC, electrolytes, Cr, urea (think prerenal if increase in urea is relatively greater than increase in Cr),  $\text{Ca}^{2+}$ ,  $\text{PO}_4^{3-}$
- urine volume, C&S, R&M: sediment, casts, crystals
- urinary indices: electrolytes, osmolality
- Foley catheterization (rule out bladder outlet obstruction)
- fluid challenge (i.e. fluid bolus to rule out most pre-renal causes)
- imaging: abdo U/S (assess kidney size, hydronephrosis, post-renal obstruction)
- indications for renal biopsy
  - diagnosis is not certain
  - prerenal azotemia or ATN is unlikely
  - oliguria persists >4 wk

### Treatment

#### 1. preliminary measures

- pre-renal
  - ♦ correct prerenal factors: optimize volume status and cardiac performance using fluids that will stay in the plasma subcompartment (NS, albumin, blood/plasma), hold ACEi/ARB (gently rehydrate when needed, i.e. CHF)
- renal
  - ♦ address reversible renal causes: d/c nephrotoxic drugs, treat infection, and optimize electrolytes
- post-renal
  - ♦ consider obstruction: structural (stones, strictures) vs. functional (neuropathy)
  - ♦ treat with Foley catheter, indwelling bladder catheter, nephrostomy, stenting

#### 2. treat complications

- fluid overload
  - ♦ NaCl restriction
  - ♦ high dose loop diuretics
- hyperkalemia (refer to *Approach to Hyperkalemia*, NP13)

The 2 most common causes of acute kidney injury in hospitalized patients are prerenal azotemia and acute tubular necrosis. Remember that prerenal failure can lead to ATN.

#### Clues to Pre-Renal Etiology

- Clinical: Decreased BP, increased HR, and orthostatic HR and BP changes
- Increased [urea] >> Increased [Cr]
- Urine  $[\text{Na}^+]$  <10-20 mmol/L
- Urine osmolality >500 mOsm/kg
- Fractional excretion of  $\text{Na}^+$  <1%

#### Clues to Renal Etiology

- Appropriate clinical context
- Urinalysis positive for casts:
  - Pigmented granular – ATN
  - WBC – AIN
  - RBC – GN

#### Clues to Post-Renal Etiology

- Known solitary kidney
- Older man
- Recent retroperitoneal surgery
- Anuria
- Palpable bladder
- Ultrasound shows hydronephrosis

#### Differentiating Pre-renal from ATN

	Pre-renal	ATN
Urinalysis	Normal	RBC, pigmented granular casts
Urine $[\text{Na}^+]$	<20	>40 mEq/L
Urine $[\text{Na}^+]/[\text{Cr}]$	<20	>40
Urine osmolality	>500	<350 mOsm/kgH <sub>2</sub> O
FeNa	<1	>1%

#### Drugs Implicated in Pre-Renal Azotemia

- Anti-hypertensives
- Diuretics
- NSAIDs
- ACEi/ARBs

- adjust dosages of medications cleared by kidney (e.g. amiodarone, digoxin, cyclosporin, tacrolimus, some antibiotics and chemotherapeutic agents)
  - dialysis
3. definitive therapy depends on etiology
- note: renal transplant is not a therapy for AKI

### Prognosis

- high morbidity and mortality in patients with sustained AKI and multi-organ failure

## Chronic Kidney Disease (CKD)

### Definition

- progressive and irreversible loss of kidney function
- abnormal markers (Cr, urea)
  - GFR <60 mL/min for >3 mo or
  - kidney pathology seen on biopsy or
  - decreased renal size on U/S (kidneys <9 cm)
- clinical features of chronic kidney disease
  - volume overload and hypertension
  - electrolyte and acid-base balance disorders (e.g. metabolic acidosis)
  - uremia

**Table 15. Stages of Chronic Kidney Disease (KDIGO, 2013)**

		Persistent Albuminuria Categories			
		GFR (mL/min/1.73m <sup>2</sup> )	A1 <30 mg/g <3 mg/mmole	A2 30-300 mg/g 3-30 mg/mmole	A3 >300 mg/g >30 mg/mmole
GFR categories (mL/min/1.73m <sup>2</sup> )	G1	≥90	1 if CKD	1	2
	G2	60-89	1 if CKD	1	2
	G3a	45-59	1	2	3
	G3b	30-44	2	3	3
	G4	15-29	3	3	4+
	G5	<15 (kidney failure)	4+	4+	4+

The numbers in the boxes are a reflection of the risk of progression and are a guide to the frequency of monitoring/year

"D" is added to G5 for patients requiring dialysis

Classification is based on cause, GFR and amount of albuminuria

Rate of progression and risk of complications are determined by the cause of CKD

### Incidence of Etiologies of Chronic Kidney Disease (CKD)

Diabetes	42.9%
Hypertension	26.4%
Glomerulonephritis	9.9%
Other/Unknown	7.7%
Interstitial nephritis/	
Pyelonephritis	4.0%
Cystic/Hereditary/Congenital	3.1%
Secondary GN/Vasculitis	2.4%

### Management of Complications of CKD

#### NEPHRON

- N** – Low-nitrogen diet
- E** – Electrolytes: monitor K<sup>+</sup>
- P** – pH: metabolic acidosis
- H** – Hypertension
- R** – RBCs: manage anemia with erythropoietin
- O** – Osteodystrophy: give calcium between meals (to increase Ca<sup>2+</sup>) and calcium with meals (to bind and decrease PO<sub>4</sub><sup>3-</sup>)
- N** – Nephrotoxins: avoid nephrotoxic drugs (ASA, gentamicin) and adjust doses of renally excreted medications

### Renin Angiotensin System Blockade and Cardiovascular Outcomes in Patients with Chronic Kidney Disease and Proteinuria: A Meta-analysis

*Am Heart J* 2008;155:791-805

**Purpose:** To evaluate the role of renin angiotensin system (RAS) blockade in improving cardiovascular CV outcomes in patients with chronic kidney disease (CKD).

**Study Selection:** Randomized controlled trials that analyzed CV outcomes in patients with CKD/proteinuria treated with RAS blockade (ACEI/ARB). Renin angiotensin system blockade-based therapy was compared with placebo and control (β-blocker, calcium-channel blockers and other antihypertensive-based therapy) therapy in the study.

**Results:** Twenty-five trials (N = 45758) were included. Compared to placebo, RAS blockade reduced the risk of heart failure in patients with diabetic nephropathy. In patients with non-diabetic CKD, RAS blockade decreased CV outcome compared to control therapy.

**Conclusions:** RAS blockade reduced CV outcomes in diabetic nephropathy as well as non-diabetic CKD.

## Management of Chronic Kidney Disease

- diet
  - protein restriction with adequate caloric intake limits endogenous protein catabolism
  - K<sup>+</sup> restriction (40 mmol/d)
  - Na<sup>+</sup> and water restriction
  - PO<sub>4</sub><sup>3-</sup> restriction (1 g/d)
  - avoid extra-dietary Mg<sup>2+</sup> (i.e. antacids)
- medical
  - treatment of secondary hyperparathyroidism
  - calcium supplements (e.g. TUMS®) treats hypocalcemia when given between meals and binds phosphate when given with meals
  - consider calcitriol (1,25-dihydroxy-vitamin D) if hypocalcemic
  - sevelamer (phosphate binder) if both hypercalcemic and hyperphosphatemic
  - vitamin D analogues are being introduced in the near future
  - cinacalcet for hyperparathyroidism (sensitizes parathyroid to Ca<sup>2+</sup>, decreasing PTH)
  - sodium bicarbonate for metabolic acidosis
  - erythropoietin injections (Hct <30%) for anemia; target Hct 33-36%
  - DDAVP for prolonged bleeding time if patient has clinical bleeding or invasive procedures
  - ACEI for hypertension (target 130/80 or less), loop diuretics when GFR <25 mL/min
  - statins for dyslipidemia
  - adjust dosages for renally excreted medications (avoid nephrotoxic medications)
- dialysis (hemodialysis, peritoneal dialysis)
- renal transplantation

### Prevention of Progression

- as above
- control of hypertension, diabetes, cardiovascular risk factors (e.g. smoking cessation)
- avoid nephrotoxins
- address reversible causes of AKI

## Renal Failure

### Presentation of Renal Failure

#### 1. Volume Overload

- due to increase in total body  $\text{Na}^+$  content
- signs: weight gain, HTN, pulmonary or peripheral edema

#### 2. Electrolyte Abnormalities

- high
  - $\text{K}^+$  (decreased renal excretion, increased tissue breakdown)
  - $\text{PO}_4^{3-}$  (decreased renal excretion, increased tissue breakdown)
  - $\text{Ca}^{2+}$  (rare; happens during recovery phase after rhabdomyolysis-induced acute kidney injury or in settings where hypercalcemia contributes to renal failure, such as in multiple myeloma or sarcoidosis)
  - uric acid
- low
  - $\text{Na}^+$  (failure to excrete excessive water intake)
  - $\text{Ca}^{2+}$  (decreased Vit D activation, hyperphosphatemia, hypoalbuminemia)
  - $\text{HCO}_3^-$  (especially with sepsis or severe heart failure)

#### 3. Uremic Syndrome

- manifestations result from retention of urea and other metabolites as well as hormone deficiencies

### Signs and Symptoms of Renal Failure

Figure 18. Signs and symptoms of renal failure

### Complications

- CNS: decreased LOC, stupor, seizure
- CVS: cardiomyopathy, CHF, arrhythmia, pericarditis, atherosclerosis
- GI: peptic ulcer disease, gastroduodenitis, AVM
- hematologic: anemia, bleeding tendency (platelet dysfunction), infections
- endocrine:
  - decreased testosterone, estrogen, progesterone
  - increased FSH, LH
- metabolic:
  - renal osteodystrophy: secondary increased PTH due to decreased  $\text{Ca}^{2+}$ , high  $\text{PO}_4^{3-}$  and low active vitamin D
    - ♦ osteitis fibrosa cystica
  - hypertriglyceridemia, accelerated atherogenesis
  - decreased insulin requirements, increased insulin resistance
- dermatologic: pruritus, ecchymosis, hematoma, calciphylaxis (vascular  $\text{Ca}^{2+}$  deposition)

## Renal Replacement Therapy

### Dialysis

#### Indications for Dialysis in Chronic Renal Failure

Table 16. Indications for Dialysis

Absolute Indications	Relative Indications
<ul style="list-style-type: none"> <li>• Volume overload*</li> <li>• Hyperkalemia*</li> <li>• Severe metabolic acidosis*</li> <li>• Neurologic signs or symptoms of uremia (encephalopathy, neuropathy, seizures)</li> <li>• Uremic pericarditis</li> <li>• Refractory accelerated hypertension</li> <li>• Clinically significant bleeding diathesis</li> <li>• Persistent severe nausea and vomiting</li> <li>• Plasma Cr &gt; 1060 <math>\mu\text{mol/L}</math> (12 mg/dL) or Urea &gt; 36 mmol/L (100 mg/dL; clinical picture also important)</li> </ul>	<ul style="list-style-type: none"> <li>• Anorexia</li> <li>• Decreased cognitive functioning</li> <li>• Profound fatigue and weakness</li> <li>• Severe anemia unresponsive to erythropoietin</li> <li>• Persistent severe pruritus</li> <li>• Restless leg syndrome</li> </ul>

\*Unresponsive to medications

- **hemodialysis:** blood is filtered across a semipermeable membrane removing accumulated toxic waste products, solutes, excess fluid (ultrafiltration), and restoring buffering agents to the bloodstream
  - available as intermittent (e.g. three times per week), continuous (CVVHD) or sustained low efficiency (SLED)
  - can be delivered at home or in-centre, nocturnal
  - vascular access can be achieved through a central line, an artificial graft or an arterio-venous fistula
- patients with chronic kidney disease should be referred for surgery to attempt construction of a primary AV fistula when their eGFR is <20 mL/min, the serum Cr level quoted as >350  $\mu\text{mol/L}$  (>4.0 mg/dL), or within 1 yr of an anticipated need
- **peritoneal dialysis:** peritoneum acts as a semipermeable membrane similar to hemodialysis filter
  - advantages: independence, fewer stringent dietary restrictions, better rehabilitation rates
  - available as continuous ambulatory (CAPD; four exchanges per day) or cyclic (CCPD; machine carries out exchanges overnight)
- refer patients with chronic renal disease to a nephrologist early on to facilitate treatment and plan in advance for renal replacement therapy (RRT)

#### Indications for Dialysis

##### HAVE PEE or AE IOU

Hyperkalemia (refractory)  
Acidosis (refractory)  
Volume overload (refractory)  
Elevated urea (>35-50 mM)  
Pericarditis  
Encephalopathy  
Edema (pulmonary)

or

Acidosis  
Electrolyte imbalance ( $\text{K}^+$ )  
Intoxication  
Overload  
Uremic encephalopathy, pericarditis, urea > 35-50 mM

#### How to Write Dialysis Orders (MUST BE INDIVIDUALIZED)

- Filter Type (e.g. F80)
- Length (e.g. 4h 3 times/wk or 2h daily)
- Q Blood Flow (max 500 cc/min)
- Ultrafiltration (e.g. 2 L or to target dry weight)
- $\text{Na}^+$  140 (can be adjusted by starting at 155 and "ramping" down to minimize cramping)
- $\text{K}^+$  [based on serum ( $\text{K}^+$ )]  
 Serum  $\text{K}^+$     Dialysate  
 4-6            1.5  
 3.5-4        2.5  
 <3.5        3.5
- $\text{Ca}^{2+}$  1.25
- $\text{HCO}_3^-$  40
- Heparin [none, tight (500 U/h) or full (1000 U/h)]
- IV fluid to support BP (e.g. N/S)

Table 17. Peritoneal Dialysis vs. Hemodialysis

	Peritoneal Dialysis	Hemodialysis
<b>Rate</b>	Slow	Fast
<b>Location</b>	Home	Hospital (usually)
<b>Ultrafiltration</b>	Osmotic pressure via dextrose dialysate	Hydrostatic pressure
<b>Solute Removal</b>	Concentration gradient and convection	Concentration gradient and convection
<b>Membrane</b>	Peritoneum	Semi-permeable artificial membrane
<b>Method</b>	Indwelling catheter in peritoneal cavity	Line from vessel to artificial kidney
<b>Complications</b>	Infection at catheter site Bacterial peritonitis Metabolic effects of glucose Difficult to achieve adequate clearance in patients with large body mass	Vascular access (clots, collapse) Bacteremia Bleeding due to heparin Hemodynamic stress of extracorporeal circuit Disequilibrium syndrome (headache, cerebral edema, hypotension, nausea, muscle cramps related to solute/water flux over short time)
<b>Preferred When</b>	Young, high functioning, residual renal function Success depends on presence of residual renal function	Bed-bound, co-morbidities, no renal function Residual renal function not as important

**When to Initiate Dialysis**

CrCl &lt; 20 mL/min

- Educate patient regarding dialysis; if not a candidate for peritoneal dialysis, make arrangements for AV fistula

CrCl &lt; 15 mL/min

- Weigh risk and benefits for initiating dialysis

CrCl &lt; 10 mL/min

- Dialysis should be initiated

**NOTE**

- Cockcroft-Gault equation (or Modification of Diet in Renal Disease equation) should be used to measure kidney function
- Monitor for uremic complications
- Significant benefits in quality of life can occur if dialysis started before CrCl < 15 mL/min
- It is unclear whether patients who start dialysis early have increased survival
- A preemptive transplant can be considered if patient is stable, in order to avoid dialysis

From: National Kidney Foundation/Kidney Disease Outcome. Quality Initiative

**Commonly Used Immunosuppressive Drugs****Calcineurin inhibitors**

- Cyclosporine
- Tacrolimus

**Antiproliferative medications**

- Mycophenolate Mofetil
- Azathioprine

**Other agents**

- Sirolimus
- Prednisone

**Anti-lymphocyte antibodies**

- Thymoglobulin
- Basiliximab

**Survival Among Nocturnal Home Haemodialysis Patients Compared to Kidney Transplant Recipients**

Nephrol Dial Transplant 2009;24:2915-2919

**Study:** Retrospective, matched cohort with 4-5 yr average follow up.

**Population:** 177 nocturnal home dialysis (NHD) patients (mean age 46, 68% white) were matched to 533 deceased donor transplant (DTX) patients and 533 live donor (LTX) transplant patients (1:3:3 ratio).

**Intervention:** Nocturnal home dialysis versus live or deceased donor transplant.

**Outcome:** Primary outcome was all cause mortality  
**Results:** No significant difference in survival or hazard ratio between NHD and DTX. Significant survival benefit for patients undergoing LTX versus NHD. Significant mortality hazard ratio reduction with LTX (0.51) with no difference in hazard ratio for DTX versus NHD reference.

**Conclusion:** NHD has comparable mortality to DTX, but is inferior to LTX.

## Renal Transplantation

- preferred modality of RRT, best way to reverse uremic signs and symptoms
- provides maximum replacement of GFR
- only therapy shown to improve survival in patients with ESRD
- native kidneys usually left in situ
- 2 types: deceased donor, living donor (related or unrelated)
- kidney transplanted into iliac fossa, transplant renal artery anastomosed to external iliac artery of recipient
- 1 yr renal allograft survival rates ≥90%

**Complications**

- leading causes of late allograft loss: interstitial fibrosis/tubular atrophy (IFTA) and death with functioning graft
- #1 cause of mortality in transplanted patients is cardiovascular disease
- immunosuppressant drug therapy: side effects include infections, malignancy (skin, Kaposi's sarcoma, post-transplant lymphoproliferative disorder)
- acute rejection: graft site tenderness, rise in Cr, oliguria, ± fever, although symptoms are uncommon
- de novo glomerulonephritis (usually membranous)
- new-onset diabetes mellitus (often due to prednisone use)
- cyclosporine or tacrolimus nephropathy (refer to *Small Vessel Disease*, NP18)
- chronic allograft nephropathy
  - early allograft damage caused by episodes of acute rejection and acute peritransplant injuries
  - immunologic and nonimmunologic factors (HTN, hyperlipidemia, age of donor, quality of graft, new onset diabetes)
  - transplant glomerulopathy from antibody injury causes nephrotic proteinuria
- CMV (cytomegalovirus) infection and other opportunistic infections usually occur between 1 and 6 mo post-transplant
- BK virus (polyoma virus) nephropathy can result from over-immunosuppression and lead to graft loss

## Common Medications

Table 18. Common Medications in Nephrology

Classification	Examples	Site of Action	Mechanism of Action (Secondary Effect)	Indication	Dosing	Adverse Effects
<b>Loop Diuretics</b>	furosemide (Lasix®) bumetanide (Bumex®/Buinex®) ethacrynate (Edecrin®) torsemide (Demadex®)	Thick ascending of Loop of Henle	↓ Na <sup>+</sup> /K <sup>+</sup> /2Cl <sup>-</sup> transport ± renal and peripheral vasodilatory effects (K <sup>+</sup> loss; ↑ H <sup>+</sup> secretion; ↑ Ca <sup>2+</sup> excretion)	Management of edema secondary to CHF, nephrotic syndrome, cirrhotic ascites; ↑ free water clearance (e.g. in SIADH-induced hyponatremia), ↓ BP (less effective due to short action)	furosemide: edema – 20-80 mg IV/IM/PO q6-8h (max 600 mg/d) until desired response HTN – 20-80 mg/d PO OD/bid dosing	Allergy in sulfa-sensitive individuals Electrolyte abnormalities; hypokalemia, hyponatremia, hypocalcemia, hypercalciuria (with stone formation) Volume depletion with metabolic alkalosis Precipitates gouty attacks
<b>Thiazide Diuretics</b>	hydrochlorothiazide (HCTZ) chlorothiazide (Diuril®) indapamide (Lozo®, Lozide®) metolazone (Zaroxolyn®) chlorthalidone (Hygroton®)	Distal convoluted tubule	Inhibit Na <sup>+</sup> /Cl <sup>-</sup> transporter (K <sup>+</sup> loss; ↑ H <sup>+</sup> secretion; ↓ Ca <sup>2+</sup> excretion)	1st line for essential HTN Treatment of edema Idiopathic hypercalciuria and stones Diabetes Insipidus (nephrogenic)	HCTZ: edema – 25-100 mg PO OD HTN – 12.5-25 PO OD (max 50 mg/d) nephrolithiasis/hypercalciuria – 25-100 mg OD	Hypokalemia Increased serum urate levels Precipitates gouty attacks, hypercalcemia Elevated lipids Glucose intolerance
<b>Potassium-Sparing Diuretics</b>	spironolactone (Aldactone®) triarterene (Dyrenium®) amiloride (Midamor®)	Cortical collecting duct (↓ Na <sup>+</sup> reabsorption)	Aldosterone antagonist Closes apical Na <sup>+</sup> channels directly	Reduces K <sup>+</sup> loss caused by other diuretics Edema/hypervolemia Severe CHF, ascites (spironolactone), cystic fibrosis (amiloride ↓ viscosity of secretions)	spironolactone: 25-200 mg/d OD/bid dosing HTN: 50-200 mg/d OD/bid dosing Hyperaldosteronism – 100-400 mg/d OD/bid dosing amiloride: edema/HTN: 5-10 mg PO OD	Hyperkalemia (caution with ACE inhibitor) Triarterene can be nephrotoxic (rare) Nephrolithiasis Gynecomastia (estrogenic effect of spironolactone)
<b>Combination Agents</b>	Dyazide® (triarterene + HCTZ) Aldactazide® (spironolactone + HCTZ) Moduretic® (amiloride + HCTZ) Vaseretic® (enalapril + HCTZ) Zestoretic® (lisinopril + HCTZ)		Combine ACE-inhibitor with thiazide for synergistic effect	Combine K <sup>+</sup> -sparing drug with thiazide to reduce hypokalemia		
<b>Osmotic Diuretics</b>	mannitol (Osmitol®) glycerol urea	Renal tubules (proximal and collecting duct)	Non-reabsorbable solutes increase osmotic pressure of glomerular filtrate – inhibits reabsorption of water and ↑ urinary excretion of toxic materials	To ↓ intracranial or intraocular pressure Mobilization of excess fluid in renal failure or edematous states	mannitol: ↓ ICP: 0.25-2 g/kg IV over 30-60 min	Transient volume expansion Electrolyte abnormalities (↓/↑ Na <sup>+</sup> , ↓/↑ K <sup>+</sup> )
<b>ACEI</b>	ramipril (Altace®) enalapril (Vasotec®) lisinopril (Prinivil®) trandolapril (Mavik®) captopril (Capoten®)	Lungs Tissues diffusely	Prevents angiotensin II vasoconstricting vascular smooth muscle → net vasodilation → ↓ BP Prevents angiotensin II mediated aldosterone release from adrenal cortex and action on proximal renal tubules → ↑ Na <sup>+</sup> and H <sub>2</sub> O excretion → ↓ BP Reduces fibrosis and atherogenesis	HTN Cardioprotective effects (see <a href="#">Cardiology</a> ) Renoprotective effects	ramipril: HTN – 2.5-20 mg PO OD/bid dosing renoprotective use – 10 mg PO OD  trandolapril: HTN – 1-4 mg PO OD	Cough Asthma Hyperkalemia Angioedema Agranulocytosis (captopril) Acute kidney injury Teratogenic
<b>ARB</b>	losartan (Cozaar®) candesartan (Atacand®) irbesartan (Avapro®) valsartan (Diovan®) telmisartan (Micardis®) eprosartan (Teveten®) olmesartan (Olmetec®)	Vascular smooth muscle, adrenal cortex, proximal tubules	Competitive inhibitor at the angiotensin II receptor: prevents angiotensin II vasoconstricting action on vascular smooth muscle → ↓ BP Prevents angiotensin II mediated aldosterone release from adrenal cortex and action on proximal renal tubules → ↑ Na <sup>+</sup> and H <sub>2</sub> O excretion	HTN Cardioprotective effects (see <a href="#">Cardiology</a> ) Renoprotective effects	HTN: losartan 25-100 mg PO OD candesartan 8-32 mg PO OD irbesartan 150-300 mg PO OD valsartan 80-320 mg PO OD telmisartan 20-80 mg PO OD eprosartan 400-800 mg PO OD olmesartan 20-40 mg PO OD	Hyperkalemia Caution – reduce dose in hepatic impairment Acute kidney injury Teratogenic
<b>Renin Antagonists</b>	aliskiren (Rasilez®)	Direct renin antagonist	Inhibits renin production and activity Cardioprotective and renoprotective abilities being evaluated	HTN	aliskiren 150-300 mg PO OD	Hyperkalemia

## Landmark Nephrology Trials

Trial	Reference	Results
4D	<i>NEJM</i> 2005; 353:238-48	Patients with type 2 DM receiving maintenance hemodialysis were randomized to 20 mg of atorvastatin per day or matching placebo. No difference in composite index of death from cardiac causes, nonfatal myocardial infarction, and stroke
AASK	<i>JAMA</i> 2001; 285:2719-28	Ramipril, compared with amlodipine, slows progression of hypertensive renal disease and proteinuria and may benefit patients without proteinuria as well.
ACEI and Diabetic	<i>NEJM</i> 1993; 329:1456-62	Captopril protects against deterioration in renal function in insulin-dependent diabetic nephropathy and is significantly more effective than blood-pressure control alone
ALTITUDE	Early Termination (Unpublished Results; protocol – <i>NDT</i> 2009; 24:1663-71)	Combining Aliskiren with ACEI or ARB in high-risk patients with type 2 diabetes leads to increased incidence of nonfatal stroke, hyperkalemia and hypotension
ASTRAL	<i>NEJM</i> 2009; 361:1953-62	Renal artery revascularization compared to medical therapy does not improve renal function, BP, renal or cardiovascular events, or mortality and carries significant operative risks
AURORA	<i>NEJM</i> 2009; 360:1395-407	Patients receiving maintenance hemodialysis randomized to rosuvastatin 10 mg daily or placebo. Rosuvastatin lowered the LDL cholesterol level but had no significant effect on the composite primary end point of death from cardiovascular causes, nonfatal myocardial infarction, or nonfatal stroke
BENEDICT	<i>NEJM</i> 2004; 351:1941-51	Treatment with ACEI trandolapril alone or trandolapril combined with verapamil decreased the incidence of microalbuminuria in patients with type 2 diabetes and hypertension with normoalbuminuria
CHOIR	<i>NEJM</i> 2006; 355:2085-98	Patients with CKD were randomly assigned to receive a dose of epoetin alfa targeted to achieve a hemoglobin level of 13.5 g/dL or 11.3 g/dL. The higher target group had an increased risk of death, myocardial infarction, hospitalization for congestive heart failure (without renal replacement therapy), or stroke
CREATE	<i>NEJM</i> 2006; 355:2071-84	Patients with CKD (15-35 mL/min) and mild to moderate anemia (11-12.5 g/dL) were randomized to normal (13-15 g/dL) or sub-normal (10.5-11.5 g/dL) hemoglobin levels. Early and complete correction of hemoglobin did not reduce the risk of cardiovascular events
DETAIL	<i>NEJM</i> 2004; 351:1952-61	The ARB telmisartan and the ACEI enalapril are equally effective in slowing renal function deterioration in type 2 diabetes with mild to moderate hypertension and early nephropathy
ELITE-SYMPHONY	<i>NEJM</i> 2007; 357:2562-75	Daclizumab induction, MMF, steroids and low-dose tacrolimus effectively maintain stable renal function following renal transplantation, without the negative effects on renal function commonly reported for standard CNi regimens
FHN	<i>NEJM</i> 2010;363:2287-300	Patients were randomized to dialysis 6x/wk (frequent) or 3x/wk (conventional). Frequent hemodialysis was associated with improvement in composite outcomes of death or change in left ventricular mass and death or change in a physical-health composite score. Frequent hemodialysis caused more frequent interventions related to vascular access
HEMO	<i>NEJM</i> 2002; 347:2010-19	Use of high dose dialysis or high flux membranes versus standard dose or low flux in thrice-weekly dialysis does not improve survival or outcomes. Possible benefit in cardiac-related outcomes with high flux membranes
IDEAL	<i>NEJM</i> 2010; 363:609-19	Patients with progressive CKD and GFR between 10 and 15 mL/min randomized to initiate dialysis at GFR of 10-14 mL/min (early) or 5-7 mL/min (late). Early initiation of dialysis in patients with stage V chronic kidney disease was not associated with an improvement in survival or clinical outcomes
IDNT	<i>NEJM</i> 2001; 345:851-60	Treatment with irbesartan reduced the risk of developing end-stage renal disease and worsening renal function in patients with type 2 DM and diabetic nephropathy
IRMA	<i>NEJM</i> 2001; 345:870-8	Irbesartan is renoprotective independently of its blood-pressure lowering effect in patients with type 2 diabetes and microalbuminuria
MDRD	<i>Ann Intern Med</i> 1995; 123:754-62	Blood pressure target for patients with proteinuria of more than 1 g/d should have a target BP of less than 125/75. For patients with proteinuria of 0.25 to 1.0 g/d should have a target BP of less than 130/80
ONTARGET	<i>Lancet</i> 2008; 372:547-53	Telmisartan and ramipril monotherapy reduced proteinuria and rise in creatinine in patients with high vascular risk; combination of the two agents led to increased acute renal failure episodes, syncope and hypotension

Trial	Reference	Results
REIN	<i>Lancet</i> 1999; 354:359-64	In non-diabetic nephropathy, ACEI were renoprotective in patients with non-nephrotic range proteinuria
REIN2	<i>Lancet</i> 2005; 365:939-46	In non-diabetic nephropathy already on ACEI, no further benefit from intensified BP control (sBP/dBP < 130/80) by adding a CCB versus conventional BP control (dBP < 90) on ACEI alone
RENAAL	<i>NEJM</i> 2001; 345:861-9	Losartan conferred significant renal benefits in patients with type 2 diabetes and nephropathy and was generally well-tolerated
RENAL	<i>NEJM</i> 2009; 361:1627-38	High intensity continuous renal-replacement therapy in acute kidney injury does not improve survival or outcomes compared to low intensity treatment, and is associated with higher rates of hypophosphatemia
ROAD	<i>JASN</i> 2007; 18:1889-98	Up-titration of either ACEI benazepril or ARB losartan to optimal anti-proteinuria doses conferred benefit on renal outcome in patients without diabetes who had proteinuria and renal insufficiency
SHARP	<i>Lancet</i> 2011; 377:2181-92	Randomized placebo-controlled trial in patients with CKD and no history of MI or coronary revascularization simvastatin 20 mg plus ezetimibe 10 mg daily versus matching placebo. Reduction of LDL cholesterol with simvastatin 20 mg plus ezetimibe 10 mg daily reduced the incidence of major atherosclerotic events in patients with CKD
TREAT	<i>NEJM</i> 2009; 361:2019-32	Patients with type 2 DM, CKD and anemia were randomized to darbepoetin targeting a hemoglobin of 13 g/dL or placebo. Darbepoetin did not reduce the risk of either death, a cardiovascular event or a renal event and was associated with an increased risk of stroke

## The Neurological Exam

### General Exam and Mental Status

- **vitals:** pulse (especially rhythm), BP, temperature
- **H&N:** meningismus, head injury/bruises, (signs of basal skull fracture: Battle's sign, raccoon eyes, hemotympanum, rhinorrhea), tongue biting
- **CVS:** carotid bruits, heart murmurs
- **mental status:** orientation (person, place, time), LOC (GCS)
  - GCS/15 – Motor/6, Verbal/5 (T= intubated), Eyes/4
- **cognition:**
  - Folstein MMSE – /30 ( $\leq 24$  indicative of dementia)
  - MoCA – /30 ( $\geq 26$  is considered normal)
  - frontal lobe testing (for perseveration)
  - clock drawing

Visit Online Atlas for Cranial Nerve Exam, Motor Exam, Sensory Exam Examination Techniques.

Battle's sign = mastoid ecchymosis

Raccoon eyes = periorbital ecchymosis

When testing CN1, avoid noxious smells like ammonia, as this tests CNV.

If patient has not brought their glasses, have them look through a pinhole for best corrected vision.

**CN Innervation of EOM**  
LR: CNVI, SO: CNIV, Other: CN3.

Contraction of the left sternocleidomastoid turns the head right.

**Caloric Reflexes**  
Describe nystagmus by direction of fast component

#### COWS

Cold  
Opposite  
Warm  
Same

#### Upper Motor Neuron Tests

**Babinski Reflex:** 'Up-going' big toe  $\pm$  fanning of toes indicates an UMN lesion.

**Hoffman Reflex:** Flexion of IP joint of the thumb when tapping the nail of the index or ring finger may indicate an UMN lesion if asymmetrical.

**Pronator Drift:** Patients are unable to maintain arm extension and supination in an UMN lesion.

### Cranial Nerves Exam

- **olfactory (CNI):** odour sensation (test each nostril separately)
- **optic (CNII)**
  - a. visual acuity: test each eye individually using best corrected vision
  - b. visual fields
  - c. pupil: direct and consensual pupillary reaction (afferent limb), accommodation, swinging flashlight test (see *Relative Afferent Pupillary Defect*, [Ophthalmology](#), OP33)
  - d. funduscopy: optic disc edema, optic disc pallor, venous pulsations, hemorrhages
- **extra ocular movements (EOM)**
  - a. **oculomotor (CNIII):** levator palpebrae superioris, medial rectus, superior rectus, inferior rectus, inferior oblique, efferent limb of pupillary light response
  - b. **trochlear (CNIV):** superior oblique
  - c. **abducens (CNVI):** lateral rectus
- **trigeminal (CNV)**
  - a. sensory: V1 (above supraorbital ridge), V2 (buccal area), V3 (mandible), corneal reflex (afferent)
  - b. motor: temporalis, masseter, pterygoids, jaw jerk reflex
- **facial (CNVII)**
  - a. sensorimotor: muscles of facial expression, hyperacusis (stapedius), corneal reflex (efferent)
  - b. visceral sensory: taste of anterior 2/3 of tongue
  - c. visceral motor: salivary and lacrimal glands
- **vestibulocochlear (CNVIII)**
  - a. vestibular: nystagmus, caloric reflexes
  - b. cochlear: Rinne, Weber
- **glossopharyngeal (CNIX) and vagus (CNX):** palatal elevation, gag reflex, vocal cord function, swallowing, taste of posterior third of tongue
- **accessory (CNXI):** trapezius and sternocleidomastoid strength
- **hypoglossal (CNXII):** tongue muscle bulk, fasciculations, strength

### Motor Exam

- **bulk:** atrophy, asymmetry
- **abnormal movements:** tremors, chorea, dystonia, dyskinesia, hemiballism, myoclonus, athetosis, tics, fasciculations
- **abnormal posturing:** decerebrate, decorticate
- **tone:** hypotonia (flaccid), hypertonia (spasticity, rigidity, paratonia), cogwheeling
- **strength**
- **reflexes:** deep tendon reflexes, abdominal reflexes, primitive reflexes, Babinski, Hoffman, clonus

Table 1. Localization of Motor Deficits

	LMN	UMN	Extrapyramidal
<b>Muscle Tone</b>	Flaccid	Spastic	Rigid
<b>Involuntary Movements</b>	Fasciculations	None	Present (e.g. tremor)
<b>Reflexes</b>	Decreased	Increased	Normal
<b>Plantar Reflex</b>	Down-going (flexor)	Up-going (extensor)	Down-going (flexor)
<b>Pattern of Muscle Weakness</b>	Proximal, distal or focal	<b>Upper extremities:</b> extensors weaker than flexors <b>Lower extremities:</b> flexors weaker than extensors	None

Table 2. Overview of Neuromuscular Diseases

	Upper and Lower Motor Neuron Disease	Peripheral Neuropathy	Neuromuscular Junction	Myopathy
<b>SIGNS AND SYMPTOMS</b>				
Weakness	Segmental and asymmetrical, distal → proximal	Distal (except GBS) but may be asymmetrical	Proximal and fatiguable	Proximal
Fasciculations	Yes	Yes	No	No
Reflexes	Increased	Decreased/absent	Normal	Normal (until late)
Sensory	No	Yes	No	No
Autonomic*	No	Yes	No	No
<b>TESTS</b>				
EMG	Denervation and reinnervation	Signs of demyelination ± axonal loss	Decremental response in MG Jitter on single fibre EMG	Small, short motor potentials
NCS	Normal	Abnormal	Normal	Normal
Muscle enzyme	Normal	Normal	Normal	Increased

\*e.g. orthostatic hypotension, anhydrosis, visual blurring, urinary hesitancy or incontinence, constipation, erectile dysfunction

Table 3. Approach to Strength Testing of Radiculopathies versus Peripheral Neuropathies

How to use this table: For each nerve root, learn two (or more) peripheral nerves (and their associated muscles/movements). In radiculopathies, all associated peripheral nerves (and their movements) will be impaired, whereas in peripheral neuropathies, only one of the nerves (and its movement) will be impaired, sparing the other nerve. Especially useful peripheral nerve "pairs" are bolded for emphasis.

Root	Peripheral Nerve	Movement	Muscle
C5	Axillary	Shoulder abduction	Deltoid
C6	Musculocutaneous (C5/6) Radial (C6)	Elbow flexion Elbow flexion Wrist extension	Biceps Brachioradialis Extensor carpi radialis longus
C7	Radial Posterior interosseus	Elbow extension Finger extension	Triceps Extensor digitorum communis
C8, T1	<b>Median</b>  <b>Ulnar</b>	Thumb flexion Thumb abduction Opposition Finger abduction	Flexor pollicis longus (look for thenar wasting) Abductor pollicis brevis (look for thenar wasting) Opponens pollicis (look for thenar wasting) First dorsal interosseus (look for wasting in first dorsal webbed space)
L2, 3, 4	<b>Femoral</b> <b>Obturator</b>	Hip flexion Hip adduction	Iliopsoas Adductor muscles
L3, 4	Femoral (L3/4) Deep peroneal (L4/5)	Knee extension Dorsiflexion	Quadriceps Tibialis anterior
L5	Sciatic (L5, S1) <b>Tibial</b> <b>Superficial peroneal</b> Deep peroneal	Hip extension Ankle inversion Ankle eversion Big toe extension	Gluteus maximus Tibialis posterior Peroneal muscles
S1	Sciatic Tibial	Knee flexion Plantar flexion	Hamstring muscles Gastrocnemius and soleus

#### Pyramidal Pattern of Muscle Weakness (i.e. UMN)

Weaker arm extensors: shoulder abduction, elbow extension, wrist extension, finger extension, finger abduction.

Weaker leg flexors: hip flexion, knee flexion, ankle dorsiflexion.

#### MRC Muscle Strength Scale

- 5 Full power
- 4 Submaximal power against resistance (ranging 4+, 4, 4-)
- 3 Full ROM against gravity without resistance
- 2 Full ROM with gravity removed
- 1 Muscle flicker
- 0 No muscle contraction

#### Primitive Reflexes

Grasp, palmomental, root, glabellar tap, snout.

#### Deep Tendon Reflexes

Root	Muscle Tendon
------	---------------

C5/6	Biceps
C6	Brachioradialis
C7	Triceps
C8	Finger flexors
L2/3	Hip adductors
L3/4	Knee extensors
S1/2	Plantar flexion

#### Deep Tendon Reflex Scoring

0	Absent
1+	Depressed
2+	Normal
3+	Increased
4+	Clonus (≥4 beats)

## Sensory Exam

- **primary sensation**
  - spinothalamic tract: pain and temperature
  - dorsal column: proprioception and vibration
- **cortical sensation**
  - graphesthesia, stereognosis, extinction, 2-point discrimination

## Coordination Exam and Gait

- **coordination exam**
  - finger-to-nose, heel-to-shin, rapid alternating movements, “scanning” speech
- **stance and gait**
  - gait: antalgic, hemiplegic, ataxic, apraxic, festination, foot drop, broad-based
  - tandem gait (heel-to-toe walking)
  - Romberg test
  - pull test for retropulsion

A slow or uncoordinated rapid alternating movement can also be a sign of subtle weakness or Parkinsonism.

### Romberg Test

Stable with eyes open and closed = normal.

Stable with eyes open, falls with eyes closed = +ve Romberg, suggesting loss of joint position sense.

## Basic Anatomy Review

Figure 1. Brainstem (axial view)

Figure 2. Brainstem (posterior view)

See Functional Neuroanatomy software

Figure 3. Discriminative touch pathway (dorsal column) from body

Figure 4. Spinothalamic tract from body

Figure 5. Discriminative touch pathway (dorsal column) from face

Figure 6. Spinothalamic tract pathway from face

Figure 7. Corticospinal motor pathway

Figure 8. Sympathetic and parasympathetic pathway

Figure 9. Dermatome map

**Myotomes**

- C5 – Shoulder abduction/elbow flexion
- C6 – Wrist extensors
- C7 – Elbow extension
- C8 – Squeeze hand
- T1 – Abduct fingers
- T2-9 – Intercostal (abdominal reflexes)
- T9-10 – Upper abdominals
- T11-12 – Lower abdominals
- L2 – Flex hip
- L3 – Hip adduction
- L4 – Knee extension and ankle dorsiflexion
- L5 – Ankle dorsiflexion and big toe extension
- S1 – Plantarflexion

# Lumbar Puncture

## Indications

- diagnostic: CNS infection (meningitis, encephalitis), inflammatory disorder (MS, Guillain-Barré, vasculitis), subarachnoid hemorrhage (if CT negative), CNS neoplasm (neoplastic meningitis)
- therapeutic: to administer anesthesia, chemotherapy, contrast media; to decrease intracranial pressure (pseudotumour cerebri, normal pressure hydrocephalus)

## Contraindications

- mass lesion causing increased intracranial pressure (ICP) – could lead to cerebral herniation
  - require CT first
- infection over lumbar puncture (LP) site/suspected epidural abscess
- low platelets (<50,000) or treatment with anticoagulation (high INR or aPTT)
- uncooperative patient

## Complications

- tonsillar herniation
- post-LP headache (5-40%): worse when upright, better supine; generally onset within 24 h
  - prevention: smaller gauge (i.e. 22) needle, reinsert stylet prior to needle removal, blunt-ended needle
  - symptomatic treatment: caffeine and sodium benzoate injection
  - corrective treatment: blood patch (autologous)
- spinal epidural hematoma
- infection

## What to send LP for

- **tube #1: cell count and differential:** RBCs, WBCs and differential
  - xanthochromia (yellow bilirubin pigmentation implies recent bleed into CSF)
- **tube #2: chemistry:** glucose (compare to serum glucose) and protein
- **tube #3: microbiology:** Gram stain and C&S
  - specific tests depending on clinical situation/suspicion
    - ♦ viral: PCR for herpes simplex virus (HSV) and other viruses
    - ♦ bacterial: polysaccharide antigens of *H. influenzae*, *N. meningitidis*, *S. pneumoniae*
    - ♦ fungal: Cryptococcal antigen, India ink stain (cryptococcus), culture
    - ♦ TB: acid-fast stain, TB culture, TB PCR
- **tube #4: cytology:** for evidence of malignant cells
- **tube #5: cell count:** compare RBC count to that of tube #1
  - **note:** tube 4 or 5 can be sent for repeat cell count

Table 4. Lumbar Puncture Interpretation (Normal vs. Various Infectious Causes)

Condition	Colour	Protein	Glucose	Cells
<b>NORMAL</b>	Clear	<0.45 g/L	60% of serum glc or >3.0 mmol/L	0-5 WBC, 0 RBC, 0 PMNs
<b>INFECTIOUS</b>				
<b>Viral infection</b>	Clear or opalescent	Normal or slightly increased <0.45-1 g/L	Normal	<1000x10 <sup>6</sup> /L Lymphocytes mostly, some PMNs
<b>Bacterial infection</b>	Opalescent yellow, may clot	>1 g/L	Decreased (<25% serum glc or <2.0 mmol/L)	>1000x10 <sup>6</sup> /L PMNs
<b>Granulomatous infection</b> (tuberculosis, fungal)	Clear or opalescent	Increased but usually <5 g/L	Decreased (usually <2.0-4.0 mmol/L)	<1000x10 <sup>6</sup> /L Lymphocytes

The needle for a lumbar puncture is inserted into one of L3-4, L4-5 or L5-S1 interspaces.

Do not delay antibiotics while waiting for a lumbar puncture if infection is suspected.

RBCs in tube #1 > #5 → traumatic tap  
RBCs in tube #1 = #5 → SAH

# Approach to Common Presentations

## Weakness

### Approach

- **mode of onset:** abrupt (vascular, toxic, metabolic), subacute (neoplastic, infective, inflammatory), insidious (hereditary, degenerative, endocrinologic, neoplastic)
- **course:** worse at onset (vascular), progressive (neoplastic, degenerative, infective), episodic (vascular, inflammatory), activity dependent (NMJ, muscular)
- **pattern:** objective vs. subjective, generalized vs. localized, asymmetric vs. symmetric, proximal vs. distal, UMN vs. LMN, peripheral vs. myotomal
- **associated symptoms:** sensory symptoms, cortical symptoms, spinal symptoms (i.e. bowel/bladder dysfunction), signs/symptoms specific to various etiologies
- **history:** family history, developmental history, medications, risk factors, recent/preceding exposures
- **investigations for LMN:** NCS/EMG
- **investigations for UMN:** imaging (brain and/or spinal cord)

### Differential Diagnosis

- objective muscle weakness
  - generalized:
    - ♦ myopathy (muscular dystrophy, polymyositis, vasculitis, collagen vascular, HIV, CMV, influenza, steroids, statins, alcohol, hypothyroidism, Cushing's syndrome, electrolyte disorders)
    - ♦ NMJ (MG, botulism, LEMS, organophosphate poisoning)
    - ♦ cachexia
  - localized:
    - ♦ UMN (leukodystrophy, vasculitis, abscess, brain tumour, vitamin B<sub>12</sub> deficiency, MS, stroke)
    - ♦ anterior horn cell (spinal muscular atrophy, ALS, polio, paraneoplastic, lead toxicity)
    - ♦ peripheral neuropathy (peroneal muscle atrophy, GBS, leprosy, amyloid, myeloma, DM, lead toxicity)
- no objective muscle weakness
  - chronic illness (cardiac, pulmonary, anemia, infection, malignancy)
  - depression, deconditioning
- if loss of passive motion, consider intra-articular, peri-articular or extra-articular causes

## Numbness/Altered Sensation

### Approach

- positive sensory symptoms: paresthesia/dysesthesia= tingling, pins and needles, prickling, burning, stabbing
- negative sensory symptoms: hypoesthesia/anaesthesia= numbness, diminution or absence of feeling
- determine distribution of sensory loss: nerve root vs. peripheral nerve
- investigations: NCS, vitamin B<sub>12</sub> levels, imaging based on associated findings

### Differential Diagnosis

- cerebral: stroke, demyelination, tumour
  - associated symptoms: hemiplegia, aphasia, apraxia
- brainstem: stroke, demyelination, tumour
  - associated symptoms: diplopia, vertigo, dysarthria, dysphagia
- spinal cord/radiculopathy: cord infarction, tumour, MS, syringomyelia, vitamin B<sub>12</sub> deficiency, disc lesion
  - associated symptoms: back/neck pain, weakness (paraparesis or Brown-Séquard pattern)
- neuropathy: focal compressive neuropathy (based on location and distribution), DM, uremia, vasculitis, B<sub>12</sub> deficiency, HIV, Lyme disease, alcohol, paraneoplastic, amyloid

## Cranial Nerve Deficits

### CN I: Olfactory Nerve

#### Clinical Features

- absence of sense of smell associated with a loss of taste

#### Differential Diagnosis

- **nasal:** physical obstruction
  - heavy smoking, chronic rhinitis, sinusitis, neoplasms, septal deformity, choanal atresia, vestibular stenosis, foreign body
- **olfactory neuroepithelial:** destruction of receptors or their axon filaments
  - influenza, herpes simplex, interferon treatment of hepatitis C virus, atrophic rhinitis (leprosy)
- **central:** lesion of olfactory pathway
  - Kallmann's syndrome, albinism, head injury, cranial surgery, SAH, chronic meningeal inflammation, meningioma, aneurysm, PD, stroke, MS
- **endocrine/metabolic**
  - DM, adrenal hypo/hyperfunction, pseudohypoparathyroidism, hypothyroidism, renal/liver failure, vitamin deficiency

If anosmia is not associated with loss of taste, consider malingering.

Kallmann's syndrome is a congenital disorder of anosmia and hypogonadotropic hypogonadism.

### CN II: Optic Nerve

- see *Neuro-Ophthalmology*, N11

**Figure 10. Diagnostic positions of gaze to isolate primary action of each muscle**

## CN III: Oculomotor Nerve

### Clinical Features

- ptosis, resting eye position is “down and out” (depressed and abducted), pupil dilated (mydriasis)
- vertical and horizontal diplopia; paralysis of adduction, elevation and depression

### Differential Diagnosis

- PCOMM aneurysm:** early mydriasis, then CN III palsy
- cavernous sinus** (internal carotid aneurysm, meningioma, sinus thrombosis): associated with deficits in other CNs near the cavernous sinus (see Figure 11)
- ischemia of CNIII** (DM, temporal arteritis, HTN, atherosclerosis): pupil sparing CN III palsy
- midbrain lesion:** complete unilateral CNIII palsy with bilateral weakness of the superior rectus and ptosis with contralateral pyramidal signs  $\pm$  mydriasis
- orbital lesion:** associated with optic neuropathy, chemosis, proptosis
- other** (inflammatory, infection, neoplasia, uncal herniation, trauma)

Figure 11. Cavernous sinus (coronal view)

Pupillary constrictor fibres run along outside of nerve, whereas vasculature is contained within nerve.  
For CN III palsy with a reactive pupil, always think ischemic cause (“pupil sparing”).  
For CN III palsy with mydriasis, think compressive lesion.

### DDx of CNIII Palsy

**iCAM**  
ischemic  
Cavernous sinus  
Aneurysm (PCOMM, IC)  
Midbrain lesion

Lesions involving the cavernous sinus can lead to cranial nerve palsies of III, IV, VI, V1 and V2 as well as orbital pain and proptosis.

CN IV is the only cranial nerve that crosses the midline and exits posteriorly. A CN IV lesion may cause a contralateral deficit.

CN IV is at risk of trauma during neurosurgical procedures involving the midbrain because of its long intracranial course.

Jaw deviation is towards the side of a LMN CN V lesion.

### Distinguishing CN III, IV, and VI Lesions

	III	IV	VI
<b>Diplopia</b>	Oblique	Vertical	Horizontal
<b>Exacerbating</b>	Near target	Looking down	Far target
<b>Head tilt</b>	Up and rotated away	Down and flexed away	Rotated towards

CN VI has the longest intracranial course and is vulnerable to increased ICP, creating a false localizing sign.

## CN IV: Trochlear Nerve

### Clinical Features

- vertical and torsional diplopia; defect of intorsion and depression
- patient may complain of difficulty going down stairs or reading

### Differential Diagnosis

- common: ischemic (DM, HTN), idiopathic, trauma (TBI or surgical), congenital
- other: cavernous sinus lesion, superior orbital fissure (tumour, granuloma)

## CN V: Trigeminal Nerve

### Clinical Features

- ipsilateral facial numbness, weakness of muscles of mastication (V3 only) with pterygoid deviation towards the side of the lesion

### Differential Diagnosis

- brainstem** (ischemia, tumour, syringobulbia, demyelination)
- peripheral** (tumour, aneurysm, chronic meningitis, metastatic infiltration of nerve)
- trigeminal ganglion** (acoustic neuroma, meningioma, fracture of middle fossa)
- cavernous sinus** (carotid aneurysm, meningioma, sinus thrombosis)
- trauma**
- note: other CN V lesions that cause facial pain = trigeminal neuralgia, herpes zoster

## CN VI: Abducens Nerve

### Clinical Features

- resting inward deviation (esotropia)
- horizontal diplopia; defect of lateral gaze

### Differential Diagnosis

- pons** (infarction, hemorrhage, demyelination, tumour): associated with facial weakness and contralateral pyramidal signs
- tentorial orifice** (compression, meningioma, trauma): false localizing sign of increased ICP
- cavernous sinus** (carotid aneurysm, meningioma, sinus thrombosis)
- ischemia of CN VI** (DM, temporal arteritis, HTN, atherosclerosis)
- congenital** (Duane's syndrome)

## CN VII: Facial Nerve

### Clinical Features

- LMN lesion: ipsilateral facial weakness (facial droop, flattening of forehead, inability to close eyes, flattening of nasolabial fold)
- UMN lesion: contralateral facial weakness with forehead sparing (due to bilateral frontalis innervation)
- impaired lacrimation, decreased salivation, numbness behind auricle, hyperacusis, taste dysfunction of anterior 2/3 of tongue

### Differential Diagnosis

- **idiopathic** = Bell's Palsy, 80-90% of cases (see [Otolaryngology](#), OT22)
  - most often related to HSV, but other viruses may be implicated (CMV, herpes zoster, EBV)
- **other**: temporal bone fracture, EBV, Ramsay-Hunt (HSV), otitis media/mastoiditis, sarcoidosis, DM mononeuropathy, parotid gland disease, Lyme meningitis, HIV

Figure 12. UMN vs. LMN facial nerve palsy

## CN VIII: Vestibulocochlear Nerve

- see [Otolaryngology](#), OT12

## CN IX: Glossopharyngeal Nerve

### Clinical Features

- unilateral lesion is rare
- taste dysfunction in posterior 1/3 of tongue
- absent gag reflex and dysphagia

### Disorders

- **glossopharyngeal neuralgia**: sharp paroxysmal pain of posterior pharynx radiating to ear, triggered by swallowing
  - treated with carbamazepine or surgical ablation of CN IX

## CN X: Vagus Nerve

### Clinical Features

- oropharyngeal dysphagia (transfer dysphagia) due to palatal and pharyngeal weakness
  - neuromuscular causes of dysphagia:
    - ♦ CNS: stroke, cerebral palsy, tumour, trauma, PD, AD, MS
    - ♦ CN: DM, laryngeal nerve palsy, polio, ALS
    - ♦ myopathic/NMJ: dermatomyositis, polymyositis, MG, sarcoidosis
  - other causes of dysphagia: see [Gastroenterology](#), G8
- dysarthria: inability to produce understandable speech due to impaired phonation and/or resonance

Forehead is spared in a UMN CN VII lesion due to bilateral innervation of CN VII nuclei from cerebral hemispheres for the frontalis.

### Facial Nerve Branch Memory Aid

#### To Zanzibar By Motor Car

Temporal  
Zygomatic  
Buccal  
Mandibular  
Cervical

When screening for dysphagia and assessing aspiration risk, the presence of a gag reflex is insufficient. The correct screening test is to observe the patient drinking water from a cup while observing for any coughing, choking, or "wetness" of voice.

### Differential Diagnosis of Lower Cranial Nerve Deficits (CN IX, X, XI, XII)

**Intracranial/skull base**: meningioma, neurofibroma, metastases, osteomyelitis, meningitis.  
**Brainstem**: stroke, demyelination, syringobulbia, poliomyelitis, astrocytoma.  
**Neck**: trauma, surgery, tumours.

Normal swallowing is initiated when the tongue moves a bolus back into the palatal archway. Tongue movements are innervated exclusively by CN XII. The bolus stimulates the soft palate to elevate and the bolus is deflected into the oropharynx. Next the pharyngeal constrictors contract, the larynx elevates, and the vocal cords close. Swallowing depends on afferent information via CN V, IX, and X and motor action via CN V, VII, IX, X, and XII.

Connections in the nucleus of the tractus solitarius in the medulla (in proximity to the respiratory centre), act as the swallowing centre. Swallowing and breathing are coordinated to prevent aspiration.

Uvula deviation is **away from** the side of a LMN CN X lesion due to impaired ipsilateral palatal elevation.

## CN XI: Accessory Nerve

### Clinical Features

- LMN lesion: paralysis of ipsilateral trapezius and sternocleidomastoid (ipsilateral shoulder drop, weakness on turning head to contralateral side)
- UMN lesion: paralysis of ipsilateral sternocleidomastoid and contralateral trapezius

CN XI is vulnerable to damage during neck surgery.

## CN XII: Hypoglossal Nerve

### Clinical Features

- LMN lesion: tongue deviation towards lesion; ipsilateral tongue atrophy and fasciculations (if chronic)
- UMN lesion: tongue deviation away from lesion; absence of atrophy and fasciculations

Ipsilateral tongue paralysis with contralateral hemiparesis/sensory symptoms is pathognomonic for a medial medullary infarction.

## NEURO-OPHTHALMOLOGY

### Abnormalities of Vision

- see [Ophthalmology](#), OP3

### Acute Visual Loss

- see [Ophthalmology](#), OP3

### Optic Neuritis

- see *Optic Disc Edema* below, *Multiple Sclerosis*, N46

### Anterior Ischemic Optic Neuropathy

- see also *Optic Disc Edema*, below
- **non-arteritic (NAION)**: due to atherosclerosis
- **arteritic (AION)**: due to giant cell arteritis (see [Rheumatology](#), RH20)

If you suspect the diagnosis of giant cell arteritis do not wait for biopsy results. Begin treatment immediately!

NAION can be caused by use of Sildenafil (Viagra®) in rare cases.

### Amaurosis Fugax

- see [Ophthalmology](#), OP37 and *Stroke*, N43

### Central Retinal Vein Occlusion (CRVO)

- see [Ophthalmology](#), OP24

### Optic Disc Edema

Table 5. Common Causes of Optic Disc Edema

	Optic Neuritis	Papilledema	AION	CRVO
<b>Age</b>	<50	Any	>50 but usually >70	>50
<b>Vision</b>	Rapidly progressive monocular central vision loss with ↓ acuity and colour vision with recovery	Late visual loss	Painless unilateral acute field defect over hours to days with ↓ colour vision	Painless unilateral variable vision loss
<b>Symptoms</b>	Pain (especially with eye movement)	Headache, n/v, local neurological deficits	If GCA: headache, scalp tenderness, jaw claudication, weight loss, fatigue	Cardiovascular risk factors
<b>Pupil</b>	RAPD	No RAPD	RAPD	± RAPD

**Table 5. Common Causes of Optic Disc Edema (continued)**

	Optic Neuritis	Papilledema	AION	CRVO
<b>Fundus</b>	Disc swelling if anterior Normal disc if retrobulbar	Bilateral disc swelling, retinal hemorrhage, no venous pulsations	Pale segmental disc edema, retinal dot, flame hemorrhages	Swollen disc, venous engorgement, retinal hemorrhage
<b>Etiologies</b>	MS, viral	Increased ICP	Giant cell arteritis Non-arteritic: atherosclerosis	Associated with vasculopathy, thrombus
<b>Investigations</b>	MRI with gadolinium	Emergent CT; LP if CT is normal to measure opening pressure	CBC, ESR, CRP, temporal artery biopsy	Fluorescein angiogram and coherence tomography
<b>Treatment</b>	IV methylprednisolone	Treat cause	Consider ASA if non-arteritic; steroids if arteritic	Optimize risk factors, reduce IOP, $\pm$ laser, $\pm$ VEGF inhibitors

## Optic Disc Atrophy

- **etiologies:** glaucoma, AION, compressive tumour, optic neuritis, Leber's hereditary optic neuropathy, congenital
- **presentation:** disc pallor, low visual acuity, peripheral vision defect, decreased colour vision
- **treatment:** none (irreversible), aim to prevent

## Abnormalities of Visual Field

**Figure 13. Characteristic visual field defects with lesions along the visual pathway**

### Bitemporal Hemianopsia DDX by Age

- Children: craniopharyngioma
- Middle aged (20s to 50s): pituitary mass
- Elderly (>60 yr): meningioma

In homonymous hemianopsia, more congruent deficits are caused by more posterior lesions. Macular sparing may occur with occipital lesions.

Check all hemiplegic patients for homonymous hemianopsia (ipsilateral to side of hemiplegia).

## Abnormalities of Eye Movements

### Disorders of Gaze

#### Pathophysiology

- horizontal gaze: FEF  $\rightarrow$  contralateral PPRF (midbrain/pons)  $\rightarrow$  eyes saccade away from FEF
- vertical gaze: cortex  $\rightarrow$  rostral interstitial nucleus in the MLF (midbrain)

#### Clinical Features

- unilateral lesion in one FEF  $\rightarrow$  eyes deviate toward the side of the lesion
  - can be overcome with doll's eye maneuver
- unilateral lesion in the PPRF  $\rightarrow$  eyes deviate away from the lesion
  - cannot be overcome with doll's eye maneuver if CN VI nucleus lesion as well
- seizure involving a FEF: eyes deviate away from the focus

#### Etiology

- common: infarcts (frontal or brainstem), MS, tumours

A lesion in a cerebral hemisphere causes eyes to "look away" from the hemiplegia, and to look towards the lesion.

A lesion in the brainstem causes the eyes to "look toward" the side of the hemiplegia, and to look away from the lesion.

## Internuclear Ophthalmoplegia (INO)

### Pathophysiology

- results from a lesion in MLF which disrupts coordination between CN VI nucleus in pons and the contralateral CNIII nucleus in midbrain → disrupts conjugate horizontal gaze

### Clinical Features

- horizontal diplopia on lateral gaze, oscillopsia
- on gaze away from the side of the lesion (see Figure 14)
  - ipsilateral adduction defect
  - contralateral abduction nystagmus
- cannot be overcome by caloric testing
- accommodation reflex intact
- may be bilateral (especially in MS)

### Etiology

- common: MS, brain stem infarct

### Investigations

- MRI

Figure 14. Internuclear ophthalmoplegia

Diplopia worse at the end of the day suggests myasthenia gravis (e.g. fatiguable).

If CN deficit is causing diplopia, it is worst in the direction of action of the muscle, but if restriction/entrapment is the cause, then diplopia is worst when trying to stretch the muscle (opposite direction).

If diplopia is only on extremes of gaze, cover each eye in isolation during extremes of gaze.

The covered eye that makes the lateral image disappear is the pathological one.

## Diplopia

### Etiology – Monocular

- mostly due to relatively benign optical problems (refractive error, cataract) or functional

### Etiology – Binocular (due to ocular misalignment)

- muscle
  - Graves' ophthalmopathy
  - EOM restriction/entrapment
- neuromuscular junction
  - MG (see *Myasthenia Gravis*, N32)
- cranial nerve palsy (see *Cranial Nerve Deficits*, N8)
- INO (see *Intranuclear Ophthalmoplegia*, above)
- other
  - orbital trauma (orbital floor fracture), tumour, infection, inflammation
  - Miller-Fisher variant of GBS
  - Wernicke's encephalopathy
  - leptomeningial disease

### Approach to Diplopia

- monocular vs. binocular
- horizontal vs. vertical vs. oblique diplopia
- direction of gaze that exacerbates diplopia
- corrective head movements

### Workup

- may observe isolated 4th or 6th nerve palsy for a few weeks, but workup if persistent or other symptoms develop
- indications for neuroimaging:
  - bilateral or multiple nerve involvement
  - severe sudden onset headache (rule out aneurysm)

## Nystagmus

- **definition:** rapid, involuntary, small amplitude movements of the eyes that are rhythmic in nature
- direction of nystagmus is labelled by the **rapid** component of the eye movement
- can be categorized by movement type (pendular, jerking, rotatory, coarse) or as physiological vs. pathological

Table 6. Nystagmus Features

	Peripheral (vestibular)	Central (brainstem)
Direction	Unidirectional, fast phase away from the lesion	May be bilateral/unidirectional
Vertical nystagmus	–	±
Gaze fixation	Relieves nystagmus	Does not relieve nystagmus
Vertigo	Severe	Mild
Auditory symptoms	Common	Extremely rare
Other neurological signs	Absent	Often present
DDx	Benign paroxysmal positional vertigo, vestibular neuritis, Ménière disease, toxicity, trauma, Ramsay Hunt syndrome	MS, Vascular (brainstem/cerebellar), neoplastic/paraneoplastic

## Abnormalities of Pupils

- see [Ophthalmology](#), OP30

## Seizure Disorders and Epilepsy

### Seizure

#### Definitions

- seizure**: transient neurological dysfunction caused by excessive activity of cortical neurons, resulting in paroxysmal alteration of behaviour and/or EEG changes
- epilepsy**: chronic condition characterized by two or more unprovoked seizures

#### Classification

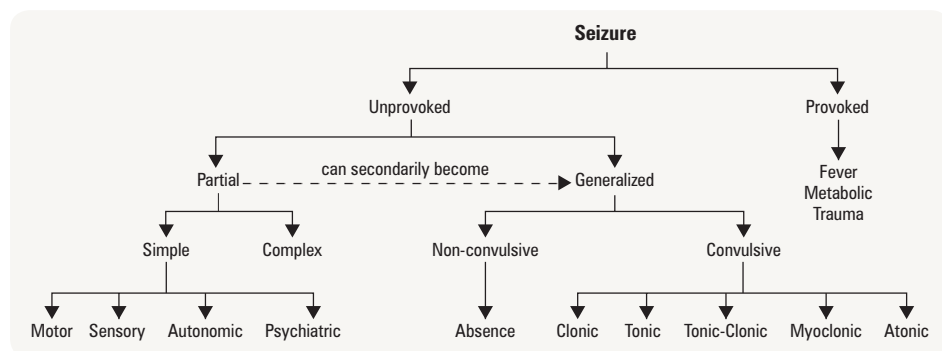

Figure 16. Classification of seizures

NOTE: seizures can also be classified using age of onset [childhood/adolescence, adulthood/late (i.e. >age 30)], setting (sleep, upon awakening), EEG (focal, generalized)

#### Signs and Symptoms

- generalized seizures (decreased LOC)**
  - tonic-clonic** [grand mal, generalized tonic-clonic (GTC)]:
    - ♦ prodrome of unease or irritability hours to days before the episode
    - ♦ tonic ictal phase: muscle rigidity
    - ♦ clonic ictal phase: repetitive violent jerking of face and limbs, tongue biting, cyanosis, frothing, incontinence
    - ♦ post-ictal phase: flaccid limbs, extensor plantar reflexes, headache, confusion, aching muscles, sore tongue, amnesia, elevated serum CK lasting hours
  - absence (petit mal)**: usually only seen in children, unresponsive for 5-10 s with arrest of activity, staring, blinking or eye-rolling, no post-ictal confusion; 3 Hz spike and slow wave activity on EEG
  - tonic**: muscle rigidity in flexion or extension
  - clonic**: repetitive rhythmic jerking movements
  - myoclonic**: sporadic contractions localized to muscle groups of one or more extremities
  - atonic**: loss of muscle tone leading to drop attack

Figure 15. Abnormal eye movements

**Medical Emergency!** Status epilepticus can cause irreversible brain damage without treatment.

Stroke is the most common cause of late-onset (>50 yr of age) seizures, accounting for 50-80% of cases.

**Seizures and Dementia**  
Neurodegenerative diseases can underlie seizures. Conversely, seizures can be a cause of dementia.

- **partial seizures**

- simple or complex can secondarily generalize, or simple → complex → generalized seizures
- **simple (preserved LOC)**
  - ♦ motor: postural, phonatory, forceful turning of eyes and/or head, focal muscle rigidity/jerking ± Jacksonian march (spreading to adjacent muscle groups)
  - ♦ sensory: unusual sensations affecting vision, hearing, smell, taste or touch
  - ♦ autonomic: epigastric discomfort, pallor, sweating, flushing, piloerection, pupillary dilatation
  - ♦ psychiatric: symptoms rarely occur without impairment of consciousness and are more commonly complex partial
- **complex (altered LOC)**
  - ♦ patient may appear to be awake but with impairment of awareness
  - ♦ classic complex seizure is characterized by automatisms such as chewing, swallowing, lip-smacking, scratching, fumbling, running, disrobing and other stereotypic movements
  - ♦ other forms: dysphasic, dysmnestic (déjà vu), cognitive (disorientation of time sense), affective (fear, anger), illusions, structured hallucinations (music, scenes, taste, smells), epigastric fullness

Complex partial status epilepticus can resemble schizophrenia or psychotic depression.

Temporal lobe epilepsy is suggested by an aura of fear, olfactory or gustatory hallucinations and visceral or déjà vu sensations.

Frontoparietal cortex seizures are suggested by contralateral focal sensory or motor phenomena.

**Table 7. Classic Factors Differentiating Seizure versus Syncope**

Characteristic	Seizure	Syncope
Time of Onset	Day or night	Day
Position	Any	Upright, not recumbent
Onset	Sudden or brief	Gradual
Aura	Possible specific aura	Lightheaded sensation
Colour	Normal or cyanotic	Pallor
Autonomic	Uncommon outside of ictal phase	Common; diaphoresis
Duration	Brief or prolonged	Brief
Incontinence	Common	Possible but rare
Post-ictal	Occurs in tonic-clonic or complex partial	No
Motor Activity	Common	Occasional brief jerks
Injury	Common, tongue biting	Rare unless from fall
Automatisms	Common in absence or complex partial	None
EEG	Usually abnormal	Normal

#### DDx of Convulsions

Syncope, pseudoseizure, hyperventilation, panic disorder, TIA, hypoglycemia, movement disorder, alcoholic blackouts, migraines (confusional, vertebrobasilar), narcolepsy (cataplexy).

Note that frontal seizures (rare) can look like a pseudoseizure due to odd motor activity that may occur.

**Table 8. Classic Factors Differentiating Seizure versus Pseudoseizure (Conversion Disorder)**

Characteristic	Seizure	Pseudoseizure*
Triggers	Uncommon	Emotional disturbance
Duration	Brief or prolonged	May be prolonged
Motor Activity	Synchronous, stereotypic, automatisms, lateral tongue biting, eyes rolled back	Opisthotonos, rigidity, forced eye closure, irregular extremity movements, shaking head, pelvic thrust, crying, geotropic eye movements, tongue biting at the tip
Timing	Day or night	Day; other people present
Physical Injury	May occur	Rare
Incontinence	May occur	Rare
Reproduction of Attack	Spontaneous	Suggestion ± stimulus
EEG	Often inter-ictal discharges	Normal
Prolactin	Increased	Normal

\*Pseudoseizures do not rule out seizures (not uncommon to present with both)

By law, the Ministry of Transportation must be contacted for all patients who have had a seizure. Patients will have their license suspended until seizure free for 6 mo. Commercial drivers face a longer wait.

## Investigations

- CBC, electrolytes, fasting blood glucose,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ , ESR, Cr, liver enzymes, CK, prolactin
- also consider toxicology screen, EtOH level, AED level (if applicable)
- CT/MRI (if new seizure without identified cause or known seizure history with new neurologic signs/symptoms)
- LP (if fever or meningismus)
- EEG

## Treatment

- avoid precipitating factors
- indications for medical therapy (anticonvulsants): 2 or more unprovoked seizures, known organic brain disease, EEG with epileptiform activity, first episode of status epilepticus, abnormal neurologic examination or findings on neuroimaging
- psychosocial issues: stigma of seizures, education of patient and family, status of driver's license, pregnancy issues
- safety issues: driving, operating heavy machinery, bathing, swimming alone
- consider surgical treatment if focal and refractory

## Status Epilepticus

- **definition:** unremitting seizure of greater than 5 min; or successive seizures without return to a baseline state
- **complications:** anoxia, cerebral ischemia and cerebral edema, rhabdomyolysis and renal failure, aspiration pneumonia/pneumonitis, death (20%)
- **initial measures:** ABCs, vitals, monitors, fingerprick glucose (STAT), ECG, nasal O<sub>2</sub>, IV NS, IV glucose, IV thiamine, ABGs (if respiratory distress/cyanotic)
- **bloodwork:** electrolytes, Ca<sup>2+</sup>, Mg<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>, glucose, CBC, toxicology screen, EtOH level, AED levels
- **focused history:** onset, past history of seizures, drug and alcohol ingestion, past medical history, associated symptoms, witnesses/collateral history
- **physical exam** (once seizures controlled): LOC, vitals, HEENT (nuchal rigidity, head trauma, tongue biting, papilledema), complete neurological exam, signs of neurocutaneous disorders, decreased breath sounds, cardiac murmurs or arrhythmias, urinary incontinence, MSK exam (r/o injuries)

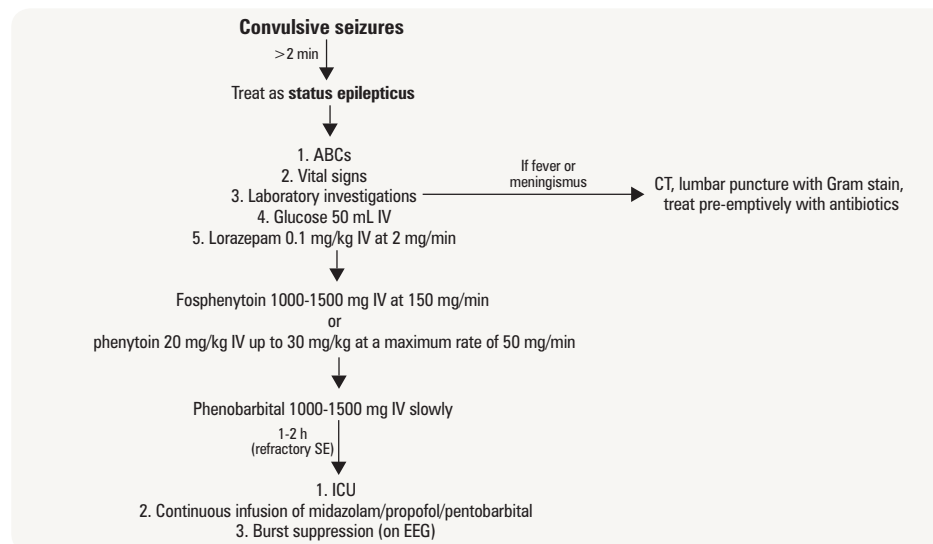

Figure 17. Status epilepticus treatment algorithm

## Antiepileptic Drugs (AED)

- **generalized-onset and partial-onset seizures:** felbamate, lamotrigine, levetiracetam, rifinamide, topiramate, valproate, zonisamide
- **partial seizures** (simple partial, complex partial and secondarily generalized seizures): carbamazepine, gabapentin, lacosamide, oxcarbazepine, phenobarbital, phenytoin, pregabalin, primidone, tiagabine, vigabatrin (note: these drugs may exacerbate generalized seizures)
- **absence seizures:** ethosuximide

### Pregnancy Issues

Teratogenicity of anticonvulsants includes neural tube defects, cleft palate, urogenital malformations and heart defects. Advise patient planning pregnancy to take 5 mg/d of folic acid. Optimize AEDs with lowest possible dose associated with good seizure control, preferably monotherapy if possible. Risk of fetal malformations with AEDs is 2x general population; highest risk associated with valproic acid and/or 2+ concurrent AEDs. Consider pre-conception AED levels if patient is well-controlled, monthly serum levels during pregnancy and titrate AED to maintain pre-conception serum levels. Refer to high risk OB for intrapartum fetal screening.

EEG findings suggestive of epilepsy: abnormal spikes, polyspike discharges, spike-wave complexes.

20-59% of first EEG are positive in epilepsy; 59-92% of epilepsy is picked up with repeated EEGs. Normal interictal EEGs do not rule out epilepsy.

The most common causes of status epilepticus are failure to take AEDs and first presentation of epilepsy. Status epilepticus as a result of EtOH withdrawal is rare, despite it being a very common cause of seizures.

Rule out non-convulsive status epilepticus in any patient who is still unconscious > 20 min post-ictal. Order a stat EEG if unsure.

# Behavioural Neurology

- see [Psychiatry](#), PS19

## Acute Confusional State/Delirium

**Table 9. Selected Intracranial Causes of Acute Confusion**

	Etiology	Key Clinical Features	Investigations
<b>Vascular</b>	Subarachnoid hemorrhage	Thunderclap headache Increased ICP Meningismus	CT (non-contrast) LP Angiography if CT, LP negative
	Stroke/TIA	Focal neurological signs	CT (non-contrast)
<b>Infectious</b>	Meningitis	Fever, headache, nausea, photophobia Meningismus	CT, LP
	Encephalitis	Focal neurological signs Fever, headache, $\pm$ seizure	CT, LP MRI
	Abscess	Increased ICP Focal neurological signs	CT with contrast (often ring enhancing lesion)
<b>Traumatic</b>	Diffuse axonal shear, epidural hematoma, subdural hematoma	Trauma hx Increased ICP Focal neurological signs	CT (non-contrast) MRI
<b>Autoimmune</b>	Acute CNS vasculitis Systemic Lupus Erythematosis	Skin rash, active joints	ANA, ANCA, RF MRI Angiography
<b>Neoplastic</b>	Mass effect/edema, hemorrhage, seizure	Increased ICP Focal neurological signs Papilledema	CT (non-contrast) MRI
<b>Seizure</b>	Status epilepticus	See <i>Seizure Disorders and Epilepsy</i> , N14	EEG
<b>Primary Psychiatric</b>	Psychotic disorder, mood disorder, anxiety disorder	No organic signs or symptoms	No specific tests

Delirium is a medical emergency carrying significant risk of morbidity and mortality. It is characterized by acute onset, disorientation, fluctuating level of consciousness, poor attention, and marked psychomotor changes.

Visual hallucinations more commonly indicate organic disease.

## Dementia

- see [Psychiatry](#), PS20

### Definition

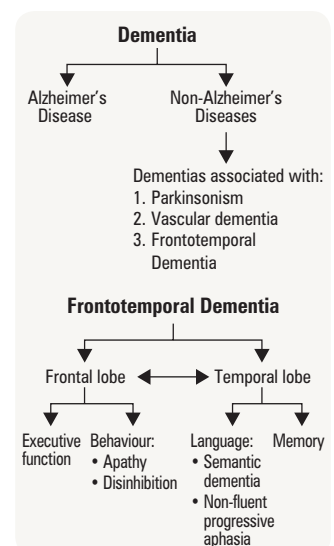

- an acquired, generalized and (usually) progressive impairment of cognitive function (i.e. memory, recall, orientation, language, abstraction) associated with impairment in activities of daily living (i.e. planning, shopping, food preparation, difficulties with finances)
- effect on content, but not level of consciousness
- see [Psychiatry](#), PS20 for DSM-IV diagnostic criteria
- see [Geriatric Medicine](#), GM5
- differentiated from Mild Cognitive Impairment (MCI) by the extent to which the impairment affects ADLs
  - MCI represents an intermediate stage between dementia and normal aging
  - by definition, IADLs are not affected in MCI

### Epidemiology

- 15% of those >65 yr of age have dementia
- <5% reversible

### Etiology

- see Table 10 for common causes of dementia
- see Table 11 for acquired causes of dementia
- reversible causes: alcohol (intoxication or withdrawal, Wernicke's encephalopathy), medication (benzodiazepines, anticholinergics), heavy metals toxicity, hepatic or renal failure, Wilson's disease, B<sub>12</sub> deficiency,  $\uparrow/\downarrow$  glucose,  $\uparrow/\downarrow$  cortisol, thyroid dysfunction, normal pressure hydrocephalus, depression (pseudodementia), intracranial tumour, subdural hematoma
- must rule out delirium

**Figure 18. Dementia classification**

## History

- “geriatric giants”
  - confusion/incontinence/falls/polypharmacy
  - memory and safety (wandering, leaving doors unlocked, leaving stove on, losing objects)
  - behavioural (mood, anxiety, psychosis, suicidal ideation, personality changes, aggression)
- ADLs and IADLs
- cardiovascular, endocrine, neoplastic, renal ROS
- alcohol, smoking
- OTCs, herbal remedies, medications (sedative hypnotics, antipsychotics, antidepressants, anticholinergics), compliance, accessibility
- history of vascular disease or head trauma
- collateral history

## Physical Examination

- blood pressure
- hearing and vision
- neurological exam with attention to signs of parkinsonism, UMN findings, cerebrovascular disease
- general physical exam depending on risk factors and history
- MMSE or MoCA, clock drawing, frontal lobe testing (go/no-go, word lists, similarities, proverb)

## Investigations

- depends on suspected etiologies (see Tables 10 and 11)
  - CBC (note MCV for evidence of alcohol use and B<sub>12</sub> deficiency), glucose, TSH, B<sub>12</sub>, RBC folate
  - electrolytes, LFTs, renal function, lipids, serum calcium
  - CT head, MRI as indicated, SPECT – optional
  - as clinically indicated: VDRL, HIV, ANA, anti-dsDNA, ANCA, ceruloplasmin, copper, cortisol, toxicology, heavy metals
- issues to consider
  - failure to cope, fitness to drive, caregiver education and stress, power of attorney, legal will, advanced medical directives

**Table 10. Common Causes of Dementia**

Etiology	Key Clinical Features	Investigations
<b>PRIMARY DEGENERATIVE</b>		
Alzheimer's disease	Memory impairment Aphasia, apraxia, agnosia	CT or MRI, SPECT
Dementia with Lewy bodies	Visual hallucinations Parkinsonism Fluctuating cognition	CT or MRI, SPECT
Frontotemporal dementia (e.g. Pick's disease)	<u>Behavioural presentation</u> : Disinhibition, perseveration, decreased social awareness, mental rigidity, memory relatively spared <u>Language presentation</u> : Progressive non-fluent aphasia, semantic dementia	CT or MRI, SPECT
Huntington's disease	Chorea	Genetic testing
<b>VASCULAR</b>		
Multi-infarct dementia	May be abrupt onset Stepwise deterioration is classic but progressive deterioration is most common Dysexecutive syndrome Focal neurological findings	CT or MRI, SPECT
CNS vasculitis	Systemic S&S of vasculitis	ANA; ANCA; RF CT or MRI Angiography

**Table 11. Acquired Causes of Dementia**

Etiology	Key Clinical Features	Investigations
<b>INFECTIOUS</b>		
Chronic meningitis	Fever, headache, nausea Meningismus Localizing neuro deficits	CT, LP
Chronic encephalitis	Fever, headache	CT or MRI
Chronic abscess	Increased ICP Localizing neuro signs	CT with contrast
HIV	See <a href="#">Infectious Diseases</a> , ID41	HIV serology
Creutzfeldt-Jacob disease	Rapidly progressive, myoclonus	EEG, CT or MRI, LP
Syphilis	Ataxia, myoclonus, tabes dorsalis	LP, CT or MRI VDRL

### Sensitivity and Specificity

Tool	Sensitivity	Specificity
MMSE	87%	82%
Clinical Judgment	85%	82%
DSM IV	76%	80%

### Vitamin B<sub>12</sub> Deficiency Symptoms

- Macrocytic anemia, pallor, SOB, fatigue, chest pain, palpitations
- Confusion or change in mental status (if advanced)
- Decreased vibration sense
- Distal numbness and paresthesia
- Weakness with UMN findings
- Diarrhea, anorexia

### Dementia DDX

#### VITAMIN D VEST

- Vitamin deficiency (B<sub>12</sub>, folate, thiamine)
- Intracranial tumour
- Trauma (head injury)
- Anoxia
- Metabolic (diabetes)
- Infection (postencephalitis, HIV)
- Normal pressure hydrocephalus
- Degenerative (Alzheimer's, Huntington's, CJD)
- Vascular (multi-infarct dementia)
- Endocrine (hypothyroid)
- Space occupying lesion (chronic subdural hematoma)
- Toxic (alcohol)

Most common causes of rapidly progressive neurodegenerative dementia (less than 4 yr survival): CJD, frontal temporal lobar dementia, tauopathies, diffuse Lewy body disease and AD.

*Arch Neurol* 2009;66:201-207

### Dementia Considerations for Management

#### ABCDs

- Affective disorders and ADLs
- Behavioural problems
- Caretaker, cognitive medications and stimulation
- Directives, Driving
- Sensory enhancement (glasses/hearing aids)

**Table 11. Acquired Causes of Dementia** (continued)

Etiology	Key Clinical Features	Investigations
<b>TRAUMATIC</b>		
Diffuse axonal shear, epidural hematoma, subdural hematoma	Trauma Hx Increased ICP, papilledema Localizing neuro signs	CT (non-contrast)
<b>RHEUMATOLOGIC</b>		
SLE	See <a href="#">Rheumatology</a> , RH11 	MRI ANA, anti-dsDNA
<b>NEOPLASTIC</b>		
Mass effect/edema, hemorrhage, seizure Paraneoplastic encephalitis	Increased ICP Localizing neuro signs Systemic symptoms of cancer	CT with contrast MRI Anti-Hu antibodies

**Cholinesterase Inhibitors for Dementia with Lewy bodies (DLB), Parkinson's Disease Dementia (PDD) and Cognitive Impairment in Parkinson's Disease (CIND-PD)**

*Cochrane DB Syst Rev 2012;3:CD006504*

**Study:** Meta-analysis of RCTs assessing efficacy of treatment with cholinesterase inhibitors in DLB, PDD, and CIND-PD.

**Results:** The six trials (n=1236) included demonstrated therapeutic benefit of cholinesterase inhibitor for global assessment, cognitive function, behavioural disturbance, and activities of daily living. Cholinesterase Inhibitor was associated with increased adverse events (OR 1.64) and drop out (OR 1.94). Adverse events were more common with rivastigmine but not with donepezil. Fewer deaths occurred in the treatment group (OR 0.28).

**Conclusion:** Current evidence supports use of cholinesterase Inhibitors for patients with PDD but its role in DLB and CIND-PD is still unclear.

## Alzheimer's Disease (AD)

- see [Psychiatry](#), PS20 

### Definition

- progressive cognitive decline interfering with social and occupational functioning characterized by the following
  1. anterograde amnesia: impaired ability to learn new information
  2. one of the following cognitive disturbances
    - a. aphasia: language disturbance
    - b. apraxia: impaired ability to carry out motor activities despite intact motor function
    - c. agnosia: failure to recognize or identify objects despite intact sensory function
    - d. disturbance in executive function: impaired planning, organizing, sequencing, abstracting

### Pathophysiology

- genetic factors
  - minority (<7%) of AD cases are familial (autosomal dominant)
  - 3 major genes for autosomal dominant AD have been identified:
    - ♦ amyloid precursor protein (chromosome 21), presenilin 1 (chromosome 14), presenilin 2 (chromosome 1)
  - the E4 polymorphism of apolipoprotein E is a susceptibility genotype (E2 is protective)
- pathology (although not necessarily specific for AD)
  - gross pathology
    - ♦ diffuse cortical atrophy, especially frontal, parietal, and temporal lobes (hippocampi)
  - microscopic pathology
    - ♦ senile plaques (extracellular deposits of amyloid in the grey matter of the brain)
    - ♦ loss of synapses
    - ♦ neurofibrillary tangles (intracytoplasmic paired helical filaments with  $\beta$ -amyloid and hyperphosphorylated Tau protein)
    - ♦ loss of cholinergic neurons in nucleus basalis of Meynert that project to the frontal cortex
  - biochemical pathology
    - ♦ 50-90% reduction in action of choline acetyltransferase

### Epidemiology

- 1/12 of population 65-75 yr of age
- 1/3 of population >85 yr of age
- accounts for 60-80% of all dementias

### Risk Factors

- age, family history, smoking, head injury, low education level, Down's syndrome

### Signs and Symptoms

- cognitive impairment
  - memory impairment for newly acquired information (early)
  - deficits in language, abstract reasoning and executive function
- psychiatric manifestations
  - major depressive disorder (5-8%)
  - psychosis (20%)
  - apathy
- motor manifestations (late)
  - parkinsonism (if present consider DLB)

### Investigations

- perform investigations to rule out other causes of dementia as necessary
- EEG: usually normal, may observe generalized slowing (nonspecific)
- MRI: preferential atrophy of the hippocampi and precuneus of the parietal lobe; dilatation of lateral ventricles; widening of cortical sulci
- SPECT: hypoperfusion in temporal and parietal lobes

#### 4 As and one D of AD

Anterograde amnesia

Aphasia

Apraxia

Agnosia

Disturbance in executive function

(Anterograde amnesia plus at least one of the other features is required for AD diagnosis)

Down's syndrome predisposes to early onset of Alzheimer's (i.e. age of ~40) due to three copies of the amyloid gene (APP)

### Treatment

- acetylcholinesterase inhibitors have been shown to slow decline in cognitive function
  - donepezil, rivastigmine, galantamine
  - relative contraindications: bradycardia, heart block, arrhythmia, CHF, CAD, asthma, COPD, ulcers or risk factors for ulcers and GI bleeding
  - galantamine is contraindicated in patients with hepatic/renal impairment
- memantine is an NMDA-receptor antagonist that has some benefits in later stage AD (i.e. when MMSE <17)
- symptomatic management
  - pharmacologic
    - low dose neuroleptics for agitation (neuroleptics may worsen cognitive decline)
    - trazodone for sleep disturbance
    - antidepressants (SSRIs)
  - non-pharmacologic
    - redirection
    - explore inciting factors for behaviour and modify behavior of patient or caregiver
    - family support and day care facilities

### Prognosis

- progressive with mean duration of disease 10 yr

#### Cognitive Effects of Atypical Antipsychotic Medications in Patients with Alzheimer's Disease: Outcomes from CATIE-AD

*Am J Psychiatry* 2011;168:831-839

**Study:** 421 outpatients with Alzheimer's disease and psychosis or agitated/aggressive behaviour were randomized to receive olanzapine, quetiapine, risperidone, or placebo in a multicenter double-blinded RCT. MMSE and Alzheimer's Disease Assessment Scale (ADAS) scores were measured at 36 wk.

**Results:** Patients receiving atypical antipsychotics exhibited a faster rate of cognitive decline as measured by MMSE scores ( $-0.067/\text{wk}$  vs.  $-0.007/\text{wk}$ ). They also had a significantly faster decline compared to placebo on a composite measure of ADAS, MMSE and various other cognitive tests ( $-0.011/\text{wk}$  vs.  $-0.001/\text{wk}$ ).

**Conclusions:** Long-term use of atypical antipsychotics for behavioural symptoms and psychosis in dementia patients is associated with greater rates of cognitive decline.

## Dementia with Lewy Bodies (DLB)

### Definition

- progressive cognitive decline interfering with social or occupational function; memory loss usually not an early feature
- one (possible DLB) or two (probable DLB) of the following:
  - fluctuating cognition with pronounced variation in attention and alertness
  - recurrent visual hallucinations
  - parkinsonism (not to be confused with Parkinson's disease dementia)
  - suggestive or supportive features include REM sleep disorder, sensitivity to neuroleptic medications (rigidity, neuroleptic malignant syndrome, extrapyramidal symptoms), repeated falls (late disease)

### Etiology and Pathogenesis

- Lewy bodies (eosinophilic cytoplasmic inclusions) found in both cortical and subcortical structures
- mixed DLB and AD pathology is common

### Epidemiology

- 15-25% of all dementias

### Treatment

- acetylcholinesterase inhibitors (e.g. donepezil)

### Prognosis

- typical survival 3-6 yr

## Frontotemporal Dementia (FTD)

### Definition

- FTD is a progressive dementia; third most common cause of cortical dementia
- behavioural variant of FTD (more common) presents with social conduct disorder predominantly
- language variants:
  - progressive nonfluent aphasia: non-fluent, laboured articulation/speech, anomia, preserved single word comprehension, word-finding deficit, impaired repetition
  - semantic dementia: fluent, normal rate, anomia, impaired single word comprehension, intact repetition, use words of generalization ("thing") or supraordinate categories ("animal" for "dog")

### Etiology and Pathogenesis

- unknown, likely genetic/familial component
- two main histological types:
  - frontal lobe degeneration with microvacuolar change
  - Pick type with astrocytic gliosis  $\pm$  ballooned cells and inclusion bodies

### Epidemiology

- 10% of all dementias

## Signs and Symptoms

- diagnosis of behavioural variant of FTD:
  - core features:
    1. insidious onset and gradual progression
    2. early decline in social interpersonal conduct
    3. early impairment in regulation of personal conduct
    4. early emotional blunting
    5. early loss of insight
  - supportive features:
    1. behavioural (decline in personal hygiene, mental rigidity, distractibility, hyperorality, perseverative or utilization behaviour)
    2. speech and language (perseverative or stereotyped speech, echolalia, mutism)
    3. physical signs (primitive reflexes, incontinence, akinesia, rigidity, tremor, low and labile blood pressure)
- severe frontal lobe impairment in absence of severe amnesia, aphasia, perceptual disorder
- imaging: predominant frontal and/or anterior temporal atrophy
- EEG usually normal

## Creutzfeldt-Jakob Disease (CJD)

- rare degenerative fatal brain disorder caused by prion proteins causing spongiform changes, astrocytosis, and neuronal loss
- most common forms are sporadic (85%), hereditary (5-10%), and acquired (<1%)
- investigations: CSF analysis, MRI brain (cortical and/or subcortical FLAIR changes), EEG (periodic complexes)
- definitive diagnosis is by brain biopsy
- no treatments currently exist

Prion proteins have a normal form and an infectious form. The infectious form is abnormally folded and leads to abnormal folding of normal prion proteins. These abnormally folded proteins aggregate leading to neuronal loss.

## Normal Pressure Hydrocephalus

- see [Neurosurgery](#), NS8

## Aphasia

### Definition

- an acquired disturbance of language characterized by errors in speech production, writing, comprehension, or reading

### Neuroanatomy of Aphasia

- Broca's area (posterior inferior frontal lobe) involved in speech production (expressive)
- Wernicke's area (posterior superior temporal lobe) involved in comprehension of language (receptive)
- angular gyrus is responsible for relaying written visual stimuli to Wernicke's area for reading comprehension
- arcuate fasciculus association bundle connects Wernicke's and Broca's areas

### Assessment of Language

- assessment of context
  - handedness (writing, drawing, toothbrush, scissors), education level, native language, learning difficulties
- assessment of aphasia
  - spontaneous speech (fluency, paraphasias, repetition, naming, comprehension – auditory and reading, writing, neologisms)

Table 12. Approach to Aphasias

	Fluency	Comprehension	Repetition	Naming	Lesion Localization
<b>Broca's</b>	Non-fluent	Good	Poor	Poor	Posterior inferior frontal lobe
<b>Motor TCA*</b>	Non-fluent	Good	Good	Poor	Frontal lobe watershed between MCA and ACA territories
<b>Mixed TCA*</b>	Non-fluent	Poor	Good	Poor	Sensory and motor transcortical regions
<b>Global</b>	Non-fluent	Poor	Poor	Poor	Posterior inferior frontal lobe AND posterior superior temporal lobe
<b>Wernicke's</b>	Fluent	Poor	Poor	Relatively spared	Posterior superior temporal lobe
<b>Conduction</b>	Fluent	Good	Poor	Poor	Arcuate fasciculus
<b>Sensory TCA*</b>	Fluent	Poor	Good	Relatively spared	Temporoparietal watershed between MCA and PCA territories
<b>Anomic</b>	Fluent	Good	Good	Poor	Numerous possible locations

TCA=Transcortical aphasia

\*Transcortical aphasias are typically associated with cerebral anoxia (e.g. post-MI, CO poisoning, hypotension)

Figure 19. Broca's and Wernicke's areas

>99% of right-handed people have left hemisphere language representation. 70% of left-handed people have left hemisphere language representation, 15% have right hemisphere representation and 15% have bilateral representation.

### Types of Paraphasias

- Semantic ("chair" for "table")
- Phonemic ("clable" for "table")

Aphasia localizes the lesion to the dominant cerebral hemisphere.

## Apraxia

### Definition

- inability to perform skilled voluntary motor sequences that cannot be accounted for by weakness, ataxia, sensory loss, impaired comprehension or inattention

### Clinicopathological Correlations

Table 13. Apraxia

	Description	Tests	Hemispheres
<b>Ideomotor</b>	Inability to perform skilled learned motor sequences	Blowing out a match; combing one's hair	Left
<b>Ideational</b>	Inability to sequence actions	Preparing and mailing an envelope	Right and left
<b>Constructional*</b>	Inability to draw or construct	Copying a figure	Right and left
<b>Dressing*</b>	Inability to dress	Dressing	Right

\*Refers specifically to the inability to carry out the learned movements involved in construction, drawing, or dressing; not merely the inability to construct, draw, or dress. Many skills aside from praxis are needed to carry out these tasks

## Agnosia

### Definition

- disorder in the recognition of the significance of sensory stimuli in the presence of intact sensation and naming

### Clinicopathological Correlations

Table 14. Agnosias

	Description	Lesion
<b>Aperceptive visual agnosia</b>	Inability to name or demonstrate the use of an object presented visually 2° to distorted visual perception Recognition by touch remains intact	Bilateral temporo-occipital cortex
<b>Associative visual agnosia</b>	Inability to name an object presented visually 2° to disconnect between visual cortex and language areas Visual perception is intact as demonstrated by visual matching	Bilateral inferior temporo-occipital junction
<b>Prosopagnosia</b>	Inability to recognize familiar faces in the presence of intact visual perception and intact auditory recognition	Bilateral occipitotemporal areas or right inferior temporo-occipital region
<b>Colour agnosia</b>	Inability to perceive colour	Bilateral inferior temporo-occipital lesions
<b>Astereognosis</b>	Inability to identify objects by touch	Anterior parietal lobe in the hemisphere opposite the affected hand
<b>Finger agnosia</b>	Inability to recognize, name, and point to individual fingers	Dominant hemisphere parietal-occipital lesions

#### Parietal Lobe Lesions

- Lesions of the dominant parietal lobe are characterized by Gerstmann's syndrome: acalculia, agraphia, finger agnosia, and left-right disorientation
- Lesions of the non-dominant parietal lobe are characterized by neglect, anosognosia, and asomatognosia
- Cortical sensory loss (graphesthesia, astereognosis, impaired 2 point discrimination and extinction) can be seen with left or right parietal lesions

- Extent of retrograde amnesia correlates with severity of injury
- Regained from most distant to recent memories

## Mild Traumatic Brain Injury

### Definition

- mild TBI = concussion
- trauma induced transient alteration in mental status that may involve loss of consciousness
- hallmarks of concussion: confusion and amnesia, which may occur within minutes
- loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15 and post-traumatic amnesia must be less than 24 h

### Epidemiology

- 75% of TBIs are estimated to be mild; remainder are moderate or severe (see [Neurosurgery](#), NS30 and [Emergency Medicine](#), ER7)
- highest rates in children 0-4 yr, adolescents 15-19 yr and elderly >65 yr

### Clinical Features

- impairments following mild TBI:
  - somatic: headache, sleep disturbance, nausea, vomiting, blurred vision
  - cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
  - emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils
- associated conditions: brain contusion, diffuse axonal injury, C-spine injury

**Investigations**

- neuro exam to identify focal neurologic deficits
- neurocognitive assessment:
  - simple orientation questions are inadequate to detect cognitive changes
  - initial assessment of severity is determined by:
    - ♦ Glasgow Coma Scale: mild: 13-15, moderate: 9-12, severe: 3-8
  - sideline evaluation: Standardized Assessment of Concussion, Westmead Post-Traumatic Amnesia Scale, Sport Concussion Assessment Tool
- neuroimaging:
  - x-ray of skull: not indicated for routine evaluation of MTBI
  - CT head as indicated by Canadian CT Head Rules (see [Emergency Medicine](#), ER10)
  - MRI not indicated in initial evaluation – indicated in presence of continued or worsening symptoms despite normal CT

**Treatment**

- observation for first 24 h after mild TBI in all patients because of risk of intracranial complications
- emergency department for assessment if any loss of consciousness or persistent symptoms
- hospitalization if: with normal CT (GCS <15, seizures, bleeding diathesis), abnormal CT scan
- early rehabilitation to maximize outcomes
  - OT, PT, SLP, vestibular therapy, driving, therapeutic recreation
- pharmacological management of headaches, pain, depression
- cognitive behavioural therapy, relaxation therapy
- follow Return to Play guidelines ([www.thinkfirst.ca](http://www.thinkfirst.ca))

**Prognosis**

- most recover from mild TBI with minimal treatment, but some experience long-term consequences
- athletes with a previous concussion are at increased risk of subsequent concussion and cumulative brain injury
- repeat TBI can lead to life threatening cerebral edema (controversially known as second impact syndrome) or permanent impairment
- sequelae include
  - postconcussion syndrome: dizziness, headache, neuropsychiatric symptoms, cognitive impairment (usually resolves within weeks to months)
  - post-traumatic headaches: begin within seven days of injury
  - post-traumatic epilepsy: twofold increase in risk of epilepsy in 5 yr post TBI, prophylactic anticonvulsants not effective
  - post-traumatic vertigo

## Neuro-oncology

### Paraneoplastic Syndromes

- see [Endocrinology](#), E51

### Tumours of the Nervous System

- see [Neurosurgery](#), NS10

# Movement Disorders

## Overview of Movement Disorders

**Table 15. Movement Disorder Definitions**

<b>Akathisia</b>	Subjective restlessness relieved by stereotypic movements (e.g. squirming)
<b>Asterixis</b>	Loss of muscle contraction (negative myoclonus)
<b>Athetosis</b>	Slow writhing movements, especially distally
<b>Bradykinesia</b>	Slow and/or small amplitude movements
<b>Chorea</b>	Brief, abrupt, irregular movements; can appear purposeful in milder forms
<b>Dyskinesia</b>	Any sudden involuntary movement, but the term is often used to describe the stereotypical movements that come with long term neuroleptic or dopaminergic use
<b>Dystonia</b>	Co-contraction of agonist and antagonists causing sustained twisting movements
<b>Freezing</b>	Episodes of halted motor action, especially during walking
<b>Hemiballismus</b>	Unilateral violent flinging movement
<b>Myoclonus</b>	Brief muscle group contraction that is either focal, segmental, or generalized
<b>Myokimia</b>	Spontaneous, fine, fascicular contraction of muscle
<b>Tachykinesia</b>	Acceleration of movements
<b>Tics</b>	Stereotyped repetitive actions due to inner urge; can be suppressed
<b>Tremor</b>	Rhythmic alternating muscle contraction and relaxation

In some cases, dystonias may only occur during voluntary movement and sometimes only during specific activities such as writing, chewing, or speaking.

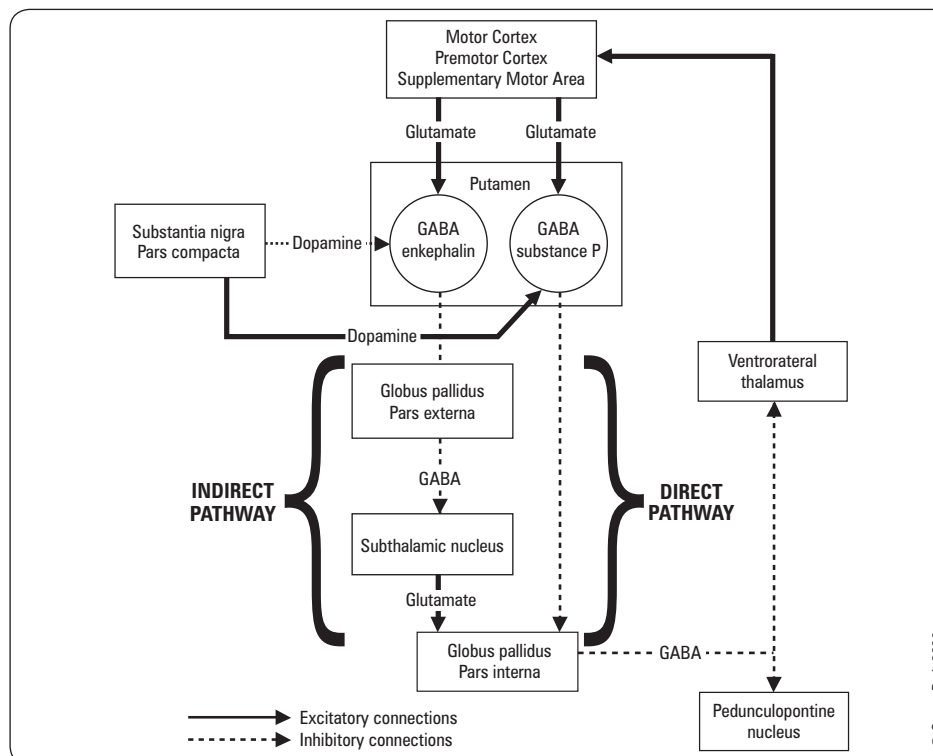

Hemiballismus is a prominent unilateral chorea that is most often due to a vascular lesion of the contralateral subthalamic nucleus.

Some myoclonus is stimulus sensitive and can be induced by noise, movement, light, visual threat or pinprick.

## Function of the Basal Ganglia

- the cerebral cortex initiates movement via excitatory (glutamatergic) projections to the striatum, which then activate two pathways: direct and indirect
- direct: cortex → striatum → GPi/SNr → thalamus → motor cortex
  - activation of this pathway removes the inhibitory effect of the GPi on the thalamus, letting the thalamus activate the cortex and ultimately allowing movement
- indirect: cortex → striatum → GPe → STN → GPi/SNr → thalamus → motor cortex
  - activation of this pathway causes inhibition of the thalamus and ultimately prevents movement

**Figure 20. Neural connections of the basal ganglia**

Figure 21. Horizontal section of basal ganglia

Movement Disorders

Differential Diagnoses

1. Tremor:

- **postural:** physiologic, anxiety, sedative/alcohol withdrawal, drug toxicity, heavy metal poisoning, carbon monoxide poisoning, thyrotoxicosis, benign essential tremor, cerebellar, Wilson's disease
  - ♦ benign essential tremor is a common autosomal dominant trait that presents as a bilateral postural tremor of the vertical axis, especially in the upper extremities
- **intention:** brainstem lesion, cerebellar lesion, alcohol, anticonvulsants, sedatives, Wilson's disease
- **resting:** Parkinsonism, Wilson's disease, mercury poisoning

Table 16. Approach to Tremors

	Resting	Postural	Intention
Body Part	Distal UE	UE/head/voice	Anywhere
Characteristics	3-7 Hz pill rolling	6-12 Hz fine tremor	< 5 Hz coarse tremor
Worse with	Rest while concentrating	Sustained posture (outstretched arms)	Finger to nose
Associated Sx	"TRAP"	± Autosomal dominant FHx	Cerebellar findings
DDx	PD, Parkinsonism, Wilson's disease	Physiologic, benign essential, drugs, hyperthyroid, hyperglycemic	Cerebellar disorders, Wilson's disease, alcohol, MS
Treatment	Sinemet, surgery, DBS	Propranolol, anticonvulsants, primidone	Treat underlying cause

2. **Chorea:** Huntington's disease, neuroacanthocytosis, SLE, APLA syndrome, Wilson's disease, cerebrovascular disease, tardive dyskinesia, senile chorea, Sydenham's chorea, pregnancy chorea

3. Dystonia

- **primary dystonia:** familial, sporadic (torticollis, blepharospasm, writer's cramp)
- **dystonia-plus syndromes:** dopa-responsive dystonia, myoclonus-dystonia
- **secondary dystonia:** thalamotomy, stroke, CNS tumour, demyelination, PNS injury, drugs/toxins (L-dopa, neuroleptics, anticonvulsants, Mn, CO, cyanide, methanol)
- **heterodegenerative dystonias:** Parkinsonian disorders, Wilson's disease, Huntington's disease

4. Myoclonus

- **physiologic myoclonus:** hiccups, nocturnal myoclonus
- **essential myoclonus**
- **epileptic myoclonus**
- **symptomatic myoclonus:**
  - degenerative disorders (Wilson's disease, Huntington disease, Alzheimers)
  - infectious disorders (CJD, viral encephalitis, AIDS-dementia complex)
  - metabolic disorders (drug intoxication/withdrawal, hypoglycemia, hyponatremia, HONK, hepatic encephalopathy, uremia, hypoxia)
  - focal brain damage (head injury, stroke, mass)

In a young patient (<45) must do TSH (thyroid disease), ceruloplasmin (Wilson's disease), and CT/MRI (cerebellar disease) as indicated by type of tremor.

**Alcohol**

- Dampens essential tremor
- Potentiates intention tremor
- Does not improve resting tremor of PD

> 90% of essential tremor does not need treatment.

Most common cause of chorea is drug therapy for PD.

**Palatal myoclonus** can result from lesion to the dentatorubroolivary pathway, and is associated with an audible clicking.

## 5. Tics

- **primary tic disorders:** transient tic disorder, chronic tic disorder, Gilles de la Tourette, adult onset or senile
- **secondary tic disorders:** encephalitis, CJD, Sydenham's chorea, head trauma, drugs, mental retardation syndromes
- association with OCD and ADHD

## Parkinson's Disease (PD)

### Etiology

- **sporadic:** combination of oxidative stress to dopaminergic neurons, environmental toxins (e.g. pesticides), accelerated aging, genetics
- **familial** (10%): autosomal dominant  $\alpha$ -synuclein mutations, autosomal recessive Parkin gene or DJ-1 gene mutation (juvenile onset)
- **MPTP** (neurotoxin)

### Epidemiology

- prevalence of 0.3% in industrialized countries, but rises with increased age
- second most common neuro-degenerative disorder, after Alzheimer's
- mean age of onset is 60 yr

### Risk Factors

- family history, male, head injury, rural living, exposure to certain neuro toxins
- protective: coffee drinking, smoking, NSAID use, estrogen replacement in post-menopausal women

### Pathophysiology

- loss of dopaminergic neurons in pars compacta of substantia nigra, thus reduced dopamine in striatum leading to disinhibition of the indirect pathway and decreased activation of the direct pathway causing increased inhibition of cortical motor areas
- $\alpha$ -synucleinopathy:  $\alpha$ -synuclein accumulates in Lewy bodies and causes neurotoxicity in substantia nigra

### Signs and Symptoms

- positive motor
  - resting tremor: asymmetric 4-5Hz "pill-rolling" tremor, especially in hands
  - rigidity: lead-pipe rigidity with cogwheeling due to superimposed tremor
- negative motor
  - bradykinesia: slow small amplitude movements, fatiguing of rapid alternating movements, difficulty initiating movement
- related findings: masked facies, hypophonia, aprosody (monotonous speech), dysarthria, micrographia, shuffling gait with decreased arm swing
- freezing: occurs with walking triggered by initiating stride or barriers/destinations, lasting seconds
- postural instability: late finding presenting as falls, festinating gait
- cognition: bradyphrenia (slow to think/respond), dementia (late finding)
- behavioural: decreased spontaneous speech, depression, sleep disturbances, anxiety
- autonomic: constipation, urinary retention, sexual dysfunction, later findings of orthostatic hypotension

### Treatment

- pharmacologic
  - mainstay of treatment: Sinemet® (levodopa/carbidopa). Levodopa is a dopamine precursor; carbidopa decreases peripheral metabolism of levodopa, decreasing side effects and increasing half-life of levodopa
    - ♦ levodopa related fluctuation: delayed onset of response (affected by mealtime), end-of-dose deterioration ("wearing-off"), random oscillations of on-off symptoms
    - ♦ major complication of levodopa is dyskinesia
  - treatment of early PD: dopamine agonists, amantadine, MAOI
  - adjuncts: dopamine agonists, MAOI, anticholinergics (especially if prominent tremors), COMT inhibitors
- surgical: thalamotomy, pallidotomy, DBS (thalamic, pallidal, subthalamic), embryonic dopaminergic stem cell transplantation
- psychiatric (see [Psychiatry](#), PS21)

#### Key Parkinsonian Features

##### TRAP

Tremor (resting)  
Rigidity  
Akinesia/bradykinesia  
Postural instability

#### Diagnostic Criteria:

- Bradykinesia, plus one of: resting tremor, muscle rigidity, postural instability not caused by other factors, or
- 3 or more of the following features:
  - Resting tremor
  - Unilateral onset
  - Persistent asymmetry, with side of onset most affected
  - Progressive disorder
  - Excellent response (70-100%) to levodopa
  - Severe levodopa-induced chorea
  - Response to levodopa for 5 or more years
  - Clinical course lasting 10 or more years

#### Consider an Alternative Diagnosis if Atypical Parkinsonism

- Poor response to L-dopa
- Abrupt onset of symptoms
- Rapid progression
- Early falls
- Early autonomic dysfunction
- Symmetric symptoms at onset
- Early age of onset (<50)
- Early cognitive impairment
- FHx of psychiatric/dementing disorders
- Recent diagnosis of psychiatric disease
- History of encephalitis
- Unusual toxin exposure
- Extensive travel history

#### Dopamine Agonist Therapy in Early Parkinson's Disease

Cochrane DB Syst Rev 2009;2:CD006564

**Study:** Meta-analysis of trials of dopamine agonists in early Parkinson's disease.

**Results:** Twenty-nine trials were included (n=5247). Dopamine agonists were found to have decreased motor side effects [dyskinesia (OR 0.51), dystonia (OR 0.64), motor fluctuations (OR 0.75)] compared to levodopa, but provided poorer symptom control compared to levodopa. Also, other side effects were increased [constipation (OR 1.59), hallucinations (OR 1.69), dizziness (OR 1.45)].

**Conclusion:** Dopamine agonists have fewer motor side effects than levodopa, but provide worse symptom control and increased rate of other side effects.

## Other Parkinsonian Disorders

- **dementia with Lewy bodies** (see *Behavioural Neurology*, N20)
- **progressive supranuclear palsy**: tauopathy with limited vertical gaze (classically downgaze), early falls, axial rigidity and akinesia, dysarthria and dysphagia
- **corticobasal degeneration**: tauopathy with varied presentations but classically presents with unilateral parkinsonism, dystonia/myoclonus, apraxia ± “alien limbs” phenomenon
- **multiple system atrophy**: synucleinopathy presenting as either cerebellar predominant (previously olivo-ponto cerebellar atrophy or OPCA) or parkinsonism predominant (previously striato-nigral degeneration). Both are associated with early autonomic dysfunction (previously Shy-Drager syndrome)
- **vascular parkinsonism**: multi-infarct presentation with lower body parkinsonism

## Huntington's Disease

### Etiology and Pathogenesis

- genetics: autosomal dominant CAG repeats (with anticipation) in Huntington gene on Chromosome 4, which leads to accumulation of defective protein in neurons
- pathology: global cerebral atrophy, especially affecting the striatum, leading to increased activity of the direct pathway and decreased activity of the indirect pathway

### Epidemiology

- North American prevalence 4-8/100,000
- mean age of onset 35-44 yr; but varies with degree of anticipation from 5-70

### Signs and Symptoms

- typical progression: insidious onset with clumsiness, fidgetiness and irritability, progressing over 15 yr to frank dementia, psychosis and chorea
  - dementia: progressive memory impairment and loss of intellectual capacity
  - chorea: begins as movement of eyebrows and forehead, shrugging of shoulders, and parakinesia (pseudopurposeful movement to mask involuntary limb jerking)
  - progresses to dance-like or ballism, and in late stage is replaced by dystonia and rigidity
  - mood changes: irritability, depression, anhedonia, impulsivity, bouts of violence

### Investigations

- MRI: enlarged ventricles, atrophy of cerebral cortex and caudate nucleus
- genetic testing
  - expansion of the cytosine-adenine-guanine (CAG) trinucleotide repeats in the HTT gene
  - CAG repeats on chromosome 4p16.3 that encodes the protein huntingtin

### Treatment

- no disease altering treatment
- psychiatric symptoms: antidepressants and antipsychotics
- chorea: neuroleptics and benzodiazepines
- dystonia: botulinum toxin

**Juvenile Onset (Westphal variant):**  
Begins in adolescence with bradykinesia and rigidity with a severe progressive course spanning 5-10 yr.

## Dystonia

### Epidemiology

- second most common movement disorder, after parkinsonism

### Clinical Features

- symptoms exacerbated by fatigue, stress, emotions; relieved by sleep or specific tactile/proprioceptive stimuli ('geste antagonist', e.g. place hand on face for cervical dystonia)
- more likely to be progressive and generalize if younger onset or leg dystonia

### Treatment

- local medical: botulinum toxin
- systemic medical: anticholinergics (benztropine), muscle relaxants (baclofen), benzodiazepines, antidopaminergics (reserpine, neuroleptics); dopamine for dopa-responsive dystonia
- surgical: surgical denervation of affected muscle, stereotaxic thalamotomy (unilateral dystonia), posteroventral pallidotomy

Botulinum toxin (BOTOX®) acts by preventing ACh release at the neuromuscular junction.

## Tic Disorders

### Clinical Classification

- **motor tics**
  - **simple:** blinking, head jerking
  - **dystonic:** bruxism, grinding teeth, abdominal tension, sustained mouth opening
  - **complex:** copropraxia (obscene gestures), echopraxia (imitate gestures), throwing, touching
- **vocal tics**
  - **simple:** blowing, coughing, grunting, throat clearing
  - **complex:** coprolalia (shout obscenities), echolalia (repeat others' phrases), palilalia (repeat own phrases)

### Treatment

- dopamine blocker

## Tourette's Syndrome (aka Gilles de la Tourette's Syndrome)

### Definition according to DSM IV

1. Presence of motor and vocal tics at some point during illness, not necessarily concurrently
2. Multiple tics a day nearly everyday or intermittently throughout 1 yr with no tic-free periods greater than 3 mo
3. Onset prior to 18 yr of age
4. Not due to effect of a substance or general medical condition

### Epidemiology

- prevalence among adolescents 3-5/100,000; M>F

### Signs and Symptoms

- tics: wide variety that wax and wane in type and severity
  - can be voluntarily suppressed for some time but are preceded by unpleasant sensation that is relieved once tic is carried out
- psychiatric: compulsive behaviours (associated with OCD and ADHD), hyperactive behaviour, 'rages', sleep-wake disturbances, learning disabilities

### Treatment

- clonidine, clonazepam

### Prognosis

- begins at 5 yr of age progressively increasing until 10 yr; often improves in adolescence and 50% are tic-free by 18 yr of age

Less than 15% of people with Tourette's have coprolalia.

## Cerebellar Disorders

### Clinico-Anatomic Correlations

- **vermis:** trunk/gait ataxia
- **cerebellar lobe (i.e. lateral):** rebound phenomenon, scanning dysarthria, dysdiadochokinesis, dysmetria, nystagmus

### Symptoms and Signs of Cerebellar Dysfunction

- nystagmus: observe on extra-ocular movement testing (most common is gaze-evoked nystagmus)
- dysarthria (ataxic): abnormal modulation of speech velocity and volume – elicit scanning/telegraphic/slurred speech on spontaneous speech (see CN X *Vagus Nerve*, N10)
- ataxia: broad-based, uncoordinated, lurching gait
- dysmetria: irregular placement of voluntary limb or ocular movement
- dysdiadochokinesis: impairment of rapid alternating movements (e.g. pronation – supination task)
- postural instability: truncal ataxia on sitting, titubation (rhythmic rocking of trunk and head), difficulty with tandem and broad-based gait
- intention tremor: typically orthogonal to intended movement, and increases as target is approached
- hypotonia: decreased resistance to passive muscular extension (occurs shortly after injury to lateral cerebellum)
- pendular patellar reflex: knee reflex causes pendular motion of leg (occurs after injury to cerebellar hemispheres)
- rebound phenomenon: overcorrection after displacement of a limb
- ocular apraxia: gaze dysmetria

### Differentiating Ataxia

	Vestibular	Cerebellar	Sensory
Nystagmus/Vertigo	+	±	–
Dysarthria	=	±	–
Limb ataxia	–	+	+
			(esp. legs)
Stance	Worse with eyes closed	Poor with eyes open or closed	+ve Romberg
Vibration/Proprioception	Normal	Normal	Impaired (esp. distal)
Ankle reflexes	Normal	Normal	Decreased/absent

## Wernicke-Korsakoff Syndrome

- see [Psychiatry](#), PS23
- note that alcohol can also cause a cerebellar ataxia separate from thiamine deficiency; this ataxia can be due to cerebellar atrophy or alcohol polyneuropathy

## Cerebellar Ataxias

### Congenital Ataxias

- early onset nonprogressive ataxias associated with various syndromes as well as developmental abnormalities (e.g. Arnold-Chiari malformation, Dandy-Walker cysts)

### Hereditary Ataxias

- **autosomal recessive:** includes Friedrich's ataxia, ataxia telangiectasia, vitamin E deficiency
  - Friedrich's ataxia: prevalence 2/100,000; onset between 8 and 15 yr
    - ♦ signs: gait and limb ataxia, weakness, areflexia, extensor plantar reflex, impaired proprioception and vibration, dysarthria
    - ♦ death in 10-20 yr from cardiomyopathy or kyphoscoliotic pulmonary restriction
- **autosomal dominant:** most commonly spinocerebellar ataxias (30 types, most due to CAG repeats)
  - signs: ataxia and dysarthria;  $\pm$  myoclonus, chorea, polyneuropathy, pyramidal or extrapyramidal features, hyporeflexia, seizures, dementia

### Acquired Ataxias

- **neurodegeneration** (e.g. multiple system atrophy)
- **systemic:** alcohol, celiac sprue, hypothyroidism, Wilson's, thiamine deficiency
- **toxins:** carbon monoxide, heavy metals, lithium, anticonvulsants, solvents
- **vascular:** infarct, bleed, basilar migraine
- **autoimmune:** MS, Miller-Fischer (GBS)

## Vertigo

- see [Otolaryngology](#), OT12

## Gait Disturbances

### Approach to Gait Disturbances

1. **Characterization of the gait disturbance**
  - posture, stride length, width between feet, height of step, stability of pelvis, symmetry, arm swing, elaborate/inconsistent movements, standing from sitting
2. **Identification of accompanying neurologic signs**
  - full neurological exam required (diagnosis often can be made by P/E alone)
3. **Identify red flags**
  - sudden onset, cerebellar ataxia, paresis (hemi, para or quadra), bowel/bladder incontinence
4. **Work up**
  - based on etiology – requires blood work, neuroimaging and urgent neurologist referral

#### Central Motor Systems

3 components to the control of gait

- Pyramidal: main outflow from cortex to spinal cord
- Extrapyramidal: basal ganglia inhibits excess movements
- Cerebellum: affects coordination of gait

Table 17. Types of Gait Disturbance

Location	Description	Disorder
Visual loss	Broad based gait with tentative steps	Cataract surgery without lense replacement
Proprioceptive loss	Sensory ataxia: wide-based with high stepping posture and positive Romberg	Demyelinating neuropathies, paraneoplastic syndrome, tabes dorsalis, MS, compressive myelopathy, B <sub>12</sub> deficiency
Peripheral vestibular lesion 1. Acute 2. Bilateral	1. Vestibular ataxia 2. Disequilibrium	1. Tumour, trauma, infectious, Ménière's disease 2. Ototoxic drugs
Peripheral nerve disorder: 1. Foot drop 2. Lumbosacral radiculopathy	Steppage gait	Acquired/hereditary peripheral neuropathy, compressive peroneal neuropathy, L4-5 radiculopathy
Myopathies	Waddling gait: broad based, short stepped gait with pronounced lumbar lordosis, rotation of pelvis	Progressive muscular dystrophy

**Table 17. Types of Gait Disturbance** (continued)

Location	Description	Disorder
<b>Pyramidal/Corticospinal tract lesion</b> 1. Unilateral 2. Bilateral	Spastic gait: spastic foot drop, circumduction, scissoring of legs or toe walking with bilateral circumduction	Unilateral: stroke (ischemic/hemorrhagic) Bilateral: cervical spondylosis, cerebral palsy, spinal cord tumour, combined spinal cord degeneration, MS, motor neuron disease
<b>Basal Ganglia</b>	1. Parkinsonian gait: small paces, stooped posture, reduced arm swing 2. Choreic/hemiballistic/dystonic gait	Infarct, Huntington's, Sydenham's chorea, Wilson's disease, lupus, neuroleptic medications, polycythemia vera, genetic dystonia
<b>Cerebellar Disorder</b>	Cerebellar ataxic gait: wide-based without high stepping; veers to side of lesion Alcoholic gait	Primary and secondary neoplasm, toxins (alcohol), vit. E deficiency, hypothyroid, hypoxia, hypoglycemia, paraneoplastic syndrome

## Motor Neuron Disease

### Amyotrophic Lateral Sclerosis (ALS) (aka Lou Gehrig's Disease)

#### Definition

- progressive neurodegenerative disease that causes UMN and LMN symptoms and is ultimately fatal

#### Etiology

- idiopathic (most), genetic (5-10% familial, especially SOD1 mutation, other: C9orf72, TARDBP)

#### Pathology

- disorder of anterior horn cells of spinal cord, cranial nerve nuclei, and corticospinal tract

#### Epidemiology

- 5/100,000; incidence increases with age

#### Signs and Symptoms

- limb motor symptoms: segmental and asymmetrical UMN and LMN symptoms
- bulbar findings: dysarthria (flaccid or spastic), dysphagia, tongue atrophy and fasciculations, facial weakness and atrophy
- pseudobulbar affect, frontotemporal dementia (up to 10%)
- sparing of sensation, ocular muscles and, sphincters

#### Investigations

- EMG: chronic denervation and reinnervation, fasciculations
- NCS : to rule out peripheral neuropathy (i.e. multifocal motor neuropathy with conduction block)
- CT/MRI: to rule out cord disease/compression

#### Management

- riluzole (modestly slows disease progression)
- symptomatic relief
  - spasticity/cramping: baclofen, tizanidine, regular exercise and physical therapy
  - sialorrhea: TCA (i.e. amitriptyline), sublingual atropine drops, parotid/submandibular botox (rare)
  - pseudobulbar affect: dextromethorphan/quinidine, TCA, SSRI
  - non-pharmacologic: high caloric diet, ventilatory support (especially BiPAP), early nutritional support (i.e. PEG tube), rehabilitation (PT, OT, SLP), psychosocial support

#### Prognosis

- median survival 3 yr; death due to respiratory failure

**Red Flags Inconsistent with ALS**  
Sensory sx, predominant pain, bowel or bladder incontinence, cognitive impairment, ocular muscle weakness.

The only interventions that have been shown to extend survival in ALS are riluzole and use of BiPAP.

**Denervation on EMG**  
Fibrillations, positive sharp waves, complex repetitive discharges; reinnervation – increased amplitude and duration of motor units.

## Other Motor Neuron Diseases

- degenerative**
  - progressive muscular atrophy (progressive bulbar palsy):** only LMN symptoms with asymmetric weakness, later onset than ALS, 5-10% of patients in ALS centres
  - primary lateral sclerosis (progressive pseudobulbar palsy):** UMN symptoms, later onset, not fatal with variable disability; 5-10% of patients in ALS centres
  - spinal muscular atrophy:** pediatric disease with symmetric LMN symptoms
- infectious**
  - post-polio syndrome:** residual asymmetric muscle weakness, atrophy
- acquired**
  - multifocal motor neuropathy:** conduction block on NCS, asymmetric LMN symptoms, ± anti-GM1 Ab, treatable with IVIg

# Peripheral Neuropathies

## Diagnostic Approach to Peripheral Neuropathies

1. Differentiate: motor vs. sensory vs. autonomic vs. mixed
2. Pattern of deficit: symmetry; focal vs. diffuse; upper vs. lower limb; cranial nerve involvement
3. Temporal pattern: acute vs. chronic; relapsing remitting vs. constant vs. progressive
4. History: PMH, detailed FHx, exposures (e.g. insects, toxins, sex, travel), systemic symptoms
5. Detailed peripheral neuro exam: LMN findings, differentiate between root and peripheral nerves, cranial nerves, respiratory status

## Classification

- **monoradiculopathy**: dermatomal deficit due to single nerve root lesion
  - due to disc herniation or root compression causing radicular pain
  - little tactile anaesthesia, as dermatomes overlap
- **polyradiculopathy**: multiple dermatome deficits due to multiple nerve root lesions
  - one type is cauda equina syndrome (lumbosacral roots)
- **plexopathy**: deficit matching distribution of a nerve plexus
  - **brachial plexopathy**
    - ♦ upper (C5-C7): LMN sx of shoulder and upper arm muscles (Erb's palsy)
    - ♦ lower (C8-T1): LMN sx and sensory sx of forearm and hand (Klumpke's palsy)
    - ♦ DDX: trauma, idiopathic neuritis, tumour infiltration, radiation, thoracic outlet syndrome (i.e. cervical rib)
  - **lumbosacral plexopathy** (rare, especially unilateral)
    - ♦ DDX: idiopathic neuritis, infarction (i.e. diabetes), compression
- **mononeuropathy**: single nerve deficit
  - **carpal tunnel syndrome** (most common): compression of median nerve at wrist
    - ♦ symptoms: wrist pain, paresthesia first 3 and ½ digits, ± radiation to elbow, worse at night
    - ♦ signs: Tinel's sign, Phalen's test, thenar muscle wasting, sensory deficit
    - ♦ EMG and NCS: slowing at wrist (both motor and sensory)
  - **Bell's palsy** (most common cranial neuropathy): see [Otolaryngology](#), OT22
  - other less common mononeuropathies due to entrapment/compression: ulnar (compression at elbow), median (at pronator teres), radial (at spiral groove of humerus), obturator (from childbirth), peroneal (due to crossing legs or surgical positioning), posterior tibial (tarsal canal)
- **mononeuropathy multiplex**: deficit affecting multiple discrete nerves (asymmetric)
  - must rule out vasculitis or collagen vascular disease
- **polyneuropathy**: symmetrical distal stocking-glove pattern
  - symmetrical distal sensorimotor deficit affecting longest fibres first (stocking-glove distribution), hypotonia; progression of dysesthesia early and weakness later
  - etiology: DM (most common), renal disease, substances, toxins, genetics, SLE, HIV, leprosy, alcohol, B<sub>12</sub> deficiency, uremia
  - **chronic inflammatory demyelinating polyneuropathy (CIDP)**
    - ♦ chronic relapsing sensorimotor polyneuropathy with increase protein in CSF and demyelination (shown on EMG/NCS)
    - ♦ course is fluctuating, in contrast with the acute onset of GBS
    - ♦ treatment: first-line is prednisone; alternatives are plasmapheresis, IVIg, and azathioprine

**Tinel's Sign:** tap lightly over the median nerve at the wrist. The patient's symptoms of carpal tunnel will be elicited in a positive test.

**Phalen's Test:** hold both wrists in forced flexion (with the dorsal surfaces of the hands pressed against each other) for 30-60 s. Test is positive if symptoms of carpal tunnel are elicited.

### Diabetic Neuropathies

- Peripheral neuropathy: pain or loss of sensation in a glove and stocking distribution (hands and feet affected before arms and legs)
- Autonomic: anhidrosis, orthostatic hypotension, impotence, gastroparesis, bowel and bladder dysfunction
- Mononeuropathy multiplex: nerve infarct or compression
- Cranial neuropathy: CN III (pupil sparing) > IV > VI
- Lumbosacral plexopathy

**DDx of Demyelinating Neuropathy**  
GBS, CIDP, paraproteinemia, diphtheria, amiodarone, Charcot-Marie-Tooth, storage diseases, pressure palsy predisposition, paraneoplastic.

Axonal neuropathies have decreased amplitude on NCS; demyelinating neuropathies have decreased velocity on NCS.

Otolotoxic drugs (e.g. aminoglycosides) should not be given to diabetics. Sensory neuropathy of the feet prevent them from adequately compensating for loss of vestibular function.

### Evaluation of Distal Symmetric Polyneuropathy: Role of Laboratory and Genetic Testing

*Neurology* 2009;72:185-192  
**Screening lab tests:** Blood glucose, serum B12 with metabolites, serum protein immunofixation electrophoresis.  
**Genetic testing:** Indicated for cryptogenic polyneuropathy exhibiting classic hereditary neuropathy phenotype. Screen for CMT1A duplication/deletion and Cx32 mutations.

**Table 18. Differential Diagnosis of Symmetric Polyneuropathy\***

	Etiology	Mechanism	Course	Modalities	Investigations
<b>Vascular</b>	PAN	Ischemic	Chronic	S/M	see <a href="#">Rheumatology</a> , RH19
	SLE	Ischemic	Chronic	S/M	see <a href="#">Rheumatology</a> , RH11
	RA	Ischemic	Chronic	S/M	see <a href="#">Rheumatology</a> , RH8
<b>Infectious</b>	HIV	Axonal/demyelination	Chronic	S/A	HIV serology
	Leprosy	Infiltrative	Chronic	S/A	Leprosy serology Nerve biopsy
	Lyme	Axonal/demyelination	Chronic	M	Lyme serology
<b>Immune</b>	GBS	Demyelination	Acute	M	LP (↑ protein; no ↑ cells)
	CIDP	Demyelination	Chronic	S/M	LP (↑ protein)
<b>Hereditary</b>	HMSN	Axonal/demyelination	Chronic	S/M	Genetic testing
<b>Neoplastic</b>	Paraneoplastic	Axonal/demyelination	Chronic	S/M	Paraneoplastic antibodies
	Myeloma	Axonal/demyelination	Chronic	S/M	SPEP Skeletal bone survey
	Lymphoma	Axonal	Chronic	M	SPEP Bone marrow biopsy
	Monoclonal gammopathy	Demyelination	Chronic	S/M	SPEP Bone marrow biopsy
<b>Toxin</b>	EtOH	Axonal	Sub-acute	S/M	GGT, MCV
	Heavy metals	Axonal	Sub-acute	S/M	Urine heavy metals
	Medications	Axonal	Sub-acute	S/M	Drug levels

**Table 18. Differential Diagnosis of Symmetric Polyneuropathy\*** (continued)

	Etiology	Mechanism	Course	Modalities	Investigations
<b>Metabolic</b>	Diabetes	Ischemic/axonal	Chronic	S/A	Fasting glucose, HbA1c, 2 h OGTT
	Hypothyroidism	Axonal	Chronic	S/M	TSH, T <sub>3</sub> , T <sub>4</sub>
	Renal failure	Axonal	Chronic	S/A	Electrolytes, Cr, BUN
<b>Nutritional</b>	B <sub>12</sub> deficiency	Axonal	Sub-acute	S/M	Vitamin B <sub>12</sub>
<b>Other</b>	Porphyria	Axonal	Sub-acute	M	Urine porphyrins
	Amyloid	Axonal	Sub-acute	S	Nerve biopsy

\*Abbreviations: CIDP – chronic inflammatory demyelinating polyradiculoneuropathy; GGT – gamma-glutamyl transferase; HMSN – hereditary motor sensory neuropathy; OGTT – oral glucose tolerance test; PAN – polyarteritis nodosa; RA – rheumatoid arthritis; SLE – systemic lupus erythematosus; SPEP – serum protein electrophoresis; S – sensory; M – motor; A – autonomic

### Guillain-Barré Syndrome (GBS)

- definition:** acute rapidly evolving polyneuropathy that often starts in the distal lower limbs and ascends
- etiology**
  - autoimmune attack and damage to peripheral nerve myelin
  - sometimes preceded by viral/bacterial infections
- signs and symptoms**
  - sensory: distal and symmetric paresthesias, loss of proprioception and vibration sense, neuropathic pain
  - motor: weakness starting distally in legs, areflexia
  - autonomic: blood pressure dysregulation, arrhythmias, bladder dysfunction
- investigations**
  - CSF: albuminocytological dissociation (high protein, normal WBC)
  - EMG/NCS: conduction block, differential or focal (motor>sensory) slowing, decreased F-wave, sural sparing
- subtypes**
  - acute inflammatory demyelinating polyneuropathy (AIDP)
  - acute motor-sensory axonal neuropathy (AMSAN)
  - acute motor axonal neuropathy (AMAN)
- treatment**
  - IVIg or plasmapheresis, ± pain management, monitor vitals and vital capacity
- prognosis**
  - peak of symptoms at 2-3 wk, resolution at 4-6 wk
  - 5% mortality (higher if require ICU); up to 15% have permanent deficits

GBS is a neurological emergency due to risk of imminent respiratory failure.

The most common antecedent infection in GBS is *Campylobacter jejuni*.

#### Miller-Fischer Variant of GBS – Triad

- Ophthalmoplegia
- Ataxia
- Areflexia

IVIg and plasmapheresis lead to more rapid improvement, less intensive care and less ventilation, but do not change mortality or relapse rate.

## Neuromuscular Junction Diseases

### Clinical Approach to Disorders of the Neuromuscular Junction

**Table 19. Common Disorders of the Neuromuscular Junction**

	Myasthenia Gravis	Lambert-Eaton	Botulism
Ocular/bulbar paresis	+	–	++ (early)
Limb weakness	+	+	+
Fatiguability	+	+	+
Post-exercise enhancement	–	+	+
Reflexes	N	↓	↓
Anticholinergic sx	–	+	++
Sensory sx	–	–	–
Associated conditions	Thymoma	Small cell carcinoma	GI S&S
Repetitive EMG stimulation	Decremental response	Incremental response	↑ (rapid stimulation) ↓ (slow stimulation)

Diseases of the neuromuscular junction typically feature prominent fatiguability. Fatiguability can be tested by holding the arms out, or by holding the gaze in the upward position (especially in MG). Muscle weakness due to fatiguability will improve with rest or ice.

### Myasthenia Gravis (MG)

#### Etiology and Pathophysiology

- progressive autoimmune disorder due to anti-AChR antibodies, resulting in early saturation at the NMJ and inadequate muscle activation with increasing nerve stimulation
- 15% of patients with MG have associated thymic neoplasia, 85% have thymic hyperplasia

### Epidemiology

- bimodal age of onset – 20s (mostly women) and 60s (mostly men)

### Signs and Symptoms

- see Table 19
- fatiguable, symmetric or asymmetric weakness without reflex changes, sensory changes, or coordination abnormalities
- ocular (diplopia/ptosis), bulbar (dysarthria/dysphagia), and/or proximal limb weakness
- symptoms may be exacerbated by infection, pregnancy, menses, and various drugs
- respiratory muscle weakness may lead to respiratory failure

### Investigations

- edrophonium (Tensilon®) test
  - assess for improvement over 2 min following edrophonium injection
- EMG
  - repetitive stimulation → decremental response
  - single fibre electromyography shows increased jitter (80-100% sensitivity)
- spirometry – forced vital capacity may be used to monitor adequacy of respiratory effort over time
- anti-acetylcholine receptor antibody assay (70-80% sensitivity)
- MUSK antibody may be used if seronegative for AChR antibody
- CT/MRI to screen for thymoma/thymic hyperplasia

### Treatment

- thymectomy
  - 85% of patients show improvement or remission
- symptomatic relief
  - acetylcholinesterase inhibitors (e.g. pyridostigmine)
  - does not affect primary pathologic process so rarely results in control of disease when used alone
- immunosuppression
  - steroids are mainstay of treatment (70-80% remission rate)
  - azathioprine, cyclophosphamide and mycophenolate as adjuncts or as steroid sparing therapy
- short-term immunomodulation (for crises)
  - IVIg and plasmapheresis

### Prognosis

- 30% eventual spontaneous remission
- with treatment, life expectancy is equal to that of a person without MG, but quality of life may vary

Figure 22. Myasthenia gravis

Tensilon® is a drug that inhibits acetylcholinesterase. It improves muscle function immediately in myasthenia gravis, but not in a cholinergic crisis. This test is infrequently used. When performed, a crash cart should be nearby as respiratory difficulty and/or bradycardia may occur.

**LEMS**  
On exam there is initial post-exercise enhancement, but with prolonged effort muscles will fatigue.

Figure 23. Lambert-Eaton myasthenic syndrome (LEMS)

## Lambert-Eaton Myasthenic Syndrome (LEMS)

### Etiology and Pathophysiology

- autoimmune disorder due to antibodies against presynaptic voltage-gated calcium channels, causing decreased ACh release at the NMJ
- 50-66% are associated with small cell carcinoma of the lung

### Signs and Symptoms

- see Table 19
- weakness of skeletal muscles without sensory or coordination abnormalities
- reflexes are diminished or absent, but increase after active muscle contraction
- bulbar and ocular muscles affected in 25% (vs. 90% in MG)
- prominent anticholinergic autonomic symptoms (dry mouth > impotence > constipation > blurred vision)

### Investigations

- edrophonium test (see *Myasthenia Gravis*, N32) → no response
- EMG
  - rapid (>10 Hz) repetitive stimulation → incremental response
  - post-exercise facilitation → an incremental response with exercise
- screen for malignancy, especially small cell lung cancer

### Treatment

- tumour removal
- acetylcholine modulation
  - increased acetylcholine release (3,4-diaminopyridine)
  - decreased acetylcholine degradation (pyridostigmine)
- immunomodulation
  - steroids, plasmapheresis, IVIg

## Botulism

### Etiology and Pathophysiology

- caused by a toxin produced by spores of *Clostridium botulinum* bacteria, which is found in soil and water throughout the world. Bacteria can enter the body through wounds or by ingesting improperly preserved foods
- infantile botulism is the most common form, and is usually from ingestion of honey or corn syrup

### Signs and Symptoms

- occur 6-48 h after ingestion
- difficulty with convergence, ptosis, paralysis of extraocular muscles
- dilated, poorly reactive pupils
- other autonomic dysfunction: jaw weakness, dysarthria, dysphagia
- spreads to trunk and limbs
  - abdominal cramps with nausea and vomiting
  - symmetric weakness with paralysis and absent/decreased deep tendon reflexes
  - anticholinergic symptoms: dry mouth, constipation, urinary retention
- rarely respiratory distress, potentially advancing to respiratory failure

### Investigations

- blood test for toxin
- stool culture

### Treatment

- botulinum anti-toxin – good prognosis with prompt treatment
- supportive therapy as required

## Myopathies

### Clinical Approach to Muscle Diseases

Table 20. Myopathies

	Etiology	Key Clinical Features	Key Investigations
Inflammatory	Polymyositis	Myalgias Pharyngeal involvement	↑ CK Biopsy: endomysial infiltrates; necrosis
	Dermatomyositis	Myalgias Characteristic rashes Can be paraneoplastic	↑ CK Biopsy: perifascicular atrophy
	Sarcoidosis	See <a href="#">Respirology</a> , R13	ACE level Biopsy: granulomas
	Inclusion body myositis	Weak quadriceps and deep finger flexors	↑ CK Biopsy: inclusion bodies
Endocrine	Thyroid (↑ or ↓) Cushing's syndrome Parathyroid (↑ or ↓)	See <a href="#">Endocrinology</a> , E20, E33	TSH, serum cortisol, calcium panel
Toxic	Medication	Medication or toxin history	Toxicology screen
	Critical illness myopathy	ICU patient Hx steroids and nondepolarizing paralyzing agents Failure to wean from ventilation	Biopsy: selective loss of thick myosin filaments
Infectious	Parasitic, bacterial or viral	Myalgias Inflammatory myopathy	↑ myoglobin
Hereditary dystrophy	Duchenne	Early onset (Duchenne and Becker)	Dystrophin analysis: absent
	Becker	Progressive proximal muscle weakness Calf pseudohypertrophy	Dystrophin analysis: abnormal
	Myotonic dystrophy	Distal myopathy Myotonia Genetic anticipation	Genetic testing
Hereditary metabolic	McArdle's	Exercise-related myalgias, cramping, and myoglobulinuria	↑ lactate ↑ serum/urinary myoglobin post-exercise
Hereditary periodic paralysis	"Channelopathy"	Episodic weakness Normal between attacks	Normal, ↑ or ↓ K <sup>+</sup>

Myopathies are characterized by prominent symmetric proximal weakness and absent sensory changes.

#### Good Questions to Assess Proximal Weakness

- Legs: climbing stairs, stand from sit
- Arms: reach above head, wash hair

#### Common Medications that Cause Myopathy:

steroids, statins, antiretrovirals, thyroxine, fibrates, cyclosporine, ipecac.

**Common Drugs that Cause Myopathy:** ethanol, cocaine, heroin.

**Table 20. Myopathies** (continued)

	Etiology	Key Clinical Features	Key Investigations
<b>Hereditary mitochondrial</b>	MERRF	Myoclonus, generalized seizures, dementia, myopathy	Biopsy: ragged red fibres Increased lactate
	MELAS	Pediatric onset, stroke-like symptoms, episodic vomiting, dementia	
	Kearns Sayre	Progressive ophthalmoplegia, retinal pigment degeneration, cardiac conduction abnormalities	

MERRF = mitochondrial encephalomyopathy with ragged red fibers; MELAS = mitochondrial encephalomyopathy, lactic acidosis, and stroke-like episodes

## Polymyositis/Dermatomyositis

- see [Rheumatology](#), RH15

## Myotonic Dystrophy

### Etiology and Pathophysiology

- unstable trinucleotide (CTG) repeat in DMK gene (protein kinase) at 19q13.3, number of repeats correlates with severity of symptoms
- autosomal dominant

### Epidemiology

- most common adult muscular dystrophy
- prevalence 3-5/100,000

### Signs and Symptoms

- appearance: ptosis, bifacial weakness, frontal baldness (including women), triangular face giving a drooping/dull appearance
- physical exam
  - distribution of weakness: distal weaker than proximal (in contrast to other myopathies), steppage gait
  - myotonia: delayed relaxation of muscles after exertion (elicit by tapping on thenar muscles with hammer)
  - cardiac: 90% have conduction defects (1° heart block; atrial arrhythmias)
  - respiratory: hypoventilation 2° to muscle weakness
  - ocular: subcapsular cataracts, retinal degeneration, decreased intraocular pressure
  - other: diabetes, infertility, testicular atrophy
- EMG: subclinical myotonia – long runs with declining frequency and amplitude

### Treatment and Prognosis

- no cure, progressive, death usually around 50 yr
- management of myotonia: phenytoin

## Duchenne and Becker Muscular Dystrophy

- see [Pediatrics](#), P44

## Pain Syndromes

## Approach to Pain Syndromes

### Definitions

- **nociceptive pain:** pain arising from normal activation of peripheral nociceptors
- **neuropathic pain:** pain arising from direct injury to neural tissue, bypassing nociceptive pathways
- **spontaneous pain:** unprovoked burning, shooting, or lancinating pain
- **paresthesiae:** spontaneous abnormal nonpainful sensations (e.g. tingling)
- **dysesthesiae:** evoked pain with inappropriate quality or excessive quantity
- **allodynia:** a dysesthetic response to a non-noxious stimulus
- **hyperalgesia:** an exaggerated pain response to a noxious stimulus

- Pinprick sensation mediated by Aδ fibers
- Pain due to tissue damage is mediated by C fibres

### Non-pharmacological Management

- physical (PT, acupuncture, chiropractic manipulation, massage)
- psychoeducational (CBT, family therapy, education, psychotherapy)

### Medical Pain Control

- combination multi-modal therapy is important
- primary analgesics: acetaminophen, NSAIDs (often used for soft tissue injuries, strains, sprains, headaches and arthritis), opiates
- adjuvants: antidepressants (TCAs, SSRIs), anticonvulsants (gabapentin, carbamazepine, pregabalin), baclofen, sympatholytics (phenoxybenzamine),  $\alpha$ 2-adrenergic agonists (clonidine)

### Surgical Pain Control

- peripheral ablation: nerve blocks, facet joint denervation
- direct delivery: implantable morphine pump
- central ablation: stereotactic thalamotomy, spinal tractotomy or dorsal root entry lesion
- DBS or dorsal column stimulation

#### WHO Pain Ladder

- **Mild pain:** Non-opioid (acetaminophen and/or NSAID)  $\pm$  adjuvant
- **Moderate pain:** Opioid for mild to moderate pain (codeine/oxycodone) + non-opioid  $\pm$  adjuvant
- **Severe pain:** Opioid for moderate to severe pain (morphine/hydromorphone) + non-opioid  $\pm$  adjuvant

Axonal regeneration is directed by intact nerve sheaths. If the nerve sheath is damaged, axons grow without direction, become tangled and form a neuroma, which can result in ectopic electrical impulses and neuropathic pain.

## Neuropathic Pain

### Definition

- pain resulting from a disturbance of the central or peripheral nervous system

### Symptoms and Signs

- hyperalgesia/allodynia
- subjectively described as burning, heat/cold, pricking, electric shock, perception of swelling, numbness (i.e. stocking/sock distribution)
- can be spontaneous or stimulus evoked
- distribution may not fall along classical neuro-anatomical lines
- associated issues: sleep difficulty, anxiety/stress/mood alteration

### Causes of Neuropathic Pain

- **sympathetic**
  - complex regional pain syndrome
- **central:** abnormal CNS activity
  - phantom limb, post spinal cord injury, post stroke, MS
- **non-sympathetic:** damage to peripheral nerves
  - **systemic disease:** DM, thyroid disease, renal disease, rheumatoid arthritis
  - **nutritional/toxicity:** alcoholism, pernicious anemia, chemotherapy
  - **infectious:** post-herpetic, HIV
  - **trauma/compression:** nerve entrapment, trigeminal neuralgia, post surgical, nerve injury, cervical/lumbar radiculopathy, plexopathy

### Treatment

- identify/treat underlying cause
- **pharmacotherapy**
  - Stepwise approach (*Canadian Pain Society*, 2007): TCA, anticonvulsant, SNRI, topical lidocaine, long acting opiate (caution), tramadol
  - other: capsaicin cream, intrathecal opioid or clonidine, botulinum toxin injection, nerve block
- **common non-pharmacologic therapies**
  - neuropsychiatry: cognitive behavioural therapy, psychotherapy
  - rehabilitation: physiotherapy
  - complementary and alternative medicine: acupuncture, meditation, massage therapy, traditional Chinese medicine
- **surgical therapies:** dorsal column neurostimulator, DBS (thalamus)

## Tic Douloureux (Trigeminal Neuralgia)

### Clinical Features

- recurrent episodes of sudden onset, excruciating unilateral paroxysmal shooting "electric" pain in trigeminal root territory (V3>V2>>V1)
- may have normal sensory exam
- pain lasts seconds/minutes over days/weeks; may remit for weeks/months
- triggers: touching face, eating, talking, cold wind, shaving, applying make-up

**Etiology**

- **classic TN:** idiopathic
- **secondary TN:** compression by tortuous blood vessel (superior cerebellar artery), cerebellopontine angle tumour (5%), multiple sclerosis (5%)

**Epidemiology**

- F > M; usually middle-aged and elderly

**Diagnosis**

- clinical diagnosis
- investigate for secondary causes, which are more likely if bilateral TN or associated sensory loss
  - MRI to rule out structural lesion, MS or vascular lesion

**Treatment**

- first line: carbamazepine or oxcarbazepine
- second line: baclofen or lamotrigine
- narcotics not generally recommended
- if medical treatment fails: Gasserian ganglion percutaneous technique, gamma knife, invasive percutaneous denervation (radiofrequency/glycerol), percutaneous balloon microcompression, microvascular decompression

## Postherpetic Neuralgia (PHN)

**Clinical Features**

- pain persisting in the region of a cutaneous outbreak of herpes zoster
- constant deep ache or burning, intermittent spontaneous lancinating/jabbing pain, allodynia
- distribution: thoracic, trigeminal, cervical > lumbar > sacral
- associated impaired sleep, decreased appetite, decreased libido

**Etiology and Pathogenesis**

- destruction of the sensory ganglion neurons (e.g. dorsal root, trigeminal, or geniculate ganglia) secondary to reactivation of herpes zoster infection

**Epidemiology**

- incidence in those with zoster increases with age (2% in <60 yr, 19% in >70 yr)
- risk factors: older age, greater acute pain, greater rash severity

**Prevention**

- varicella zoster vaccine in childhood reduces incidence of varicella zoster
- herpes zoster vaccine (Zostavax®) reduces incidences of shingles, PHN and other herpetic sequel (currently recommended in Canada for those >60 yr old)

**Treatment**

- medical: TCA (i.e. amitriptyline), anti-convulsants (i.e. pregabalin, gabapentin), analgesia (i.e. opiates, lidocaine patch), intrathecal methylprednisolone, topical capsaicin
  - early treatment of acute herpes zoster with antivirals (acyclovir; longer-acting famciclovir and valacyclovir more effective)
  - treatment of herpes zoster with corticosteroids DOES NOT decrease PHN
- surgical: spinal tractotomy, dorsal root entry zone lesion, DBS of thalamus

**Herpes zoster of trigeminal nerve:** typically involves V1 (ophthalmic division).

**Hutchinson's sign:** tip of nose involvement predicts corneal involvement.

## Painful Diabetic Neuropathy

**Approach**

- determine if pain is neuropathic or vascular
- more likely neuropathic if:
  - feet > calves
  - sharp/tingling pain
  - pain present at rest and improves with walking

**Treatment**

- Level A: pregabalin
- Level B: venlafaxine, duloxetine, amitriptyline, gabapentin, valproate, rarely opioids, capsaicin

## Complex Regional Pain Syndromes (CRPS)

### Clinical Features

- presence of an initiating noxious event (MI, stroke)
- continuing pain, allodynia, or hyperalgesia with pain disproportionate to inciting event
- evidence during the course of symptoms of edema, changes in skin blood flow or abnormal vasomotor activity
- absence of conditions that would otherwise account for degree of pain and dysfunction
- other features can include edema, osteoporosis, hyperhydrosis, hair loss, fascial thickening

### Classification

- **CRPS type I (reflex sympathetic dystrophy):** minor injuries of limb or lesions in remote body areas precede onset of symptoms
- **CRPS type II (causalgia):** injury of peripheral nerves precedes the onset of symptoms

### Investigations

- trial of differential neural blockade may be helpful in diagnosis
- autonomic testing (evidence of sympathetic dysfunction)
- bone scan, plain radiography, MRI

### Prevention

- early mobilization after injury/infarction

### Treatment

- goal of treatment: to facilitate function
- conservative treatment: education, support groups, PT/OT, smoking cessation
- medical: topical capsaicin, TCA, NSAID, tender point injections with corticosteroid/lidocaine, gabapentin/pregabalin/lamotrigine, calcitonin or bisphosphonates, oral corticosteroids
- surgical: paravertebral sympathetic ganglion blockade
- refer to pain management clinic

#### Prescribing of Opioid Analgesics and Related Mortality Before and after the Introduction of Long-Acting Oxycodone

CMAJ 2009;181:891-896

**Study:** Epidemiological study of 3271 opioid related deaths from 1991-2007 that assessed association with introduction of long-acting oxycodone to the Ontario provincial formulary.

**Results:** Opioid related deaths increased significantly in association with introduction of long acting oxycodone.

**Conclusion:** Opioids must be used cautiously given serious potential harm, and careful monitoring is required.

If CT is negative but clinically there is suspicion of SAH or meningitis, perform a lumbar puncture.

#### Headache DDx

##### ER VISIT

**Eye** (acute angle closure glaucoma, sinusitis)

**Recurrent/Chronic** (migraine, tension, cluster, TMJ disease, cervical OA)

**Vascular** (SAH, ICH, temporal arteritis)

**Infectious** (meningitis, encephalitis)

**Systemic** (anemia, anoxia, CO, pre-eclampsia)

**ICP** (mass/abscess, HTN encephalopathy, pseudotumour cerebri)

**Trauma** (concussion, SDH, EDH)

## Headache

- see [Emergency Medicine](#), ER24 and [Family Medicine](#), FM36

### Clinical Approach

- **history**
  - pain characteristics: onset, frequency, duration, intensity, location, radiation, other specific features (e.g. worse in AM, worse with bending/cough/Valsalva)
  - associated symptoms: visual changes, change in mental status, nausea/vomiting, fever, meningismus, photophobia, phonophobia, TMJ popping/clicking, jaw claudication, neurological sx
  - precipitating/alleviating factors (triggering factors, analgesics), medications (esp. nitrates, CCBs, NSAIDs, anticoagulants), PMH, FHx
  - red flags (possible indications for CT scan/further investigation): new-onset headache (esp. if age <5 or >50), quality worse/different than previous headaches, sudden and severe ('thunderclap'), immunocompromised, fever, focal neurological deficits, trauma
- **physical**
  - vitals (including BP and temp), Kernig's/Brudzinski's, MSK examination of head and neck
  - HEENT: fundi (papilledema, retinal hemorrhages), red eye, temporal artery tenderness, sinus palpation, TMJ
  - full neurologic exam (including LOC, orientation, pupils (symmetry), and focal neurological deficits)
  - **red flags:** papilledema, altered LOC, fever, meningismus, focal neurological deficits, signs of head trauma

### Classification

- **primary**
  - tension, migraine, cluster, exertional, cervical OA, TMJ syndrome
- **secondary**
  - SAH, ICH, stroke, venous sinus thrombosis, meningitis/encephalitis, trauma, increased ICP (space-occupying lesion, malignant HTN or pseudotumour cerebri), temporal arteritis, sinusitis, acute-angle closure glaucoma, pre-eclampsia, post lumbar puncture, drugs/toxins (e.g. nitroglycerin use and analgesia withdrawal); all can be associated with serious morbidity or mortality

Table 21. Headaches – Selected Primary Types

	Tension-Type	Migraine	Cluster
<b>Prevalence</b>	70%	12%	<1%
<b>Age of Onset</b>	15-40	10-30	20-40
<b>Sex Bias</b>	F > M	F > M	M > F
<b>Family History</b>	None	+++	+
<b>Location</b>	Bilateral frontal Nuchal-occipital	Unilateral>bilateral Fronto-temporal	Retroorbital
<b>Duration</b>	Minutes – days	Hours – days	10 min-2 h
<b>Onset/Course</b>	Gradual; worse in PM	Gradual; worse in PM	Daily attacks for weeks to months; more common early AM or late PM
<b>Quality</b>	Band-like; constant	Throbbing	Constant, aching, stabbing
<b>Severity</b>	Mild-moderate	Moderate-severe	Severe (wakes from sleep)
<b>Triggers/Provoking</b>	Depression Anxiety Noise Hunger Sleep deprivation	Noise/light Caffeine/alcohol Hunger Stress Sleep deprivation	Light EtOH
<b>Palliating</b>	Rest	Rest	Walking around
<b>Associated Sx</b>	No vomiting No photophobia	Nausea/vomiting Photo/phonophobia Aura	Red watery eye Nasal congestion or rhinorrhea Unilateral Horner's
<b>Management</b>	Non-pharmacological • Psychological counseling • Physical modalities (e.g. heat, massage) Pharmacological • Simple analgesics • Tricyclic antidepressants	Acute Rx • ASA • NSAIDs • Triptans • Ergotamine Prophylaxis 1. TCA 2. Anticonvulsants 3. Propranolol	Acute Rx • O <sub>2</sub> • Sumatriptan (nasal or injection) Prophylaxis • Verapamil • Lithium • Methysergide • Prednisolone

Table 22. Prophylactic Management of Migraine Headaches

Class	Drug	Evidence	Contraindications	Side Effects
<b>Beta-blockers</b>	Propranolol	A	Asthma, DM (mask hypoglycemia)	Fatigue
	Timolol	A		Depression
	Metoprolol	B	CHF	Light-headedness
<b>TCA</b>	Amitriptyline	A	Heart disease, glaucoma	Sedation
	Nortriptyline	C	*Avoid in elderly	Dry mouth Weight gain Light-headedness
<b>CCB's</b>	Flunarizine	A	Depression, obesity	Weight gain, depression, PD (rare)
	Verapamil	B	Heart disease	Weight gain (10-20 lb), constipation
<b>AED</b>	Valproate	A	Liver, renal, pancreatic diseases	Weight gain, tremor, alopecia, teratogenic: N.T. defect
	Topiramate + folic acid supplement	A	Renal	Paresthesia, weight LOSS, cognitive: memory loss, difficulty concentrating, renal stone (rare)

Table 23. Headaches – Selected Serious but Rare Secondary Types

	Meningeal Irritation	Increased ICP	Temporal Arteritis
<b>Age of Onset</b>	Any age	Any age	> 60
<b>Location</b>	Generalized	Any location	Temporal
<b>Onset/Course</b>	Meningitis: hours-days SAH: thunderclap onset	Gradual; worse in AM	Variable
<b>Severity</b>	Severe	Severe	Variable; can be severe
<b>Provoking</b>	Head movement	Lying down Valsalva Head low Exertion	Jaw claudication
<b>Associated Sx</b>	Neck stiffness Photophobia Focal deficits (e.g. CN palsies)	Nausea/vomiting Focal neuro symptoms Decreased level of consciousness	Polymyalgia rheumatica Visual loss

#### The Rational Clinical Examination: Does this Patient with Headache have a Migraine or Need Neuroimaging?

JAMA 2006;296:1274-1283

Does this patient with headache have a migraine? The most useful panel of questions for diagnosing migraine is summarized by the POUNDING mnemonic:

- P** – Pulsatile quality
- O** – duration of 4-72 h
- U** – Unilateral location
- N** – Nausea or vomiting
- D** – Disabling intensity

The LR for definite or possible migraine diagnosis varies with the number of features present: with ≥4, 3 and ≥2 features, the LRs are 24 (1.5-388), 3.5 (1.3-9.2) and 0.41 (0.32-0.52) respectively.

#### Does this patient with headache need neuroimaging?

In patients with new or changed headache the prevalence of significant intracranial pathology is 32% (24-42%), and in those presenting with thunderclap headache the prevalence is 43% (20-68%).

Several individual clinical features were found to be predictive of significant intracranial pathology:

Symptom	OR
Cluster-type headache	10.7 (2.2-52)
Abnormal neurological exam	5.3 (2.4-12)
Undefined-type headache (non-tension/migraine/cluster-type)	3.8 (2.0-7.1)
Headache with aura	3.2 (1.6-6.6)
Aggravated by exertion/Valsalva	2.3 (1.4-3.8)
Headache with vomiting	1.8 (1.2-2.6)

#### Acute and Preventive Pharmacologic Treatment of Cluster Headache

Neurology 2010;75:463-473

**Study:** Meta-analysis of prospective, double-blind, RCTs of pharmacologic agents for prevention or treatment of CH.

**Results:** 27 trials were included. Sumatriptan 6 mg SC, zolmitriptan nasal spray 5-10 mg, and 100% oxygen 6-12 L/min received Level A recommendation for acute treatment. For prevention, Level B recommendations were given for intranasal civamide 100 ug daily and suboccipital steroid injections.

**Conclusion:** Sumatriptan, zolmitriptan, and mid flow oxygen are effective acute treatments for CH.

#### Anticonvulsants in Migraine Prophylaxis

Cochrane DB Syst Rev 2009;3:CD003226

**Study:** Meta-analysis of prospective, controlled trials of anticonvulsant drugs in migraine headache prophylaxis.

**Results:** Twenty-three studies (n=2927) were included. Anticonvulsants reduce migraine frequency by 1.3 attacks per 28 d compared to placebo and double the number of patients for whom migraine frequency is reduced by 50% (RR=2.25, NNT=3.9). Valproate and topiramate are better than placebo, while clonazepam, acetazolamide, lamotrigine and vigabatrin are not. Clinically important adverse events were associated with valproate and topiramate with NNH 7.0 to 18.8 and 2.4 to 31.2 respectively.

**Conclusion:** Anti-convulsants are effective in reducing migraine frequency and reasonably well-tolerated. Valproate and topiramate are the two most studied but further studies of head-to-head comparisons between agents is needed.

**Table 23. Headaches – Selected Serious but Rare Secondary Types** (continued)

	Meningeal Irritation	Increased ICP	Temporal Arteritis
<b>Physical Signs</b>	Kernig's sign Brudzinski's sign Meningismus	Focal neuro symptoms Papilledema	Temporal artery changes: • Firm, nodular, incompressible • Tender
<b>Management</b>	CT/MRI with gadolinium/ LP, antibiotics for bacterial meningitis	CT/MRI and treatment to reduce pressure See <a href="#">Neurosurgery</a> , NS6	Prednisone See <a href="#">Rheumatology</a> , RH20
<b>Etiology</b>	Meningitis, SAH	Tumour, ITH, malignant hypertension	Vasculitis (GCA)

ITH – idiopathic intracranial hypertension

The oral contraceptive pill is contraindicated with complicated migraine due to risk of stroke.

Migraine auras can mimic other causes of transient neurological deficits (e.g. TIAs and seizures).

**"Menstrual Migraine" Subtype**  
Migraine headache that is associated with the onset of menstruation – usually 2 d before to 3 d after the onset of menstrual bleeding.

If patient presents to ED with severe migraine and nausea/vomiting – consider treating with IV anti-emetics (chlorpromazine, prochlorperazine).

#### Pharmacological Treatments for Acute Migraine

Pain 2002;97:247-257

**Study:** Meta-analysis of 54 double-blind, placebo-controlled RCTs of pharmacologic treatment of acute migraine of moderate to severe intensity (21,022 patients in total).

**Data extraction:** Number of patients, dosing regimens, details of study design, and timing or type of rescue medication. Outcomes include headache relief at 1 and 2 h, freedom from pain at 2 h, sustained relief for 24 h, and adverse effects within 24 h.

**Main Results:** Data were available for 9 oral medications, 2 intranasal medications, and subcutaneous sumatriptan. For h/a relief at 2 h, all interventions were effective except Cafergot®, with NNTs ranging from 2.0 for sumatriptan 6 mg SC to 5.4 for naratriptan 2.5 mg. The lowest NNT for oral medication was 2.6 for eletriptan 80 mg. For patients pain free at 2 h, the lowest NNT was 2.1 for sumatriptan 6 mg SC, with the lowest NNT for oral medication being 3.1 for rizatriptan 10 mg. For sustained relief over 24 h NNT ranged from 2.8 for eletriptan 80 mg to 8.3 for rizatriptan 5 mg. Side effects could not be analyzed systematically. There were no drug-to-drug comparisons.

**Conclusion:** Overall, most treatments were effective. Subcutaneous sumatriptan and oral triptans were most effective.

A prophylactic agent is recommended only if migraine attacks are severe enough to cause impairment of a patient's quality of life or if a patient has >3 migraines/month that have not responded adequately to treatment.

Neurology 2000;55:754-763

## Migraine Headaches

### Definition (common migraine)

- ≥5 attacks fulfilling each of the following criteria
  - 4-72 h duration
  - 2 of the following: unilateral, pulsating, moderate-severe (interferes with daily activity), aggravated by routine physical activity
  - 1 of the following: nausea/vomiting, photophobia/phonophobia/osmophobia

### Epidemiology

- 18% females, 6% males; frequency decreases with age (especially at menopause)

### Etiology and Pathophysiology

- theories of migraine etiology:
  - depolarizing wave of "cortical spreading depression" across the cerebral cortex that may cause an aura (e.g. visual symptoms due to wave through occipital cortex) and also activate trigeminal nerve afferent fibres
  - possible association with vasoconstriction/dilation
- significant genetic contribution
- **triggers:** stress, sleep excess/deprivation, drugs (estrogen, nitroglycerin), hormonal changes, caffeine withdrawal, chocolate, tyramines (e.g. red wine), nitrites (e.g. processed meats)

### Signs and Symptoms

- stages of uncomplicated migraine
  - i. prodrome (hours to days before headache onset)
  - ii. aura
  - iii. headache (see Table 21 for description of typical headache)
  - iv. postdrome
- aura
  - fully reversible symptom of focal cerebral dysfunction lasting <60 min
  - examples: visual disturbance (fortification spectra – zigzags; scintillating scotomata – spots), unilateral paresthesia and numbness or weakness, aphasia
- prodrome/postdrome: appetite change, autonomic symptoms, altered mood, psychomotor agitation/retardation
- classification of migraines
  - common migraine: no aura
  - classic migraine: with aura (headache follows reversible aura within 60 min)
  - complicated migraine: with severe/persistent sensorimotor deficits
    - ♦ examples:
      - basilar-type migraine (occipital headache with diplopia, vertigo, ataxia, and altered level of consciousness)
      - hemiplegic/hemisensory migraine
      - ophthalmoplegic migraine
  - acephalgic migraine (i.e. migraine equivalent): aura without headache

### Management

- avoid triggers
- mild to moderate migraine
  - 1st line: NSAIDs (ibuprofen, naproxen)
- moderate to severe migraine
  - triptans (most effective), ergots (dihydroergotamine, DHE)
- migraine prophylaxis: anticonvulsants (divalproex, topiramate, gabapentin), TCA (amitriptyline, nortriptyline), propranolol, calcium channel blocker (verapamil)

# Sleep Disorders

## Overview of Sleep

### Definition

- newborn: 18 h sleep (50% REM), adolescents: 10 h, adults: 7-9 h but most get insufficient amounts
- many elderly have reduced sleep as a consequence of underlying sleep disorders

### Sleep Architecture

- **polysomnogram (PSG) measures:** EEG, eye movements (electro-oculogram – EOG), EMG, respiratory effort, oxygenation, ECG

**Table 24. Sleep Stage Characteristics**

	EEG	EOG	Muscle Tone	Other Characteristics
Waking State	Low voltage high frequency, dominant $\alpha$ rhythm (8-13 Hz)	Rapid, blinking	High	
Stage N1 (~5%)	<50% $\alpha$ activity replaced with $\theta$ (4-7 Hz). Vertex waves	Slow, roving eye movements	High, but gradually dropping	Marker for very light quality sleep or sleep disruption
Stage N2 (~50%)	K complexes high voltage negative and positive discharges with spindles (11-16 Hz)	Still	High	
Stage N3 (previously 3 and 4)/Slow Wave/Delta Sleep (~20%)	Slow wave activity – high voltage (>75 $\mu$ V), low frequency (<2 Hz)	Still	Low	Homeostatic sleep Reduced BP, HR, cardiac output, RR Growth hormone release
Rapid Eye Movement (REM) Sleep (~25%)	Mixed frequency, low voltage, sawtooth waves	Rapid eye movements	Very low	Irregular respiration Arrhythmias, heart rate variation Classical dreaming state

### Element of Sleep History

- Initiation of sleep
  - Events prior to bed
  - Lights
  - Latency (estimated)
  - Restless legs
  - Hallucinations
- Maintaining sleep
  - Number of wakeups/night
  - Sleep walking/talking
  - Snoring/gasping
  - Dreams/nightmares
- Consequences of sleep
  - Restorative
  - Morning headache
  - Falling asleep in inappropriate setting

### Drug Effects on Wakefulness and Sleep

- Antihistamines associated with increased sleepiness
- Stimulants increase arousal
- Caffeine (an adenosine antagonist) increase wakefulness
- Benzodiazepines reduce slow wave sleep
- Antidepressants (TCA/MAO-I/SSRI) reduce REM, prolong REM latency
- Alcohol may hasten sleep onset but associated with increased arousals

Avoid sleep medications (esp. in elderly patients) due to increased risk of falls, pseudodepression, memory loss.

## Disturbances of Alertness and Sleep

### Coma

- see [Neurosurgery](#), NS34

### Insomnia

- **definition/criteria:**
  - difficulty initiating or maintaining sleep, or waking up earlier than desired (leading to sleep that is chronically non-restorative/poor quality) despite adequate opportunity and circumstances for sleep
- **types:**
  - sleep state misperception, psychophysiologic insomnia (learned sleep-preventing associations – i.e. clock watching), fatal familial insomnia (rare prion protein mutation causing autonomic dysfunction), idiopathic (lifelong difficulty)
  - **secondary causes:**
    - ♦ psychiatric disorders (80% of psychiatric patients): anxiety and depression (see [Psychiatry](#), PS10, PS13)
    - ♦ neurologic disorders: neurodegenerative disease, epilepsy, neuromuscular disorders, many others
    - ♦ sleep disorders: restless legs syndrome (sleep initiation difficulties), sleep apnea (sleep maintenance difficulties)
    - ♦ medical conditions: pregnancy, cardiorespiratory (COPD/HF), GERD, pain (arthritis, fibromyalgia, cancer)
    - ♦ drugs/toxins: caffeine, alcohol, stimulants, antidepressants, glucocorticoids, sedative withdrawal
- **treatment:**
  - sleep log, sleep hygiene, stimulus control, sleep restriction, relaxation response, cognitive behavioral therapy

**Sleep Apnea**

- **definition**
  - disorder of breathing in sleep associated with sleep disruption and consequent excessive somnolence
- **epidemiology:**
  - >2-4% of the population
  - increasing obesity
  - significant morbidity: HTN, stroke, heart failure, sleepiness, mortality (accidents)
- **types:**
  - obstructive sleep apnea: see [Respirology](#), R31
  - central sleep apnea: no effort to breathe over 10 s
  - mixed apnea: starts as central, but eventually becomes obstructive
- **etiology of central apnea:** heart failure, opiates, brainstem pathology, myotonic dystrophy
- **diagnosis:** apnea hypopnea index (AHI) or respiratory disturbance index (RDI) should be <5 in the normal or pathologic state
- **treatment:** conservative measures, dental devices, CPAP (common), surgery (rare), ensure driving safety

**Restless Leg Syndrome (RLS) and Periodic Limb Movement Disorder (PLMD)**

- **definition:**
  - urge to move with accompanied uncomfortable sensations that begin or worsen with rest, are partially or totally relieved with movement, and are worse in evening/night
  - RLS refers to sensation
  - PLMD refers to the manifestation
- **epidemiology:** 10% North Americans, 90% of RLS have PLMD, 50% of PLMD have RLS
- **etiology:** central (spasticity), or peripheral nervous system (radiculopathy, neuropathy), pregnancy, iron deficiency, alcohol use
- **treatment:**
  - underlying contributors (iron and B<sub>12</sub> supplementation), dopaminergic agonists (first line), clonazepam (causes tachyphylaxis), opioids (only exceptional circumstances)
  - NOT recommended: Sinemet®, causes augmentation

**Narcolepsy**

- **definition/clinical features:** excessive daytime sleepiness (all narcolepsy), cataplexy = loss of muscle tone with emotional stimuli (pathognomonic), sleep paralysis (unable to move upon waking for 2-3 min), hypnagogic hallucinations (vivid dreams or hallucinations at sleep onset)
- **epidemiology:** prevalence 1:2000, onset in adolescence/early adulthood; life-long disorder
- **etiology:** presumed autoimmune attack on orexin/hypocretin system, post head injury, multiple sclerosis, hypothalamic tumours; rarely familial
- **diagnosis:** based on clinical history + multiple sleep latency test findings of short sleep latency <8 min and REM within 15 min of sleep onset on 2/4 naps
- **treatment:**
  - sleep hygiene and scheduled brief naps, restricted driving
  - alerting agents modafinil (non-amphetamine stimulant), stimulant (i.e. methylphenidate)
  - anti-cataplectic: TCAs, SSRIs, sodium oxybate

**Parasomnias**

- **definition/clinical features:** unusual behaviors in sleep with clinical features appropriate to stage of sleep
- **etiology:** in elderly, REM sleep behavior disorder may be associated with Parkinson's disease; in children slow wave sleep arousals (sleep walking) may be associated with sleep disordered breathing
- **diagnosis:** clinical history in children, polysomnography in adults to exclude nocturnal seizures
- **treatment:** behavioral management (safety, adequate sleep); clonazepam for REM sleep behavior, tonsillectomy if appropriate in children

**Circadian Rhythm**

- **definition/clinical features:** abnormalities based on time of day rather than sleep (i.e. jet lag, shift work)
- **diagnosis:** clinical history

## CNS Infections

- see [Infectious Diseases](#), ID19

## Spinal Cord Syndromes

- see [Neurosurgery](#), NS28

# Stroke

## Terminology

- **stroke**: sudden onset of neurological deficits of a vascular basis with infarction of CNS tissue
  - infarction is permanent tissue injury (confirmed by neuroimaging)
- **transient ischemic attack (TIA)**: sudden onset of neurological deficits of a vascular basis without infarction (i.e. resolution)

## Pathophysiology

- two major types: ischemic (~80%) and hemorrhagic (~20%)

### 1. Ischemic

- **arterial thrombosis**: thrombus formation in artery (local/in situ)
  - ♦ **large vessel**: stenosis or occlusion of the internal carotid artery, vertebral, or intracranial arteries
    - mechanisms:
      - insufficient blood flow beyond lesion (hemodynamic stroke)
      - underlying processes: atherosclerosis (most common cause), dissection and vasculitis
  - ♦ **small vessel/lacunar**
    - mechanism: chronic hypertension and diabetes cause vessel wall thickening and decreased luminal diameter
    - affects mainly small penetrating arteries (primarily basal ganglia, internal capsule and thalamus)
- **cardioembolic**: blockage of cerebral arterial blood flow due to particles originating from a cardiac source
  - ♦ atrial fibrillation (most common), rheumatic valve disease, prosthetic heart valves, recent MI, fibrous and infectious endocarditis
- **systemic hypoperfusion** (global cerebral ischemia)
  - ♦ inadequate blood flow to brain, usually secondary to cardiac pump failure (e.g. cardiac arrest, arrhythmia or MI)
  - ♦ primarily affects watershed areas (between the major cerebral arterial territories)

### 2. Hemorrhagic

- **intracerebral hemorrhage (ICH)**
  - ♦ mechanisms:
    - hypertensive (most common): rupture of small microaneurysms (Charcot-Bouchard aneurysms) causing intraparenchymal hemorrhage
      - most common sites: putamen, thalamus, cerebellum, and pons
    - other: trauma, amyloid angiopathy (associated with lobar hemorrhage), vascular malformations, vasculitis, drug use (cocaine or amphetamines)
- **subarachnoid hemorrhage (SAH)** see [Neurosurgery](#), NS18

### Stroke Syndromes According to Vascular Territory

- **ACA**: contralateral leg paresis and sensory loss
- **MCA**: proximal occlusion involves:
  1. contralateral weakness and sensory loss of face and arm
  2. cortical sensory loss
  3. may have contralateral homonymous hemianopia or quadrantanopia
  4. if left hemisphere: aphasia
  5. if right hemisphere: neglect
  6. eye deviation towards the side of the lesion and away from the weak side
- **PCA**:
  1. contralateral hemianopia or quadrantanopia
  2. midbrain findings: CN III and IV palsy/pupillary changes, hemiparesis
  3. thalamic findings: sensory loss, amnesia, decreased level of consciousness
  4. if bilateral: cortical blindness or prosopagnosia
- **basilar artery** (locked-in syndrome):
  1. quadriparesis
  2. dysarthria
  3. impaired eye movements
- **PICA (lateral medullary or Wallenberg syndrome)**: ipsilateral ataxia, ipsilateral Horner's, ipsilateral facial sensory loss, contralateral limb impairment of pain and temperature sensation, nystagmus, vertigo, nausea/vomiting, dysphagia, dysarthria, hiccups
- **medial medullary infarct (anterior spinal artery, which can be associated with anterior cord infarct)**: contralateral hemiparesis (facial sparing), contralateral impaired proprioception and vibration sensation, ipsilateral tongue weakness

#### Hypertension Encephalopathy

Acute severe HTN (typically dBp >130 or sBP >200) can cause hypertensive encephalopathy – abnormal fundoscopic exam (papilledema, hemorrhages, exudates, cotton-wool spots), focal neurologic symptoms, nausea, vomiting, visual disturbances and change in LOC.

Early seizure activity occurs in 5-25% of patients after ICH.

Consider transfer of acute stroke patient to a designated stroke centre for neuroprotective or thrombolytic therapy if the patient is seen in first few hours.

Cerebral venous sinus thrombosis should be considered in the differential diagnosis of stroke and headache. It is an uncommon cause of either, but is associated with high morbidity and mortality. Patients often present with headache alone, but can also have seizures, focal neurological deficits, or cranial nerve palsies. This is diagnosed with MRV or CTV. Treatment is typically anticoagulation with heparin initially, then transition to warfarin.

20-40% of patients with ischemic stroke may develop hemorrhagic transformation within 1 wk after the initial infarction.

Figure 24. Vascular territories

- **lacunar infarcts (deep hemispheric white matter):**
  - pure motor hemiparesis: posterior limb of internal capsule: contralateral arm, leg, and face
  - pure sensory loss: thalamic: hemisensory loss
  - ataxic hemiparesis: ipsilateral ataxia and leg paresis
  - dysarthria-clumsy hand syndrome: dysarthria, facial weakness, dysphagia, mild hand weakness and clumsiness

Bloodwork should only delay treatment if: patient is on anti-coagulants, low Ptt count suspected, abnormal electrolytes suspected or any bleeding abnormality suspected.

Suspect an alternate diagnosis if: fever, decreased LOC, fluctuating symptoms, gradual onset, no focal neurological symptoms, and/or positive symptoms.

Infarcted area of brain tissue can often appear normal on CT during the first several hours after the onset of stroke.

**Aspect Score:** 10-point quantitative score to assess ischemic changes on CT scan

- 10/10 is normal and <4/10 signifies high risk of bleed with rtPA
- Subtract 1 point for each of following structures if abnormal within the ischemic hemisphere: caudate, lentiform, insula, internal capsule, MCA 1, 2, 3, 4, 5, 6 regions.

If rtPA given at stroke onset, delay acute antiplatelet/anticoagulation treatment by 24 h.

The **National Institute of Health Stroke Scale (NIHSS)** is a standardized clinical examination that determines the severity of an acute stroke. It can also be used to monitor response to treatment over time.

The scale uses 11 items that evaluate:

- Level of consciousness
- Visual system
- Motor system
- Sensory system
- Language abilities

Scoring (x/42):

- 0=no stroke
- 1-4=mild stroke
- 5-15=moderate stroke
- 15-20=moderate to severe stroke
- 21-42=severe stroke

rtPA should be considered if score 6 or greater.

**Absolute Contraindications to rtPA**

Hx: improving sx, minor sx, seizure at stroke onset, recent major surgery (within 14 d) or trauma, recent GI or urinary hemorrhage (within 21 d), recent LP or arterial puncture at noncompressible site, PMHx ICH, sx of SAH/pericarditis/MI, pregnancy.

P/E: sBP ≥185, dBP ≥110, aggressive Rx to decrease BP, uncontrolled serum glucose, thrombocytopenia.

Ix: hemorrhage or mass on CT, high INR or aPTT.

## Assessment and Treatment of Ischemic Stroke

### General Assessment

- ABCs, full vital sign monitoring, check glucose, urgent CODE STROKE if <4.5 h from symptom onset (for possible thrombolysis)
- history
  - onset: time when last known to be awake and symptom free
  - mimics to rule out: seizure/post-ictal, hypoglycemia, migraine, conversion disorder
- investigations:
  - non-contrast CT head (STAT): to rule out hemorrhage and assess extent of infarct
  - ECG: to rule out atrial fibrillation (cardioembolic cause)
  - CBC, electrolytes, creatinine, PTT/INR, blood glucose
- imaging (i.e. CT) signs of stroke:
  - loss of cortical white-grey differentiation
  - sulcal effacement (i.e. mass effect decreases visualization of sulci)
  - hypodensity of parenchyma
  - insular ribbon sign
  - hyperdense MCA sign

### ACUTE STROKE MANAGEMENT

#### 1. Thrombolysis

- **rtPA** (recombinant tissue plasminogen activator)
- given **within 4.5 h** of acute ischemic stroke onset provided there are clinical indications and no contraindications to use:
- indications: based on NIH Stroke Scale (NIHSS – see sidebar)
- contraindications: see sidebar

#### 2. Anti-Platelet Therapy

- give at presentation of TIA or stroke if rtPA not received
- antiplatelet agents:
  - ASA: recommended dose 81 mg chewed
  - if patient intolerant to ASA, use other antiplatelet agent (i.e. clopidogrel)

#### 3. Acute Anti-Coagulant Therapy

- for patients with TIA or stroke and atrial fibrillation if rtPA not received
  - recommend IV heparin (or ensuring INR between 2-3 if already anticoagulated on warfarin)

### Other Acute Management Issues

- avoid hyperglycemia which can increase the infarct size
- lower temperature if febrile
- prevent complications:
  - NPO if dysphagia (to be reassessed by SLP)
  - DVT prophylaxis if bed-bound
  - initiate rehabilitation early

### Blood Pressure Control

- do **NOT** lower the blood pressure unless the hypertension is severe
  - antihypertensive therapy is withheld for at least 5 d after thromboembolic stroke unless sBP >220 mmHg or dBP >120 mmHg, or in the setting of acute MI, renal failure, aortic dissection
- acutely elevated BP is necessary to maintain brain perfusion to the ischemic penumbra
- most patients with an acute cerebral infarct are initially hypertensive and their BP will fall spontaneously within 1-2 d
- IV labetalol first-line if needed

### Etiological Diagnosis

- further investigations:
  - additional neuroimaging (MRI)
  - vascular imaging: CTA/MRA/carotid dopplers
  - cardiac tests: ECHO, holter monitoring
  - correct etiological diagnosis is critical for appropriate secondary prevention strategies

## Primary and Secondary Prevention of Ischemic Stroke

### Anti-Platelet Therapy

- primary prevention
  - current evidence has not firmly established a protective role for antiplatelet agents for low-risk patients without a prior stroke/TIA
- secondary prevention
  - ASA is the initial antiplatelet of choice for stroke prevention
  - other agents (generally reserved for those who suffer cerebrovascular symptoms while on ASA or in unable to tolerate ASA)
    - ♦ Aggrenox® (ESPRIT trial)
    - ♦ clopidogrel (CAPRIE trial)
  - there is no benefit (and increased risk of major bleeding) to combining ASA and clopidogrel (MATCH and CHARISMA trials)

### Carotid Stenosis

- primary prevention (asymptomatic)
  - carotid endarterectomy is controversial: if stenosis >60%, risk of stroke is 2% per year; carotid endarterectomy reduces the risk of stroke by 1% per year (but 5% risk of complications)
- secondary prevention (previous stroke/TIA in carotid territory)
  - carotid endarterectomy clearly benefits those with symptomatic severe stenosis (70-99%), and is less beneficial for those with symptomatic moderate stenosis (50-69%) (NASCET trial), see [Neurosurgery](#), NS25
- according to the CREST trial, endarterectomy and carotid stenting have similar benefits in a composite endpoint of reduction of stroke, MI and death. However, in the periprocedural period, stenting results in a higher rate of stroke, while endarterectomy results in a higher rate of MI

### Atrial Fibrillation

- primary and secondary prevention with anticoagulation
  - risk stratification using CHADS<sup>2</sup> score (see sidebar)
    - ♦ 0 (very low risk): antiplatelet
    - ♦ 1 (low risk): anticoagulant or antiplatelet – patient specific decision
    - ♦ >2 (mod-high risk): anticoagulant
  - anticoagulation therapy
    - ♦ warfarin (titrate to INR 2-3)
    - ♦ dabigatran (110 or 150 mg bid) may be an option to warfarin, but should be used cautiously due to lack of a reversal agent should bleeding occur

### Hypertension

- primary prevention
  - targets: BP <140/90 (or <130/80 for diabetics or renal disease)
  - ramipril 10 mg PO OD is effective in patients at high risk for cardiovascular disease (HOPE trial)
    - ♦ ACEI reduce the risk of stroke beyond their antihypertensive effect
- secondary prevention
  - ACEI and thiazide diuretics are recommended in patients with previous stroke/TIA (PROGRESS trial)

### Hypercholesterolemia

- primary prevention
  - statins reduce the risk of stroke in patients with CAD or at high risk for cardiovascular events, even with normal cholesterol (CARE trial)
- secondary prevention
  - statins reduce risk of subsequent stroke – best evidence is for high dose atorvastatin (SPARCL trial) but lower doses may be more appropriate if patient cannot tolerate high dose

### Diabetes

- ideal management: HbA1c <7%, fasting blood glucose between 4 and 7

### Smoking

- primary prevention
  - smoking increases risk of stroke in a dose-dependent manner
- secondary prevention
  - after smoking cessation, the risk of stroke decreases to baseline within 2-5 yr

#### tPA in Acute Stroke – NINDS Trial

*NEJM* 1995;333:1581-1588

**Study:** Randomized, double-blind, placebo-controlled trial (3 mo follow-up).

**Patients:** 624 patients (mean age 76 yr) with ischemic stroke of recent onset, and no evidence of intracranial hemorrhage on CT. Exclusions included hx of recent stroke or recent surgery, sBP >185, dBP >110, symptoms of SAH, recent GI or GU hemorrhage, seizure with onset of stroke, and recent use of anticoagulants.

**Intervention:** IV tPA or placebo within 180 min of the onset of symptoms.

**Outcomes:** Neurologic deficit at 24 h (NIHSS scale) and functional outcome at 3 mo.

**Results:** There was no significant difference between groups at 24 h. At 3 mo, there were more patients in the tPA group with minimal or no disability (50% vs. 38%, p=0.03). Intracerebral hemorrhage was more common in the tPA group (p<0.001). There was no difference in mortality.

**Conclusion:** IV tPA given within 3 h of onset of acute ischemic stroke improves functional outcome at 3 mo. The risk of intracerebral bleeding is increased.

**Addendum:** When re-assessed at 12 mo from the time of treatment, patients in the tPA group were 30% more likely to have minimal or no disability, with no significant difference in mortality or rate of recurrent stroke (*NEJM* 1999;340:1781-1787).

#### Dabigatran vs. Warfarin in Patients with Atrial Fibrillation (The RE-LY Trial)

*NEJM* 2011; 365:883-891

**Study Type:** Prospective, multi-center RCT. Double-blinded between different doses of dabigatran, unblinded comparison between dabigatran and warfarin.

**Population:** 18,113 patients with atrial fibrillation and a risk of stroke followed over 2 yr.

**Primary Outcome:** Stroke or systemic embolism.

**Results:** Rates of outcome were 1.69% per year in warfarin group and 1.53% per year in dabigatran group (RR 0.91, P <0.001 for non-inferiority).

Minor bleeds were slightly increased in warfarin group (3.36% versus 2.71% with dabigatran; P = 0.003). Risk of hemorrhagic stroke was lower with dabigatran (0.12% versus 0.38%; P <0.001).

**Conclusions:** Dabigatran at 110 mg PO bid was associated with similar rates of stroke and systemic embolism and lower rates of major hemorrhage compared to warfarin in patients with atrial fibrillation. The 150 mg PO bid dose of dabigatran was more effective at stroke prevention and had a similar bleeding risk to warfarin.

#### High-dose Atorvastatin after Stroke or Transient Ischemic Attack (SPARCL trial)

*NEJM* 2006;355:549-559

**Method:** Multicenter double-blind RCT

**Population:** 4731 patients with stroke or TIA within 1-6 mo before study entry, LDL 100-190 mg/dL, no coronary heart disease.

**Intervention:** 80 mg atorvastatin PO OD or placebo.

**Outcome:** First non-fatal or fatal stroke over 5 yr

**Results:** Patients receiving atorvastatin had a lower rate of stroke (ARI 2.2%, hazard ratio 0.84; P = 0.03). There was a five-yr absolute reduction in risk of 3.5% (P=0.002). There was no significant change in mortality rate, but a small significant increase in the risk of hemorrhagic stroke.

**Conclusions:** High-dose atorvastatin decreases overall incidence of strokes and cardiovascular events in patients with a history of recent stroke or TIA.

#### CHADS<sup>2</sup>

Stroke risk stratification for patients with atrial fibrillation

Congestive heart failure (1 point)

Hypertension sBP >160 mmHg/treated hypertension (1 point)

Age >75 yr (1 point)

Diabetes (1 point)

Prior Stroke or TIA (2 points)

### Physical Activity

- regular physical activity is an important lifestyle measure in stroke prevention and its beneficial effect has a dose-related response in terms of intensity and duration of activity

### Stroke Rehabilitation

- individualized based on severity and nature of impairment; may require inpatient program and continuation through home care or outpatient services
- multidisciplinary approach includes dysphagia assessment and dietary modifications, communication rehabilitation, cognitive and psychological assessments including screen for depression, therapeutic exercise programs, assessment of ambulation and evaluation of need for assistive devices, splints or braces, vocational rehabilitation

## Cerebral Hemorrhage

### Investigations

- general investigations, see *Assessment and Treatment of Ischemic Stroke*, N44
- further investigations:
  - lumbar puncture (if suspect subarachnoid hemorrhage despite negative CT)
  - may require cerebral angiogram if suspect aneurysm or AVM
  - if typical location for hypertensive hemorrhage, repeat CT head in 4-6 wk after hemorrhage has resolved to rule out an underlying lesion

### Management

- medical
  - anti-hypertensives: no conclusive BP target ranges for managing ICH exist; 2010 AHA/ASA guidelines suggest that reducing sBP to as low as 140 mmHg with IV anti-hypertensives is safe and appropriate management (target BP 140-160 systolic)
  - ICP lowering medical management (if necessary): see *Neurosurgery*, NS7
- surgical: see *Neurosurgery*, NS19

## Multiple Sclerosis (MS)

### Definition

- a chronic inflammatory disease of the CNS characterized by relapsing remitting, or progressive neurologic symptoms due to inflammation, demyelination and axonal degeneration

### Clinical Patterns of MS (Figure 25)

- relapsing remitting (RRMS) 85%, primary progressive (PPMS) 10%, progressive relapsing (PRMS) 5%, secondary progressive (SPMS)
- most RRMS goes on to become SPMS

### MS Variants

- Devic's = neuromyelitis optica (NMO):** severe optic neuritis and extensive transverse myelitis extending >3 vertebral segments (NMO antibody positive)
- clinically isolated syndrome (CIS):** single MS-like episode, which may progress to MS
- tumefactive MS:** solitary lesion >2 cm mimicking neoplasms on MRI
- fulminant MS (Marburg):** rapidly progressive and fatal MS associated with severe axonal damage, inflammation, and necrosis
- acute disseminated encephalomyelitis (ADEM):** monophasic demyelinating disorder with multifocal neurologic symptoms seen mainly in children often following infection or vaccination

### Etiology

- genetic
  - polygenetic: the HLA-DRB1 gene has been demonstrated to be a genetically susceptible area
  - 30% concordance for monozygotic twins, 2-4% risk in offspring of affected mother or father
- environmental
  - MS is more common in regions with less sun exposure and lower stores of vitamin D (Europe, Canada, US, New Zealand, SE Australia)
  - MS has also been linked to certain viruses (EBV is associated with MS)

### Epidemiology

- onset 17-35 yr; 3F:1M
- PPMS occurs in an older population with 1F:1M

### ABCD<sup>2</sup> Score

To predict/identify individuals at high risk of stroke following TIA

**Age:** 1 point for age >60 yr

**Blood pressure (at presentation):**

1 point for hypertension

(>140/90 mmHg at initial evaluation)

**Clinical features:** 2 points for unilateral weakness, 1 for speech disturbance without weakness

**Duration of symptoms:** 1 point for 10-59 min, 2 points for >60 min

**Diabetes:** 1 point

**Stroke risk:** Scores 0-3: low risk, 4-5: moderate risk, 6-7: high risk

Carotid endarterectomy needs to be done within 2 wk of the ischemic event for the most benefit.

### ACE Inhibitor in Stroke Prevention – HOPE Trial

*NEJM* 2000;342:145-153

**Study:** Randomized, blinded, placebo-controlled trial. Mean follow-up 5 yr.

**Patients:** 9297 patients 55 yr of age or older (mean age 66 y, 73% men) who had evidence of vascular disease or diabetes plus one other cardiovascular risk factor and who were not known to have a low ejection fraction or heart failure.

**Intervention:** Ramipril 10 mg daily orally vs. matching placebo.

**Main Outcomes:** Stroke, MI, or death from cardiovascular causes

**Results:**

Outcome	RRR (95%CI)	NNT (CI)
Stroke	32% (16 to 44)	67 (43 to 145)
MI, stroke, or CV mortality	22% (14 to 30)	26 (19 to 43)
All-cause mortality	16% (5 to 25)	56 (32 to 195)

Treatment with ramipril reduced the risk of stroke (3.4 percent vs. 4.9 percent; RR 0.68;  $p < 0.001$ ).

**Conclusions:** In adults at high risk for cardiovascular events, ramipril reduced the risk of stroke, as well as other vascular events and overall mortality.

Figure 25. Clinical patterns of MS

### Chronic Cerebrospinal Venous Insufficiency (CCSVI)

A theory proposed in 2008 describing abnormal venous blood flow in patients with MS. Highly controversial theory currently being investigated.

## Diagnosis

- dissemination in space and in time as based on the revised McDonald criteria
  - dissemination in time: 2 or more attacks, new gadolinium enhancing lesion 3 mo later, or new T2 lesions >1 mo after first attack
  - dissemination in space: clinical evidence of 2 or more lesions; or three of [1 gadolinium enhancing or 9 T2 lesions], [1 infratentorial lesion], [1 juxtacortical lesion], [3 periventricular lesions]

## Clinical Features

- symptoms include numbness, visual disturbance (optic neuritis), weakness, spasticity, diplopia (e.g. INO), impaired gait, vertigo, bladder dysfunction
- Lhermitte's sign:** flexion of neck causes electric shock sensation down back into limbs indicating cervical cord lesion
- Uhthoff's phenomenon:** worsening of symptoms (classically optic neuritis) in heat
- SPMS: classically weakness of legs in pyramidal distribution paired with cerebellar findings of arms (i.e. intention tremor)
- symptoms not commonly found in MS: visual field defects, aphasia, apraxia, progressive hemiparesis
- relapse: acute/subacute onset of clinical dysfunction that peaks from days to weeks, followed by remission with variable symptom resolution (symptoms must last at least 24 h)
- in RRMS, average 0.4 to 0.6 relapses/yr, but higher disease activity in first year of disease

## Investigations

- MRI:** demyelinating plaques appear as hyperintense lesions on T2 weighted MRI, with active lesions showing enhancement with gadolinium
  - typical locations: periventricular, corpus callosum, cerebellar peduncles, brainstem, juxta cortical region, and dorsolateral spinal cord
  - Dawson's fingers: periventricular lesions extending into corpus callosum
  - cranial MRI is more sensitive than spinal MRI
- CSF:** oligoclonal bands in 90%, increased IgG concentration
- evoked potentials (visual/auditory/somatosensory):** delayed but well-preserved wave forms

## Treatment

- acute treatment:** methylprednisolone 1000 mg IV daily x 3-7 d (no taper required); if poor response to corticosteroids may consider plasma exchange
- disease modifying therapy (DMT):**
  - goals: decrease relapse rate, decrease progression of disability, slow accumulation of MRI lesions
  - first line: interferon- $\beta$  (injection: Betaseron®, Avonex®, Rebif®), glatiramer acetate (injection: Copaxone®)
  - second line: natalizumab (Tysabri®) (monthly IV infusion)
  - new oral agents: fingolimod (available) and cladribine (not yet available)
    - indications for fingolimod: newly diagnosed patients with active RRMS who prefer oral treatment despite increased risks or those intolerant of first line therapies
  - CIS: early treatment with interferons may delay potential second attack
  - RRMS: DMT reduces rate of relapse by about 30%
  - PPMS/SPMS: no proven efficacy of DMTs
- symptomatic treatment**
  - spasticity: baclofen, tizanidine, dantrolene, benzodiazepine, botulinum toxin
  - bladder dysfunction: oxybutynin
  - pain: TCA, carbamazepine, gabapentin
  - fatigue: amantidine, modafinil, methylphenidate
  - depression: antidepressant, lithium
  - constipation: high fibre intake, stool softener, laxatives
  - sexual dysfunction: sildenafil, tadalafil, vardenafil
- education and counseling:** MS society, support groups, psychosocial issues

## Prognosis

- good prognostic indicators: female, young, RRMS, presenting with optic neuritis, low burden of disease on initial MRI, low rate of relapse early in disease
- PPMS: poor prognosis, higher rates of disability, poor response to therapy

Most symptoms in MS are due to cord, brainstem and optic nerve lesions.

The Expanded Disability Status Scale (EDSS) is used as a measure of disability progression and is scored from 0 to 10 based on the neurologic exam and ambulation.

**Recombinant Interferon Beta or Glatiramer Acetate for Delaying Conversion of the First Demyelinating Event to Multiple Sclerosis**  
*Cochrane DB Syst Rev* 2008;2:CD005278  
**Study:** Meta-analysis of RCTs of clinically isolated syndrome (CIS) patients treated with immunomodulatory drugs.

**Primary Outcomes:** Proportion of patients converting to clinically definite MS and adverse effects.

**Results:** Three trials (n=1160) tested the efficacy of interferon (IFN $\beta$ ) and no trial tested glatiramer acetate (GA). A pooled odds ratio (OR) of 0.53 (5% CI, 0.40-0.71,  $p < 0.0001$ ) for patients on IFN versus placebo at one year. Two year follow-up odds ratio was 0.52 (95% CI 0.38-0.70,  $p < 0.0001$ ). There was no significant increase in adverse events for those on IFN $\beta$ .

**Conclusions:** IFN $\beta$  treatment can delay progression to clinically definite MS in patients with CIS over two years.

**Oral Fingolimod or Intramuscular Interferon for Relapsing Multiple Sclerosis**  
*NEJM* 2010;362:402-415

**Method:** Multicenter double-blind RCT.

**Population:** 1292 patients with relapsing-remitting MS and at least one relapse.

**Intervention:** Oral fingolimod at 0.5-1.25 mg or 30  $\mu$ g IM interferon- $\beta$ .

**Outcomes:** Annualized relapse rate over 1 yr; lesions on T2-weighted MRI.

**Results:** Annualized relapse rate was lower in both groups receiving fingolimod compared to interferon: 0.20 (95% CI 0.16-0.26) with 1.25 mg fingolimod, 0.16 (95% CI 0.12 to 0.21) with 0.5 mg fingolimod, 0.33 with interferon (95% CI 0.26-0.42;  $P < 0.001$ ). MRI findings also showed greater reduction of lesions in fingolimod-treated patients. Progression of disability was unchanged. Side effects included severe infections like HSV encephalitis, disseminated VZV, other HSV infections, and skin cancer.

**Conclusions:** Oral fingolimod is superior to interferon  $\beta$  injections in reducing relapses and MRI lesion load in patients with MS.

## Common Medications

Table 25. Common Medications – Major issues

Indications	Mechanism of Action/Class	Generic Name	Trade Name	Dosing	Contraindications	Side Effects
Parkinson's disease	Dopamine precursor	levodopa + carbidopa	Sinemet®	Carbidopa 25 mg/levodopa 100 mg PO tid Maximum 200 mg carbidopa and 2000 mg levodopa per day	Narrow-angle glaucoma, use of MAO inhibitor in last 14 d, history of melanoma or undiagnosed skin lesions	Nausea, hypotension, hallucinations, dyskinesias in last 14 d, history of melanoma or undiagnosed skin lesions
	Dopamine agonist	bromocriptine	Parlodel®	1.25 mg PO bid, increase by 2.5 mg/d q2-4wk, up to 10-30 mg PO tid	Concomitant use of potent inhibitors of CYP3A4, uncontrolled hypertension, ischemic heart disease, peripheral vascular disease. Caution with renal or hepatic disease	Hypotension, nausea, dizziness, constipation, diarrhea, vomiting, abdominal cramps, headache, nasal congestion, drowsiness, hallucinations
	MAO B inhibitor	selegiline	Eldepryl®	5 mg PO bid	Concomitant use of meperidine or tricyclic antidepressants	Headache, insomnia, dizziness, nausea, dry mouth, hallucinations, confusion, orthostatic hypotension, increased akinesia, risk of hypertensive crisis with tyramine-containing foods
Myasthenia gravis	Acetylcholinesterase inhibitor	pyridostigmine	Mestinon®	600 mg/d PO divided in 5-6 doses Range 60-1500 mg/d	GI or GU obstruction	Nausea, vomiting, diarrhea, abdominal cramps, increased peristalsis, increased salivation, increased bronchial secretions, miosis, diaphoresis, muscle cramps, fasciculations, muscle weakness
Acute migraine	Triptan (selective 5-hydroxytryptamine receptor agonist)	sumatriptan	Imitrex®	25-100 mg PO prn, maximum 200 mg/d	Hemiplegic/basilar migraine, ischemic heart disease, cerebrovascular disease, uncontrolled hypertension, use of ergotamine/5-HT <sub>1</sub> agonist in past 24 h, use of MAO inhibitor in last 14 d, severe hepatic disease	Vertigo, chest pain, flushing, sensation of heat, hypertensive crisis, peripheral vascular disease, coronary artery vasospasm, cardiac arrest, nausea, vomiting, headache, hyposalivation, fatigue
	Ergot (5-HT <sub>1D</sub> receptor agonist)	dihydroergotamine	Migranal®	Nasal spray 0.5 mg/spray, maximum 4 sprays/d	Hemiplegic/basilar migraine, high-dose ASA therapy, uncontrolled hypertension, ischemic heart disease, peripheral vascular disease, severe hepatic or renal dysfunction, use of triptans in last 24 h, use of MAO inhibitors in last 14 d	Coronary artery vasospasm, transient myocardial ischemia, myocardial infarction, ventricular tachycardia, ventricular fibrillation. May cause significant rebound headache
Migraine prophylaxis	Anticonvulsant	topiramate	Topamax®	25 mg OD PO (in evening); may increase weekly by 25 mg/d to a max 50 mg bid		Sedation, mood disturbance, cognitive dysfunction, anorexia, nausea, diarrhea, paresthesias, metabolic acidosis, glaucoma, SJS/TEN
	β-blocker	propranolol	Inderal®	80 mg/d divided every 6-8 h; increase by 20-40 mg/dose every 3-4 wk to max 160-240 mg/d in divided doses q6-8h	Uncompensated CHF, severe bradycardia or heart block, severe COPD or asthma	Fatigue, cognitive dysfunction, disturbed sleep, rashes, dyspepsia, dry eyes, heart failure, bronchospasm, risk of acute tachycardia and HTN if withdrawal
Epilepsy	Anticonvulsant for partial ± 2° generalization, generalized tonic-clonic	carbamazepine	Tegretol® (Carbatrol)	Start at 100-200 mg PO OD-bid, increase by 200 mg/d up to 800-1200 mg/d	History of bone marrow depression, hepatic disease, hypersensitivity to the drug, use of MAO inhibitor in last 14 d	Drowsiness, headache, unsteadiness, dizziness, n/v, skin rash, agranulocytosis/aplastic anemia (rare)
	Anticonvulsant for partial, tonic-clonic, status epilepticus	phenytoin	Dilantin®	100 mg PO tid, maintenance dose up to 200 mg PO tid SE: 10-15 mg/kg IV loading dose then maintenance doses of 100 mg PO or IV q6-8h	Hypersensitivity, pregnancy, breast-feeding; caution with P-450 interactions	Hypotension, SJS/TEN, SLE-type symptoms, gingival hypertrophy, peripheral neuropathy, headache, blood dyscrasias, nystagmus, n/v, constipation, sedation, teratogenic
	Anticonvulsant for partial or generalized, absence seizures	valproic acid	Depacon® Depakene® Depakote®	10-15 mg/kg/d PO, increase incrementally until therapeutic dose to max of 60 mg/kg/d	Hypersensitivity, hepatic disease, urea cycle disorders	Hepatic failure, headache, somnolence, alopecia, n/v, diarrhea, tremor, diplopia, thrombocytopenia, hypothermia, pancreatitis, encephalopathy
	Anticonvulsant for absence seizures	ethosuximide	Zarontin®	500 mg/d PO, increase by 250 mg every 4-7 d to max 1.5 g/d in divided doses	Hypersensitivity (succinimides)	CNS depression, blood dyscrasias, SLE, SJS, GI symptoms

**Table 25. Common Medications – Major issues (continued)**

Indications	Mechanism of Action/Class	Generic Name	Trade Name	Dosing	Contraindications	Side Effects
<b>Stroke prevention in AF</b>	Anticoagulant (direct thrombin inhibitor)	dabigatran	Pradax®	110 mg PO bid or 150 mg PO bid	CrCl <30 mL/min, significant hemostatic impairment or CNS lesions within 6 mo with high risk of bleeding	Dyspepsia, gastritis, bleeding
<b>Mild to moderate AD or DLB</b>	Cholinesterase Inhibitor	donepezil	Aricept®	5 mg PO OD, may increase to 10 mg PO OD after 4-6 wk	Hypersensitivity to donepezil or to piperidine derivatives	Diarrhea, n/v, insomnia, muscle cramps, fatigue, anorexia, HTN, syncope, AV block
<b>Multiple sclerosis</b>	MS Disease Modifying Therapy	interferon-β-1b interferon-β-1a SC interferon-β-1a IM	Betaseron® Rebif® Avonex®	0.25 mg (8 MU) SC every other day 44 µg SC 3 times/wk 30 µg IM once weekly	Pregnancy, hypersensitivity to natural or recombinant interferon β	Injection site reactions, injection site necrosis, flu-like symptoms (fever, chills, myalgia; tend to decrease over time)
	MS Disease Modifying Therapy	glatiramer acetate	Copaxone®	20 mg SC OD	Hypersensitivity to glatiramer or mannitol	Injection site reactions, nausea, transient chest pain, vasodilation
	MS Disease Modifying Therapy	natalizumab	Tysabri®	300 mg IV given over 1 h, every 4 wk	Hypersensitivity to natalizumab, progressive multifocal leukoencephalopathy (PML)	Rash, nausea, arthralgia, headache, infections, rare risk of PML and melanoma
	MS Disease Modifying Therapy	fingolimod	Gilenya®	0.5 mg PO OD	Not available	Diarrhea, transaminitis, headache, bradyarrhythmia, lymphocytopenia
<b>Spasticity (i.e. MS)</b>	Muscle Relaxant – Antispastic	baclofen	Lioresal®	5 mg PO tid, increase by 15 mg/d q3d to max dose 80 mg/d in three divided doses	Hypersensitivity to baclofen	Transient drowsiness, daytime sedation, dizziness, weakness, fatigue, convulsions, constipation, nausea

## Landmark Neurology Trials

Trial	Reference	Results
CREST	<i>NEJM</i> 2010; 363:11-23	Carotid stenting and endarterectomy had similar benefits in reduction of stroke, MI and death in carotid stenosis, but in the periprocedural period, stenting had a higher rate of stroke, while endarterectomy had a higher rate of MI
ECASS 3	<i>NEJM</i> 2008; 359:1317-29	rtPA improved clinical outcomes when administered within 3 to 4.5 h of acute ischemic stroke
Interferon- $\beta$ Multiple Sclerosis Study Group Trial	<i>Neurology</i> 1993; 43:655-61	Interferon- $\beta$ -1b reduces relapse rate and severity of relapses in RRMS
NASCET	<i>NEJM</i> 1991; 7:445-53	Patients with symptomatic carotid stenosis of 70-99% benefited more from carotid endarterectomy than best medical therapy
NINDS rtPA	<i>NEJM</i> 1995; 333:1581-7	rtPA reduces mortality and long-term disability when administered within 3 h of acute stroke
PROFESS	<i>NEJM</i> 2008; 359:1238-51	ASA + dipyridamole and clopidogrel showed similar benefits in secondary stroke prevention
RELY	<i>NEJM</i> 2009; 361:1139	Dabigatran superior to warfarin for stroke prevention in patients with atrial fibrillation
SPARCL	<i>NEJM</i> 2006; 355:549-59	The observed benefit of statins in cardiovascular disease is also extended to patients with a recent stroke or TIA

## Basic Anatomy Review

See Functional  
Neuroanatomy Software

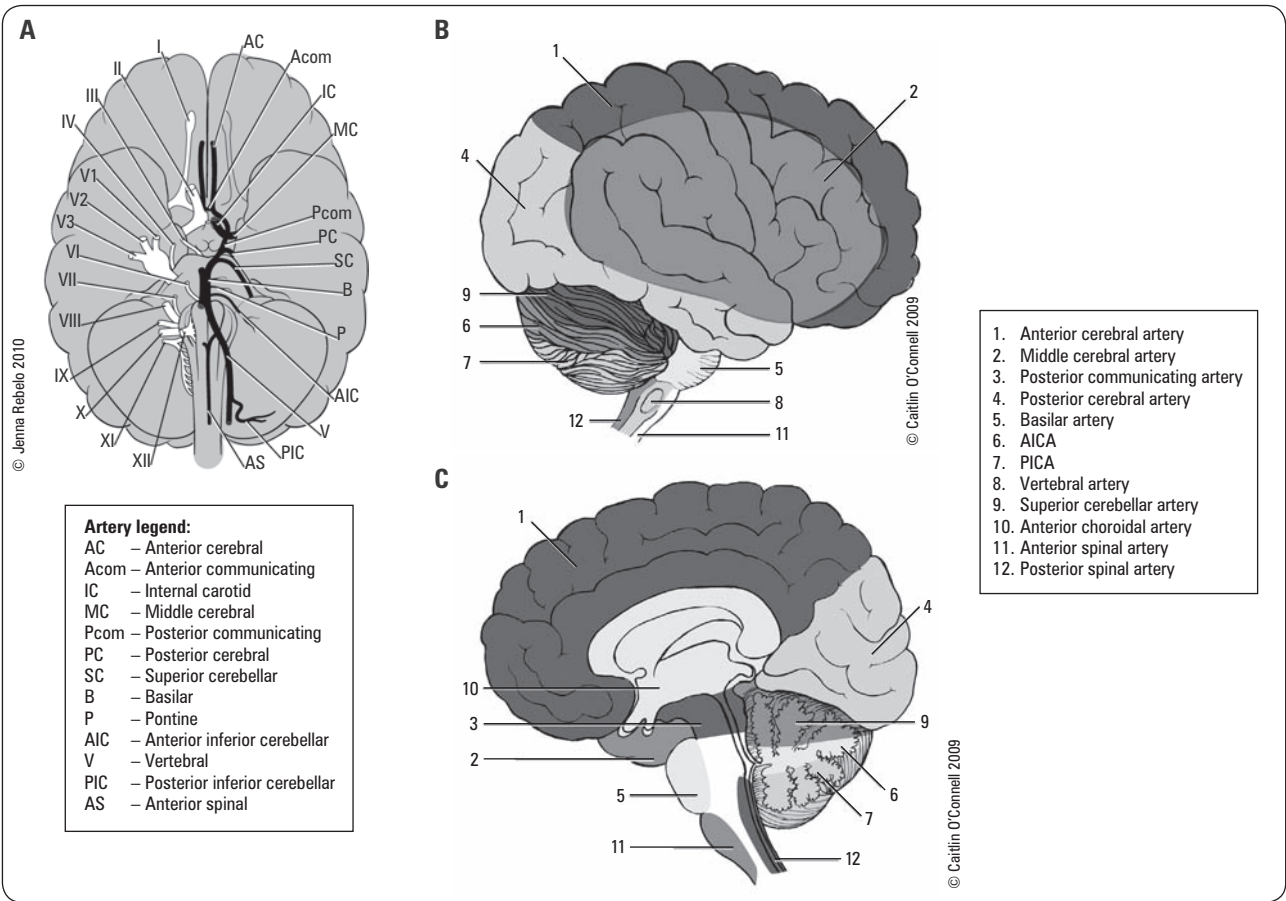

**Figure 1. Magnetic resonance imaging (MRI) neuroanatomy**

From Stewart P et al. Functional Neuroanatomy (Version 2.1). Health Education Assets Library, 2005

**Figure 2. Relationship of nerve roots to vertebral level in the cervical and lumbar spine**

**Note:** AP views depict left-sided C4-5 and L4-5 disc herniation, and correlating nerve root impingement

**Figure 3. Vascular supply of the brain.** Please refer to legend for artery names. 3A. Circle of Willis, most common variant. 3B. Vascular territories of the brain and brainstem, saggital view, seen laterally. 3C. Vascular territories of the brain and brainstem, saggital view, seen medially

**Figure 4. Aneurysms of the Circle of Willis**

## Differential Diagnoses of Common Neurosurgical Presentations

Intracranial Mass Lesions	Disorders of the Spine	Peripheral Nerve Lesions
Tumour Metastasis Astrocytoma Meningioma Vestibular schwannoma (acoustic neuroma) Pituitary adenoma Primary CNS lymphoma	Extradural Degenerative: disc herniation, canal stenosis, spondylolisthesis/spondylolysis Infection/inflammation: osteomyelitis, discitis Ligamentous: ossification of posterior longitudinal ligament (OPLL) Trauma: mechanical compression/instability, hematoma Tumours (55% of all spinal tumours): lymphoma, metastases (lymphoma, lung, breast, prostate), neurofibroma	Neuropathies Traumatic Entrapments Iatrogenic Inflammatory Tumours
Pus/inflammation Cerebral abscess, extradural abscess, subdural empyema Encephalitis (see <a href="#">Infectious Diseases, ID20</a> ) Tumefactive multiple sclerosis (MS)	Intradural extramedullary Vascular: dural arterio-venous fistula, subdural hematoma (especially if on anticoagulants) Tumours (40% of all spinal tumours): meningioma, schwannoma, neurofibroma	
Blood Extradural (epidural) hematoma Subdural hematoma Ischemic stroke Hemorrhage: SAH, ICH, IVH	Intradural intramedullary Tumours (5% of all spinal tumours): astrocytomas and ependymomas most common; also hemangioblastomas and dermoids	
Cyst	Syringomyelia (common causes: trauma, congenital, idiopathic) Infectious/inflammatory: TB, sarcoid, transverse myelitis Vascular: AVM, ischemia	

## INTRACRANIAL PATHOLOGY

### Intracranial Pressure (ICP) Dynamics

**Table 1. Approach to Intracranial Pathology**

Issue	Time Frame	Features
Vascular	Sudden	No headache = occlusive Headache = hemorrhagic
Metabolic	Hours to days	Affects entire CNS
Infectious	Days to weeks	Often a source of infection on history
Tumour	Months	Increased ICP: Initially → Headache <ul style="list-style-type: none"> <li>• Constant</li> <li>• Progressive</li> <li>• Severe</li> <li>• Worse in morning</li> </ul> As ICP increases: <ul style="list-style-type: none"> <li>• Blurry vision</li> <li>• Projectile vomiting</li> </ul> Severely raised ICP: <ul style="list-style-type: none"> <li>• Cushing's reflex               <ul style="list-style-type: none"> <li>• Bradycardia</li> <li>• Hypertension</li> </ul> </li> </ul>

**Table 2. Consequences of Common Brain Lesions**

Location of lesion	Consequence
Frontal lobe	<ol style="list-style-type: none"> <li>1. Disinhibition</li> <li>2. Concentration deficits</li> <li>3. Orientation deficits</li> <li>4. Judgement deficits</li> <li>5. <math>\pm</math> Primitive reflex re-emergence</li> </ol>
Right parietal lobe	Spatial neglect syndrome • Contralateral agnosia
Basal ganglia	<ol style="list-style-type: none"> <li>1. Rest tremor</li> <li>2. Chorea</li> <li>3. Athetosis</li> </ol>
Subthalamic nucleus	Contralateral hemiballismus
Amygdala (bilateral)	Kluver-Bucy syndrome* <ol style="list-style-type: none"> <li>1. Hyperorality</li> <li>2. Hypersexuality</li> <li>3. Disinhibition</li> </ol>
Mammillary bodies (bilateral)	Wernicke-Korsakoff syndrome <ol style="list-style-type: none"> <li>1. Wernicke               <ul style="list-style-type: none"> <li>• Confusion</li> <li>• Ophthalmoplegia</li> <li>• Ataxia</li> </ul> </li> <li>2. Korsakoff               <ul style="list-style-type: none"> <li>• Memory loss</li> <li>• Confabulation</li> <li>• Personality changes</li> </ul> </li> </ol>
Hippocampus	Anterograde amnesia
Reticular activating system (midbrain)	Reduced levels of arousal and wakefulness
PPRF	Eyes look away from lesion
Frontal eye fields	Eyes look toward lesion
Cerebellar hemisphere	<ol style="list-style-type: none"> <li>1. Intention tremor</li> <li>2. Limb ataxia</li> <li>3. Fall towards side of lesion</li> </ol>
Cerebellar vermis	<ol style="list-style-type: none"> <li>1. Truncal ataxia</li> <li>2. Dysarthria</li> </ol>

## ICP/Volume Relationship

- adult skull is rigid with a constant intracranial volume
- contents (CSF, blood, brain) are incompressible
- increase in one constituent/space-occupying lesion = increase in ICP
- however, ICP does not rise initially due to compensatory mechanisms (autoregulation):
  - **immediate:** displacement of CSF to lumbar theca, displacement of blood from venous sinuses
  - **delayed:** displacement of ECF or ICF; displacement of brain tissue into compartments under less pressure (herniation)
- once compensation is exhausted, ICP rises exponentially

## Cerebral Blood Flow (CBF)

- CBF depends on cerebral perfusion pressure (CPP) and cerebral vascular resistance (CVR)
- normal CPP >50 mmHg in adults
- cerebral autoregulation maintains constant CBF by compensating for changes in CPP, unless:
  - high ICP such that CPP <60 mmHg
  - MAP >150 mmHg or MAP <50 mmHg
  - brain injury: e.g. SAH, severe trauma

**Figure 5. ICP-volume curve**

Adapted from Lindsay KW. Bone I: Neurology and neurosurgery illustrated. © 2004. With permission from Elsevier.

$$\text{CBF} = \text{CPP} / \text{CVR}$$

$$\text{CPP} = \text{MAP} - \text{ICP}$$

## ICP Measurement

- normal ICP <15 mmHg (8-18 cm H<sub>2</sub>O) for adult, 3-7 mmHg (4-9.5 cm H<sub>2</sub>O) for child; varies with patient position
  - moderate elevation: increase in mean pressure >20 mmHg
  - severe elevation: increase in mean pressure >40 mmHg
- waveform: comprised of respiratory and cardiac pulsations (Traube-Hering waves); the amplitude increases with ICP
  - $\beta$ -waves: coarse, variably increased amplitude, frequency 1/2-2/min, often related to respiration
  - plateau waves: elevation of ICP over 50 mmHg lasting 5-20 min, precursor of further deterioration

### Acute Monitoring

- lumbar puncture (LP) (see sidebar)
- intraventricular catheter/ventriculostomy/external ventricular drain (EVD) ("gold standard", also permits therapeutic drainage of CSF to decrease ICP)

### Chronic Monitoring

- fibre optic monitor (intraventricular, intraparenchymal, subdural), subarachnoid bolt (Richmond screw), and epidural monitor

## Elevated ICP

### Etiology

- intracranial space-occupying lesion:
  - tumour
  - pus
  - blood [trauma → hematoma (most common), subarachnoid hemorrhage]
  - depressed skull fracture
  - foreign body
- increased intracranial blood volume
  - vasodilatation (increased pCO<sub>2</sub>/decreased pO<sub>2</sub>/decreased extracellular pH, e.g. hypoventilation)
  - venous outflow obstruction (venous sinus thrombosis, superior vena cava syndrome, space occupying lesion)
  - cranial dependency
- cerebral edema
  - vasogenic (vessel damage, e.g. hypertensive encephalopathy, tumour)
  - cytotoxic (tissue/cell death, e.g. hypoxia, brain injury)
  - osmotic (acute hyponatremia, hepatic encephalopathy)
- impaired autoregulation (hypotension, hypertension, brain injury)
- hydrocephalus (obstructive, non-obstructive)
- tension pneumocephalus (gas within the cranial cavity)
- pseudotumour cerebri (idiopathic intracranial hypertension)
- status epilepticus (chronic seizure resulting in brain edema)

### Clinical Features

#### 1. Acute Elevated ICP

- headache (H/A): worse in the morning, aggravated by stooping and bending
- nausea and vomiting (N/V)
- decreased level of consciousness (LOC) if ICP = diastolic BP, or midbrain compressed
- drop in GCS = best index to monitor progress and predict outcome of acute intracranial process (see *Neurotrauma*, NS30)
- papilledema ± retinal hemorrhages (may take 24-48 h to develop)
- abnormal extra-ocular movements (EOM):
  - CN VI palsy: often falsely localizing (causative mass may be remote from nerve)
  - upward gaze palsy (especially in children with obstructive hydrocephalus)
- herniation syndromes (see *Herniation Syndromes*, NS7)
- focal signs/symptoms due to lesion

#### 2. Chronic Elevated ICP

- H/A
  - postural: worsened by coughing, straining, bending over
  - morning/evening H/A → vasodilatation due to increased CO<sub>2</sub> with recumbency

**Figure 6. Cerebral autoregulation curve**

Adapted from Lindsay, et al. *Neurology and neurosurgery* illustrated. ©2004. With permission from Elsevier

#### Consider Monitoring of ICP in the Following Situations

- Patients with an abnormal head CT and GCS score of 3-8 after cardiopulmonary resuscitation
- Or
- Patients with a normal head CT and GCS score of 3 to 8 AND the presence of two or more of the following:
  - Age over 40 yr
  - Unilateral or bilateral motor posturing
  - Systolic blood pressure less than 90 mmHg
- Postoperative monitoring
- Investigation of normal pressure hydrocephalus (NPH)

Lumbar puncture is contraindicated with known/suspected intracranial mass.

#### Blood Brain Barrier

Glucose and amino acids cross slowly  
Non-polar/lipids cross fast

#### Blood Brain Barrier

Infarction/neoplasm → destroy tight junctions → vasogenic edema

#### Cushing's Triad of Acute Raised ICP (full triad seen in 1/3 of cases)

- Hypertension
- Bradycardia (late finding)
- Irregular respiratory pattern

#### Papilledema

- Elevated optic disc with blurred margins
- Larger blind spot

- visual changes
  - due to papilledema
  - enlarged blind spot, if advanced → episodic constrictions of visual fields (“grey-outs”)
  - optic atrophy/blindness
  - differentiate from papillitis (usually unilateral with decreased visual acuity)
- decreased level of consciousness

### Investigations

- patients with suspected elevated ICP require an urgent CT/MRI
- ICP monitoring where appropriate

## Herniation Syndromes

**Table 3. Herniation Syndromes**

Herniation Syndrome	Definition	Etiology	Clinical Features
<b>1. Subfalcine</b>	Cingulate gyrus herniates under falx	<ul style="list-style-type: none"> <li>• Lateral supratentorial lesion</li> </ul>	<ul style="list-style-type: none"> <li>• Usually asymptomatic</li> <li>• Warns of impending transtentorial herniation</li> <li>• Risk of ACA compression</li> </ul>
<b>2. Central Tentorial (Axial)</b>	Displacement of diencephalon through tentorial notch	<ul style="list-style-type: none"> <li>• Supratentorial midline lesion</li> <li>• Diffuse cerebral swelling</li> <li>• Late uncal herniation</li> </ul>	<ul style="list-style-type: none"> <li>• Small pupils, moderately dilated, fixed (rostral to caudal deterioration), sequential failure of diencephalon, medulla</li> <li>• Decreased LOC (midbrain compression) EOM/upward gaze impairment (“sunset eyes”): compression of pretectum and superior colliculi</li> <li>• Brainstem hemorrhage (“Duret’s” – secondary to shearing of basilar artery perforating vessels)</li> <li>• Diabetes insipidus (traction on pituitary stalk and hypothalamus), end-stage sign</li> </ul>
<b>3. Lateral Tentorial (Uncal)</b>	Uncus of temporal lobe herniates down through tentorial notch	<ul style="list-style-type: none"> <li>• Lateral supratentorial lesion (often rapidly expanding traumatic hematoma)</li> </ul>	<ul style="list-style-type: none"> <li>• Ipsilateral non-reactive dilated pupil (earliest, most reliable sign) + ipsilateral EOM paralysis, ptosis (CN III compression)</li> <li>• Decreased LOC (midbrain compression)</li> <li>• Contralateral hemiplegia ± extensor (upgoing) plantar response ± ipsilateral hemiplegia (“Kernohan’s notch” – a false localizing sign resulting from pressure from the edge of the tentorium on the contralateral cerebral peduncle)</li> </ul>
<b>4. Upward</b>	Cerebellar vermis herniates through tentorial incisura	<ul style="list-style-type: none"> <li>• Large posterior fossa mass (common after VP shunting)</li> </ul>	<ul style="list-style-type: none"> <li>• Cerebellar infarct [superior cerebellar artery (SCA) compression]</li> <li>• Hydrocephalus (cerebral aqueduct compression)</li> </ul>
<b>5. Tonsillar</b>	Cerebellar tonsils herniate through foramen magnum	<ul style="list-style-type: none"> <li>• Infratentorial lesion</li> <li>• Following central tentorial herniation</li> <li>• Following LP in presence of intracranial mass lesion</li> </ul>	<ul style="list-style-type: none"> <li>• Neck stiffness and head tilt (tonsillar impaction)</li> <li>• Decreased LOC (midbrain compression)</li> <li>• Flaccid paralysis</li> <li>• Respiratory irregularities, respiratory arrest (compression of medullary respiratory centres)</li> <li>• Blood pressure instability (compression of medullary cardiovascular centres)</li> </ul>

**Figure 7. Herniation types – see Table 4 for description**

## Treatment of Elevated ICP

- CT or MRI to identify etiology, assess for midline shift/herniation
- treat primary cause (i.e. remove mass lesions, ensure adequate ventilation)
- if elevated ICP persists following treatment of primary cause, consider therapy when ICP >20 mmHg
- goals: keep ICP <20 mmHg, CPP >65 mmHg, MAP >90 mmHg

### Conservative Measures

- elevate head of bed at 30°, maintain neck in neutral position → increases intracranial venous outflow with minimal effect on arterial pressure
- prevent hypotension with fluid and vasopressors, dopamine, norepinephrine prn
- ventilate to normocarbica (pCO<sub>2</sub> 35-40 mmHg) → prevents vasodilatation
- oxygen to maintain pO<sub>2</sub> >60 mmHg → prevents hypoxic brain injury
- osmolar diuresis (mannitol 20% IV solution 1-1.5 g/kg, then 0.25 g/kg q6h to serum osmolality of 315-320)
  - can give rapidly, acts in 15-30 min, must maintain sBP >90 mmHg
- corticosteroids → decrease edema over subsequent days around brain tumour, abscess, blood
  - no proven value in head injury or stroke

### Treatment of Elevated ICP:

#### ICP HEAD

Intubate  
Calm (sedate)/Coma  
Place drain/Paralysis

Hyperventilate  
Elevate head  
Adequate BP  
Diuretic (mannitol)

### Aggressive Measures

- sedation ("light" e.g. barbiturates/codeine → "heavy" e.g. fentanyl/MgSO<sub>4</sub>)
- paralysis with vecuronium → reduces sympathetic tone, reduces HTN induced by muscle contraction
- hyperventilate to pCO<sub>2</sub> 30-35 mmHg
  - use for brief periods only – also results in decreased cerebral blood flow
- drain 3-5 mL CSF via ventricles, assess each situation independently
- insert EVD (if acute) or shunt
- barbiturate-induced coma induced with pentobarbital to reduce cerebral blood flow and metabolism (10 mg/kg over 30 min, then 1 mg/kg q1h continuous infusion)
  - decreases mortality, but no improvement in neurological outcome
- decompressive craniectomy is a last resort
- no role for the use of hypothermia in head injury

## Hydrocephalus

- hydrocephalus in children, see *Pediatric Neurosurgery*, NS36

### Definition

- increased CSF volume

### Etiology

- obstruction to CSF flow
- decreased CSF absorption
- increased CSF production (rarely) – e.g. choroid plexus papilloma (0.4-1% of intracranial tumours)

### Epidemiology

- estimated prevalence 1-1.5%; incidence of congenital hydrocephalus ~1-2/1000 live births

### Classification

**Table 4. Classification of Hydrocephalus**

Disorder	Definition	Etiology	Findings on CT/MRI
<b>Obstructive (Non-Communicating) Hydrocephalus</b>	Circulation blocked within ventricular system proximal to the arachnoid granulations	<b>Acquired</b> <ul style="list-style-type: none"> <li>• Aque ductal stenosis (adhesions following infection, hemorrhage)</li> <li>• Intraventricular lesions (tumours e.g. 3rd ventricle colloid cyst, hematoma)</li> <li>• Mass causing tentorial herniation, aqueduct/4th ventricle compression</li> <li>• Others: neurosarcoidosis, abscess/granulomas, arachnoid cysts</li> </ul> <b>Congenital</b> <ul style="list-style-type: none"> <li>• Aque ductal stenosis, Dandy-Walker malformation, Chiari malformation (see <i>Pediatric Neurosurgery</i>, NS37)</li> </ul>	<ul style="list-style-type: none"> <li>• Ventricular enlargement proximal to block</li> <li>• Periventricular hypodensity (transependymal migration of CSF forced into extracellular space)</li> <li>• Sulcal effacement</li> </ul>
<b>Non-Obstructive (Communicating) Hydrocephalus</b>	CSF absorption blocked at extraventricular site = arachnoid granulations	<ul style="list-style-type: none"> <li>• Post-infectious (#1 cause) meningitis, cysticercosis</li> <li>• Post-hemorrhagic (#2 cause) → SAH, IVH, traumatic</li> <li>• Choroid plexus papilloma (rare, causes increased CSF production)</li> <li>• Idiopathic → normal pressure hydrocephalus</li> </ul>	<ul style="list-style-type: none"> <li>• All ventricles dilated</li> </ul>
<b>Normal Pressure Hydrocephalus (NPH)</b>	Persistent ventricular dilatation in the context of normal CSF pressure	<ul style="list-style-type: none"> <li>• Idiopathic (50%)</li> <li>• Others: subarachnoid hemorrhage, meningitis, trauma, radiation-induced</li> </ul>	<ul style="list-style-type: none"> <li>• Enlarged ventricles without increased prominence of cerebral sulci</li> </ul>
<b>Hydrocephalus Ex Vacuo</b>	Ventricular enlargement resulting from atrophy of surrounding brain tissue	<ul style="list-style-type: none"> <li>• Normal aging</li> <li>• Alzheimer's, Creutzfeldt-Jacob Disease</li> </ul>	<ul style="list-style-type: none"> <li>• Enlarged ventricles and sulci</li> <li>• Cerebral atrophy</li> </ul>

1. Lateral ventricles
2. Choroid plexus
3. Third ventricle
4. Cerebral aqueduct (of Sylvius)
5. Fourth ventricle
6. Foramina of Luschka and Magendie
7. Arachnoid granulations
8. Subarachnoid space
9. Superior sagittal sinus

© Karl Francis 2004

**Figure 8. The flow of CSF**

CSF produced by choroid plexus, flows to: ventricles → foramina of Luschka (lateral) and Magendie (medial) → subarachnoid space → absorbed by arachnoid villi/granulations into venous sinuses.

CSF production = CSF reabsorption = ~500 mL/d in normal adults  
 Normal CSF volume ~150 mL (50% spinal, 50% intracranial → 25 mL intraventricular, 50 mL subarachnoid)

### Clinical Features

- acute hydrocephalus
  - signs and symptoms of acute elevated ICP (see *Elevated ICP*, NS6)
  - impaired upward gaze (“sunset eyes”) and/or CN VI palsy
- chronic/gradual onset hydrocephalus (i.e. NPH)
  - gradual onset of classic triad developing over weeks or months
    - ♦ pressure of ventricle on LE motor fibres → gait disturbance (ataxia and apraxia usually initial symptoms)
    - ♦ pressure on cortical bowel/bladder centre → urinary incontinence
    - ♦ pressure on frontal lobes → dementia
  - CSF pressure can be measured within clinically “normal” range

#### Classic Triad of NPH Progression

##### AID

Ataxia/Apraxia of gait  
Incontinence  
Dementia

### Investigations

- CT/MRI (periventricular lucency suggests raised CSF pressure)
- ultrasound (through anterior fontanelle in infants)
- ICP monitoring (e.g. LP) may be used to investigate NPH, test response to shunting (lumbar tap test)
- radionuclide cisternography can test CSF flow and absorption rate (unreliable)
- $\beta$ -2 transferrin assay to test for the presence of CSF leak

### Treatment

- ventricular drainage
- surgical removal of obstruction (if possible) or excision of choroid plexus papilloma
- shunts
  - ventriculoperitoneal (VP): most common
  - ventriculopleural
  - ventriculo-atrial (VA): relatively increased risk of infections, shunt emboli
  - lumboperitoneal: for communicating hydrocephalus and pseudotumour cerebri
- third ventriculostomy (for obstructive hydrocephalus) via ventriculoscopy
- LPs for transient hydrocephalus (e.g. SAH), IVH in premature infants, etc.

### Shunt Complications

Table 5. Shunt Complications

Complication	Etiology	Clinical Features	Investigations
<b>Obstruction</b> (most common)	<ul style="list-style-type: none"> <li>• Obstruction by choroid plexus</li> <li>• Buildup of proteinaceous accretions, blood, cells (inflammatory or tumour)</li> <li>• Infection</li> <li>• Disconnection or damage</li> </ul>	<ul style="list-style-type: none"> <li>• Acute hydrocephalus</li> <li>• Increased ICP</li> </ul>	<ul style="list-style-type: none"> <li>• “Shunt series” (plain x-rays of entire shunt that only rule-out disconnection, break, tip migration)</li> <li>• CT</li> <li>• Radionuclide “shuntogram”</li> </ul>
<b>Infection</b> (3-6%)	<ul style="list-style-type: none"> <li>• <i>S. epidermidis</i></li> <li>• <i>S. aureus</i></li> <li>• <i>P. acnes</i></li> <li>• Gram-negative bacilli</li> </ul>	<ul style="list-style-type: none"> <li>• Fever, N/V, anorexia, irritability</li> <li>• Meningitis</li> <li>• Peritonitis</li> <li>• Signs and symptoms of shunt obstruction</li> <li>• Shunt nephritis (VA shunt)</li> </ul>	<ul style="list-style-type: none"> <li>• CBC</li> <li>• Blood culture</li> <li>• Tap shunt for C&amp;S (LP usually NOT recommended)</li> </ul>
<b>Overshunting</b> (10% over 6.5 yr)	<ul style="list-style-type: none"> <li>• Slit ventricle syndrome, collapse of ventricles leading to occlusion of shunt ports by ependymal lining</li> <li>• Subdural hematoma</li> <li>• Collapsing brain tears bridging veins (especially common in NPH patients)</li> <li>• Secondary craniostylosis (children): apposition and overlapping of the cranial sutures in an infant following decompression of hydrocephalus</li> </ul>	<ul style="list-style-type: none"> <li>• Chronic or recurring headaches often relieved when lying down</li> <li>• Asymptomatic</li> <li>• Headaches, vomiting, somnolence</li> <li>• Abnormal head shape</li> </ul>	<ul style="list-style-type: none"> <li>• CT/MRI</li> <li>• Slit-like ventricles on imaging</li> <li>• CT</li> <li>• Clinical</li> <li>• CT</li> </ul>
<b>Seizures</b> (5.5% risk in 1st yr, 1.1% after 3rd yr)			<ul style="list-style-type: none"> <li>• EEG</li> </ul>
<b>Inguinal Hernia</b> (17% incidence with VP shunt inserted in infancy) $\pm$ skin breakdown over hardware	<ul style="list-style-type: none"> <li>• Increased intraperitoneal pressure/fluid results in hernia becoming apparent</li> </ul>	<ul style="list-style-type: none"> <li>• Inguinal swelling, discomfort</li> </ul>	<ul style="list-style-type: none"> <li>• U/S</li> </ul>

## Idiopathic Intracranial Hypertension (Pseudotumour Cerebri)

### Definition

- raised intracranial pressure and papilledema without evidence of any mass lesion, hydrocephalus, infection, or hypertensive encephalopathy (diagnosis of exclusion)

### Etiology

- unknown (majority), but associated with:
  - lateral venous sinus thrombosis
  - habitus/diet: obesity, hyper/hypovitaminosis A
  - endocrine: reproductive age, menstrual irregularities, Addison's/Cushing's disease, thyroid irregularities
  - hematological: iron deficiency anemia, polycythemia vera
  - drugs: steroid administration or withdrawal, tetracycline, nalidixic acid, etc.
- risk factors overlap with those of venous sinus thrombosis; similar to those for gallstones ("fat, female, fertile, forties")

### Epidemiology

- incidence ~0.5/100,000 per year
- usually in 3rd and 4th decade (F>M)

### Clinical Features

- symptoms and signs of raised ICP (H/A in >90%, pulsatile intracranial noise), but no LOC or diplopia
- decreased visual acuity, papilledema, visual field defect, optic atrophy (key morbidity)
- usually self-limited, recurrence is common, chronic in some patients
- risk of blindness is not reliably correlated to symptoms or clinical course

### Investigations

- CT: normal
- CSF studies: normal
- MRI: must look for venous sinus thrombosis

### Treatment

- rule out conditions that cause intracranial hypertension (especially sinus thrombosis)
- discontinue offending medications, encourage weight loss, fluid/salt restriction
- pharmacotherapy: acetazolamide (decreases CSF production), thiazide diuretic or furosemide
- if above fail: serial LPs, shunt
- optic nerve sheath decompression (if progressive impairment of visual acuity)
- 2-yr follow-up with imaging to rule out occult tumour, ophthalmology follow-up

#### Important Features to Note on CT and MRI (± contrast enhancement)

- Lesions (± edema, necrosis, hemorrhage)
- Midline shifts and herniations
- Effacement of ventricles and sulci (often ipsilateral), basal cisterns
- Single or multiple (multiple implies metastasis)

## Tumours

Figure 9. Tumours

#### DDx for Ring Enhancing Lesion on CT with Contrast

##### MAGICAL DR

- Metastases\*
- Abscess\*
- Glioblastoma (high grade astrocytoma)\*
- Infarct
- Contusion
- AIDS (toxoplasmosis)
- Lymphoma
- Demyelination
- Resolving hematoma
- (\* 3 most common Dx's)

#### Primary Sources of Metastatic Brain Tumours

Lung	44%
Breast	10%
Kidney (RCC)	7%
GI	6%
Melanoma	3%

### Classification

- primary vs. metastatic, intra-axial (parenchymal) vs. extra-axial, supratentorial vs. infratentorial, adult vs. pediatric
- benign: non-invasive, devastating due to expansion of mass in fixed volume of skull (mass effect)
- malignant: implies rapid growth, invasiveness, but rarely extracranial metastasis
- types of intracranial tumours (\* = most common)
  - neuroepithelial tissue
    - ♦ astrocytic tumours: astrocytoma, glioblastoma
    - ♦ oligodendroglial tumours
    - ♦ oligoastrocytic tumours
    - ♦ neuronal and mixed neuronal-glial tumours: ganglion cell tumours, cerebral neurocytomas/neuroblastomas
    - ♦ embryonal tumours: medulloblastoma, neuroectodermal
    - ♦ other: pineal, ependymal, and choroid plexus tumours
  - meningeal: meningiomas\*, mesenchymal, hemangioblastomas
  - cranial and paraspinal nerves: schwannoma, neurofibroma
  - lymphomas and hematopoietic neoplasms
  - germ cell: germinomas, teratomas
  - pituitary adenomas\*
  - sellar region: craniopharyngiomas, spindle cell oncocyoma
  - cysts: epidermoid/dermoid cysts, colloid cysts
  - local extension: chordomas, glomus jugulare tumours
  - metastatic tumours

### Clinical Features

- progressive neurological deficit (70%): usually motor weakness,  $\pm$  CN deficits, sensory, cognitive, personality, endocrine deficits (these may localize lesion)
- H/A (50%)  $\pm$  symptoms of elevated ICP (see *Elevated ICP*, NS6)
- N/V (40%)
- seizures (25%)
- papilledema, vision changes
- symptoms suggestive of TIA (ictal, post-ictal, or ischemic 2° to “steal phenomenon”)
- rarely presents with hemorrhage
- familial syndromes associated with CNS tumours
  - von Hippel-Lindau (hemangioma)
  - tuberous sclerosis (astrocytoma)
  - neurofibromatosis type 1 and 2 (astrocytoma, acoustic neuroma respectively)
  - Li-Fraumeni (astrocytoma)
  - Turcot syndrome (glioblastoma multiforme)
  - multiple endocrine neoplasia type 1 (MEN-1) (pituitary adenoma)

### Investigations

- CT, MRI, stereotactic biopsy (tissue diagnosis), metastatic work-up

### Treatment

- conservative: serial Hx, Px, imaging for slow growing/benign lesions
- medical: corticosteroids to reduce cytotoxic cerebral edema, pharmacological (see *Pituitary Adenoma*, NS14)
- surgical: total or partial excision (decompressive, palliative), shunt if hydrocephalus
- radiotherapy: conventional fractionated radiotherapy (XRT), stereotactic radiosurgery (e.g. Gamma Knife®)
- chemotherapy: e.g. alkylating agents (temozolomide)

**Table 6. Tumour Types: Age, Location**

Age	Supratentorial	Infratentorial (posterior fossa)
<15 yr	Astrocytoma (all grades) (50%) Craniopharyngioma (2-5%) Others: pineal region tumours, choroid plexus tumours, ganglioglioma, DNET	Medulloblastoma (15-20%) Cerebellar astrocytoma (15%) Ependymoma (9%) Brainstem astrocytoma
>15 yr	High grade astrocytoma (12-15%, e.g. GBM) Metastasis (15-30%, includes infratentorial) Meningioma (15-20%) Low grade astrocytoma (8%) Pituitary adenoma (5-8%) Oligodendroglioma (5%) Other: colloid cyst, CNS lymphoma, dermoid/epidermoid cysts	Metastasis Acoustic neuroma (schwannoma) (5-10%) Hemangioblastoma (2%) Meningioma

#### Management of Single Brain Metastasis: A Practice Guideline

*Curr Oncol* 2007;14:131-143

**Background:** In Ontario the benefits of surgical resection  $\pm$  adjuvant whole-brain radiation therapy (WBRT) or stereotactic radiosurgery (SRS) in confirmed single brain metastasis are summarized in this manuscript.

**Methods:** Medline, Cancerlit, Embase and Cochrane Library databases as well as abstracts published in the proceedings of the annual meetings of the American Society of Clinical Oncology (1997-2005) and American Society for Therapeutic Radiology and Oncology (1998-2004) were systematically searched for relevant evidence. Outcomes were compared in terms of survival, local control of disease, quality of life, and adverse effects. The finalized review of these works was condensed into a practice guideline approved by the Neuro-oncology DSG and Ontario practitioners (through an electronic survey).

**Results:** Two of three RCTs reported a significant survival benefit for patients with single brain metastasis who underwent surgical resection as compared with those who received WBRT alone. The RCT that compared surgical resection plus WBRT with surgical resection alone reported no significant difference in overall survival or length of functional independence; however, tumour recurrence at the site of the metastasis and anywhere in the brain was less frequent in patients who received WBRT as compared with patients in the observation group. In addition, patients who received WBRT were less likely to die from neurologic causes. Results of the RCT that compared WBRT and SRS with WBRT alone indicated a significant improvement in median survival in patients who received SRS.

**Conclusions:** Surgical excision should be considered for patients with good performance status, minimal or no evidence of extracranial disease, and a surgically accessible single brain metastasis amenable to complete excision. Furthermore, to reduce the risk of tumour recurrence postoperative WBRT should be considered. As an alternative to surgical resection, WBRT followed by SRS boost should be considered, however, the evidence is insufficient to recommend SRS alone as a single-modality therapy.

Primary CNS lymphoma reported in 6-20% of HIV infected patients.

#### Brain Metastasis

~1/3 of all adult brain tumours  
Well circumscribed, often at grey-white matter junction

#### Primary Brain Tumours

- Rarely undergo metastasis
- Adults = mostly supratentorial
- Children = mostly infratentorial

Table 7. Unique Presentations of Brain Tumours

Tumour	Features	Diagnosis	Notes
<b>Tumours at the base of the frontal lobe</b>	Foster-Kennedy Syndrome 1. Inappropriate behaviour 2. Ipsilateral optic nerve atrophy 3. Contralateral papilledema 4. Anosmia	CT MRI (better)	
<b>Craniopharyngioma</b>	1. Youngsters 2. Short for age 3. Bitemporal hemianopsia	1. X-ray: calcified lesion above sella 2. MRI	
<b>Prolactinomas</b>	1. Young women 2. Amenorrhea 3. Galactorrhea	1. $\beta$ -hCG $\rightarrow$ r/o pregnancy 2. TSH, $T_4 \rightarrow$ r/o hypothyroidism 3. Prolactin level 4. MRI	Treat with 1. Bromocriptine/cabergoline 2. Surgery if non-responsive to bromocriptine or wants to get pregnant
<b>Acromegaly</b>	1. Enlarged hands, feet, tongue 2. HTN 3. DM 4. Sweaty hands 5. Headache 6. History of wedding bands/hats not fitting anymore	1. Somatomedin C level 2. MRI	Treat with 1. Radiation, or 2. Surgery (better)
<b>Pituitary apoplexy</b>	Bleed into tumour $\rightarrow$ destroy pituitary gland 1. Pituitary tumour • Headache • Visual loss • Endocrine issues 2. Episodic severe headaches 3. Increased compression of nearby structures • Decreased visual acuity • Bilateral pallor of optic nerves 4. Pituitary destruction • Stupor • Hypotension	1. CT 2. MRI (better)	Must 1. Replace steroid hormones 2. Eventually replace other hormones
<b>Pineal gland tumour</b>	1. Loss of upper gaze 2. "Sunset eyes" (Parinaud syndrome)	1. CT 2. MRI (better)	
<b>Brain tumours in children</b>	Often posterior fossa tumours 1. Cerebellar symptoms • Stumbling • Truncal ataxia 2. "Knee-chest" position to relieve headache	1. CT 2. MRI (better)	
<b>Brain abscess</b>	Similar symptoms as brain tumours + fever + nearby infection	1. CT	

## Metastatic Tumours

- most common brain tumour seen clinically
- 15-30% of cancer patients present with cerebral metastatic tumours
  - most common sources : lungs, breast
  - other sources : kidney, thyroid, stomach, prostate, testis, melanoma
- hematogenous spread most common

### Location

- 80% are hemispheric, often at grey-white matter junction or junction of temporal-parietal-occipital lobes (likely emboli spreading to terminal MCA branches)

### Investigations

- identify primary tumour
  - metastatic work-up (CXR, CT chest/abdo, abdominal U/S, bone scan, mammogram)
- CT with contrast  $\rightarrow$  round, well-circumscribed, often ring enhancing, ++ edema, often multiple
- MRI more sensitive, especially for posterior fossa
- consider biopsy in unusual cases, or if no primary identified

### Treatment

- medical
  - phenytoin (or levetiracetam) for seizure prophylaxis if patient presents with seizure
  - dexamethasone to reduce edema given with ranitidine
  - chemotherapy (e.g. small cell lung cancer)

Figure 10. Multiple brain metastases (see arrows)

- radiation
  - stereotactic radiosurgery: for discrete, deep-seated/inoperable tumours
  - multiple lesions: use whole brain radiation therapy (WBRT); consider stereotactic radiosurgery if <3 lesions
  - post-op WBRT is commonly used
- surgical
  - single/solitary lesions: use surgery + radiation

### Prognosis

- median survival without treatment once symptomatic is ~1 mo, with optimal treatment 6-9 mo but varies depending on primary tumour type

## Astrocytoma

- most common primary intra-axial brain tumour, common in 4-6th decades

**Table 8. Astrocytoma Grading System**

World Health Organization (WHO)	Typical CT/MRI Findings	Survival
I – Pilocytic astrocytoma	± mass effect, ± enhancement	>10 yr, cure if gross total resection
II – Low grade/diffuse	Mass effect, no enhancement	5 yr
III – Anaplastic	Complex enhancement	1.5-2 yr
IV – Glioblastoma multiforme (GBM)	Necrosis (ring enhancement)	12 mo, 10% at 2 yr

### Clinical Features

- sites: cerebral hemispheres >> cerebellum, brainstem, spinal cord
- symptoms: recent onset of new/worsening H/A, N/V, seizure, ± focal deficits or symptoms of increased ICP

### Investigations

- CT/MRI with contrast: variable appearance depending on grade (see Table 8)
- tissue biopsy: WHO grade and histology correlates with prognosis, but 25% chance of sampling error due to tumour heterogeneity

### Treatment

- low grade diffuse astrocytoma
  - close follow-up, radiation, chemotherapy, surgery all valid options
  - surgery: not curative, trend towards better outcomes
  - radiotherapy alone or post-op prolongs survival (retrospective evidence)
  - chemotherapy: usually reserved for tumour progression
- high grade astrocytomas (anaplastic astrocytoma and GBM)
  - surgery
    - ♦ gross total resection: maximal safe resection + fractionated radiation with 2 cm margin + concomitant and adjuvant temozolomide
      - except: extensive dominant lobe GBM, significant bilateral involvement, end of life near, extensive brainstem involvement
    - ♦ stereotactic biopsy if resection not possible, followed by fractionated radiation with 2 cm margin
  - expectant (based on functional impairment – Karnofsky score <70; patient's/family's wishes)
  - aim to prolong "quality" survival
  - chemotherapy: ~20% response rate, temozolomide (agent of choice); better response to temozolomide predicted by MGMT gene hypermethylation
- multiple gliomas: WBRT ± chemotherapy

**Figure 11. High grade astrocytoma on CT**

### Karnofsky General Cancer Performance Status Scale Rating Criteria

Rating Criteria (%)	
100	No complaints; no evidence of disease
90	Able to carry on normal activity; minor signs or symptoms of disease
80	Normal activity with effort; some signs or symptoms of disease
70	Cares for self; unable to carry on normal activity or to do active work
60	Requires occasional assistance, but is able to care for most of his personal needs
50	Requires considerable assistance and frequent medical care
40	Disabled; requires special care and assistance
30	Severely disabled; hospital admission is indicated although death not imminent
20	Very sick; hospital admission necessary; active supportive treatment necessary
10	Moribund; fatal processes progressing rapidly
0	Dead

## Meningioma

- mostly benign (1-2% anaplastic), slow-growing, extra-axial, circumscribed (non-infiltrative), arise from arachnoid membrane
- often calcified, cause hyperostosis of adjacent bone
- classically see Psammoma bodies on histology
- common locations: parasagittal convexity or falx (70%), sphenoid wing, tuberculum sellae, foramen magnum, olfactory groove

### Clinical Features

- middle aged, slight female preponderance (M:F = 2:3), high progesterone receptors (increase in size with pregnancy), symptoms of increased ICP, focal deficits, usually solitary (10% multiple, likely with loss of NF2 gene/22q12 deletion)

### Investigations

- CT with contrast: homogeneous, densely enhancing, along dural border (“dural tail”), well circumscribed (Figure 12)
- contrast enhanced MRI provides better detail
- angiography
  - most are supplied by external carotid feeders (meningeal vessels)
  - also assesses venous sinus involvement, “tumour blush” commonly seen (prolonged contrast image)
- octreotide scintigraphy: to establish if expression of somatostatin receptor

### Treatment

- conservative management for non-progressive, asymptomatic lesions
- surgery is treatment of choice if symptomatic or progression on sequential imaging (curative if complete resection)
- SRS may be an option for lesions <3 cm
- endovascular embolization to facilitate surgery
- SRS or XRT for recurrent atypical/malignant meningiomas

### Prognosis

- >90% 5-yr survival, recurrence rate variable (often ~10-20%)
- depends on extent of resection (Simpson's classification)

#### WHO Classification of Meningioma (by histology)

- Grade 1: low risk of recurrence
- Grade 2: intermediate risk of recurrence
- Grade 3: high risk of recurrence

Figure 12. Meningioma on CT

Progressive unilateral or asymmetrical sensorineural hearing loss = acoustic neuroma until proven otherwise.

Figure 13. Vestibular schwannoma (tumour in cerebello-pontine angle)

## Vestibular Schwannoma (Acoustic Neuroma)

- slow-growing (average of 1 mm/yr), benign posterior fossa tumour
- arises from vestibular component of CN VIII in internal auditory canal, expanding into bony canal and cerebello-pontine angle (CPA)
- if bilateral, diagnostic of neurofibromatosis type II
- epidemiology: all age groups affected, peaks at 4<sup>th</sup>-6<sup>th</sup> decades

### Clinical Features

- compression of structures in CPA, often CN VIII (hearing loss 98%, tinnitus, dysequilibrium), followed by CN V and VII
- ataxia and raised ICP are late features

### Investigations

- MRI with gadolinium or T2 FIESTA sequence (>98% sensitive/specific), CT with contrast 2nd choice
- audiogram, brainstem auditory evoked potentials, caloric tests

### Treatment

- conservative: serial imaging
- radiation: stereotactic radiosurgery or fractionated radiotherapy
- surgery if: lesion >3 cm, brainstem compression, edema, hydrocephalus
  - curable if complete resection (almost always possible)
  - operative complications: CN VII, VIII dysfunction (only significant disability if bilateral), CSF leak

## Pituitary Adenoma

- primarily from anterior pituitary, 3<sup>rd</sup>-4<sup>th</sup> decades, M=F
- incidence in autopsy studies approximately 20%
- classification
  - microadenoma <1 cm; macroadenoma ≥1 cm
  - endocrine active (functional/secretory) vs. inactive (non-functional)
- differential: parasellar tumours (e.g. craniopharyngioma, tuberculum sellae meningioma), carotid aneurysm

### Clinical Features

- mass effects
  - H/A
  - bitemporal hemianopsia (compression of optic chiasm) (see [Neurology](#), N12 for details of visual field deficit)
  - CN III, IV, V<sub>1</sub>, V<sub>2</sub>, VI palsy (compression of cavernous sinus)

- endocrine effects
  - hyperprolactinemia (prolactinoma): infertility, amenorrhea, galactorrhea, decreased libido
  - ACTH production: Cushing's disease, hyperpigmentation
  - GH production: acromegaly/gigantism
  - panhypopituitarism (hypothyroidism, hypoadrenalism, hypogonadism)
  - associated MEN-1 syndrome
  - diabetes insipidus
- pituitary apoplexy (sudden expansion of mass due to hemorrhage or necrosis)
  - abrupt onset H/A, visual disturbances, ophthalmoplegia, reduced mental status, and panhypopituitarism
  - CSF rhinorrhea and seizures (rare)
  - signs and symptoms of subarachnoid hemorrhage (rare)

### Investigations

- formal visual fields, CN testing
- endocrine tests (prolactin level, TSH, 8 AM cortisol, fasting glucose, FSH/LH, IGF-1), electrolytes, urine electrolytes, and osmolarity
- imaging (MRI with and without contrast)

### Treatment

- medical
  - for apoplexy: rapid corticosteroid administration  $\pm$  surgical decompression
  - for prolactinoma: dopamine agonists (e.g. bromocriptine)
  - for Cushing's: serotonin antagonist (cyproheptadine), inhibition of cortisol production (ketoconazole)
  - for acromegaly: somatostatin analogue (octreotide)  $\pm$  bromocriptine
  - endocrine replacement therapy
- surgical
  - trans-sphenoidal, trans-ethmoidal, trans-cranial approaches for non-secreting adenomas causing mass effect and Cushing/acromegaly (50% cure rate)

**Go Look For The Adenoma Please – GH, LH, FSH, TSH, ACTH, Prolactin**  
A compressive adenoma in the pituitary will impair hormone production in this order (i.e. GH-secreting cells are most sensitive to compression).

## Pus

### Sources of Pus/Infection

- four routes of microbial access to CNS
  1. hematogenous spread (most common): arterial and retrograde venous
    - ♦ adults: chest is #1 source (lung abscess, bronchiectasis, empyema)
    - ♦ children: congenital cyanotic heart disease with R to L shunt
    - ♦ immunosuppression (AIDS – toxoplasmosis)
  2. direct implantation (dural disruption)
    - ♦ trauma
    - ♦ iatrogenic (e.g. following LP, post-op)
    - ♦ congenital defect (e.g. dermal sinus)
  3. contiguous spread (adjacent infection): from air sinus, naso/oropharynx, surgical site (e.g. otitis media, mastoiditis, sinusitis, osteomyelitis, dental abscess)
  4. spread from PNS (e.g. viruses: rabies, herpes zoster)
- common examples
  - epidural abscess: in cranial and spinal epidural space, associated with osteomyelitis
    - ♦ treatment: immediate drainage and antibiotics, surgical emergency if cord compression
  - subdural empyema: bacterial/fungal infection, due to contiguous spread from bone or air sinus, progresses rapidly
    - ♦ treatment: surgical drainage and antibiotics, 20% mortality
  - meningitis, encephalitis (see [Infectious Diseases](#), ID19, ID20)
  - cerebral abscess (see *Cerebral Abscess*, below)

## Cerebral Abscess

### Definition

- pus in brain substance, surrounded by tissue reaction (capsule formation)

### Etiology

- modes of spread (see above): 10-60% of patients have no cause identified
- pathogens
  - *Streptococcus* (most common), often anaerobic or microaerophilic
  - *Staphylococcus* (penetrating injury)
  - Gram-negatives, anaerobes (*Bacteroides*, *Fusobacterium*)
  - in neonates: *Proteus* and *Citrobacter* (exclusively)
  - immunocompromised: fungi and protozoa (*Toxoplasma*, *Nocardia*, *Candida albicans*, *Listeria monocytogenes*, *Mycobacterium* and *Aspergillus*)

Figure 14. Cerebral abscess on CT

### Risk Factors

- lung abnormalities [infection, AV fistulas; especially Osler-Weber-Rendu syndrome (aka hereditary hemorrhagic telangiectasia)]
- congenital coronary heart disease: R-to-L shunt bypasses pulmonary filtration of micro-organisms
- bacterial endocarditis
- penetrating head trauma
- immunosuppression (e.g. AIDS)
- dental abscess

### Clinical Features

- focal neurological signs and symptoms
  - H/A, decreased LOC; hemiparesis and seizures in 50%
- mass effect, increased ICP and sequelae (cranial enlargement in children)
- hemiparesis and seizures in 50%
- $\pm$  signs and symptoms of systemic infection (low-grade fever, leukocytosis)

### Complications

- with abscess rupture: ventriculitis, meningitis, venous sinus thrombosis
- CSF obstruction
- transtentorial herniation

### Investigations

- CT scan often first test in emergency department (see Figure 14)
- MRI
  - imaging of choice
  - apparent diffusion coefficient (ADC) used to differentiate abscess (black) from tumour (white)
- WBC/ESR may be normal, blood cultures rarely helpful and LP contraindicated if large mass
- CSF: non-specific (high ICP, high WBC, high protein, normal carbohydrate), rarely helpful, usually negative culture

### Treatment

- aspiration  $\pm$  excision and send for Gram stain, acid fast bacillus (AFB), C&S, fungal culture
- excision preferable if location suitable
- antibiotics
  - empirically: vancomycin + ceftriaxone + metronidazole or chloramphenicol or rifampin (6-8 wk therapy)
  - revise antibiotics when C&S known
- anti-convulsants (1-2 yr)
- follow up CT is critical (do weekly initially, more frequent if condition deteriorates)

### Prognosis

- mortality with appropriate therapy ~10%, permanent deficits in ~50%

#### Brain Abscess in 142 Patients: Factors Influencing Outcome and Mortality *Surg Neurol* 2006;65:557-562

**Introduction:** This study looked to identify prognostic factors for outcome and mortality in patients with brain abscess.

**Methods:** 142 patients (98 male, mean age 41.5 yr, range 2-84) were reviewed retrospectively and had (a) a localized brain parenchymal lesion with ring enhancement by contrast visible on CT or MRI and (b) at least one of: positive blood cultures, positive cultures of intracerebral materials, or histology of the intracerebral lesion suggesting brain abscess. Outcome was assessed according to the Glasgow Outcome Score (GOS). All patients were treated with IV antibiotics for at least 4 wk. Drainage and excision was performed on lesions  $>2.5$  cm in largest diameter.

**Results:** A total of 105 patients had a favourable outcome: 63 (44.4%) had full recovery and 42 (29.6%) had mild deficits. 37 patients had an unfavourable outcome: 24 died in hospital and 13 had moderate to severe disability. Improved outcome was associated with being male (OR 9.81,  $p=0.002$ ), having a presenting GCS  $>12$  (OR 6.20,  $p=0.019$ ), being sepsis-free throughout hospitalization (OR 761.49,  $p<0.001$ ) or having gram-positive cocci grown from abscess culture (OR 42.3,  $p=0.013$ ). No other variables proved to be prognostic.

**Conclusion:** Surgical management (craniotomy drainage, stereotactic aspiration or excision) is recommended in all patients with regards to obtaining culture materials, even when the abscess is small ( $<2.5$  cm), deeply seated or multiple in nature. The improved prognosis associated with being sepsis-free and/or growing gram-positive cocci, likely results in part from having culture and sensitivity analysis to guide appropriate antimicrobial management.

## Blood

**Table 9. Comparison of Epidemiology and Etiology of Intracranial Bleeds**

Types of Hematoma/Hemorrhage	Etiology	Epidemiology	Clinical Features	CT Features	Treatment	Prognosis
<b>Epidural Hematoma</b>	Skull fracture causing middle meningeal bleed	M>F (4:1), associated with trauma	Lucid interval before LOC	Hyperdense lenticular mass with sharp margins, usually limited by suture lines	Craniotomy	Good with prompt management (Note: respiratory arrest can occur from uncal herniation)
<b>Acute SDH</b>	Ruptured subarachnoid bridging vessels	Age $>50$ , associated with trauma	No lucid interval, hemiparesis, pupillary changes	Hyperdense crescentic mass, crossing sutures lines	Craniotomy if bleed $>1$ cm thick	Poor
<b>Chronic SDH</b>	Ruptured subarachnoid bridging vessels	Age $>50$ , EtOH abusers, anti-coagulated	Often asymptomatic, minor H/A, confusion, signs of increased ICP	Hypodense crescentic mass, crossing suture lines	Burr hole to drain; craniotomy if recurs	Good
<b>SAH</b>	Trauma, spontaneous (aneurysms, idiopathic, AVM)	Age 55-60 20% cases under age 45	Sudden onset thunderclap headache, signs of increased ICP	Hyperdense blood in cisterns/fissures (sensitivity decreases over time)	Conservative: NPO, IV NS, ECG, Foley, BP 120-150, vasospasm prophylaxis (nimodipine); open vs. endovascular surgery to repair if rebleed	Poor: 50% mortality 30% of survivors have moderate to severe disability
<b>ICH</b>	HTN, vascular abnormality, tumours, infections, coagulopathy	Age $>55$ , male, drug use (cocaine, EtOH, amphetamine)	TIA-like symptoms, signs of increased ICP	Hyperdense intraparenchymal collection	Medical: decrease BP, control ICP Surgical: craniotomy	Poor: 44% mortality due to cerebral herniation

## Extradural ("Epidural") Hematoma

### Etiology

- temporal-parietal skull fracture: 85% are due to ruptured middle meningeal artery; remainder of cases are due to bleeding from middle meningeal vein, dural sinus, or bone/diploic veins

### Epidemiology

- young adult, male > female = 4:1; rare before age of 2 or after age 60

### Clinical Features

- classic sequence (seen in <30%): post-traumatic reduced LOC, a lucid interval of several hours, then obtundation, hemiparesis, ipsilateral pupillary dilatation, and coma
- signs and symptoms depend on severity but can include H/A, N/V, amnesia, altered LOC, HTN and respiratory distress
- deterioration can take hours to days

### Investigations

- CT without contrast: "lenticular-shaped" usually limited by suture lines (see Figure 15)

### Treatment

- admission, observation with serial CT indicated if all of the following are present:
  - small volume clot, minimal midline shift (MLS <5 mm), GCS >8, no focal deficit
- otherwise, craniotomy to evacuate clot, follow up CT
- mannitol pre-op if elevated ICP/brain herniation

### Prognosis

- good with prompt management, as the brain is often not damaged
- worse prognosis if bilateral Babinski or decerebration pre-op
- death is usually due to respiratory arrest from uncal herniation (injury to the midbrain)

Figure 15. Extradural hematoma on CT

### CT Density and MRI Appearance of Blood

Time	CT	MRI T1	MRI T2
<b>Acute</b> (<72 h)	Hyper.	Grey	Black
<b>Subacute</b> (<3 wk)	Iso.	White	White
<b>Chronic</b> (>3 wk)	Hypo.	Black	Black

MRI-T1: "George Washington Bridge"  
MRI-T2: "Oreo" cookie –  
Black/White/Black

## Subdural Hematoma (SDH)

### ACUTE SUBDURAL HEMATOMA

#### Etiology

- rupture of vessels that bridge the subarachnoid space (e.g. cortical artery, large vein, venous sinus) or cerebral laceration

#### Risk Factors

- trauma, acceleration-deceleration injury, anti-coagulants, alcohol, cerebral atrophy, infant head trauma (see [Pediatrics](#), P86)

#### Clinical Features

- no lucid period, signs and symptoms can include altered LOC, pupillary irregularity, hemiparesis

#### Investigations

- CT: hyperdense concave "crescentic" mass, crossing suture lines (see Figure 16)

#### Treatment

- craniotomy if clinically symptomatic, if hematoma >1 cm thick, or if MLS >5 mm (optimal if surgery <4 h from onset); otherwise observe with serial imaging

#### Prognosis

- poor overall since the brain parenchyma is often injured (mortality range is 50%-90%, due largely to underlying brain injury)
- prognostic factors: initial GCS and neurologic status, post-op ICP

### CHRONIC SUBDURAL HEMATOMA

#### Etiology

- many start out as acute SDH
- blood within the subdural space evokes an inflammatory response:
  - fibroblast invasion of clot and formation of neomembranes within days → growth of neocapillaries → fibrinolysis and liquefaction of blood clot
- course is determined by the balance of rebleeding from neomembranes and resorption of fluid

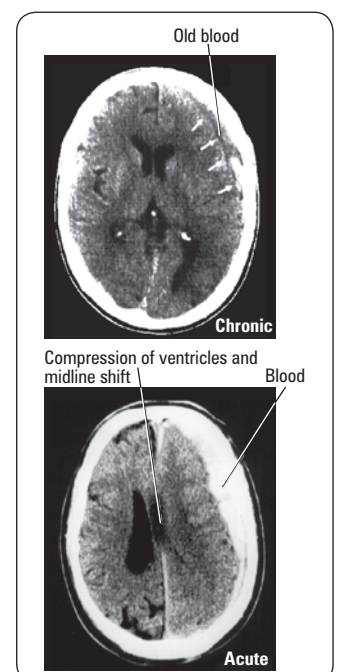

Figure 16. Subdural hematoma on CT

**Risk Factors**

- older, alcoholics, patients with CSF shunts, anti-coagulants, coagulopathies

**Clinical Features**

- often due to minor injuries or no history of injury
- may present with minor H/A, confusion, language difficulties, TIA-like symptoms, symptoms of raised ICP  $\pm$  seizures, progressive dementia, gait problem
- obtundation disproportionate to focal deficit; “the great imitator” of dementia, tumours

**Investigations**

- CT: hypodense (liquefied clot), crescentic mass (see Figure 16)

**Treatment**

- seizure prophylaxis only if post-traumatic seizure
- reverse coagulopathies
- burr hole drainage of liquefied clot indicated if symptomatic or thickness  $>1$  cm; craniotomy if recurs more than twice

**Prognosis**

- good overall as brain usually undamaged, but may require repeat drainage

## Cerebrovascular Disease

**Ischemic Cerebral Infarction (80%)**

- embolic, thrombosis of intracerebral arteries, vasculitis, hypercoagulability, etc. (see [Neurology](#), N43)

**Intracranial Hemorrhage (20%)**

- subarachnoid hemorrhage (SAH), spontaneous intracerebral hemorrhage (ICH), intraventricular hemorrhage (IVH)

## Subarachnoid Hemorrhage (SAH)

**Definition**

- bleeding into subarachnoid space (intracranial vessel between arachnoid and pia)

**Etiology**

- trauma (most common)
- spontaneous
  - ruptured aneurysms (75-80%)
  - idiopathic (14-22%)
  - AVMs (4-5%)
- coagulopathies (iatrogenic or primary), vasculitides, tumours, cerebral artery dissections ( $<5\%$ )

**Epidemiology**

- $\sim 10-28/100,000$  population/yr
- peak age 55-60, 20% of cases occur under age 45

**Risk Factors**

- hypertension
- pregnancy/parturition in patients with pre-existing AVMs, eclampsia
- oral contraceptive pill
- substance abuse (cigarette smoking, cocaine, alcohol)
- conditions associated with high incidence of aneurysms (see *Intracranial Aneurysms*, NS21)

**Clinical Features of Spontaneous SAH**

- sudden onset (seconds) of severe “thunderclap” headache usually following exertion and described as the “worst headache of my life” (up to 97% sensitive, 12-25% specific)
- nausea/vomiting, photophobia
- meningismus (neck pain/stiffness, positive Kernig’s and Brudzinski’s sign)
- decreased LOC (due to either raised ICP, ischemia, seizure)
- focal deficits: cranial nerve palsies (CN III, IV), hemiparesis
- ocular hemorrhage in 20-40% (due to sudden raised ICP compressing central retinal vein)
- reactive hypertension

**Fisher Grade (SAH on CT scan)**

Grade	Finding
1	Normal scan
2	$<1$ mm thick blood
3	$>1$ mm thick blood
4	SAH + ICH or IVH

**Hunt and Hess Grade (clinical grading scale for SAH)**

Grade	Description
1	No Sx or mild H/A and/or mild meningismus
2	Grade 1 + CN palsy
3	Confusion/lethargy, mild hemiparesis or aphasia
4	GCS $<15$ but $>8$ , moderate-severe hemiparesis, mild rigidity
5	Coma (GCS $<9$ ), decerebrate, moribund appearance

Mortality of Grade 1-2 20%, increased with grade

- sentinel bleeds
  - represents undiagnosed SAH
  - SAH-like symptoms lasting <1 d (“thunderclap H/A”)
  - may have blood on CT or LP
  - ~30-60% of patients with full blown SAH give history suggestive of sentinel bleed within past 3 wk
- differential diagnosis: sentinel bleed, dissection/thrombosis of aneurysm, venous sinus thrombosis, benign cerebral vasculitis, benign exertional H/A

### Investigations

- non-contrast CT (Figure 17) – for diagnosis of SAH
  - 98% sensitive within 12 h, 93% within 24 h; 100% specificity
  - may be negative if small bleed or presentation delayed several days
  - acute hydrocephalus, IVH, ICH, infarct or large aneurysm may be visible
- lumbar puncture (highly sensitive) – for diagnosis of SAH if CT negative but high suspicion:
  - elevated opening pressure (>18 cm H<sub>2</sub>O)
  - bloody initially, xanthochromic supernatant with centrifugation (“yellow”) by ~12 h, lasts 2 wk
  - RBC count usually >100,000/mm<sup>3</sup> without significant drop from first to last tube (in contrast to traumatic tap)
  - elevated protein due to blood breakdown products
- four vessel cerebral angiography (“gold standard” for aneurysms)
  - demonstrates source of SAH in 80-85% of cases
  - angiogram negative SAH: repeat angiogram in 7-14 d, if negative → “perimesencephalic SAH”
- MRA and CTA: sensitivity up to 95% for aneurysms, CTA>MRA for smaller aneurysms and delineating adjacent bony anatomy

Figure 17. Diagnosis of SAH

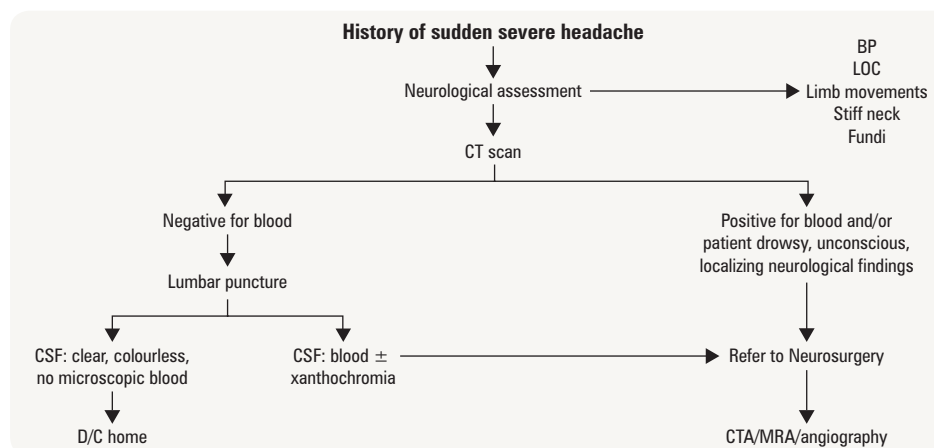

Figure 18. Approach to SAH

### World Federation of Neurological Surgeons Grading of SAH

WFNS Grade	GCS Score	Aphasia, Hemiparesis, or Hemiplegia
0 *		
1	15	–
2	13-14	–
3	13-14	+
4	7-12	+ or –
5	3-6	+ or –

\*Intact aneurysm

### Nontraumatic Subarachnoid Hemorrhage in the Setting of Negative Cranial Computed Tomography Results: External Validation of a Clinical and Imaging Prediction Rule

*Ann Emerg Med* 2012;59:460-8.e1-7. doi:10.1016

**Background:** Two rules for SAH diagnosis exist.

A clinical prediction rule states that patients with acute severe headache but without the clinical variables age ≥40 yr, neck pain, loss of consciousness, or onset of headache with exertion are at low risk for SAH. An imaging prediction rule bases diagnosis on non-contrast cranial CT for patients within 6 h of headache onset.

**Methods:** Matched case-control study of 55 patients at 21 emergency departments between 2000 and 2011, and diagnoses were verified by lumbar puncture.

**Results:** The clinical prediction rule for diagnosis of SAH was 97.1% sensitive, 22.7% specific, and had a negative likelihood ratio of 0.13. Using the imaging prediction rule resulted in a false negative rate of 20%.

**Conclusions:** Performing the clinical and imaging rules together has the potential for maximizing sensitivity of prediction and reducing rates of lumbar puncture, but using imaging alone can result in missed cases.

## Treatment

- admit to ICU or NICU
  - oxygen/ventilation prn
  - NPO, bed rest, elevate head of bed 30°, minimal external stimulation, neurological vitals q1h
  - aim to maintain sBP = 120-150 (balance of vasospasm prophylaxis, risk of re-bleed, risk of hypotension since CBF autoregulation impaired by SAH)
  - cardiac rhythm monitor, Foley prn, strict monitoring of ins and outs
- medications:
  - IV NS with 20 mmol KCl/L at 125-150 cc/h
  - nimodipine 60 mg PO/NG q4h x 21 d for vasospasm neuroprotection; may discontinue earlier if patient is clinically well
  - seizure prophylaxis: levetiracetam (Keppra®) 500 mg PO/IV q12h x 1 wk
  - mild sedation prn

## Complications

- vasospasm: vasoconstriction and permanent pathological vascular changes in response to vessel irritation by blood
  - onset: 4-14 d post-SAH, peak at 6-8 d; most commonly due to SAH, rarely due to ICH/IVH
  - clinical features (delayed ischemic deficit): confusion, decreased LOC, focal deficit (speech or motor)
  - risk factors: large amount of blood on CT (high Fisher grade), smoking, increased age, HTN
  - “symptomatic” vasospasm in 20-30% of SAH patients
  - “radiographic” vasospasm in 30-70% of arteriograms performed 7 d following SAH
  - diagnosed clinically, and/or with transcranial Doppler (increased velocity of blood flow)
  - risk of cerebral infarct and death
  - treatment
    - ♦ hyperdynamic (“triple H” – see sidebar) therapy using fluids and pressors, usually after ruptured aneurysm has been clipped/coiled
    - ♦ direct vasodilation via angioplasty or intraarterial verapamil for refractory cases
- hydrocephalus (15-20%): due to blood obstructing CSF drainage
  - can be acute or chronic, requires extraventricular drain (EVD) or shunt, respectively
- neurogenic pulmonary edema
- hyponatremia: due to cerebral salt wasting (increased renal sodium loss and ECFV loss), not SIADH
- diabetes insipidus
- cardiac: arrhythmia (>50% have ECG changes), MI, CHF

## Prognosis

- 10-15% mortality before reaching hospital, overall 50% mortality (majority within first 2-3 wk)
- 30% of survivors have moderate to severe disability
- a major cause of mortality is rebleeding, for aneurysms:
  - risk of rebleed: 4% on first day, 15-20% within 2 wk, 50% by 6 mo
  - if no rebleed by 6 mo, risk decreases to same incidence as unruptured aneurysm (2%)
  - only prevention is early clipping or coiling of “cold” aneurysm
  - rebleed risk for “perimesencephalic SAH” is approximately same as for general population

### Calcium Antagonists for Aneurysmal Subarachnoid Hemorrhage

*Cochrane DB Syst Rev* 2007;3:CD0000277

**Introduction:** This study looked to review the evidence in regards as to whether calcium antagonists improve the outcome in patients with aneurysmal subarachnoid hemorrhage.

**Methods/Population:** The review included 3361 patients presenting with aneurysmal subarachnoid hemorrhage from 16 RCTs comparing treatment with calcium antagonists vs. control from 1980 to March 2006.

**Results:** The results were based mainly on one large trial of oral nimodipine, which showed a RR of 0.67 (95% CI 0.55 to 0.81) and the evidence for other calcium agonists was not statistically significant.

**Conclusion:** The authors endorse the use of oral nimodipine in patients with aneurysmal subarachnoid hemorrhage.

### “Triple H” Therapy for Vasospasm

Hypertension  
Hypervolemia  
Hemodilution

### Magnesium for Aneurysmal Subarachnoid Hemorrhage (MASH-2): A Randomized Placebo-Controlled Trial

*Lancet* 2012;380:44-49

**Introduction:** MgSO<sub>4</sub> is a neuroprotective agent that may improve outcomes after SAH.

**Methods:** Phase 3 multicentre, international, randomized, placebo-controlled trial of adults with SAH on imaging comparing either IV MgSO<sub>4</sub> or placebo treatment. Primary outcome was poor outcome rated on a score of 4-5 on Rankin score or death at 3 mo after SAH.

**Results:** 2.6.2% of patients had poor outcome in the magnesium group compared to 25.3% of patients in the placebo group.

**Conclusions:** IV MgSO<sub>4</sub> does not improve clinical outcome after aneurysmal SAH.

# Intracerebral Hemorrhage (ICH)

## Definition

- hemorrhage within brain parenchyma, accounts for ~10% of strokes
- can dissect into ventricular system (IVH) or through cortical surface (SAH)

## Etiology

- HTN (usually causes bleeds at putamen, thalamus, pons and cerebellum)
- hemorrhagic transformation (reperfusion post stroke, surgery, strenuous exercise, etc.)
- vascular anomalies
  - aneurysm, AVMs, and other vascular malformations (see *Vascular Malformations*, NS23)
  - venous sinus thrombosis
  - arteriopathies (cerebral amyloid angiopathy, lipohyalinosis, vasculitis)
- tumours (1%): often malignant (e.g. GBM, lymphoma, metastases)
- drugs (amphetamines, cocaine, alcohol, anticoagulants, etc.)
- coagulopathy (iatrogenic, leukemia, TTP, aplastic anemia)
- CNS infections (fungal, granulomas, herpes simplex encephalitis)
- post trauma (immediate or delayed, frontal and temporal lobes most commonly injured via coup-contrecoup mechanism)
- eclampsia
- post-operative (post-carotid endarterectomy cerebral reperfusion, craniotomy)
- idiopathic

**Epidemiology**

- 12-15 cases/100,000 population/yr

**Risk Factors**

- increasing age (mainly >55 yr)
- male gender
- HTN
- Black/Asian > Caucasian
- previous CVA of any type (23x risk)
- both acute and chronic heavy alcohol use; cocaine, amphetamines
- liver disease
- anticoagulants

**Clinical Features**

- TIA-like symptoms often precede ICH, can localize to site of impending hemorrhage
- location: basal ganglia/internal capsule (50%), thalamus (15%), cerebral white matter (15%), cerebellum/brainstem – usually pons (15%)
- gradual onset of symptoms over minutes-hours, usually during activity
- H/A, N/V, and decreased LOC are common
- specific symptoms/deficits depend on location of ICH

**Investigations**

- hyperdense blood on non-contrast CT
- CTA routine, if spot sign demonstrated there is high likelihood of clot growth

**Treatment**

- medical
  - decrease MAP to pre-morbid level or by ~20% (target BP 140/90)
  - check PTT/INR, and correct coagulopathy
  - control raised ICP (see *Intracranial Pressure Dynamics*, NS4)
  - levetiracetam/phenytoin for seizure prophylaxis
  - follow electrolytes (SIADH common)
  - angiogram to r/o vascular lesion unless >45 yr, known HTN, and putamen/thalamic/posterior fossa ICH (yield ~0%)
- surgical
  - craniotomy with evacuation of clot, treatment of source of ICH (i.e. AVM, tumour, cavernoma), ventriculostomy to treat hydrocephalus
  - indications
    - ♦ symptoms of raised ICP or mass effect
    - ♦ rapid deterioration (especially if signs of brainstem compression)
    - ♦ favourable location (e.g. cerebellar, non-dominant hemisphere)
    - ♦ young patient (<50 yr)
    - ♦ if tumour, AVM, aneurysm, or cavernoma suspected (resection or clip to decrease risk of rebleed)
  - contraindications
    - ♦ small bleed: minimal symptoms, GCS >10
    - ♦ poor prognosis: massive hemorrhage (especially dominant lobe), low GCS/coma, lost brainstem function
    - ♦ medical reasons [e.g. very elderly, severe coagulopathy, difficult location (e.g. basal ganglia, thalamus)]

**Prognosis**

- 30-d mortality rate 44%, mostly due to cerebral herniation
- rebleed rate 2-6%, higher if HTN poorly controlled

## Intracranial Aneurysms

**Epidemiology**

- prevalence 1-4% (20% have multiple)
- female > male; age 35-65 yr

**Risk Factors**

- autosomal dominant polycystic kidney disease (15%)
- fibromuscular dysplasia (7-21%)
- AVMs
- connective tissue diseases (Ehlers-Danlos, Marfan)
- family history
- bacterial endocarditis
- Osler-Weber-Rendu syndrome (hereditary hemorrhagic telangiectasia)
- atherosclerosis and HTN
- trauma

**Types** (for location, see Figure 4, NS3)

- saccular (berry)
  - most common type
  - located at branch points of major cerebral arteries (Circle of Willis)
  - 85-95% in carotid system, 5-15% in vertebrobasilar circulation
- fusiform
  - atherosclerotic
  - more common in vertebrobasilar system, rarely rupture
- infectious
  - secondary to any infection of vessel wall, 20% multiple
  - 60% *Streptococcus* and *Staphylococcus*
  - 3-15% of patients with bacterial endocarditis

**Table 10. 5-year Cumulative Rupture Risk in Unruptured Aneurysms Based on Size and Location**

	Cavernous Carotid	AC/MC/IC	Vertebrobasilar/PC/PComm
<7 mm	0%	0%	2.5%
7-12 mm	0%	2.6%	14.5%
13-24 mm	3%	14.5%	18.4%
≥24 mm	6.4%	40%	50%

AC – anterior cerebral/anterior communicating artery; MC – middle cerebral artery; IC – internal carotid artery; PC – posterior cerebral artery; PComm – posterior communicating artery  
*The Lancet* 2003;362:103-10

### Clinical Presentation

- rupture (90%), most often SAH, but 30% ICH, 20% IVH, 3% subdural bleed
- sentinel hemorrhage (“thunderclap H/A”) → requires urgent clipping/coiling to prevent catastrophic bleed
- mass effect (giant aneurysms)
  - internal carotid or anterior communicating aneurysm may compress:
    - ♦ the pituitary stalk or hypothalamus causing hypopituitarism
    - ♦ the optic nerve or chiasm producing a visual field defect
  - basilar artery aneurysm may compress midbrain, pons (limb weakness), or CN III
  - posterior communicating artery aneurysm may produce CN III palsy
  - intracavernous aneurysms (CN III, IV, V<sub>1</sub>, V<sub>2</sub>, VI)
- distal embolization (e.g. amaurosis fugax)
- seizures
- headache (without hemorrhage)
- incidental CT or angiography finding (asymptomatic)

### Investigations

- CT angiogram (CTA), magnetic resonance angiography (MRA), cerebral angiogram

### Treatment

- ruptured aneurysms
  - overall trend towards better outcome with early surgery or coiling (48-96 h after SAH)
  - treatment options: surgical placement of clip across aneurysm neck, trapping (clipping of proximal and distal vessels), thrombosing using Guglielmi detachable coils (coiling), wrapping (last resort)
  - choice of surgery vs. coiling not yet well defined, consider location, size, shape, and tortuosity of the aneurysm, patient comorbidities, age, and neurological condition. In general:
    - ♦ coiling: posterior > anterior circulation, deep/eloquent location, basilar artery bifurcation/apex, older age, presence of comorbidities, presence of vasospasm
    - ♦ clipping: superficial > deep, broad aneurysmal base, branching arteries at the aneurysm base, tortuosity/atherosclerosis of afferent vessels, dissection, hematoma, acute brainstem compression
- unruptured aneurysms
  - average 1% annual risk of rupture: risk dependent on size and location of aneurysm
  - no clear evidence on when to operate: need to weigh life expectancy
  - risk of morbidity/mortality of SAH (20%-50%) vs. surgical risk (2%-5%)
  - generally treat unruptured aneurysms >10 mm
  - consider treating when aneurysm 7-9 mm in middle-aged, younger patients or patients with a family history of aneurysms
  - follow smaller aneurysms with serial angiography

#### Commonest Locations of Saccular Aneurysms

- AComm: 30%
- PComm: 25%
- MCA: 20%
- Basilar tip: 7%

#### Risk of Recurrent Subarachnoid Haemorrhage, Death, or Dependence and Standardised Mortality Ratios after Clipping or Coiling of an Intracranial Aneurysm in the International Subarachnoid Aneurysm Trial (ISAT): Long-Term Follow-Up

*Lancet Neurol* 2009;8:427-433

**Objective:** To assess the long-term risk of death, disability, and rebleeding in patients randomly assigned to clipping or endovascular coiling after rupture of an intracranial aneurysm in the follow-up of the ISAT trial

**Methods:** Randomized controlled trial comparing endovascular coiling treatment with craniotomy and clipping for ruptured intracranial aneurysms in 2143 patients who were considered eligible for either modality of therapy. Annual follow-up was done for a mean length of 9 yr to assess long-term survival and dependency.

**Results:** 10 patients in the coiled group and 3 patients in the clipped group had rebled from the original aneurysm. In patients with ruptured intracranial aneurysms suitable for both treatments, the survival rate at 5 yr after endovascular coiling was higher at 89% vs 86% for neurosurgical clipping (relative risk 0.77,  $p=0.03$ ). The likelihood of independence at 5 yr following treatment is the same for both groups (83% for coiling vs 82% for clipping).

**Conclusions:** The risk of death at 5 yr was significantly lower in the coiled group than it was in the clipped group. There was a small increased risk of recurrent bleeding from a coiled aneurysm compared with a clipped aneurysm.

#### Unruptured Intracranial Aneurysms – Risk of Rupture and Risks of Surgical Intervention. International Study of Unruptured Intracranial Aneurysms Investigators

*NEJM* 1998;339:1725-33

**Introduction:** The management of unruptured intracranial aneurysms requires knowledge of the natural history of these lesions.

**Methods:** Retrospective and prospective, multicenter, international study of 2621 patients with unruptured intracranial aneurysms.

**Results:** In patients with no previous history of aneurysm rupture, cumulative rate of rupture of aneurysms less than 10 mm was less than 0.05% and for aneurysms greater than 10 mm was less than 1%. However, giant aneurysms >25 mm had a 6% risk of rupture within 1 yr. In patients with a previous history of aneurysm bleed from a different aneurysm, the risk of rupture for aneurysms <10 mm was 0.5% and for aneurysms >10 mm was less than 1%.

**Conclusions:** Surgery is unlikely to reduce rates of morbidity and mortality in patients with unruptured intracranial aneurysms smaller than 10 mm in diameter and no history of subarachnoid hemorrhage. In these patients, the morbidity and mortality related to surgery greatly exceeded the 7.5 yr risk of rupture for aneurysms <10 mm.

## Carotid Stenosis

### Definition

- narrowing of the internal carotid artery lumen due to atherosclerotic plaque formation, usually near common carotid bifurcation into internal and external carotids

### Risk Factors

- for atherosclerosis: HTN, smoking, DM, CVD or CAD, dyslipidemia

### Clinical Features

- may be asymptomatic
- symptomatic stenosis may present as TIA, reversible ischemic neurologic deficit (RIND), or stroke
- retinal insufficiency or infarct permanently or temporarily (amaurosis fugax), (see [Ophthalmology](#), OP37)
- middle cerebral artery (MCA) occlusive symptoms

### Investigations

- CBC, PTT/INR (hypercoagulable states)
- fundoscopy: cholesterol emboli in retinal vessels (Hollenhorst plaques)
- auscultation over carotid bifurcation for bruits (do not correlate with degree of stenosis)
- carotid duplex: determines severity of disease (mild/moderate/severe stenosis or occlusion)
- angiogram: "gold standard" but invasive and 1/200 risk of stroke (not for screening)
- MRA: safer than angiogram, may overestimate stenosis

### Treatment

- control of HTN, lipids, diabetes
- antiplatelet agents (ASA ± dipyridamole, clopidogrel) ~25% relative risk reduction
- carotid endarterectomy (generally if symptomatic and >70% stenosis, see Tables 11 and 12)
- endovascular angioplasty ± stenting

### Prognosis

**Table 11. Symptomatic Carotid Stenosis: North American Symptomatic Carotid Endarterectomy Trial (NASCET)**

% Stenosis on Angiogram	Risk of Major Stroke or Death	
	Medical Rx	Medical + Surgical Rx
70-99%	26% over 2 yr	9% over 2 yr
50-69%	22% over 5 yr	16% over 5 yr
<50%	Surgery has no benefit with 5% complication rate	

**Table 12. Asymptomatic Carotid Stenosis: Asymptomatic Carotid Atherosclerosis Study (ACAS) and Asymptomatic Carotid Surgery Trial (ACST)**

% Stenosis on Angiogram	Risk of Major Stroke or Death	
	Medical Rx	Medical + Surgical Rx
60-99%	11% over 5 yr	5.1% over 5 yr (ACAS)
50-69%	11.8% over 5 yr	6.4% over 5 yr (ACST)

#### Prevention of Disabling and Fatal Strokes by Successful Carotid Endarterectomy in Patients Without Recent Neurological Symptoms: Randomized Controlled Trial

*Lancet* 2004;363:1491-1502

**Study:** Asymptomatic Carotid Surgery Trial (ACST), a RCT with follow-up at 5 yr.

**Patients:** 3120 asymptomatic patients with significant carotid artery stenosis were randomized equally between immediate carotid endarterectomy (CEA) and indefinite deferral of CEA and were followed for up to 5 yr (mean 3.4 yr).

**Main Outcome:** Any stroke (including fatal or disabling).

**Conclusions:** In asymptomatic patients with significant carotid artery stenosis, immediate CEA reduced the net 5-yr stroke risk from about 12% to about 6%. Half of this 5-yr benefit involved disabling or fatal strokes.

#### Spetzler-Martin AVM Grading Scale

Item	Score
<b>Size</b>	
0-3 cm	1
3.1-6.0 cm	2
> 6 cm	3
<b>Location</b>	
Noneloquent	0
Eloquent	1
<b>Deep venous drainage</b>	
Not present	0
Present	1

AVM grades calculated by adding the 3 individual Spetzler-Martin Scale scores from the above table. e.g. a 2 cm tumour in noneloquent location without deep venous drainage = Grade I

## Vascular Malformations

### Types

- arteriovenous malformations (AVMs)
- cavernous malformations (= cavernomas, cavernous hemangiomas/angiomas)
- venous angioma
- capillary telangiectasias
- arterio-venous fistula (AVF) (carotid-cavernous fistula, dural AVF, vein of Galen aneurysm)
- "angiographically occult vascular malformations" (any type, 10% of malformations)

## Arteriovenous Malformations (AVMs)

### Definition

- tangle of abnormal vessels/arteriovenous shunts, with no intervening capillary beds or brain parenchyma, usually congenital

### Epidemiology

- prevalence ~0.14%, male:female = 2:1, average age at diagnosis = 33 yr
- 15-20% of patients with hereditary hemorrhagic telangiectasia (Osler-Weber-Rendu syndrome) will have cerebral AVMs

### Clinical Features

- hemorrhage (40-60%): small AVMs are more likely to bleed due to direct high pressure AV connections
- seizures (50%): more common with larger AVMs
- mass effect
- focal neurological signs secondary to ischemia (high flow → “steal phenomena”)
- localized headache, increased ICP
- bruit (especially with dural AVMs)
- may be asymptomatic (“silent”)

### Investigations

- MRI (flow void), MRA
- angiography (7% will also have one or more associated aneurysms)

### Treatment

- decreases risk of future hemorrhage and seizure
  - surgical excision is treatment of choice
  - SRS is preferred for small (<3 cm) or very deep lesions
  - endovascular embolization (glue, balloon) can facilitate surgery or SRS for larger lesions
- conservative (e.g. palliative embolization, seizure control if necessary)

### Prognosis

- 10% mortality, 30-50% morbidity (serious neurological deficit) per bleed
- risk of major bleed in untreated AVMs: 2-4% per year

## Cavernous Malformations

- benign vascular hamartoma consisting of irregular sinusoidal vascular channels located within the brain without intervening neural tissue or associated large arteries/veins
- several genes now described: CCM1, CCM2, CCM3
- prevalence of 0.1-0.2%, both sporadic and hereditary forms described

### Clinical Features

- seizures (60%), progressive neurological deficit (50%), hemorrhage (20%), H/A
- often an incidental finding
- hemorrhage risk less than AVM, usually minor bleeds

### Investigations

- T2WI MRI (non-enhancing; see Figure 19) gradient echo sequencing (best for diagnosis)

### Treatment

- surgical excision
  - only appropriate for symptomatic lesions that are surgically accessible (supratentorial lesions are less likely to bleed than infratentorial lesions)

**Figure 19. MRI of cavernous malformation**

A. T2 weighted imaging MRI

B. Gradient echo sequencing MRI

#### Stereotactic Radiosurgery for Cavernous Malformations

*J Neurosurg* 2000;93:987-991

**Introduction:** The use of radiosurgery for treatment of cerebral cavernous malformations (CM) is controversial. The safety and efficacy of CM radiosurgery is described.

**Methods:** Retrospective review of 17 patients with CM who underwent radiosurgery over a 10-yr period. All patients had at least 2 documented hemorrhages prior to therapy.

**Results:** Annual hemorrhage rate 51 mo preceding surgery was 40.1% compared to 8.8% in first 2 yr after radiosurgery and 2.9% thereafter. However, 41% of patients developed a permanent radiation-related morbidity.

**Conclusions:** Impossible to conclude that radiosurgery protects patients with CMs against future hemorrhage.

#### RED FLAGS for Back Pain

##### BACK PAIN

**Bowel/Bladder** (retention or incontinence)

**Anesthesia** (saddle)

**Constitutional symptoms**

**Chronic disease**

**Parasthesia**

**Age >50 or <20**

**IV drug use**

**Neuromotor deficits**

##### Cauda Equina

- Urinary retention or incontinence, fecal incontinence or loss of anal sphincter tone, saddle anesthesia, uni/bilateral, leg weakness/pain

##### Malignancy

- Age >50, previous hx of cancer, pain unrelieved by bed rest, constitutional symptoms

##### Infection

- Increased ESR, IV drug use, immunosuppressed, fever

##### Compression Fracture

- Age >50, trauma, prolonged steroid use

## EXTRACRANIAL PATHOLOGY

## Approach to Limb/Back Pain

- see [Orthopedics](#), OR21

## Extradural Lesions

### Root Compression

#### Differential Diagnosis

- herniated disc
- neoplasm (neurofibroma, schwannoma)
- synovial cyst, abscess
- hypertrophic bone/spur

## Cervical Disc Syndrome

#### Etiology

- nucleus pulposus herniates through annulus fibrosus and impinges upon nerve root, most commonly at C6-C7 (C7 root)

### Clinical Features

- pain down arm in nerve root distribution, worse with neck extension, ipsilateral rotation and lateral flexion (all compress the ipsilateral neural foramen)
- LMN signs and symptoms
- central cervical disc protrusion causes myelopathy as well as nerve root deficits

### Investigations

- if red flags: C-spine x-ray, CT, MRI (imaging of choice)
- only consider EMG, nerve conduction studies if diagnosis uncertain and presenting more as peripheral nerve issue.

### Treatment

- conservative
  - no bedrest unless severe radicular symptoms
  - activity modification, patient education (reduce sitting, lifting)
  - physiotherapy, exercise programs focus on strengthening core muscles
  - analgesics, NSAIDs are more efficacious
  - avoid cervical manipulation, like traction
- surgical indications
  - intractable pain despite adequate conservative treatment for >3 mo
  - progressive neurological deficit
  - anterior cervical discectomy is usual surgical choice

### Prognosis

- 95% improve spontaneously in 4-8 wk

**Table 13. Lateral Cervical Disc Syndromes**

	C4-5	C5-6	C6-7	C7-T1
<b>Root Involved</b>	C5	C6	C7	C8
<b>Incidence</b>	2%	19%	69%	10%
<b>Sensory</b>	Shoulder	Thumb	Middle finger	Ring finger, 5th finger
<b>Motor</b>	Deltoid, biceps, supraspinatus	Biceps	Triceps	Digital flexors, intrinsic
<b>Reflex</b>	No change	Biceps, brachioradialis	Triceps	Finger jerk (Hoffmann's sign)

Disc herniations impinge the nerve root at the level below the interspace (i.e. C5-6 disc affects the C6 nerve root).

#### Sensory Fibres

Fasciculus gracilis/cuneatus: joint position, fine touch, vibration  
Spinothalamic tract: pain and temperature

#### Motor Fibres

Corticospinal tract: skilled movements

**Figure 20A. Axial section of cervical spine with vascular and functional territories**

**Figure 20B. Axial section of thoracic spine with vascular and functional territories**

**Figure 20C. Axial section of lumbar spine with vascular and functional territories**

## Cervical Stenosis (Cervical Spondylosis)

### Definition

- cervical spondylosis is chronic disc degeneration and associated facet arthropathy
- resultant syndromes include mechanical neck pain, radiculopathy (root compression), myelopathy (spinal cord compression), and combinations

### Epidemiology

- typically begins at age 40-50, male > female, most commonly at the C5-C6 > C6-C7 levels

### Pathogenesis

- cervical stenosis leading to spinal cord compression and myelopathy is a serious and common issue
- pathophysiology includes static compression, dynamic compression and vascular compromise

### Clinical Features

- insidious onset of mechanical neck pain exacerbated by excess vertebral motion (particularly rotation and lateral bending with a vertical compressive force – Spurling's test)
- occipital headache is common
- radiculopathy may involve 1 or more roots, and symptoms include neck, shoulder and arm pain, paresthesias and numbness
- cervical myelopathy may be characterized by weakness (upper > lower extremity), decreased dexterity, and sensory changes
- UMN findings such as hyperreflexia, clonus and Babinski reflex may be present
- most worrisome complaint is lower extremity weakness (corticospinal tracts)
- myelopathy may be associated with funicular pain, characterized by burning and stinging ± Lhermitte's sign (lightning-like sensation down the back with neck flexion)

### Investigations

- x-ray of cervical spine ± flexion/extension (alignment, fractures)
- MRI most useful for determination of compression of the neural element
- CT is only used for better determination of bony anatomy (i.e. OPLL)
- EMG/nerve conduction studies reserved for peripheral nerve investigation

### Treatment

- decompression and stabilization need to be included in the management
- NSAIDs, moist heat, strengthening and range of motion exercises, analgesics, cervical collar, cervical traction
- surgical indications: myelopathy with motor impairment, progressive neurologic impairment, intractable pain

## Lumbar Disc Syndrome

### Etiology

- posteriolaterally herniated disc compressed nerve root exiting **BELOW** the level of the disc or the traversing nerve root
- far lateral disc herniation compressed nerve root **AT** the level of the disc or the exiting nerve root
- central herniation causes cauda equina or lumbar stenosis (neurogenic claudication)

### Clinical Features

- initially back pain, then leg pain > back pain
- limited back movement (especially forward flexion) due to pain
- motor weakness, dermatomal sensory changes, decreased reflexes
- exacerbation with coughing, sneezing or straining. Relief with flexing the knee or thigh
- nerve root tension signs
  - straight leg raise (SLR: Lasegue's test) or crossed SLR (pain should occur at less than 60 degrees) suggests L5, S1 root involvement
  - femoral stretch test suggests L2, L3 or L4 root involvement

### Investigations

- MRI is modality of choice
- x-ray spine (only to rule out other lesions), CT (bony anatomy)
- myelogram and post-myelogram CT (only if MRI is contraindicated)

### Treatment

- conservative (same as cervical disc disease)
- surgical indications
  - same as cervical disc + cauda equina syndrome

### Prognosis

- 95% improve spontaneously within 4 to 8 wk
- do not follow patients with serial MRIs. Clinical status is more important at guiding management

**Table 14. Lateral Lumbar Disc Syndromes**

	L3-4	L4-5	L5-S1
<b>Root Involved</b>	L4	L5	S1
<b>Incidence</b>	<10%	45%	45%
<b>Pain</b>	Femoral pattern	Sciatic pattern	Sciatic pattern
<b>Sensory</b>	Medial leg	Dorsal foot to hallux Lateral leg	Lateral foot
<b>Motor</b>	Tibialis anterior (dorsiflexion)	Extensor hallucis longus (hallux extension)	Gastrocnemius, soleus (plantar flexion)
<b>Reflex</b>	Knee jerk	Medial hamstrings	Ankle jerk

**Table 15. Differentiating Conus Medullaris Syndrome from Cauda Equina Syndrome**

	Conus Medullaris Syndrome	Cauda Equina Syndrome
<b>Onset</b>	Sudden, bilateral	Gradual, unilateral
<b>Spontaneous Pain</b>	Rare, if present usually bilateral, symmetric in perineum or thighs	Severe, radicular type: in perineum, thighs, legs, back, or bladder
<b>Sensory Deficit</b>	Saddle; bilateral and symmetric; sensory dissociation	Saddle; no sensory dissociation; may be unilateral and asymmetric
<b>Motor Deficit</b>	Symmetric; paresis less marked; fasciculations may be present	Asymmetric; paresis more marked; atrophy may be present; fasciculations rare
<b>Reflexes</b>	Only ankle jerk absent (preserved knee jerk)	Knee and ankle jerk may be absent
<b>Autonomic Symptoms (bladder dysfunction, impotence, etc.)</b>	Urinary retention and atonic anal sphincter prominent early; impotence frequent	Sphincter dysfunction presents late; impotence less frequent

## Cauda Equina Syndrome

### Etiology

- compression or irritation of lumbosacral nerve roots below conus medullaris (below L2 level)
- decreased space in the vertebral canal below L2
- common causes: herniated disc ± spinal stenosis, vertebral fracture, and tumour

**Figure 20D. Axial section of sacral spine with vascular and functional territories**

**Figure 21. T2-weighted MRI of lumbar disc herniation**

### Magnetic Resonance Imaging in Follow-up Assessment of Sciatica

NEJM 2013;368:999-1007

**Background:** Follow-up MRI is a controversial method for monitoring sciatica in patients with known lumbar-disk herniation.

**Methods:** Participants (n=283) were recruited from a simultaneous, parallel, randomized study comparing surgery and conservative care for sciatica (the Sciatica Trial). MRI and clinical assessment were undertaken pre-treatment and 1 yr post-treatment randomization to visualize disk herniation and evaluate outcome.

**Results:** At 1 yr, disk herniation was visible in 35% with a favorable outcome (complete, or nearly complete symptom resolution) and in 33% with an unfavorable outcome (p=0.70). A favorable outcome was reported in 85% of patients with disk herniation and 83% without disk herniation (p=0.70).

**Conclusions:** Anatomical abnormalities visible on repeated MRI 1 yr after treatment for sciatica due to lumbar-disk herniation could not distinguish patients with resolution of their symptoms from patients still experiencing symptoms.

**Clinical Features**

- usually acute (develops in less than 24 h); rarely subacute or chronic
- motor (LMN signs)
  - weakness/paraparesis in multiple root distribution
  - reduced deep tendon reflexes (knee or ankle)
- autonomic
  - urinary retention (or overflow incontinence) and/or fecal incontinence due to loss of anal sphincter tone
- sensory
  - low back pain radiating to legs (sciatica) aggravated by Valsalva maneuver and by sitting; relieved by lying down
  - bilateral sensory loss or pain: depends on the level affected
  - saddle area (S2-S5) anesthesia
  - sexual dysfunction (late finding)

**Investigations**

- urgent MRI to confirm compression of S2-3-4 nerve root by a large disc herniation
- post-void residual very helpful to determine if true retention is present. Volumes controversial but anything over 250 cc in a healthy individual is cause for concerns

**Treatment**

- surgical decompression (<48 h) to preserve bowel, bladder and sexual function, and/or to prevent progression to paraplegia

**Prognosis**

- markedly improves with surgical decompression
- recovery correlates with function at initial presentation: if patient is ambulatory, likely to continue to be ambulatory; if unable to walk, unlikely to walk after surgery

## Lumbar Spinal Stenosis

**Etiology**

- congenital narrowing of spinal canal combined with degenerative changes (herniated disc, hypertrophied facet joints, and ligamentum flavum)

**Clinical Features**

- gradually progressive back and leg pain with standing and walking that is relieved by sitting or lying down (neurogenic claudication – 60% sensitive)
- neurologic exam may be normal, including straight leg raise test

**Investigations**

- MRI is the optimal investigation to confirm and localize the level of stenosis. Unlike nerve root compression which can be localized with clinical exam this is more difficult and requires imaging

**Treatment**

- conservative: NSAIDs, analgesia
- surgical: laminectomy with root decompression (the role of fusion may need to be considered if the amount of bone removed with the laminectomy results in de-stabilization)

## Neurogenic Claudication

**Etiology**

- ischemia of lumbosacral nerve roots secondary to vascular compromise and increased demand from exertion, often associated with lumbar stenosis

**Clinical Features**

- dermatomal pain/paresthesia/weakness of buttock, hip, thigh, or leg initiated by standing or walking
- slow relief with postural changes (sitting >30 min), NOT simply exertion cessation
- induced by variable degrees of exercise or standing
- may be elicited with lumbar extension, but may not have any other neurological findings, no signs of vascular compromise (e.g. ulcers, poor capillary refill, etc.)

**Investigations**

- bicycle test may help distinguish neurogenic claudication (NC) from vascular claudication (the waist-flexed individuals on the bicycle with NC can last longer)

**Treatment**

- same as for lumbar spinal stenosis

**Key Features of Neurogenic vs. Vascular Claudication**

**Neurogenic Claudication:** dermatomal distribution with positional relief occurring over minutes.

**Vascular Claudication:** sclerotomal distribution with relief occurring with rest over seconds.

# Intradural Intramedullary Lesions

## Syringomyelia (Syrinx)

### Definition

- cystic cavitation of the spinal cord
- presentation is highly variable, usually progresses over months to years
- initially pain, weakness; later atrophy and loss of pain and temperature sensation

### Etiology

- 70% are associated with Chiari I malformation, 10 % with basilar invagination
- post-traumatic
- tumour
- tethered cord

### Clinical Features

- nonspecific features for any intramedullary spinal cord pathology:
  - initially pain, weakness, atrophy, loss of pain and temperature in upper extremities (central syrinx) with progressive myelopathy over years
  - sensory loss with preserved touch and joint position sense in a band-like distribution at the level of cervical syrinx
  - sensory loss: suspended dissociated sensory loss may result in painless ulcerations and/or burns
  - dysesthetic pain often occurs in the distribution of the sensory loss
  - LMN arm/hand weakness or wasting
  - painless neuropathic arthropathies (Charcot's joints), especially in the shoulder and neck due to loss of pain and temperature sensation (seen in less than 5%)

Figure 22. T1 Weighted MRI of syringomyelia

### Investigations

- MRI is best method, myelogram with delayed CT

### Treatment

- treat underlying cause (e.g. posterior fossa decompression for Chiari I, surgical removal of tumour if causing a syrinx)
- rarely does the syrinx need to be shunted, only when progressive and size allows for insertion of tube

# Spinal Cord Syndromes

- see [Neurology](#), N4, for spinal cord anatomy
- Spinal cord injury impairment classified according to ASIA score
- ASIA A: complete, no motor/sensory below neurological level including S4/5
- ASIA B: incomplete, sensory but not motor function preserved below neurological level including S4/5
- ASIA C: incomplete, motor function preserved below neurological level and more than half of the key muscles below neurological level have a muscle grade <3
- ASIA D: incomplete, motor function preserved below neurological level and more than half of the key muscles below neurological level have a muscle grade 3 or more
- ASIA E: normal motor and sensory function

### Complete Spinal Cord Lesion

- bilateral loss of motor/sensory and autonomic function at  $\geq 4$  segments below lesion/injury, with UMN signs
- about 3% of patients with complete injuries will develop some recovery within 24 h, beyond 24 h, no distal function will recover

### Incomplete Spinal Cord Lesion

- any residual function at  $\geq 4$  segments below lesion
- signs include sensory/motor function in lower limbs and "sacral sparing" (perianal sensation, voluntary rectal sphincter contraction)

Compartmentalize spinal cord syndromes anatomically by location.

**Table 16. Comparison between Incomplete Spinal Cord Lesion Syndromes**

Syndrome	Etiology	Motor	Sensory
<b>Brown-Séquard</b>	Hemisection of cord	Ipsilateral LMN weakness at the lesion Ipsilateral UMN weakness below the lesion	Ipsilateral loss of vibration and proprioception Contralateral loss of pain and temperature Preserved light touch
<b>Anterior Cord</b>	Anterior spinal artery compression or occlusion	Bilateral LMN weakness at the lesion Bilateral UMN weakness below the lesion Urinary retention	Preserved vibration and proprioception Bilateral loss of pain and temperature Preserved light touch
<b>Central Cord</b> (most common)	Syringomyelia, tumours, spinal hyperextension injury	Bilateral motor weakness: Upper limb weakness (LMN lesion) greater than Lower limb weakness (UMN lesion) Urinary retention	Variable bilateral suspended sensory loss Loss of pain and temperature greater than loss of vibration and proprioception
<b>Posterior Cord</b>	Posterior spinal artery infarction, trauma	Preserved	Bilateral loss of vibration, proprioception, light touch at and below the lesion Preserved pain and temperature

**Figure 23. Spinal cord lesion syndromes**

- see [Neurology](#), N31 and [Plastic Surgery](#), PL28

### Seddon's Classification of Peripheral Nerve Injury

- class I: **neurapraxia** – axon structurally intact but fails to function; recovery within hours to months (average 6-8 wk)
- class II: **axonotmesis** – axon and myelin sheath disrupted but endoneurium and supporting structures intact → Wallerian degeneration of axon segment distal to injury → spontaneous axonal recovery at 1 mm/d, max at 1-2 yr
- class III: **neurotmesis** – nerve completely transected, need surgical repair for possibility of recovery
- etiologies: ischemia, nerve entrapment – nerve compressed by nearby anatomic structures, often secondary to localized, repetitive mechanical trauma with additional vascular injury to nerve

### Investigations

- neurological exam (power, sensation, reflexes), localization via Tinel's sign (paresthesias elicited by tapping along the course of a nerve)
- electrophysiological studies (EMG, nerve conduction study) may be helpful in assessing nerve integrity and monitoring recovery, not helpful until 2-3 wk post-injury
- labs: bloodwork, CSF
- imaging: C-spine, chest/bone x-rays, myelogram, CT, magnetic resonance neurography, identify etiology
- angiogram if vascular damage is suspected

### Treatment

- early neurosurgical consultation if injury is suspected
- entrapment
  - conservative: prevent repeated stress/injury, physiotherapy, NSAIDs, local anaesthesia/steroid injection
  - surgical: nerve decompression ± transposition for progressive deficits, muscle weakness/atrophy, failure of medical management
- stretch/contusion
  - follow-up clinically for recovery; exploration if no recovery in 3 mo
- axonotmesis
  - if no evidence of recovery, resect damaged segment
  - prompt physical therapy and rehabilitation to increase muscle function, maintain joint range of motion, and maximize return of useful function
  - recovery usually incomplete
- neurotmesis
  - surgical repair of nerve sheath unless known to be intact [suture nerve sheaths directly if ends approximate or nerve graft (usually sural nerve)]
  - clean laceration: early exploration and repair
  - contamination or associated injuries: tag initially with nonabsorbable suture, reapproach within 10 d

### Complications

- neuropathic pain: with neuroma formation
- complex regional pain syndrome: with sympathetic nervous system involvement

**Figure 24. Peripheral nerve structure**

## SPECIALTY TOPICS

### Neurotrauma

**Trauma Management** (see also [Emergency Medicine](#), ER6)

#### Indications for Intubation in Trauma

1. depressed LOC (patient cannot protect airway): usually GCS  $\leq 8$
2. need for hyperventilation
3. severe maxillofacial trauma: patency of airway is doubtful
4. need for pharmacologic paralysis for evaluation or management
  - if basal skull fracture suspected, use orotracheal instead of nasotracheal intubation
  - note: intubation prevents patient's ability to verbalize for determining GCS

### Trauma Assessment

#### INITIAL MANAGEMENT

##### ABCs of Trauma Management

- see [Emergency Medicine](#), ER8

#### NEUROLOGICAL ASSESSMENT

##### Mini-History

- period of LOC, post-traumatic amnesia, loss of sensation/function, type of injury/accident

##### Neurological Exam

- Glasgow Coma Scale (GCS)
- head and neck (lacerations, bruises, basal skull fracture signs, facial fractures, foreign bodies)
- spine (palpable deformity, midline pain/tenderness)
- eyes (pupillary size and reactivity)
- brainstem (breathing pattern, CN palsies)
- cranial nerve exam
- motor exam, sensory exam (only if GCS is 15), reflexes
- sphincter tone
- record and repeat neurological exam at regular intervals

##### Investigations

- spinal injury precautions (cervical collar) are continued until C-spine is cleared
- C,T,L-spine x-rays
  - AP, lateral, odontoid views for C-spine (must see from C1 to T1; swimmer's view if necessary) or CT
  - rarely done: oblique views looking for pars interarticularis fracture ("Scottie dog" sign)
- CT head and upper C-spine (whole C-spine if patient unconscious) look for fractures, loss of mastoid or sinus air spaces, blood in cisterns, pneumocephalus
- cross and type, ABG, CBC, drug screen (especially alcohol)
- chest and pelvic x-ray as indicated

#### TREATMENT

##### Treatment for Minor Head Injury

- observation over 24-48 h
- wake every hour
- judicious use of sedatives or pain killers during monitoring period

##### Treatment for Severe Head Injury (GCS $\leq 8$ )

- clear airway and ensure breathing (if GCS  $\leq 8$ , intubate)
- secure C-spine
- maintain adequate BP
- monitor for clinical deterioration
- monitor and manage increased ICP if present (see *Herniation Syndromes*, NS7)

##### Admission required if:

- skull fracture (indirect signs of basal skull fracture, see *Head Injury*, NS31)
- confusion, impaired consciousness, concussion with  $>5$  min amnesia
- focal neurological signs, extreme headache, vomiting, seizures
- unstable spine
- use of alcohol
- poor social support

#### Glasgow Coma Scale

Eye Response	Verbal Response	Motor Response
4 spontaneous	5 oriented	6 obeys commands
3 opens eyes to voice	4 confused	5 localizes to pain
2 opens eyes to pain	3 inappropriate words	4 withdraws from pain
1 no eye opening	2 incomprehensible sounds	3 flexion to pain (decorticate posturing)
	1 no response	2 extension to pain (decerebrate posturing)
	T intubated	1 no response

Best response for each component recorded individually (e.g. E3V3M5)  
 $\geq 13$  is mild injury; 9-12 is moderate injury;  $\leq 8$  is severe injury

#### Assessment of Spine CT/X-ray (parasagittal view)

##### ABCDs

**Alignment** (Columns: anterior vertebral line, posterior vertebral line, spinolaminar line, posterior spinous line)  
**Bone** (vertebral bodies, facets, spinous processes)  
**Cartilage**  
**Disc** (disc space and interspinous space)  
**Soft tissues**

#### The Canadian CT Head Rule for Patients with Minor Head Injury

*The Lancet* 2001;357:1391-1396

**CT Head is only required for patients with minor head injuries with any one of the following:**

##### High risk (for neurological intervention)

- GCS score  $<15$  at 2 h after injury
- Suspected open or depressed skull fracture
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, cerebrospinal fluid otorrhea/rhinorrhea, Battle's sign)
- Vomiting  $\geq 2$  episodes
- Age  $\geq 65$  yr

##### Medium risk (for brain injury on CT)

- Amnesia after impact  $>30$  min
- Dangerous mechanism (pedestrian struck by motor vehicle, occupant ejected from motor vehicle, fall from height  $>3$  feet or five stairs)

**Minor head injury** is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.

- Never do lumbar puncture in head injury unless increased ICP has been ruled out
- All patients with head injury have C-spine injury until proven otherwise
- Suspect hematoma in alcoholic-related injuries
- Low BP after head injury means injury elsewhere
- Must clear spine both radiologically AND clinically

## Head Injury

### Epidemiology

- male to female: 2-3:1

### Pathogenesis

- acceleration/deceleration: contusions, subdural hematoma, axon and vessel shearing/mesencephalic hematoma
- impact: skull fracture, concussion, epidural hematoma
- penetrating: worse with high velocity and/or high missile mass
  - low velocity: highest damage to structures on entry/exit path
  - high velocity: highest damage away from missile tract

### Scalp Injury

- rich blood supply
- considerable blood loss (vessels contract poorly when ruptured)
- minimal risk of infection due to rich vascularity

### Skull Fractures

- depressed fractures: double density on skull x-ray (outer table of depressed segment below inner table of skull), CT with bone window is gold standard
- simple fractures (closed injury): no need for antibiotics, no surgery
- compound fractures (open injury): increased risk of infection, surgical debridement within 24 h is necessary
  - internal fractures into sinus may lead to meningitis, pneumocephalus
  - risk of operative bleed may limit treatment to antibiotics
- basal skull fractures: not readily seen on x-ray, rely on clinical signs
  - retroauricular ecchymoses (Battle's sign)
  - periorbital ecchymoses (raccoon eyes)
  - hemotympanum
  - CSF rhinorrhea, otorrhea (suspect CSF if halo or target sign present); suspect with Lefort II/III midface fracture

### Cranial Nerve Injury

- most traumatic causes of cranial nerve injury do not warrant surgical intervention
- surgical intervention
  - CN II: local eye/orbit injury
  - CN III, IV, VI: if herniation secondary to mass
  - CN VIII: repair of ossicles
- CN injuries that improve
  - CN I: recovery may occur in a few months; most do not improve
  - CN III, IV, VI: majority recover
  - CN VII: recovery with delayed lesions
  - CN VIII: vestibular symptoms improve over weeks, deafness usually permanent (except when resulting from hemotympanum)

### Arterial Injury

- e.g. carotid-cavernous (C-C) fistula, carotid/vertebral artery dissection

### Intracranial Bleeding

- see *Blood*, NS16 and *Cerebrovascular Disease*, NS18

#### A Trial of Intracranial-Pressure Monitoring in Traumatic Brain Injury *NEJM* 2012;367:2471-2481

**Background:** ICP monitoring is frequently used to monitor severe traumatic brain injury, but controversy exists over whether it is beneficial.

**Methods:** Study sample (n=324 patients, aged 13 yr or older) consisted of those who had severe traumatic brain injury and were being treated in ICU in Bolivia or Ecuador. Patients were randomly assigned to one management group:

1. ICP-monitoring based management or
2. management based on imaging and clinical examination.

Primary outcome was a composite of survival time, impaired consciousness, functional status (at 3, 6 mo), and neuropsychological status (at 6 mo).

**Results:** No significant difference between management groups based on primary outcome, 6-mo mortality, median length of ICU stay, or occurrence of serious adverse events. However, duration of brain-specific treatments (e.g. use of hyperosmolar fluids or hyperventilation) higher in the imaging-clinical examination group (4.8 d vs. 3.4 d, p=0.002).

**Conclusion:** Maintaining monitored ICP at 20 mmHg or less is not superior to care based on imaging and clinical examination.

#### AAN Classification

- Grade 1: altered mental status <15 min
- Grade 2: altered mental status >15 min
- Grade 3: any loss of consciousness

See sidebar on NS32 for management by classification

## Brain Injury

### Primary Impact Injury

- mechanism of injury determines pathology: penetrating injuries, direct impact
  - low velocity: local damage
  - high velocity: distant damage possible (due to wave of compression), concussion
- concussion:** a trauma-induced alteration in mental status
  - American Academy of Neurology (AAN) Classification (see sidebar)
  - no parenchymal abnormalities on CT
- coup** (damage at site of blow) and **contrecoup** (damage at opposite site of blow) (see Figure 25)
  - acute decompression causes cavitation followed by a wave of acute compression
- contusion** (hemorrhagic)
  - high density areas on CT ± mass effect
  - commonly occurs with brain impact on bony prominences (inferior frontal lobe, pole of temporal lobe)
- diffuse axonal injury/shearing**
  - wide variety of damage results
  - may tear blood vessels (hemorrhagic foci)
  - often the cause of decreased LOC if no space occupying lesion on CT

**Figure 25. CT showing coup-contrecoup injury**

## Secondary Pathologic Processes

- same subsequent biochemical pathways for each traumatic etiology
- delayed and progressive injury to the brain due to
  - high glutamate release → NMDA → cytotoxic cascade
  - cerebral edema
  - intracranial hemorrhages
  - ischemia/infarction
  - raised ICP, intracranial HTN
  - hydrocephalus

## Extracranial Conditions

- hypoxemia
  - due to trauma to the chest, upper airway, brainstem
  - extremely damaging to vulnerable brain cells
  - leads to ischemia, raised ICP
- hypercarbia
  - leads to raised ICP (secondary to vasodilation)
- systemic hypotension
  - caused by blood loss (e.g. ruptured spleen)
  - loss of cerebral autoregulation leads to decreased CPP, ischemia
- hyperpyrexia
  - leads to increased brain metabolic demands → ischemia
- fluid and electrolyte imbalance
  - iatrogenic (most common)
  - SIADH caused by head injury
  - diabetes insipidus (DI)
  - may lead to cerebral edema and raised ICP
- coagulopathy

## Intracranial Conditions

- raised ICP due to traumatic cerebral edema OR traumatic intracranial hemorrhage

## Brain Injury Outcomes

- mildly traumatic (GCS 13-15): post-concussive symptoms: H/A, fatigue, dizziness, nausea, blurred vision, diplopia, memory impairment, tinnitus, irritability, low concentration; 50% at 6 wk, 14% at 1 yr
- moderately traumatic (GCS 9-12): proportional to age (>40) and CT findings; 60% good recovery, 26% moderately disabled, 7% severely disabled, 7% vegetative/dead
- severe (GCS ≤8): difficult to predict, correlates with post-resuscitation GCS (especially motor) and age

SIADH → hyponatremia  
DI → hypernatremia

### Management Associated with AAN Concussion Grades

AAN Grade	Management Options
1	<ul style="list-style-type: none"> <li>• Examine 15 min for amnesia and other symptoms</li> <li>• Return to normal activity if symptoms clear within 15 min</li> </ul>
2	<ul style="list-style-type: none"> <li>• Remove from activity for 1 d, then reexamine</li> <li>• CT or MRI if H/A or other symptoms worsen or last &gt; 1 wk</li> <li>• Return to normal activity after 1 wk without symptoms</li> </ul>
3	<ul style="list-style-type: none"> <li>• Emergent neuro exam + imaging; if initial exam is normal, may go home with close follow up</li> <li>• Admit if any signs of pathology or persistent abnormal mental status</li> <li>• CT or MRI if H/A or other symptoms</li> <li>• If brief loss of consciousness (&lt; 1 min), return to normal activity after 1 wk without symptoms</li> <li>• If prolonged loss of consciousness (&gt; 1 min), return to normal activity only after 2 wk without symptoms</li> </ul>

## Late Complications of Head/Brain Injury

- seizures: 5% of head injury patients develop seizures
  - incidence related to severity and location of injury (increased with local brain damage or intracranial hemorrhage)
  - post-traumatic seizure may be immediate, early, or late
  - presence of early (within first wk) post-traumatic seizure raises incidence of late seizures
- meningitis: associated with CSF leak from nose or ear
- hydrocephalus: acute hydrocephalus or delayed normal pressure hydrocephalus (NPH)

## Spinal Cord Injury (SCI)

- see [Orthopedics](#), OR21 and [Emergency Medicine](#), ER9

## Neurogenic and Spinal Shock

1. neurogenic shock: hypotension that follows SCI (sBP usually ≤80 mmHg) caused by:
  - interruption of sympathetics (unopposed parasympathetics) below the level of injury
  - loss of muscle tone due to skeletal muscle paralysis below level of injury → venous pooling (relative hypovolemia)
  - blood loss from associated wounds (true hypovolemia)
2. spinal shock: transient loss of all neurologic function below the level of the spinal cord injury, causing flaccid paralysis and areflexia for variable periods

## Whiplash-Associated Disorders

- definition: traumatic injury to the soft tissue structures in the region of the cervical spine due to hyperflexion, hyperextension, or rotational injury to the neck

### Early versus Delayed Decompression for Traumatic Cervical Spinal Cord Injury: Results of the Surgical Timing in Acute Spinal Cord Injury Study (STASCIS)

*PLoS ONE* 2012;7:e32037. doi:10.1371/journal.pone.0032037

**Introduction:** This study sought to determine the relative effectiveness of early (<24 h after injury) versus late (≥24 h after injury) decompressive surgery following a traumatic cervical spinal cord injury (SCI).

**Methods/Population:** A prospective cohort study completed in 2002-2009 involving 6 North American institutions. Participants were 16-80 yr of age with a cervical SCI. Outcomes evaluated were changes in American Spinal Injury Association Impairment Scale (AIS) grade at 6 mo follow-up, complications, and mortality.

**Results:** Of 313 participants enrolled, 182 underwent early surgery and 131 underwent late surgery. 222 participants were available for follow-up at 6 mo. The odds of at least 2 grade AIS improvement were greater for those who had early surgery compared to those with late surgery (OR = 2.83, 95% CI: 1.10, 7.28). 1 mortality was observed for each group during the first 30 d post injury. No statistically significant differences were observed for complications (p = 0.21).

**Conclusion:** Early decompression surgery following a SCI is safe and associated with higher AIS improvement at 6 mo following injury.

### Initial Management of SCI

- major causes of death in SCI are aspiration and shock
- the following patients should be treated as having a SCI until proven otherwise:
  - all victims of significant trauma
  - minor trauma patients with decreased LOC or complaints of neck or back pain, weakness, abdominal breathing, numbness/tingling, or priapism

### Stabilization and Initial Evaluation in the Hospital

1. ABCs, immobilization (backboard/head strap), oxygenation, foley catheter to urometer, temperature regulation
2. hypotension: maintain sBP >90 mmHg with pressors (dopamine), hydration, and atropine
  - DVT prophylaxis
3. monitor CBC/electrolytes
4. focused history (see *Trauma Assessment*, NS30)
5. spine palpation: point tenderness or deformity
6. motor level assessment (including rectal exam for voluntary anal sphincter contraction)
7. sensory level assessment: pinprick, light touch, and proprioception
8. evaluation of reflexes
9. signs of autonomic dysfunction: altered level of perspiration, bowel or bladder incontinence, priapism
10. radiographic evaluation
  - 3 views C-spine x-rays (AP, lateral, and odontoid) to adequately visualize C1 to C7-T1 junction
  - flexion-extension views to disclose occult instability
  - CT scan (bony injuries) typically most trauma centre use the CT as the modality of choice for looking at fractures, very sensitive with the high resolution scanners.
  - MRI mandatory if neurological deficits (soft tissue injuries)

### Medical Management Specific to SCI

- option: methylprednisolone (given within 8 h of injury) this is controversial and you need to confer with Neurosurgery service
- $\pm$  decompression in acute, non-penetrating SCI

**Pharmacological Therapy for Acute Spinal Cord Injury: Congress of Neurological Surgeons (CNS) and American Association of Neurological Surgeons (AANS) Guidelines**

*Neurosurgery* 2013;72(Suppl 2):93-105

Level I Recommendations

- No Class I or Class II medical evidence supports the use of methylprednisone in the treatment of acute SCI. Several Class II and Class III studies have been published stating inconsistent effects of methylprednisone likely related to random chance or selection bias.
- Administration of GM-1 ganglioside (Sygen) for the treatment of acute SCI is not recommended.

## Fractures of the Spine

### FRACTURES AND FRACTURE-DISLOCATIONS OF THE THORACIC AND LUMBAR SPINE

- assess ligamentous instability using flexion/extension x-ray views of C-spine  $\pm$  MRI
- thoracolumbar spine unstable if 4/6 segments disrupted (3 columns divided into left and right)
  - anterior column: anterior half of vertebral body, disc, and anterior longitudinal ligament
  - middle column: posterior half of vertebral body, disc, and posterior longitudinal ligament
  - posterior column: posterior arch, facet joints, pedicle, lamina and supraspinous, interspinous and ligamentum ligaments

### Types of Injury (Denis Classification)

- **compression fracture** (58%)
  - produced by flexion
  - posterior ligament complex (supraspinous and interspinous ligaments, ligamentum flavum and intervertebral joint capsules) remain intact
  - fractures are stable but lead to kyphotic deformity
- **burst fracture** (17%)
  - stable: anterior and middle columns parted with bone retropulsed nearby
    - ♦ hallmark is pedicle widening on AP X-ray
    - ♦ spinal cord (seen on x-ray and CT); posterior column is uninjured
  - unstable: same as the stable but with posterior column disruption (usually ligamentous)
- **flexion distraction injury** (6%)
  - hyperflexion and distraction of posterior elements
    - ♦ middle and posterior columns fail in distraction
  - classic: Chance = horizontal fracture through posterior arch, pedicles, posterior vertebral body
  - can be purely ligamentous, i.e. through PLL and disc
- **fracture-dislocation** (6%)
  - anterior and cranial dislocation of superior vertebral body  $\rightarrow$  3 column failure
  - three types:
    - ♦ flexion-rotation
    - ♦ flexion-distraction
    - ♦ shear/hyperextension (rare)

### Management of Thoracolumbar Injury

- severity and management based on TLICS classification (see sidebar)

#### TLICS Scoring

Parameter	Points
Morphology	
Compression fracture	1
Burst fracture	2
Translational/rotational fracture	3
Distraction	4
Neurologic status	
Intact	0
Nerve root injury	2
Spinal cord status	
Incomplete	3
Complete	2
Cauda equine	3
Posterior ligamentous complex	
Intact	0
Injury suspected/indeterminate	2
Injured	3

- TLICS scoring based on morphology of injury, status of posterior ligamentous complex, and neurological status
- Non-operative management if TLICS = 0-3, operative management if TLICS = 5+, either operative or non-operative if TLICS = 4

## FRACTURES OF THE CERVICAL SPINE

### Types of Injury

- C1 vertebral fracture (Jefferson fracture)
  - vertical compression forces the occipital condyles of the skull down on the C1 vertebra (atlas), pushing the lateral masses of the atlas outward and disrupting the ring of the atlas
  - also can cause an occipital condylar fracture
- odontoid process fracture (see Figure 26)
  - causes C1 and odontoid of C2 to move independently of C2 body
  - this occurs because
    - ♦ normally C1 vertebra and odontoid of C2 are a single functional unit
    - ♦ alar and transverse ligaments on posterior aspect of odontoid most commonly remain intact following injury
  - patients often report a feeling of instability and present holding their head with their hands
- C2 vertebral fracture (hangman fracture, traumatic spondylolisthesis of axis):
  - bilateral fracture through the pars interarticularis of C2 with subluxation of C2 on C3
  - usually neurologically intact
- Clay-Shoveler fracture
  - avulsion of spinous process, usually C6 or C7

### Imaging

- AP spine x-ray (open-mouth and lateral view), CT

### Treatment

- immobilization in cervical collar or halo vest until healing occurs (usually 2-3 mo)
- Type II and III odontoid fractures
  - consider surgical fixation for comminution, displacement or inability to maintain alignment with external immobilization
  - confirm stability after recovery with flexion-extension x-rays

Figure 26. Odontoid fracture classification

## Neurologically Determined Death

### Definition

- irreversible and diffuse brain injury resulting in absence of clinical brain function
- cardiovascular activity may persist for up to 2 wk

### Criteria of Diagnosis

- prerequisites: no CNS depressant drugs/neuromuscular blocking agents, no drug intoxication/poisoning, temperature  $>32^{\circ}\text{C}$ , no electrolyte/acid-base/endocrine disturbance
- absent brainstem reflexes:
  - absent pupillary light reflex
  - absent corneal reflexes
  - absent oculocephalic response
  - absent caloric responses (e.g. no deviation of eyes to irrigation of each ear with 50 cc of ice water – allow 1 min after injection, 5 min between sides)
  - absent pharyngeal and tracheal reflexes
  - absent cough with tracheal suctioning
  - absent respiratory drive at  $\text{PaCO}_2 >60$  mmHg or  $>20$  mmHg above baseline (apnea test)
- 2 evaluations separated by time, usually performed by two specialists (e.g. anesthetist, neurologist, neurosurgeon)
- confirmatory testing: flat EEG, absent perfusion assessed with cerebral angiogram

## Coma

### Definition

- an unrousable state in which patients show no meaningful response to environmental stimuli

### Pathophysiology

- lesions affecting the cerebral cortex bilaterally, the reticular activating system (RAS) or their connecting fibres
- focal supratentorial lesions do not alter consciousness except by herniation (compression on the brainstem or on the contralateral hemisphere) or by precipitating seizures

**Classification**

- structural lesions (tumour, pus, blood, infarction, CSF): 1/3 of comas
  - supratentorial mass lesion: leads to herniation
  - infratentorial lesion: compression of or direct damage to the RAS or its projections
- metabolic disorders/diffuse hemispheric damage: 2/3 of comas
  - deficiency of essential substrates (e.g. oxygen, glucose, vitamin B<sub>12</sub>)
  - exogenous toxins (e.g. drugs, heavy metals, solvents)
  - endogenous toxins/systemic metabolic diseases (e.g. uremia, hepatic encephalopathy, electrolyte imbalances, thyroid storm)
  - infections (meningitis, encephalitis)
  - trauma (concussion, diffuse shear axonal damage)

**Investigations and Management**

- ABCs
- labs: electrolytes, extended electrolytes, TSH, LFTs, Cr, BUN, toxin screen, glucose
- CT/MRI, LP, EEG

## Persistent Vegetative State

**Definition**

- a condition of complete unawareness of the self and the environment accompanied by sleep-wake cycles with either complete or partial preservation of hypothalamic and brainstem autonomic function
- “awake but not aware”
- follows comatose state

**Etiology/Prognosis**

- most commonly caused by cardiac arrest or head injury
- due to irreversible loss of cerebral cortical function but intact brainstem function
- average life expectancy is 2-5 yr

## Pediatric Neurosurgery

### Spinal Dysraphism

**SPINA BIFIDA OCCULTA****Definition**

- congenital absence of a spinous process and a variable amount of lamina
- no visible exposure of meninges or neural tissue

**Epidemiology**

- 15-20% of the general population; most common at L5 or S1

**Etiology**

- failure of fusion of the posterior neural arch

**Clinical Features**

- no obvious clinical signs
- presence of lumbosacral cutaneous abnormalities (dimple, sinus, port-wine stain, or hair tuft) should increase suspicion of an underlying anomaly (lipoma, dermoid, diastematomyelia)

**Investigations**

- plain film: absence of the spinous process along with minor amounts of the neural arch
- U/S, MRI to exclude spinal anomalies

**Treatment**

- requires no treatment

Figure 27. Spina bifida occulta

## MENINGOCELE (SPINA BIFIDA APERTA)

### Definition

- herniation of meningeal tissue and CSF through a defect in the spine, without associated herniation of neural tissue

### Etiology

- primary failure of neural tube closure

### Clinical Features

- most common in lumbosacral area
- usually no disability, low incidence of associated anomalies and hydrocephalus

### Investigations

- plain films, CT, MRI, U/S, echo, genitourinary (GU) investigations

### Treatment

- surgical excision and tissue repair (excellent results)

Figure 28. Meningocele

## MYELOMENINGOCELE (SPINA BIFIDA APERTA)

### Definition

- herniation of meningeal and CNS tissue through a defect in the spine

### Etiology

- same as meningocele

### Clinical Features

- sensory and motor changes distal to anatomic level producing varying degrees of weakness
- urinary and fecal incontinence
- 65-85% of patients with myelomeningocele have hydrocephalus
- most have Type II Chiari malformation (see *Chiari Malformations*, NS37)

### Investigations

- plain films, CT, MRI, U/S, echo, GU investigations

### Treatment

- surgical closure to preserve neurologic status and prevent CNS infections
- closure in-utero shown to decrease hydrocephalus and improve post natal motor scores

### Prognosis

- operative mortality close to 0%, 95% 2-yr survival
- 80% have IQ >80 (but most are 80-95), 40-85% ambulatory, 3-10% have normal urinary continence
- early mortality usually due to Chiari malformation complications (respiratory arrest and aspiration), whereas late mortality is due to shunt malfunction

Figure 29. Myelomeningocele

## Intraventricular Hemorrhage (IVH)

- see [Pediatrics](#), P73

## Hydrocephalus in Pediatrics

### Etiology

- congenital
  - aqueductal anomalies, primary aqueductal stenosis in infancy
  - secondary gliosis due to intrauterine viral infections (mumps, varicella, TORCH)
  - Dandy-Walker malformation (2-4%)
  - Chiari malformation, especially Type II
  - myelomeningocele
- acquired
  - post meningitis
  - post hemorrhage (SAH, IVH)
  - masses (vascular malformation, neoplastic)

### Clinical Features

- symptoms and signs of hydrocephalus are age related in pediatrics
- increased head circumference (HC), bulging anterior fontanelle, widened cranial sutures
- irritability, lethargy, poor feeding and vomiting
- “cracked pot” sound on cranial percussion

- scalp vein dilation (increased collateral venous drainage)
- sunset sign – forced downward deviation of eyes
- episodic bradycardia and apnea

#### Investigations

- skull x-ray, U/S, CT, MRI, ICP monitoring

#### Treatment

- similar to adults (see *Hydrocephalus*, NS8)

## Dandy-Walker Malformation

#### Definition

- atresia of foramina of Magendie and Luschka, resulting in:
  - complete or incomplete agenesis of the cerebellar vermis with widely separated, hypoplastic cerebellar hemispheres
  - posterior fossa cyst, enlarged posterior fossa
  - dilatation of 4th ventricle (also 3rd and lateral ventricles)
- associated anomalies
  - hydrocephalus (90%)
  - agenesis of corpus callosum (17%)
  - occipital encephalocele (7%)

#### Epidemiology

- 2-4% of pediatric hydrocephalus

#### Clinical Features

- 20% are asymptomatic, seizures occur in 15%
- symptoms and signs of hydrocephalus combined with a prominent occiput in infancy
- ataxia, spasticity, poor fine motor control common in childhood

#### Investigations

- ultrasound, CT, MRI

#### Treatment

- asymptomatic patients require no treatment
- associated hydrocephalus requires surgical treatment
  - e.g. ventriculoperitoneal (VP) shunt, cystoperitoneal (CP) shunt, limboperitoneal (LP) shunt, ventriculoatrial (VA) shunt, lumbar drain

#### Prognosis

- 75-100% survival, 50% have normal IQ

## Chiari Malformations

#### Definition

- malformations at the medullary-spinal junction

#### Etiology

- unclear, likely maldevelopment/dysgenesis during fetal life

#### Categories

- Type I (cerebellar ectopia)
  - definition: cerebellar tonsils lie below the level of the foramen magnum
  - epidemiology: average age at presentation 15 yr
  - clinical features:
    - ♦ many are asymptomatic
    - ♦ scoliosis
    - ♦ brain compression
    - ♦ central cord syndrome (65%)
    - ♦ syringomyelia (50%)
    - ♦ foramen magnum compression syndrome (22%)
    - ♦ cerebellar syndrome (11%)
    - ♦ hydrocephalus (10%)
- Type II
  - definition: part of cerebellar vermis, medulla, and 4th ventricle extend through the foramen magnum often to midcervical region
  - almost always associated with a myelomeningocele
  - epidemiology: present in infancy
  - clinical features: findings due to brainstem and lower cranial nerve dysfunction
  - syringomyelia, hydrocephalus in >80%

Figure 30. Chiari malformations

**Investigations**

- MRI

**Treatment**

- indications for surgical decompression
  - Type I: symptomatic patients (early surgery recommended; <2 yr post symptom onset) → suboccipital craniectomy, duraplasty
  - Type II: neurogenic dysphagia, stridor, apneic spells → cervical laminectomy, duraplasty

## Craniosynostosis

**Definition**

- premature closure of the cranial suture(s)

**Classification**

- sagittal (most common): long narrow head with ridging sagittal suture (scaphocephaly)
- coronal: expansion in superior and lateral direction (brachiocephaly)
- metopic (trigonocephaly)
- lambdoid: least common

**Epidemiology**

- 0.6/1000 live births, most cases are sporadic; familial incidence is 2% of sagittal and 8% of coronal synostosis

**Clinical Features**

- skull deformity, raised ICP ± hydrocephalus
- ophthalmologic problems due to increased ICP or bony abnormalities of the orbit
- must differentiate between positional plagiocephaly (secondary to back sleeping)

**Investigations**

- plain radiographs, CT scan

**Treatment**

- parental counseling about nature of deformity, associated neurological symptoms
- surgery for cosmetic purposes, except in cases of elevated ICP (≥2 sutures involved)

## Pediatric Brain Tumours

- see also *Tumours*, NS10

**Epidemiology**

- 20% of all pediatric cancers (second only to leukemia)
- 60% of pediatric brain tumours are infratentorial
- pediatric brain tumours arise from various cellular lineages
  - glia: low-grade astrocytoma (supra- or infratentorial), anaplastic astrocytoma, glioblastoma multiforme (largely supratentorial) (see *Astrocytoma*, NS13 for details)
  - primitive nerve cells: supratentorial [primitive neuroectodermal tumour (PNET)]
    - ♦ 90% of neonatal brain tumours, infratentorial (medulloblastoma), pineal gland (pineoblastoma)
  - non-neuronal cells: germ cell tumour, craniopharyngioma, dermoid, meningioma, neurinoma (schwannoma), pituitary adenoma, others

**Clinical Features**

- vomiting, seizure, macrocrania, hydrocephalus
- developmental delay, poor feeding, failure to thrive
- often initially escapes diagnosis due to expansile cranium and neural plasticity in children

**Table 17. Overview of Childhood Primary Brain Tumours**

<b>Pilocytic (low grade) Astrocytoma</b>	<ul style="list-style-type: none"> <li>• Usually in posterior fossa</li> <li>• Well circumscribed</li> <li>• Benign, good prognosis</li> </ul>
<b>Medulloblastoma</b>	<ul style="list-style-type: none"> <li>• A primitive neuroectodermal tumour (PNET)</li> <li>• In cerebellum → compresses 4th ventricle → hydrocephalus</li> <li>• Highly malignant</li> </ul>
<b>Ependymoma</b>	<ul style="list-style-type: none"> <li>• In 4th ventricle → hydrocephalus</li> <li>• Poor prognosis</li> </ul>
<b>Hemangioblastoma</b>	<ul style="list-style-type: none"> <li>• Often cerebellar</li> <li>• Associated with von Hippel-Lindau syndrome with retinal angiomas</li> <li>• Can produce EPO → secondary polycythemia</li> </ul>
<b>Craniopharyngioma</b>	<ul style="list-style-type: none"> <li>• Causes bitemporal hemianopsia (thus often confused with pituitary adenoma)</li> <li>• Most common supratentorial childhood tumour</li> <li>• Benign</li> </ul>

**Relative Frequency of Pediatric Brain Tumours**

Tumour Type	Percent (%)
Astrocytoma, low-grade	40
Supratentorial	(23)
Infratentorial	(17)
Medulloblastoma	20
Brainstem glioma	8
Ependymoma	8
Malignant glioma	6
Craniopharyngioma	6
PNET	4
Pineal, germ cell tumour	3
Other	5

## Movement Disorders

- see *Tremor, Parkinson's Disease, Dystonia, and Multiple Sclerosis* sections in [Neurology](#), N25, N26, N27, N46, respectively

**Table 18. Surgical Targets for Movement Disorders**

Disorder	Indications	Procedures	Outcomes	Morbidity
<b>Parkinson's Disease</b>	Intractable contralateral bradykinesia/tremor Failure of medical management (advanced disease) Drug-induced dyskinesias (see dystonia, below)	Simultaneous, bilateral surgery/stimulation is most common Preferred target: anterodorsal subthalamic nucleus (STN) Other targets: stereotactic ablation (pallidotomy)/stimulation of posteroventral globus pallidus pars interna (GPI) Caudal zona incerta Parkinsonian tremor: stereotactic ablation (thalamotomy)/stimulation of ventral intermediate (Vim) nucleus of thalamus	39-48% improvement in Unified Parkinson's Disease Rating Scale (UPDRS) scores Reduced dosage of medications (STN) More effective than medical management in advanced PD Early intervention may reduce severity, course, and progression of disease Of little benefit for patients with atypical presentations	Intracerebral hemorrhage, infection, seizure (1%-4%) Paresthesias Involuntary movements Cognitive functioning: decreased lexical fluency, impaired executive function (STN > GPI) Psychiatric: depression, mania, anxiety, apathy (STN > GPI)
<b>Dystonia</b>	Contralateral primary (generalized) dystonias; cervical and tardive dystonias (GPI) Contralateral secondary dyskinesia (i.e. drug-induced: L-dopa, neuroleptics; STN)	Preferred target (primary dystonia): stereotactic ablation (pallidotomy)/stimulation of posteroventral GPI Secondary dystonia: stimulation of anterodorsal STN Stimulation of ventral posterior lateral (VPL) thalamic nucleus	Primary dystonia: 51% reduction in Burke-Fahn-Marsden Dystonia Scale (BFMDs) score Secondary dystonia: 62-89% improvement in dystonias Delayed effects: weeks → months	Intracerebral hemorrhage, infection, seizure (1%-4%) Minor effects on cognitive functioning (especially decreased lexical fluency; STN > GPI)
<b>Tremor</b>	Contralateral appendicular ET (first disorder to be treated by DBS; DBS is viable alternative to Rx) Intention tremor (IT) resulting from demyelination of cerebellar outflow tracts (e.g. in multiple sclerosis) Brainstem tremor (Holmes tremor)	Preferred target: stereotactic ablation (thalamotomy)/stimulation of Vim nucleus of thalamus Other targets: stimulation of caudal zona incerta Parkinsonian tremor: stimulation of anterodorsal STN	Durable reductions in essential tremor rating scale (ETRS) scores Reduced dosage of medications Conflicting data on vocal/facial tremor	Intracerebral hemorrhage, infection, seizure (1%-4%) Paresthesias/pain Dysarthria Ataxia Minor effects on cognitive functioning (especially decreased lexical fluency) Tolerance may develop over time

## Neuropsychiatric Disorders

- see *Tourette's Syndrome, Obsessive Compulsive Disorder and Depression* sections in [Neurology](#), N28 and [Psychiatry](#), PS16, PS10

**Table 19. Surgical Targets for Neuropsychiatric Disorders**

Disorder	Indications	Procedures	Outcomes	Morbidity
<b>Obsessive Compulsive Disorder (OCD)</b>	Severe symptoms refractory to medical management	Anterior capsulotomy/stimulation of the anterior limb of the internal capsule (IC)	Currently under investigation Reportedly 25-75% response rate	Intracerebral hemorrhages (1%-2%) Mild effects on cognitive functioning Anxiety ± panic disorder (case report)
<b>Tourette's Syndrome</b>	Severe symptoms refractory to medical management	Stimulation of midline intralaminar nuclei of the thalamus Stimulation of motor and limbic portions of GPI Stimulation of the anterior limb of the IC	Currently under investigation Reportedly >70% reduction in vocal or motor tics + urge	Intracerebral hemorrhages (1%-2%) Mild sexual dysfunction
<b>Major Depressive Disorder (MDD)</b>	Severe depression refractory to medical management and ECT	Stimulation of the subgenual cingulate cortex	Currently under investigation Reportedly 60% response rate; 35% remission rate	Intracerebral hemorrhages (1%-2%) Pain, headache Worsening mood, irritability

## Chronic Pain

**Table 20. Surgical Targets for Chronic Pain**

Disorder	Indications	Procedures	Outcomes	Morbidity
<b>Neuropathic Pain</b>	Severe, intractable, organic neuropathic pain (e.g. post-stroke pain, phantom limb pain, trigeminal neuralgia, chronic low-back pain, complex regional pain syndrome)	Preferred target: stimulation of the contralateral VPL VPM thalamic nuclei $\pm$ periventricular/periaqueductal grey matter (PVG/PAG) Other targets: stimulation of the contralateral IC Stimulation of the contralateral motor cortex	47% improvement in perception of pain intensity Less favourable results in central pain syndromes and poorly localized pain	Intracerebral hemorrhages (1%-2%) Paraesthesia Anxiety $\pm$ panic disorder
<b>Nociceptive Pain</b>	Severe, intractable, organic nociceptive pain	Bilateral (most common) stimulation of the PVG/PAG	Reportedly 63% improvement in perception of pain intensity	Intracerebral hemorrhages (1%-2%) Paraesthesia Anxiety $\pm$ panic disorder

## Surgical Management of Epilepsy

- see [Neurology](#), N16 for the medical treatment of epilepsy

### Indications

- medically refractory seizures, usually defined as seizures resistant to two first line anti-seizure medications used in succession
- identification of a distinct epileptogenic region through clinical history, EEG, MRI, and neuropsychological testing. Other localizing investigations include magnetoencephalography, SPECT, and PET
- if a distinct epileptogenic region cannot be identified, the patient may be a candidate for a palliative procedure such as corpus callosotomy

### Procedure

- adults: resection of the hippocampus and parahippocampal gyrus for mesial temporal lobe epilepsy arising from mesial temporal sclerosis
- children: resection of an epileptogenic space-occupying lesion
- hemispherectomy and corpus callosotomy are less common

### Outcomes

- 41-79% of adult patients are seizure free for 5 yr after temporal lobe resection
- 58-78% of children are seizure free after surgery
- surgery is associated with improvements in preexisting psychiatric conditions such as depression and anxiety, as well as improvement in quality of life measures

### Morbidity

- 0.4-4% of surgical patients will have partial hemianopsia, aphasia, motor deficit, sensory deficit, or cranial nerve palsy following anteromedial temporal lobectomies
- most patients will have some decline in verbal memory following dominant temporal lobectomy and in visuospatial memory in non-dominant temporal resection
- the degree of memory decline stabilizes after 1-2 yr

### Predictors

- positive predictive factors for seizure freedom following anteromedial temporal lobectomy
  - hippocampal sclerosis (unilateral)
  - focal localization of interictal epileptiform discharges
  - absence of preoperative generalized seizures
  - tumoural cause
  - complete resection of the lesion

#### A Randomized, Controlled Trial of Surgery for Temporal Lobe Epilepsy

*NEJM* 2001;345:311-318

**Introduction:** This RCT evaluates the efficacy and safety of neurosurgery for temporal lobe epilepsy.

**Methods:** 80 patients with poorly controlled temporal lobe epilepsy were randomized for surgery (n=40) or for continued treatment with antiepileptic drugs (n=40). The primary outcome was freedom from seizures that impair awareness of self and surroundings during the period of 1 yr. Secondary outcomes included frequency and severity of seizures, quality of life, disability and death.

**Results:** The surgical group had higher cumulative proportion of patients without seizures impairing awareness compared to the medical group (p<0.01). The surgical group also had lower seizure frequency (p<0.001) and better quality of life (p<0.001). 4 patients in the surgical group had adverse effects (thalamic infarct, n = 1; wound infection, n = 1; verbal memory decline impairment occupation, n = 2). One patient in the medical group died; no patients died in the surgical group.

**Conclusions:** In patients with poorly controlled temporal-lobe epilepsy, surgery is superior to prolonged medical therapy.

## Surgical Management for Trigeminal Neuralgia

- reserved for cases refractory to medical management; see [Neurology](#), N36 for medical management

### Surgical Options

- trigeminal nerve branch procedures
  - local blocks (phenol, alcohol)
  - neurectomy of the trigeminal branch
- nerve branches
  - V<sub>1</sub> block at the supraorbital, supratrochlear nerves
  - V<sub>2</sub> block at the foramen rotundum or infraorbital nerves
  - V<sub>3</sub> block at the foramen ovale
- percutaneous trigeminal rhizotomy
  - glycerol injection
  - mechanotrauma via catheter balloon
- radiofrequency thermocoagulation
- Gamma Knife® radiosurgery
- microvascular decompression
  - posterior fossa craniotomy with microsurgical exploration of the root entry zone, displacement of the vessel impinging on the nerve with placement of non-absorbable Teflon® felt

## Common Medications

Table 21. Common Medications

Drug Name	Dosing Schedule	Indications	Side Effects	Common Interactions	Contraindications	Comments
<b>lorazepam</b> (Ativan®)	4 mg IV over 2 min, q10-15min (do not exceed 8 mg/12h)	Status epilepticus	Drowsiness, sedation	Other CNS depressants, digoxin (increases digoxin levels)		Start phenytoin loading simultaneously
<b>carbamazepine</b> (Tegretol®)	Trigeminal neuralgia (tic douloureux): 100 mg PO bid, increase by 200 mg/d up to a maximum of 1200 mg/d Seizures: 200 mg PO bid, increase by 200 mg (inpatient: q3d; outpatient: q7d) until therapeutic level achieved (usual optimum dosage: 800-1200 mg/d; range: 600-2000 mg/d)	Trigeminal neuralgia Seizures	Worsening of seizures, heart failure, arrhythmias, AV block, aplastic anemia, agranulocytosis, thrombocytopenia, hepatitis, erythema multiforme, Stevens-Johnson syndrome	Lithium (increases lithium toxicity), MAOI Other meds may increase carbamazepine levels or have decreased effects	Hypersensitivity to TCAs, previous bone marrow suppression, MAOI in past 14 d	Monitor CBC (potential hematological toxicity)
<b>phenytoin</b> (Dilantin®)	Seizures: Loading dose: 18 mg/kg slow IV or 300-600 mg PO/d divided bid/tid Maintenance: 200-500 mg IV/d (max rate: <40-50 mg/min or 300 mg PO q4h); average maintenance dose: 300 mg/d PO Status epilepticus: 200 mg IV over 30 min (~20 mg/kg; if not taking regularly), or 500 mg IV over 10 min (if already on phenytoin)	Seizures Status epilepticus	Thrombocytopenia, leukopenia, heart failure, agranulocytosis, pancytopenia, toxic hepatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis	Other meds may increase phenytoin levels and toxicity or have decreased effects	Bradycardias, heart block	Important to give over time to prevent causing a cardiac arrest
<b>dexamethasone</b> (Decadron®)	Loading dose: 10-20 mg IV Maintenance: 4-6 mg IV/d divided qid (may be PO)	Cerebral edema (e.g. secondary to tumour, head injury, pseudotumour cerebri) Preoperative preparation for patients with increased ICP secondary to brain neoplasms	Pseudotumour cerebri, seizures, leukopenia, heart failure, arrhythmias, thromboembolism, pancreatitis, acute adrenal insufficiency; avoid abrupt withdrawal	Aminoglutethimide, antidiabetics, ASA, NSAIDs, barbiturates, phenytoin, rifampin, cardiac glycosides, cyclosporine, ephedrine, oral anticoagulants, potassium-depleting drugs, salicylates, skin-testing antigens, toxoids, vaccines	Systemic fungal infections, immunosuppressive dose with live virus vaccines	No longer used in acute spinal cord injury

**Table 21. Common Medications** (continued)

Drug Name	Dosing Schedule	Indications	Side Effects	Common Interactions	Contraindications	Comments
<b>mannitol</b>	1-1.5 g/kg IV rapid infusion (350 mL of 20% solution) followed by 0.25 g/kg IV q6h	Raised ICP	Seizures, heart failure	Lithium (increases excretion of lithium)	Anuria, severe pulmonary congestion, frank pulmonary edema, severe heart failure, severe dehydration, metabolic edema, progressive renal disease or dysfunction, active intracranial bleeding except during craniotomy	Effect occurs in 1-5 min, maximal at 20-60 min Often alternated with furosemide 10-20 mg IV q6h Indwelling urinary catheter to measure ins and outs
<b>nimodipine (Nimotop®)</b>	60 mg PO/NG q4h x 21 d started within 96 h of SAH	Vasospasm in SAH	Decreased blood pressure, tachycardia, dyspnea	Antihypertensives (may increase hypotensive effects), CCB (may increase effects), cimetidine (increases nimodipine bioavailability)	None known	Causes vasodilation Only calcium channel blocker that crosses blood brain barrier Use half the normal dose for liver failure; monitor BP always

## Basic Anatomy Review

Figure 1. Placental blood flow

### Placenta

- site of fetal nutritive, respiratory, and excretory function
- discoid mass composed of fetal (chorion frondosum) and maternal (decidua basalis) tissues divided by fissures into cotyledons (lobules) on the uterine side
- produces hormones such as progesterone, placental lactogen, estrogen, relaxin,  $\beta$ -hCG and IGFs
- poor implantation can lead to spontaneous abortion
- abnormal location, implantation, or detachment can lead to antepartum hemorrhage (see *Antepartum Hemorrhage*, OB25)

## Pregnancy

### Diagnosis of Pregnancy

#### History

- obstetrical and gynecological history
- obtain the year, location, mode of delivery, duration of labour, sex, gestational age, birth weight and complications of every pregnancy; organize into **GTPAL** format:
  - **G** (Gravidity)
    - ♦ **G**: total number of pregnancies of any gestation
    - ♦ includes current pregnancy, abortions, ectopic pregnancies, and hydatidiform moles (multiple gestation = one pregnancy)
  - **P** (Parity) (TPAL)
    - ♦ **T**: number of term infants delivered (>37 wk)
    - ♦ **P**: number of premature infants delivered (20-36+6 wk)
    - ♦ **A**: number of abortions (loss of intrauterine pregnancy prior to viability of fetus <20 wk and/or <500 g fetal weight)
      - induced (therapeutic) and spontaneous (miscarriage)
    - ♦ **L**: number of living children
- symptoms: amenorrhea, nausea and/or vomiting, breast tenderness, urinary frequency, fatigue

#### Physical Signs

- Goodell's sign: softening of the cervix (4-6 wk)
- Chadwick's sign: bluish discolouration of the cervix and vagina due to pelvic vasculature engorgement (6 wk)
- Hegar's sign: softening of the cervical isthmus (6-8 wk)
- uterine enlargement
- breast engorgement

## Acronyms

AC	abdominal circumference
ACOG	American Congress of Obstetricians and Gynecologists
AFI	amniotic fluid index
AFLP	acute fatty liver of pregnancy
AFV	amniotic fluid volume
ALPHA	antenatal psychosocial health assessment
AP	anteroposterior
APS	antiphospholipid antibody syndrome
BPP	biophysical profile
C/S	Cesarean section
CPD	cephalopelvic disproportion
CTG	cardiotocography
CVS	chorionic villus sampling
D&C	dilatation and curettage
DIC	disseminated intravascular coagulation
DVT	deep vein thrombosis
ECV	external cephalic version
EDC	estimated date of confinement
EFM	electronic fetal monitoring
EFW	estimated fetal weight
FDP	fibrin degradation products
FHR	fetal heart rate
FL	femur length
FM	fetal movement
FPG	fasting plasma glucose
FTS	first trimester screen
GA	gestational age
GBS	Group B <i>Streptococcus</i>
GDM	gestational diabetes mellitus
HC	head circumference
HELLP	hemolysis, elevated liver enzymes, low platelets
IGF	infant growth factors
IMM	intramymetrial
IOL	induction of labour
IPS	integrated prenatal screen
IUFD	intrauterine fetal death
IUGR	intrauterine growth restriction
IVH	intraventricular hemorrhage
LLDP	left lateral decubitus position
LMP	last menstrual period
MSAFP	maternal serum $\alpha$ -fetoprotein
MSS	maternal serum screen
MTX	methotrexate
NST	non-stress test
NTDs	neural tube defects
NTUS	nuchal translucency ultrasound
OA	occiput anterior
OGCT	oral glucose challenge test
oNTD	open neural tube defect
OP	occiput posterior
OT	occiput transverse
PAPP-a	pregnancy-associated plasma protein a
PG	plasma glucose
PPD	postpartum depression
PPH	postpartum hemorrhage
PPROM	preterm premature rupture of membranes
PROM	premature rupture of membranes
PTL	preterm labour
RDS	respiratory distress syndrome
ROM	rupture of membranes
SFH	symphysis fundal height
SOCG	Society of Obstetricians and Gynaecologists of Canada
SVD	spontaneous vaginal delivery
TENS	transcutaneous electrical neuro stimulation
TPN	total parental nutrition
UTI	urinary tract infection
VBAC	vaginal birth after Cesarean

#### Umbilical Vessels

Always check the umbilical cord for 2 arteries and 1 vein: approximately 1/3 of babies with a single uterine artery will have another anomaly.

## Investigations

- **β-hCG:** peptide hormone composed of α and β subunits produced by placental trophoblastic cells – maintains the corpus luteum during pregnancy
  - positive in serum 9 d post-conception, positive in urine 28 d after first day of LMP
  - plasma levels double every 1-2 d, peak at 8-10 wk, then fall to a plateau until delivery
    - ♦ levels less than expected by dates suggest: ectopic pregnancy, abortion, or inaccurate dates
    - ♦ levels higher than expected suggest: multiple gestation, molar pregnancy, trisomy 21, or inaccurate dates
- **U/S**
  - transvaginal
    - ♦ 5 wk: gestational sac visible ( $\beta$ -hCG  $\geq 1,200$ -1,500 mIU/mL)
    - ♦ 6 wk: fetal pole seen
    - ♦ 7-8 wk: fetal heart tones visible
  - transabdominal
    - ♦ 6-8 wk: intrauterine pregnancy visible ( $\beta$ -hCG  $\geq 6,500$  mIU/mL)

### β-hCG Rule of 10s

10 IU at time of missed menses  
100,000 IU at 10 wk (peak)  
10,000 IU at term

### Trimesters

- T1 (first trimester): 0-12 wk
- T2 (second trimester): 12-28 wk
- T3 (third trimester): 28-40 wk
- Normal pregnancy term: 37-42 wk

## Maternal Physiology

**Table 1. Physiologic Changes During Pregnancy**

<b>Skin</b>	Increased pigmentation of perineum and areola, chloasma (pigmentation changes under eyes and on bridge of nose), linea nigra (midline abdominal pigmentation) Other: spider angiomas, palmar erythema due to increased estrogen, striae gravidarum due to connective tissue changes
<b>Cardiovascular</b>	Hyperdynamic circulation Increased CO, HR and blood volume Decreased BP due to decreased PVR Enlarging uterus compresses IVC and pelvic veins Decreased venous return leads to risk of hypotension Increased venous pressure leads to risk of varicose veins, hemorrhoids, leg edema
<b>Hematologic</b>	Hemodilution causes physiologic anemia and apparent decrease in hemoglobin and hematocrit Increased leukocyte count but impaired function leads to improvement in autoimmune diseases Gestational thrombocytopenia: mild (platelets $> 70,000/\mu\text{L}$ ) and asymptomatic, normalizes within 2-12 wk following delivery Hypercoagulable state: increased risk of DVT and PE but also decreased bleeding at delivery
<b>Respiratory</b>	Increased incidence of nasal congestion and epistaxis Increased $\text{O}_2$ consumption to meet increased metabolic requirements Elevated diaphragm i.e. patient appears more "barrel-chested" Increased minute ventilation leads to decreased $\text{CO}_2$ resulting in mild respiratory alkalosis that helps $\text{CO}_2$ diffuse across the placenta from fetal to maternal circulation No change in VC and $\text{FEV}_1$ Decreased TLC, FRC, and RV
<b>Gastrointestinal</b>	GERD due to increased intra-abdominal pressure and progesterone (causing decreased sphincter tone and delayed gastric emptying) Increased gallstones due to progesterone causing increased gallbladder stasis Constipation and hemorrhoids due to progesterone causing decreased GI motility
<b>Genitourinary</b>	Increased urinary frequency due to increased total urinary output Increased incidence of UTI and pyelonephritis due to urinary stasis (see <i>Urinary Tract Infection</i> , OB20) Glycosuria that can be physiologic especially in the 3rd trimester; must test for GDM Ureters and renal pelvis dilation ( $R > L$ ) due to progesterone-induced smooth muscle relaxation and uterine enlargement Increased CO and thus increased GFR leads to decreased creatinine (normal in pregnancy 35-44 mmol/L), uric acid, and BUN
<b>Neurologic</b>	Increased incidence of carpal tunnel syndrome and Bell's palsy
<b>Endocrine</b>	Thyroid: moderate enlargement and increased basal metabolic rate Increased total thyroxine and thyroxine binding globulin (TBG) Free thyroxine index and TSH levels are normal Adrenal: maternal cortisol rises throughout pregnancy (total and free) Calcium: decreased total maternal $\text{Ca}^{2+}$ due to decreased albumin Free ionized $\text{Ca}^{2+}$ (i.e. active) proportion remains the same due to parathyroid hormone (PTH), results in increased bone resorption and gut absorption, increased bone turnover (but no loss of bone density due to estrogen inhibition)

## Prenatal Care

- provided by obstetrician, family doctor, midwife, or multidisciplinary team (based on patient preference and risk factors)
- Antenatal Records (province specific)

### Family doctors and midwives to consider OB consultation if:

- Insulin-dependent GDM
  - VBAC
  - HTN
  - Multiple gestation
  - Malpresentation
  - Active antepartum hemorrhage
  - PTL/PPROM
  - Failure to progress/descend
  - Induction/augmentation if high risk
  - Tears: 3rd or 4th degree
  - Retained placenta
- Note: Guidelines vary by institution.

Advise all women capable of becoming pregnant to supplement their diet with 0.4 mg/d of folic acid (CTFPHC Grade II-2-A Evidence).

Sometimes GP is used to describe gravida and parity. In this case, parity is used to describe number of term and premature infants delivered.

In history of previous pregnancies, **ALWAYS** ask:  
GTPAL  
Year  
Sex  
Weight  
Gestational age (GA)  
Mode of delivery  
Length of labour  
Complications

Ask every woman about abuse – not just those whose situations raise suspicion of abuse AND ask as early as possible in pregnancy.

ALPHA form <http://www.ecmaj.ca/content/159/6/677.full.pdf>

Tests for HIV, prenatal and genetic screening are voluntary and require proper counselling and informed consent before proceeding.

## Preconception Counselling

- 3-8 wk GA is a critical period of organogenesis, so early preparation is vital
- past medical history:** optimize medical illnesses and necessary medications prior to pregnancy (see *Medical Conditions in Pregnancy*, OB13, and *Medications in Pregnancy*, OB10)
- supplementation**
  - folic acid: encourage diet rich in folic acid and supplement 8-12 wk preconception until end of T1 to prevent NTDs
    - 0.4-1 mg daily in all women, 5 mg if previous NTD, anti-epileptic medications, diabetes mellitus or BMI >35 kg/m<sup>2</sup>
  - iron supplementation, prenatal vitamins
- risk modification**
  - lifestyle: balanced nutrition and physical fitness
  - medications: patients with chronic diseases should discuss whether their medications may be teratogenic prior to conception so they may be adjusted. It is not advised to stop medications abruptly when becoming pregnant
  - infection screening: rubella, HBsAg, VDRL, Pap smear, gonorrhea/chlamydia, HIV
  - genetic testing as appropriate for high risk groups (see *Prenatal Screening* section, Table 2, OB5); consider genetics referral in known carriers, recurrent pregnancy loss/stillbirth, family members with developmental delay or birth anomalies
  - social: alcohol, smoking, drug use, domestic violence
    - use ALPHA form to screen for antenatal risk factors associated with poor postpartum family outcomes (woman abuse, child abuse, postpartum depression, marital dysfunction and increased physical illness)

## Initial Prenatal Visit

- usually within 12 wk of the first day of LMP or earlier if <20 or >35 yr old or other risk factors are present
- Antenatal Records are filled out on the first prenatal visit

### History

- gestational age by dates from the first day of the LMP
- if LMP unreliable, get a dating ultrasound (see below)
- EDC using Naegle's Rule:
  - 1st day of LMP + 7 d – 3 mo
  - e.g. LMP = 1 Apr 2013, EDC = 8 Jan 2014 (modify if cycle >28 d by adding number of d >28)
- history of present pregnancy (e.g. bleeding, nausea, vomiting)
- history of all previous pregnancies
- past medical history, past gynecological history
- prescription and non-prescription medications
- family history: genetic disease, birth defects, multiple gestation
- social history: smoking, alcohol, drug use, domestic violence (use ALPHA form), consanguinity

### Physical Examination

- complete exam to obtain baseline patient information
- BP and weight important for interpreting subsequent changes
- pelvic exam

### Investigations

- bloodwork
  - CBC, blood group and type, Rh antibodies, infection screening as per preconception counselling
- urine R&M, C&S
  - screen for bacteriuria and proteinuria
- pelvic exam
  - Pap smear (unless done within last 6-12 mo), cervical culture for *N. gonorrhoeae* (GC) and *C. trachomatis*, vaginal swab for bacterial vaginosis (BV)

## Subsequent Prenatal Visits

### Timing

- for uncomplicated pregnancies, q4-6wk until 28 wk, q2wk from 28 to 36 wk and weekly from 36 wk until delivery

### Assess at Every Visit

- record estimated GA
- history of present pregnancy: fetal movements, uterine bleeding, leaking, cramping
- physical exam: BP, weight gain, SFH, Leopold's maneuvers (T3) for lie, position and presentation of fetus
- investigations: urinalysis for glucosuria, ketones, proteinuria; fetal heart rate starting at 12 wk using Doppler U/S

### Leopold's Maneuvers

- performed after 30-32 wk gestation
- first maneuver: to determine which fetal part is lying furthest away from the pelvic inlet
- second maneuver: to determine the location of the fetal back
- third maneuver: to determine which fetal part is lying above the pelvic inlet
- fourth maneuver: to locate the fetal brow

Figure 2. Leopold's maneuvers (T3)

Reprinted with permission from Essentials of Clinical Examination Handbook, 6th ed. Lincoln, McSheffrey, Tran, Wong

### Symphysis Fundal Height (SFH)

- 12 wk: Uterine fundus at pubic symphysis
- 20 wk: Fundus at umbilicus, SFH should be within 2 cm of GA between 20-36 wk
- 37 wk: Fundus at sternum

### Small for Dates

- Date miscalculation
- IUGR
- Fetal demise
- Oligohydramnios

### Large for Dates

- Date miscalculation
- Multiple gestation
- Polyhydramnios
- LGA (familial, diabetes)

## Prenatal Screening and Diagnostic Tests

### SCREENING TESTS

- testing should only occur following counselling and with the informed consent from the patient

Table 2. High-Risk Population Screening Tests

Disease [Inheritance]	Population(s) at Risk	Screening Test(s)
<b>Thalassemia [AR]</b>	<b>Mediterranean, South East Asian, Western Pacific, African, Middle Eastern, Caribbean, South American</b>	CBC (MCV and MCH), Hb electrophoresis or HPLC
<b>Sickle Cell [AR]</b>	<b>African, Caribbean, Mediterranean, Middle Eastern, Indian, South American</b>	CBC (MCV and MCH), Hb electrophoresis or HPLC
<b>Cystic Fibrosis (CF) [AR]</b>	Mediterranean, Finnish, Caucasian, or FHx	CFTR gene DNA analysis
<b>Tay Sachs Disease [AR]</b>	Ashkenazi Jewish*, French Canadians, Cajun	Enzyme assay HEXA, or DNA analysis HEXA gene
<b>Fragile X Syndrome [X-linked]</b>	Family history – confirmed or suspected	DNA analysis: FMR-1 gene

AR = autosomal recessive; HPLC = high performance liquid chromatography; HEXA = hexosaminidase A

\*If both partners are Ashkenazi Jewish, test for Canavan disease and Familial Dysautonomia (FD); if family history of a specific condition, look for carrier status: e.g. Gaucher, CF, Bloom syndrome, Niemann-Pick disease, etc. In all cases, if both partners positive, refer for genetic counselling

**Table 3. Gestation-Dependent Screening Investigations**

Gestational Age (wk)	Investigations	Details
8-12	Dating U/S, initial Pap smear, chlamydia/gonorrhea cultures	
10-12	CVS	
11-14	FTS IPS Part 1	Measures 1. Nuchal translucency on U/S 2. $\beta$ -hCG 3. PAPP-A
11-14	Nuchal translucency U/S	
15-16 to term	Amniocentesis	
15-20	IPS Part 2	Measures 1. MSAFP 2. $\beta$ -hCG 3. Unconjugated estrogen (estriol or $\mu$ E3) 4. Inhibin A
15-20	Maternal serum screen (MSS) (or MSAFP only for patients who did FTS earlier)	Measures 1. MSAFP 2. $\beta$ -hCG 3. Unconjugated estrogen (estriol or $\mu$ E3)
18-20 to term	Fetal movements (quickening)	
18-20	U/S for dates, fetal growth and anatomy assessment	
24-28	50 g OGCT	
28	Repeat CBC RhIG for all Rh negative women	
35-37	GBS screen	
6 wk postpartum	Discuss contraception, menses, breastfeeding, depression, mental health, support Physical exam: breast exam, pelvic exam including Pap smear (only if due as per provincial screening)	

Maternal serum screen is also referred to as Triple Screen. If Inhibin A is also tested, it is referred to as Quadruple Screen

Ideally testing for MSS and IPS Part 2 occur between 15-18 wk to give women more time to make decisions and move ahead with diagnostic testing should the result screen be positive

**Routine T2 U/S at 18-22 wk, helps determine:**

- Number of fetuses
- GA (if no prior U/S)
- Location of placenta
- Fetal anomalies

## ULTRASOUND SCREENING

- dating ultrasound best done between 8-12 wk GA (most accurate form of pregnancy dating)
  - measurement of crown-rump length (margin of error  $\pm$  5 d)
  - change EDC to U/S date if  $>1$  wk discrepancy from EDC based on LMP
- NTUS at 11-14 wk GA
  - measures the amount of fluid behind the neck of the fetus
  - early screen for Trisomy 21 (may also detect cardiac and other aneuploidies like Turner's syndrome)
  - NT measurement is necessary for the FTS and IPS Part 1
- fetal growth and anatomy ultrasound routinely done at 18-20 wk GA (margin of error  $\pm$  7 d) (see [Pediatrics](#), P41 for congenital anomalies)
- earlier or subsequent ultrasounds performed when medically indicated

**Table 4. Comparison of FTS, MSS and IPS**

First Trimester Screen (FTS)	Maternal Serum Screen (MSS)	Integrated Prenatal Screen (IPS)
11-14 wk	15-20 wk	Nuchal translucency on 12 wk U/S FTS at 11-14 wk MSS + inhibin A at 15-20 wk
Risk estimate for 1. Down syndrome (Trisomy 21): increased NT, increased $\beta$ -hCG, decreased PAPP-A  Note: does not measure risk of open neural tube defect (oNTD) and should be combined with MSAFP at 16 wk Useful where patient wants results within the first trimester More accurate estimate of Down syndrome risk than MSS, sensitivity $\sim$ 85% (when combined with age) 5% false positive rate Patients with positive screen should be offered CVS or amniocentesis	Risk estimate for 1. oNTD: increased MSAFP (sensitivity 80-90%) 2. Trisomy 21: decreased MSAFP, increased $\beta$ -hCG, decreased $\mu$ E3 (sensitivity 65%) 3. Trisomy 18: decreased MSAFP, decreased $\beta$ -hCG, decreased $\mu$ E3 (sensitivity 80%) Only offered alone if patient missed the time window for IPS or FTS 8% baseline false positive rate for Trisomy 21, lower for oNTD and Trisomy 18 Patients with positive screen should be offered U/S or amniocentesis	Risk estimate for oNTD, Trisomy 21, Trisomy 18 Sensitivity $\sim$ 85-90% 2% false positive rate Patients with positive screen should be offered U/S and/or amniocentesis

Note: In twins, FTS, MSS and IPS are not applicable; screen with NT for chromosomal abnormalities and MSAFP for oNTDs

## DIAGNOSTIC TESTS

### Indications

- maternal age  $>35$  (increased risk of chromosomal anomalies)
- risk factors in current pregnancy:
  - abnormal U/S
  - abnormal prenatal screen (IPS, FTS, or MSS)
- past history/family history of:
  - previous pregnancy with chromosomal anomaly or genetic disease
  - either parent a known carrier of a genetic disorder or balanced translocation
  - family history of chromosomal anomaly, genetic disorder, birth defect, or undiagnosed mental retardation
  - consanguinity
  - three or more spontaneous abortions

### AMNIOCENTESIS

- U/S-guided transabdominal extraction of amniotic fluid

### Indications

- identification of genetic anomalies (15-16 wk gestation) as per indications above
- assessment of fetal lung maturity (T3) via the L/S ratio (lecithin:sphingomyelin)
  - if  $>2:1$ , RDS is less likely to occur

### Advantages

- also screens for oNTD (acetylcholinesterase and amniotic AFP) – 96% accurate
- in women  $>35$  yr, the risk of chromosomal anomaly (1/180) is greater than the risk of miscarriage from the procedure
- more accurate genetic testing than CVS

### Disadvantages

- 1/400 – 1/500 risk of spontaneous abortion
- results take 14-28 d; FISH can be done on chromosomes X, Y, 21, 13, 18 to give preliminary results in 48 h

### CHORIONIC VILLUS SAMPLING

- biopsy of fetal-derived chorion using a trans-abdominal needle or trans-cervical catheter at 10-12 wk

### Advantages

- enables pregnancy to be terminated earlier than with amniocentesis
- rapid karyotyping and biochemical assay within 48 h, including FISH analysis
- high sensitivity and specificity

### Disadvantages

- 1-2% risk of spontaneous abortion
- does not screen for oNTD
- 1-2% incidence of genetic mosaicism “false negative” results

### ISOIMMUNIZATION SCREENING

#### Definition

- isoimmunization: antibodies (Ab) produced against a specific RBC antigen (Ag) as a result of antigenic stimulation with RBC of another individual

#### Etiology

- maternal-fetal circulation normally separated by placental barrier, but sensitization can occur and can affect the current pregnancy, or more commonly, future pregnancies
- in pregnancy, anti-Rh Ab produced by a sensitized Rh-negative mother can lead to fetal hemolytic anemia
- overall risk of isoimmunization of an Rh-negative mother with an Rh-positive ABO-compatible infant is 16%
- sensitization routes
  - incompatible blood transfusions
  - previous fetal-maternal transplacental hemorrhage (e.g. ectopic pregnancy)
  - invasive procedures in pregnancy (e.g. prenatal diagnosis, cerclage, D&C)
  - any type of abortion
  - labour and delivery

#### DDx of Increased MSAFP

- Incorrect GA
- $>1$  fetus (e.g. twins)
- Fetal demise
- oNTD
- Abdominal wall defects (e.g. omphalocele)

#### DDx of Decreased MSAFP

- Incorrect GA
- Gestational trophoblastic neoplasia
- Missed abortion
- Chromosomal anomalies
- Maternal diabetes

Compared to CVS, amniocentesis has a higher accuracy of prenatal cytogenetic diagnosis (99.8% vs. 97.5%) and lower risk of spontaneous abortion (0.5% vs. 1-2%).

#### Risk Factors for Neural Tube Defects

##### GRIMM

**Genetics:** family history of NTD (risk of having second child with NTD is increased to 2-5%), consanguinity, chromosomal (characteristic of trisomy 13, 18, and 21)

**Race:** European Caucasians  $>$  African Americans, 3-fold higher in Hispanics

**Insufficient vitamins:** zinc and folate

**Maternal chronic disease** (e.g. diabetes)

**Maternal use of anti-epileptic drugs**

General population risk for NTD is 0.1%.

## Investigations

- routine screening with indirect Coombs test at first visit for blood group, Rh status, and antibodies
- Kleihauer-Betke test used to determine extent of fetomaternal hemorrhage by estimating volume of fetal blood volume that entered maternal circulation.
- detailed U/S for hydrops fetalis

## Prophylaxis

- exogenous Rh IgG (Rhogam® or WinRho®) binds to Rh antigens of fetal cells and prevents them from contacting maternal immune system
- Rhogam® (300 µg) given to all Rh negative and antibody screen negative women in the following scenarios:
  - routinely at 28 wk GA (provides protection for ~12 wk)
  - within 72 h of the birth of an Rh positive fetus
  - with a positive Kleihauer-Betke test
  - with any invasive procedure in pregnancy (CVS, amniocentesis)
  - in ectopic pregnancy
  - with miscarriage or therapeutic abortion (only 50 µg required)
  - with an antepartum hemorrhage
- if Rh negative and Ab screen positive, follow mother with serial monthly Ab titres throughout pregnancy ± serial amniocentesis as needed (Rhogam® has no benefit)

## Investigations

- MCA dopplers are done to assess degree of fetal anemia or if not available bilirubin is measured by serial amniocentesis to assess the severity of hemolysis
- cordocentesis for fetal Hb should be used cautiously (not first line)

## Treatment

- falling biliary pigment warrants no intervention (usually indicative of either unaffected or mildly affected fetus)
- intrauterine transfusion of O-negative pRBCs may be required for severely affected fetus or early delivery of the fetus for exchange transfusion

## Complications

- anti-Rh IgG can cross the placenta and cause fetal RBC hemolysis resulting in fetal anemia, CHF, edema, ascites
- severe cases can lead to fetal hydrops (edema in at least two fetal compartments due to fetal heart failure secondary to anemia) or erythroblastosis fetalis (moderate to severe immune-mediated hemolytic anemia)

## GROUP B *STREPTOCOCCUS* SCREEN

### Epidemiology

- 15-40% vaginal carrier rate

### Risk Factors (for neonatal disease)

- GBS bacteriuria during current pregnancy even if treated
- previous infant with invasive GBS infection
- preterm labour <37 wk
- ruptured membranes >18 h before delivery
- intrapartum maternal temperature ≥38°C
- positive GBS screen during current pregnancy

### Clinical Features

- not harmful to mother
- risk of vertical transmission (neonatal sepsis, meningitis or pneumonia, and death)

### Investigations

- offer screening to all women at 35-37 wk with vaginal and anorectal swabs for C&S

### Treatment

- treatment of maternal GBS at delivery decreases neonatal morbidity and mortality
- indications for antibiotic prophylaxis: positive GBS screen or GBS status unknown and one of the risk factors (see above)
- antibiotics for GBS prophylaxis
  - penicillin G 5 million units IV then 2.5 million units IV q4h until delivery
  - penicillin allergic but not at risk for anaphylaxis: cefazolin 2 g IV then 1 g q8h
  - penicillin allergic and at risk for anaphylaxis: clindamycin 900 mg IV q8h or erythromycin 500 mg IV q6h
- if fever, broad spectrum antibiotic coverage is advised

#### Rh Antibody Titre

A positive titre (≥1:16) indicates an increased risk of fetal hemolytic anemia.

Standard dose of 300 µg of Rhogam sufficient for 30 mL of fetal blood. Give additional 10 µg of Rhogam for every mL of fetal blood over 30 mL.

#### Indications for Intrapartum Antibiotic GBS Prophylaxis

Centers for Disease Control and Prevention. Prevention of Perinatal Group B Streptococcal Disease. *MMWR* 2010;59(RR-10):14

- Previous infant with invasive GBS disease
- GBS bacteriuria during any trimester of the current pregnancy
- Positive GBS vaginal-rectal screening culture in late gestation during current pregnancy
- Unknown GBS status at the onset of labour (culture not done, incomplete, or results unknown) and any of the following:
  - Delivery at <37 wk gestation
  - Amniotic membrane rupture ≥18 h
  - Intrapartum temperature ≥100.4°F (≥38.0°C)
- Intrapartum nucleic-acid amplification test positive for GBS

# Counselling of the Pregnant Woman

## Nutrition

- Canada's Food Guide to Healthy Eating suggests:
  - 3-4 servings of milk products daily (greater if multiple gestation)
  - a daily caloric increase of ~100 cal/d in the 1st trimester, ~300 cal/d in the second and third trimesters and ~450 cal/d during lactation
  - daily multivitamin should be continued in the 2nd trimester for women who do not consume an adequate diet; otherwise routine vitamin supplementation is not necessary (avoid excess vitamin A)
- nutrients important during pregnancy
  - folate: 0.4 mg/d for first 12 wk (5 mg/d if high risk)
    - ♦ supports maternal increase in blood volume, growth of maternal and fetal tissue, decreases incidence of neural tube defects
    - ♦ foods rich in folic acid include: spinach, lentils, chick peas, asparagus, broccoli, peas, Brussels sprouts, corn and oranges
  - calcium: 1200-1500 mg/d
    - ♦ maintains integrity of maternal bones, skeletal development of fetus, breast milk production
  - vitamin D: 1000 IU
    - ♦ promotes calcium absorption
  - iron: 0.8 mg/d in T1, 4-5 mg/d in T2 and >6 mg/d in T3
    - ♦ supports maternal increase in blood cell mass, supports fetal and placental tissue
    - ♦ required amounts exceed normal body stores and typical intake, and therefore need supplemental iron
    - ♦ iron is the only known nutrient for which requirements during pregnancy cannot be met by diet alone (see *Iron Deficiency Anemia*, OB13)
  - essential fatty acids – supports fetal neural and visual development
    - ♦ contained in vegetable oils, margarines, peanuts, fatty fish

### Caffeine

- diuretic and stimulant that readily crosses placenta
- less than 200 mg per day is not thought to contribute to miscarriage or preterm birth (ACOG)
  - relationship between caffeine and IUGR is unknown (ACOG)
  - SOCG states 1-2 cups/d are safe during pregnancy

### Herbal Teas and Preparations

- not enough scientific information about safety of various herbs and herbal products to recommend their use during pregnancy
- some herbal teas can have toxic or pharmacological effects on the mother or fetus
- chamomiles have been reported to exhibit adverse effects on the uterus

### Food Borne Illnesses

- microbiological contamination of food may occur through cross-contamination and/or improper food handling
  - listeriosis (*Listeria monocytogenes*) and toxoplasmosis (*Toxoplasma gondii*) are of concern during pregnancy
  - avoid consumption of raw meats, fish, poultry, raw eggs, and unpasteurized dairy products
  - avoid soft cheeses, deli meats, smoked salmon and pates as they may be sources of *Listeria*
- chemical contamination of food
  - current guideline for mercury of 0.5 ppm in fish is not considered harmful for the general population, including pregnant women
  - Health Canada advises pregnant women to limit consumption of top predator fish such as shark, swordfish, king mackerel, tilefish, and fresh/frozen tuna (not canned tuna) to one meal per month

#### Sources of Caffeine

- 5 oz cup coffee: 40-180 mg
- 5 oz brewed tea: 20-90 mg
- 12 oz cola: 46 mg
- Red Bull®: 67 mg
- Dark chocolate bar: 10 mg
- 8 oz hot chocolate: 5 mg

#### Herbal Teas Considered Safe in Moderation (2-3 cups/d)

- Citrus peel
- Ginger
- Lemon balm
- Linden flower – not with prior cardiac condition
- Orange peel
- Rose hip

## Lifestyle

- exercise under physician guidance
- absolute contraindications
  - ruptured membranes, preterm labour, hypertensive disorders of pregnancy, incompetent cervix, IUGR, multiple gestations (>3), placenta previa after 28th wk, persistent 2nd or 3rd trimester bleeding, uncontrolled type I diabetes, uncontrolled thyroid disease, or other serious cardiovascular, respiratory or systemic disorder

- relative contraindications
  - previous preterm birth, mild/moderate cardiovascular or respiratory disorder, anemia (Hb  $\leq 100$  g/L), malnutrition or eating disorder, twin pregnancy after 28th wk, other significant medical conditions
- weight gain: optimal gain depends on pre-pregnancy weight (varies from 6.8-18.2 kg)
- work: strenuous work, extended hours and shift work during pregnancy may be associated with greater risk of low birth weight, prematurity, and spontaneous abortion
- travel: not harmful, but stress related to travel may be associated with preterm labour
  - air travel is acceptable in second trimester; airline cutoff for travel is 36-38 wk gestation depending on the airline to avoid giving birth on the plane
- sexual intercourse: may continue, except in patients at risk for: abortion, preterm labour, or placenta previa; breast stimulation may induce uterine activity and is discouraged in high-risk patients near term
- smoking: assist/encourage to reduce or quit smoking
  - increased risk of: decreased birth weight, placenta previa/abruption, spontaneous abortion, preterm labour, stillbirth
- alcohol: no amount of alcohol is safe in pregnancy. Encourage abstinence from alcohol during pregnancy; alcohol increases incidence of abortion, stillbirth, and congenital anomalies
  - fetal alcohol syndrome (see [Pediatrics](#), P24)
- cocaine: microcephaly, growth retardation, prematurity, abruptio placentae

#### Expected Weight Gain

BMI (kg/m <sup>2</sup> )	Weight (kg)
<19	12.7-18.2
19-25	11.3-15.9
>25	6.8-11.3

**General Rule:** 1-3.5 kg/wk during T1, then 0.45 kg/wk until delivery

## Medications

- most drugs cross the placenta to some extent
- very few drugs are teratogenic, but very few drugs have proven safety in pregnancy
- use any drug with caution and only if necessary
- analgesics: acetaminophen preferable to ASA or ibuprofen

**Table 5. Documented Adverse Effects, Contraindicated**

Contraindicated Medication	Adverse Effect
ACE inhibitors	Fetal renal defects, IUGR, oligohydramnios
tetracycline	Stains infant's teeth, may affect long bone development
retinoids (e.g. Accutane®)	CNS, craniofacial, cardiac, and thymic anomalies
DES (and other estrogenic or androgenic compounds)	Vaginal adenosis, adenocarcinoma, uterine malformation in females exposed to DES in utero
misoprostol	Mobius syndrome (congenital facial paralysis with or without limb defects, spontaneous abortion, preterm labour)

**Table 6. Documented Adverse Effects, Weigh Benefits vs. Risks and Consider Medication Change**

Medication	Adverse Effect
phenytoin	Fetal hydantoin syndrome in 5-10% (IUGR, mental retardation, facial dysmorphogenesis, congenital anomalies)
valproate	oNTD in 1%
carbamazepine	oNTD in 1-2%
lithium	Ebstein's cardiac anomaly, goitre, hyponatremia
warfarin	Increased incidence of spontaneous abortion, stillbirth, prematurity, IUGR, fetal warfarin syndrome (nasal hypoplasia, epiphyseal stippling, optic atrophy, mental retardation, intracranial hemorrhage)
erythromycin	Maternal liver damage (acute fatty liver)
sulpha drugs	Anti-folate properties, therefore theoretical risk in T1; risk of kernicterus in T3
chloramphenicol	Grey baby syndrome (fetal circulatory collapse 2° to toxic accumulation)

#### Drug Resources during Pregnancy and Breastfeeding

- Motherisk at the Hospital for Sick Children in Toronto: [www.motherisk.org](http://www.motherisk.org)
- Hale T. Medications and mothers' milk, 11th ed. Pharmasoft Publishing, 2004

Trimethoprim is a folic acid antagonist associated with NTD.

## Immunizations

### Intrapartum

- administration is dependent on the risk of infection vs. risk of immunization complications
- safe: tetanus toxoid, diphtheria, influenza, hepatitis B
- avoid live vaccines (risk of placental and fetal infection): polio, measles/mumps/rubella, varicella
- contraindicated: rubella, oral typhoid

### Postpartum

- rubella vaccine for all non-immune mothers
- hepatitis B vaccine should be given to infant within 12 h of birth if maternal status unknown or positive – follow-up doses at 1 and 6 mo
- human papillomavirus (HPV) vaccine – if meets criteria

## Radiation

- ionizing radiation exposure is considered teratogenic at high doses
  - if indicated for maternal health, should be done
- imaging not involving direct abdominal/pelvic high dosage is not associated with adverse effects
  - higher dosage to fetus: plain x-ray of lumbar spine/abdomen/pelvis, barium enema, CT abdomen, pelvis, lumbar spine
- most investigations involve minimal radiation exposure (see Table 7)
- radioactive isotopes of iodine are contraindicated
- no known adverse effects from U/S or MRI

### Radiation in Pregnancy

- Necessary amount to cause miscarriage: >5 rads
- Necessary amount to cause malformations: >20-30 rads

**Table 7. Approximate Fetal Doses from Common Diagnostic Procedures**

Examination	Estimated Fetal Dose (rad)	Number of Exams Safe in Pregnancy
<b>Plain Film</b>		
Abdomen	0-14	35
Pelvis	0-11	45
Lumbar spine	0-17	29
Thoracic spine	0.009	555
Chest (2 views)	<0.001	5000
<b>CT</b>		
Abdomen	0-8	6
Pelvis	2-5	2
Lumbar spine	0-24	20
Chest	0.006	833

Adapted from Cohen-Kerem, et al. 2005 and Valentin, 2000

## Termination of Pregnancy

- see [Gynecology](#), GY9

### Definition

- active termination of a pregnancy before fetal viability (usually <500 g or 20 wk GA)

### Indications

- inability to carry a pregnancy to term due to medical or social reasons (including patient preference)

### Management

- medical
  - <9 wk: methotrexate + misoprostol
  - >12 wk: prostaglandins (intra- or extra-amniotically or IM) or misoprostol
- surgical
  - <12 wk: dilatation + vacuum aspiration ± curettage
  - >12 wk: dilatation and evacuation, early induction of labour
  - common complications: pain or discomfort
  - less common complications: hemorrhage, perforation of uterus, laceration of cervix, risk of infertility, infection/endometritis, Asherman's syndrome (adhesions within the endometrial cavity causing amenorrhea/infertility), retained products of conception
- counselling
  - supportive and counselling services
  - future contraception and family planning services
  - ensure follow-up

### CMA policy (1988)

"Induced abortion should be uniformly available to all women in Canada" and "there should be no delay in the provision of abortion services".

Terminations are generally done until the stage of viability (~23.5 wk), although this varies depending on the provider.

### Induced Abortion Statistics

- Rate per 1,000 women (all ages): 13.7
- 31.4% of all abortion services are accessed by women aged 20-24

Adapted from Statistics Canada. Induced abortion statistics. 82-223-XWE, 2005;16

# Prenatal Fetal Monitoring

## Fetal Movements

- patients will generally first notice fetal movement ("quickening") at 18-20 wk in primigravidas; can occur 1-2 wk earlier in multigravidas; can occur 1-2 wk later if placenta is implanted on the anterior wall of uterus
- if the patient is concerned about decreased fetal movement, she is counselled to choose a time when the fetus is normally active to count movements (usually recommended after 28 wk)
  - if there is a subjective decrease in fetal movement, try drinking juice, eating, changing position or moving to a quiet room and count for 2 h. There should be  $\geq 6$  movements in 2 h
  - if there are  $< 6$  movement counts in 2 h, patient should present to labour and delivery triage

### DDx of Decreased Fetal Movements

#### DASH

Death of fetus  
Amniotic fluid decreased  
Sleep cycle of fetus  
Hunger/Thirst

## NON-STRESS TEST (NST)

### Definition

- FHR tracing  $\geq 20$  min using an external Doppler to assess FHR and its relationship to fetal movement (see *Fetal Monitoring in Labour*, OB34)

### Indication

- any suggestion of uteroplacental insufficiency or suspected compromise in fetal well-being

Table 8. Classification of Antepartum Non-Stress Test

Parameter	Normal NST (Previously "Reactive")	Atypical NST (Previously "Non-Reactive")	Abnormal NST (Previously "Non-Reactive")
Baseline	110-160 bpm	100-110 bpm or $> 160$ bpm for $< 30$ min Rising baseline	Bradycardia $< 100$ bpm Tachycardia $> 160$ for $> 30$ min Erratic baseline
Variability	6-25 bpm (moderate) $\leq 5$ (absent or minimal) for $< 40$ min	5 (absent or minimal) for 40-80 min	$\leq 5$ for 80 min Sinusoidal 25 bpm for $> 10$ min
Decelerations	None or occasional variable $< 30$ s	Variable decelerations 30-60 s duration	Variable decelerations $> 60$ s Late deceleration(s)
Accelerations in Term Fetus	2 accelerations with acme of $\geq 15$ bpm, lasting 15 s or over $< 40$ min of testing	2 accelerations with acme of $\geq 15$ bpm, lasting 15 s in 40-80 min	$< 2$ accelerations with acme of $\geq 15$ bpm, lasting 15 s in $> 80$ min
Accelerations in Preterm Fetus ( $< 32$ wk)	$> 2$ accelerations with acme of $> 10$ bpm, lasting 10 s in $< 40$ min	$< 2$ accelerations with acme of $> 10$ bpm, lasting 10 s in 40-80 min	$< 2$ accelerations with acme of $> 10$ bpm, lasting 10 s in $> 80$ min
Action	FURTHER ASSESSMENT OPTIONAL, based on total clinical picture	FURTHER ASSESSMENT REQUIRED	URGENT ACTION REQUIRED An overall assessment of the situation and further investigation with U/S or BPP is required. Some situations will require delivery

Normal NST: 2 accels,  $> 15$  bpm from baseline, lasting  $> 15$  s in 20 min.

Adapted from SOGC, Fetal Health Surveillance: Antepartum and Intrapartum Consensus Guideline, September 2007

### Operating Characteristics

- false positive rate depends on duration; false negative rate = 0.2-0.3%

### Interpretation

- normal: at least 2 accelerations of FHR  $> 15$  bpm from the baseline lasting  $> 15$  s, in 20 min
- abnormal:  $< 2$  accelerations of FHR in 40 min
- if no observed accelerations or fetal movement in the first 20 min, stimulate fetus (fundal pressure, acoustic/vibratory stimulation) and continue monitoring for 30 min
- if NST abnormal, then perform BPP

## BIOPHYSICAL PROFILE

### Definition

- U/S assessment of the fetus  $\pm$  NST

### Indications

- abnormal or atypical NST
- post-term pregnancy
- decreased fetal movement
- any other suggestion of fetal distress or uteroplacental insufficiency

### Operating Characteristics

- false positive rate  $\leq 30\%$ , false negative rate = 0.1%

**Table 9. Scoring of the BPP**

Parameter	Reassuring (2 points)	Non-Reassuring (0 points)
<b>AFV*</b>	Fluid pocket of 2 cm in 2 axes	Oligohydramnios
<b>Breathing</b>	At least one episode of breathing lasting at least 30 s	No breathing
<b>Limb Movement</b>	Three discrete movements	Two or less
<b>Fetal Tone</b>	At least one episode of limb extension followed by flexion	No movement

\*AFV is a marker of chronic hypoxia, all other parameters indicate acute hypoxia

#### Reassuring BPP (8/8)

##### LAMB

Limb extension + flexion

AFV 2 cm x 2 cm

Movement (3 discrete)

Breathing (one episode x 30 s)

### Interpretation

- 8: perinatal mortality rate 1:1000; repeat BPP as clinically indicated
- 6: perinatal mortality rate 31:1000; repeat BPP in 24 h
- 0-4: perinatal mortality rate 200:1000; deliver fetus if benefits of delivery outweigh risks

## Medical Conditions in Pregnancy

### Iron and Folate Deficiency Anemia

**Table 10. Iron Deficiency and Folate Deficiency Anemia**

	Iron Deficiency Anemia	Folate Deficiency Anemia
<b>Etiology</b>	See <a href="#">Hematology</a> , H14	See <a href="#">Hematology</a> , H23
<b>Epidemiology</b>	Responsible for 80% of causes of non-physiologic anemia during pregnancy	Incidence varies from 0.5-25% depending on region, population, diet
<b>Clinical Features</b>	See <a href="#">Hematology</a> , H14	See <a href="#">Hematology</a> , H23
<b>Investigations</b>	See <a href="#">Hematology</a> , H14	See <a href="#">Hematology</a> , H24
<b>Management</b>	Prevention (non-anemic): 30 mg elemental iron/d (met by most prenatal vitamins) Treatment (anemic): 30-120 mg elemental iron/d 325 mg ferrous fumarate = 106 mg elemental $\text{Fe}^{2+}$ ; 325 mg ferrous sulfate = 65 mg elemental $\text{Fe}^{2+}$ ; 325 mg ferrous gluconate = 36 mg elemental $\text{Fe}^{2+}$	Prevention: 0.4-1 mg folic acid PO daily for 1-3 mo preconceptually and throughout T1, or 5 mg folic acid per day with past history of oNTD, diabetes or anti-epileptic medication use
<b>Complications</b>	Maternal: angina, CHF, infection, slower recuperation, preterm labour Fetal: decreased oxygen carrying capacity leading to fetal distress, IUGR and low birth weight	Maternal: decreased blood volume, nausea, vomiting, anorexia Fetal: neural tube defects in T1, low birth weight, prematurity
<b>Notes</b>	Mother needs 1 g of elemental iron per fetus; this amount exceeds normal stores + dietary intake Iron requirements increase during pregnancy due to fetal/placental growth (500 mg), increased maternal RBC mass (500 mg) and losses (200 mg) – more needed for multiple gestations	Minimum daily requirement is 0.4 mg Most often associated with iron deficiency anemia Folic acid is necessary for closure of neural tube during early fetal development (by day 28 of gestation)

### Diabetes Mellitus (DM)

#### Classification of Diabetes Mellitus

- Type 1 and Type 2 DM (see [Endocrinology](#), E6)
- GDM: onset of diabetes mellitus during pregnancy

#### Etiology

- Type 1 and Type 2 DM
- GDM: usually around 24-28 wk GA, anti-insulin factors produced by placenta and high maternal cortisol levels create increased peripheral insulin resistance → higher fasting glucose → leading to GDM and/or exacerbating pre-existing DM

#### Epidemiology

- 2-4% of pregnancies are complicated by DM

## MANAGEMENT

### A. TYPE 1 AND TYPE 2 DM

#### Preconception

- pre-plan and refer to high-risk clinic
- optimize glycemic control
- counsel patient re: potential risks and complications
- evaluate for diabetic retinopathy, neuropathy, coronary artery disease

#### Pregnancy

- if already on oral medication, generally switch to insulin therapy
  - continuing glyburide or metformin controversial
  - teratogenicity unknown for other oral anti-hyperglycemics
- tight glycemic control
  - insulin dosage may need to be adjusted in T2 due to increased demand and increased insulin resistance
- monitor as for normal pregnancy plus initial 24 h urine protein and creatinine clearance, retinal exam, HbA1c
  - HbA1c: >140% of pre-pregnancy value associated with increased risk of spontaneous abortion and congenital malformations
- increased fetal surveillance (BPP, NST)

#### Labour

- timing of delivery depends on fetal and maternal health and risk factors (i.e. must consider size of baby, lung maturity, maternal blood glucose and blood pressure control)
- can wait for spontaneous labour if blood glucose well-controlled and BPP normal
- induce by 40 wk
- type of delivery
  - increased risk of cephalopelvic disproportion (CPD) and shoulder dystocia with babies >4,000 g (8.8 lbs)
  - elective C/S for predicted birthweight >4,500 g (9.9 lbs) (controversial)
- monitoring
  - during labour monitor blood glucose q1h with patient on insulin and dextrose drip
  - aim for blood glucose between 3.5 to 6.5 mmol/L to reduce the risk of neonatal hypoglycemia

#### Postpartum

- insulin requirements dramatically drop with expulsion of placenta (source of insulin antagonists)
- no insulin is required for 48-72 h postpartum in most Type 1 DM
- monitor glucose q6h, restart insulin at two-thirds of pre-pregnancy dosage when glucose >8 mmol/L

### B. GESTATIONAL DIABETES MELLITUS

#### Screening + Diagnosis

- at 24-28 wk GA
- pregnant females age >25 or age <25 yr with >1 risk factor (see sidebar)
- 1 h, 50 g Oral Glucose Challenge Test (OGCT): not fasting
  - PG <7.8 mmol/L = no GDM
  - PG ≥7.8-10.3 mmol/L = further investigation with OGTT
  - PG ≥10.3 mmol/L = GDM
- 2 h, 75 g Oral Glucose Tolerance Test (OGTT): fasting
  - FPG ≥5.3 mmol/L
  - PG 1 h ≥10.6 mmol/L
  - PG 2 h ≥8.9 mmol/L
    - ♦ 2/3 of the above = GDM
    - ♦ 1/3 of the above = impaired glucose tolerance (IGT)

#### Management

- treat both GDM and IGT
- first line is management through diet modification and increased physical activity
- tight glycemic control optimal as in Type 1 and Type 2 DM
- monitoring and timing of delivery as for Type 1 and Type 2 DM
- stop insulin and diabetic diet postpartum
- follow-up with 2 h, 75 g OGTT 6 wk-6 mo postpartum

Post-prandial blood glucose values seem to be the most effective at determining the likelihood of macrosomia or other adverse pregnancy outcomes.

#### Monitoring Glucose Levels

- Frequent measurements of blood glucose during pregnancy are advised for women with Type 1 or 2 diabetes to help prevent or treat both hypoglycemia and hyperglycemia, and also improves neonatal outcome
- Aim for FPG ≤5.3 mmol/L (95 mg/dL), 1 h post prandial
- PG ≤7.8 mmol/L (140 mg/dL), 2 h post prandial PG ≤6.7 mmol/L (120 mg/dL)
- Most women can be followed with monthly HbA1c determinations

#### Risk Factors for GDM:

- Age >25
- Obesity
- Ethnicity (Aboriginal, Hispanic, Asian, African)
- FHx of DM
- Previous history of GDM
- Previous child with birthweight >4.0 kg
- Polycystic ovarian syndrome
- Current use of glucocorticoids
- Essential hypertension or pregnancy-related hypertension

## Prognosis

- most maternal and fetal complications are related to hyperglycemia and its effects

## Long Term Maternal Complications

- Type 1 and Type 2 DM: risk of progressive retinopathy and nephropathy
- GDM: 50% risk of developing Type 2 DM in next 20 yr

**Table 11. Complications of DM in Pregnancy**

Maternal	Fetal
<b>Obstetric</b> <ul style="list-style-type: none"> <li>Hypertension/preeclampsia (especially if pre-existing nephropathy/proteinuria): insulin resistance is implicated in etiology of hypertension</li> <li>Polyhydramnios: maternal hyperglycemia leads to fetal hyperglycemia, which leads to fetal polyuria (a major source of amniotic fluid)</li> </ul>	<b>Growth Abnormalities</b> <ul style="list-style-type: none"> <li>Macrosomia: maternal hyperglycemia leads to fetal hyperinsulinism resulting in accelerated anabolism</li> <li>Intrauterine growth restriction (IUGR): due to placental vascular insufficiency</li> </ul>
<b>Diabetic Emergencies</b> <ul style="list-style-type: none"> <li>Hypoglycemia</li> <li>Ketoacidosis</li> <li>Diabetic coma</li> </ul>	<b>Delayed Organ Maturity</b> <ul style="list-style-type: none"> <li>Fetal lung immaturity: hyperglycemia interferes with surfactant synthesis (respiratory distress syndrome)</li> </ul>
<b>End-organ Involvement or Deterioration (occur in DM1 and DM2, not in GDM)</b> <ul style="list-style-type: none"> <li>Retinopathy</li> <li>Nephropathy</li> </ul>	<b>Congenital Anomalies (occur in DM1 and DM2, not in GDM)</b> <ul style="list-style-type: none"> <li>2-7x increased risk of cardiac (VSD), NTD, GU (cystic kidneys), GI (anal atresia), and MSK (sacral agenesis) anomalies due to hyperglycemia</li> <li>Note: Pregnancies complicated by GDM do not manifest an increased risk of congenital anomalies because GDM develops after the critical period of organogenesis (in T1)</li> </ul>
<b>Other</b> <ul style="list-style-type: none"> <li>Pyelonephritis/UTI: glucosuria provides a culture medium for <i>E. coli</i> and other bacteria</li> <li>Increased incidence of spontaneous abortion (in DM1 and DM2, not in GDM): related to pre-conception glycemic control</li> </ul>	<b>Labour and Delivery</b> <ul style="list-style-type: none"> <li>Preterm labour/prematurity: most commonly in patients with hypertension/preeclampsia. Preterm labour is associated with poor glycemic control but the exact mechanism is unknown</li> <li>Increased incidence of stillbirth</li> <li>Birth trauma: due to macrosomia, can lead to difficult vaginal delivery and shoulder dystocia</li> </ul>
	<b>Neonatal</b> <ul style="list-style-type: none"> <li>Hypoglycemia: due to pancreatic hyperplasia and excess insulin secretion in the neonate</li> <li>Hyperbilirubinemia and jaundice: due to prematurity and polycythemia</li> <li>Hypocalcemia: exact pathophysiology not understood, may be related to functional hypoparathyroidism</li> <li>Polycythemia: hyperglycemia stimulates fetal erythropoietin production</li> </ul>

## Hypertension in Pregnancy

- hypertensive disorders of pregnancy are classified as either **preexisting** or **gestational hypertension**

### PRE-EXISTING HYPERTENSION

#### Definition

- HTN (>140/90) prior to 20 wk GA, persisting >7 wk postpartum
- essential hypertension is associated with an increased risk of gestational HTN, abruptio placentae, IUGR and intrauterine fetal demise (IUFD)

**Ominous symptoms of HTN in pregnancy**  
RUQ pain, headache and visual disturbances.

### GESTATIONAL HYPERTENSION

#### Definition

- sBP >140 or dBP >90 developing after 20th wk GA in a woman known to be normotensive before pregnancy

#### Risk Factors

- maternal factors
  - primigravida (80-90% of gestational HTN)
  - first conception with a new partner
  - PMHx or FHx of gestational HTN
  - DM, chronic HTN, or renal insufficiency
  - Antiphospholipid syndrome
  - extremes of maternal age (<18 or >35 yr)
- fetal factors
  - IUGR or oligohydramnios, GTN, multiple gestation, fetal hydrops
  - previous stillbirth or intrauterine fetal demise

## Clinical Evaluation of Hypertension in Pregnancy

- in general, clinical evaluation should include the mother and fetus
- **evaluation of mother:**
  - body weight
  - central nervous system
    - ♦ presence and severity of headache
    - ♦ visual disturbances – blurring, scotomata
    - ♦ tremulousness, irritability, somnolence
    - ♦ hyperreflexia
  - hematologic
    - ♦ bleeding, petechiae
  - hepatic
    - ♦ RUQ or epigastric pain
    - ♦ severe nausea and vomiting
  - renal
    - ♦ urine output and colour
  - non-dependent edema (i.e. hands and face)
- **evaluation of fetus:**
  - fetal movement
  - fetal heart rate tracing – NST
  - ultrasound for growth
  - biophysical profile
  - Doppler flow studies

## Laboratory Evaluation of Gestational Hypertension

- hemoglobin, platelets, blood film
- PTT, INR, fibrinogen, D-dimer – especially if surgery or regional anesthetics are planned
- ALT, AST, LDH, bilirubin
- proteinuria, creatinine, uric acid
- 24 h urine collection for total protein and creatinine clearance

## Complications

- maternal
  - liver and renal dysfunction
  - seizure
  - abruptio placentae
  - left ventricular failure/pulmonary edema
  - DIC (release of placental thromboplastin consumptive coagulopathy)
  - HELLP syndrome (see Table 12, OB19)
    - ♦ treat with FFP infusion or plasma exchange
  - hemorrhagic stroke (50% of deaths)
- fetal (2° to placental insufficiency)
  - IUGR, prematurity, abruptio placentae, IUFD

## Management

- for both preexisting and gestational hypertension, labetalol 100-300 mg PO bid/tid, nifedipine, 30-50 mg PO daily or  $\alpha$ -methyldopa 250-500 mg PO tid/qid
- no ACE inhibitors, diuretics or propranolol (teratogens)
- preexisting HTN and gestational HTN without any deterioration can be followed until 37 wk then decide to induce shortly thereafter

## PREECLAMPSIA

### Definition

- pre-existing or gestational hypertension with new onset proteinuria or adverse conditions

### Risk Factors

- nulliparity
- preeclampsia in a previous pregnancy
- age >40 yr or <18 yr
- FHx of preeclampsia
- chronic HTN
- chronic renal disease
- antiphospholipid antibody syndrome or inherited thrombophilia
- vascular or connective tissue disease
- diabetes mellitus (pregestational and gestational)
- high BMI
- hydrops fetalis

### I-A Evidence-Recommendation Highlights of SOGC Clinical Practice Guidelines Diagnosis, Evaluation, and Management of the Hypertensive Disorders of Pregnancy

JOGC 2008;30:S1-47

- For BP measurement, Korotkoff phase V should be used to designate the dBP
- For preeclampsia prevention among low-risk women with low dietary calcium intake (<600 mg/d), oral calcium supplementation of at least 1g/d is recommended
- For preeclampsia prevention among increased risk women, low-dose Aspirin® (75-100 mg/d) is recommended until delivery
- Umbilical artery Doppler velocimetry should be part of the antenatal fetal surveillance in preeclampsia
- Initial antihypertensive therapy for severe hypertension (sBP >160 mmHg or dBP ≥110) should be with labetalol, nifedipine, or hydralazine
- Initial antihypertensive therapy for non-severe hypertension (BP 140-159/90-109 mmHg) should be with methyldopa,  $\beta$ -blockers, or calcium channel blockers
- Antenatal corticosteroids for fetal lung maturation should be considered for all women with preeclampsia before 34 wk gestation
- In a planned vaginal delivery with an unfavourable cervix, cervical ripening should be used
- Oxytocin 5 units IV or 10 units IM should be used as part of the management during the third stage of labour
- MgSO<sub>4</sub> is the recommended first-line treatment for eclampsia
- MgSO<sub>4</sub> is the recommended eclampsia prophylaxis in severe preeclampsia

### Hypertension in Pregnancy

#### Adverse Maternal Conditions

- sBP >160 mmHg
- dBP >100 mmHg
- HELLP
- Cerebral haemorrhage
- Renal dysfunction: oliguria <500 mL/d
- Left ventricular failure, pulmonary edema
- Abruptio, DIC

#### Symptoms:

- Abdominal pain, nausea, vomiting
- Headaches, visual problems
- SOB, chest pain
- Eclampsia: convulsions

#### Adverse Fetal Conditions

- Intrauterine growth restriction
- Oligohydramnios
- Absent/reversed umbilical artery end diastolic flow

#### Can result in:

- Fetal disability and/or death

- unexplained fetal growth restriction
- abruptio placentae
- there is a potential for further deterioration to severe preeclampsia as defined above (see Figure 3)
- the adverse conditions are many and include both maternal and fetal issues (see sidebar, OB15)

### Management

- management will depend on GA, possible threat of seizures (check reflexes)
- if stable and no adverse factors, may admit and follow, ± decide to deliver as approaching 34-36 wk (must weigh risks of fetal prematurity vs. risks of developing severe preeclampsia/eclampsia)
- for severe preeclampsia, stabilize and deliver
- if severe preeclampsia, during labour, increase maternal monitoring: hourly input and output, urine dip q12h, hourly neurological vitals, and increase fetal monitoring (continuous FHR monitoring)
- antihypertensive therapy
  - lowering BP decreases the risk of stroke
  - hydralazine 5-10 mg IV bolus over 5 min q15-30min as necessary
  - labetalol 20-50 mg IV q10min
  - 2nd line: nifedipine 10-20 mg PO q20-60min
- seizure prevention
  - MgSO<sub>4</sub>
  - postpartum management
  - risk of seizure highest in first 24 h postpartum – continue MgSO<sub>4</sub> for 12-24 h after delivery
  - vitals q1h
  - consider HELLP syndrome in toxic patients
  - most return to a normotensive BP within 2 wk

#### Preeclampsia Investigations

- CBC
- Liver enzymes
- INR and aPTT
- Cr
- Uric Acid
- LDH
- Albumin
- Bilirubin
- Urine (dip ± 24 h collection)

#### HELLP Syndrome

- Hemolysis
- Elevated Liver enzymes
- Low Platelets

## ECLAMPSIA

### Definition

- the occurrence of one or more generalized convulsions and/or coma in the setting of preeclampsia and in the absence of other neurologic conditions

### Epidemiology

- an eclamptic seizure occurs in approximately 0.5% of mildly preeclamptic women and 2-3% of severely preeclamptic women

### Risk Factors

- same as risk factors for Preeclampsia, see above

### Clinical Manifestations

- eclampsia is a clinical diagnosis
- typically tonic-clonic and lasting 60-75 s
- one of the signs of an impending seizure is hyperreflexia
- symptoms that may occur before the seizure include persistent frontal or occipital headache, blurred vision, photophobia, right upper quadrant or epigastric pain, and altered mental status
- in up to one third of cases, there is no proteinuria or blood pressure is less than 140/90 mmHg prior to the seizure
- in general, women with typical eclamptic seizures who do not have focal neurologic deficits or prolonged coma do not require diagnostic evaluation including imaging

### Management

- ABCs
- roll patient into LLDP
- supplemental O<sub>2</sub> via face mask to treat hypoxemia due to hypoventilation during convulsive episode
- aggressive antihypertensive therapy for sustained diastolic pressures ≥105 mmHg or systolic blood pressures ≥160 mmHg with hydralazine or labetalol
- prevention of recurrent convulsions: to prevent further seizures and the possible complications of repeated seizure activity (e.g. rhabdomyolysis, metabolic acidosis, aspiration pneumonitis, etc.) MgSO<sub>4</sub> is now the drug of choice, with previously used agents including diazepam and phenytoin
- the definitive treatment of eclampsia is DELIVERY, irrespective of gestational age, to reduce the risk of maternal morbidity and mortality from complications of the disease
- mode of delivery is dependent on clinical situation and fetal-maternal condition

#### Differential Diagnosis of Cause for Seizure in a Pregnant Woman

- Stroke
- Hypertensive disease (hypertensive encephalopathy, pheochromocytoma)
- Space-occupying lesion of the CNS
- Metabolic disorders (hypoglycemia, SIADH)
- Infection (meningitis, encephalitis)
- Thrombotic thrombocytopenic purpura or thrombophilia
- Idiopathic epilepsy
- Use of illicit drugs
- Cerebral vasculitis

#### Note

Eclampsia prior to 20 wk of gestation is rare and should raise the possibility of an underlying molar pregnancy or antiphospholipid syndrome.

#### MgSO<sub>4</sub> toxicity

- Flushing
- Hyporeflexia
- Somnolence
- Respiratory and cardiac depression
- Weakness

**Note:** Increased risk of toxicity with concurrent calcium channel blocker use or renal disease

#### Treatment:

- Stop MgSO<sub>4</sub>
- Calcium gluconate 10% in 10 mL via IV

## Nausea and Vomiting

### Epidemiology

- affects 50-90% of pregnant women
- often limited to T1 but may persist

### Management

- r/o other causes of N/V
- weigh frequently, assess level of hydration, test urine for ketones
- **non-pharmacological:**
  - avoid mixing fluids and solids, frequent small meals
  - stop prenatal vitamins (folic acid must continue until >12 wk)
  - increase sleep/rest
  - ginger (maximum 1000 mg/d)
  - acupuncture, acupressure
- **pharmacological:**
  - first line: Diclectin® (10 mg doxylamine succinate with vitamin B<sub>6</sub>) 4 tablets PO daily to maximum of 8 tablets
  - if no improvement, try dimenhydrinate (50-100 mg q4-6h PO), followed by hydroxyzine, pyridoxine, phenothiazine, or metoclopramide
  - vitamin B<sub>6</sub> lollipops
  - if patient dehydrated, assess fluid replacement needs and resuscitate accordingly
- **severe/refractory:**
  - consider homecare with IV fluids and parenteral anti-emetics, hospitalization

## Hyperemesis Gravidarum

### Definition

- intractable nausea and vomiting, usually presents in T1 then diminishes; occasionally persists throughout pregnancy
- affects ~1% of pregnancies

### Etiology

- multifactorial with hormonal, immunologic and psychologic components
- rapidly rising  $\beta$ -hCG  $\pm$  estrogen levels may be implicated

### Investigations

- r/o systemic causes: GI inflammation, pyelonephritis, thyrotoxicosis
- r/o obstetrical causes: multiple gestation, GTN, HELLP syndrome
- CBC, electrolytes, BUN, creatinine, LFTs, urinalysis
- ultrasound

### Management

- thiamine supplementation may be indicated
- **non-pharmacological:** (see *Nausea and Vomiting*, above)
- **pharmacological options**
  - Diclectin® (see dosage *Nausea and Vomiting*, above)
  - Dimenhydrinate can be safely used as an adjunct to Diclectin® (1 suppository bid or 25 mg PO qid)
  - other adjuncts: hydroxyzine, pyridoxine, phenothiazine, metoclopramide
  - also consider: ondansetron or methylprednisolone
  - if severe: admit to hospital, NPO initially then small frequent meals, correct hypovolemia, electrolyte disturbance and ketosis, TPN (if very severe) to reverse catabolic state

### Complications

- maternal
  - dehydration, electrolyte and acid-base disturbances
  - Mallory-Weiss tear
  - Wernicke's encephalopathy, if protracted course
  - death
- fetal: usually none, IUGR is 15x more common in women losing >5% of pre-pregnancy weight

## Jaundice in Pregnancy

### Epidemiology

- affects 1 in 1500 pregnancies

### Etiology

- viral hepatitis (most common)
- unique to pregnancy (see Table 12)
- cholestatic jaundice of pregnancy
- HELLP syndrome
- hepatic rupture, hematoma and infarct
- AFLP
- hyperemesis gravidarum (rarely causes hepatic dysfunction)
- pre-existing conditions (see [Gastroenterology](#), *Liver/Biliary Tract*, G28, G40)

**Table 12. Conditions Causing Jaundice in Pregnancy**

	HELLP Syndrome	Cholestatic Jaundice of Pregnancy	Hepatic Infarct, Hematoma, and Rupture	Acute Fatty Liver of Pregnancy (AFLP)
<b>Definition</b>	Hemolysis, elevated liver enzymes, low platelets Pathogenesis unknown	Clinical syndrome characterized by intense pruritus that precedes jaundice by 7-14 d Pathogenesis unknown, may be due to increased sensitivity to high levels of estrogen or abnormal progesterational steroids	Rare consequence of preeclampsia, typically occurring in T3 Vasospasm-induced hepatic infarction can lead to hematoma formation; hematoma can lead to rupture	Form of hepatic failure with coagulopathy and encephalopathy characterized by microvesicular fatty infiltrates in liver parenchyma Pathogenesis unknown
<b>Epidemiology</b>	Affects 20% of women with severe preeclampsia Presents >27 wk GA (11% sooner); up to 30% of cases present AFTER delivery and with no previous signs of hypertension	17-29 wk GA High incidence in Chile and Scandinavia; rare in Asian and African populations		1 in 7,000 deliveries 3rd trimester (28-40 wk GA) Maternal mortality as high as 75%; resolution of hepatic dysfunction with delivery or termination of pregnancy
<b>Clinical Features</b>	Epigastric, RUQ or chest pain, N/V, symptoms of preeclampsia (headache, blurred vision, thirst) ± jaundice Atypical presentations: asymptomatic reduction in platelet count, "flu-like" symptoms	Intense pruritus (usually, worst on palms and soles of feet) ± icterus (1-2 wk later) Steatorrhea unusual	Hepatic rupture: RUQ abdominal pain, abdominal distention, nausea/vomiting, and hypertension, followed by shock	Acute nausea/vomiting, severe upper abdominal pain preceding jaundice Confusion Preeclampsia Pruritus Range in presentation: • Mild to fulminant
<b>Investigations</b>	AST (70-663 U/L), total bilirubin slightly increased, low platelet count (7-99), elevated LDH ± elevated D-dimers, tissue polypeptide antigen (TPA) and fibronectin, fragmented RBCs on smear Liver biopsy (rarely done)	ALT <500 IU, ALP and GGT markedly elevated (to levels consistent with moderate to severe cholestasis)	Hemoperitoneum (paracentesis, U/S, CT, MRI showing ruptured liver)	Elevated PTT and low serum fibrinogen AST > ALT Hypoglycemia Preeclampsia and HELLP features Liver biopsy to establish diagnosis • If liver biopsy not possible, CT most useful
<b>Management</b>	Supportive care (in ICU) and prompt delivery	Ursodeoxycholic acid (20-25 mg/kg/d) Pruritus: cholestyramine Prophylactic vitamin K before delivery Consider induction of labour (see <i>Induction of Labour</i> , OB36)	Aggressive: rapid delivery and trauma surgery to repair liver	Early diagnosis with prompt delivery followed by maximal supportive care • ABCs, mechanical ventilation, transfusion of blood products • Hepatic encephalopathy treatment: lactulose, catharsis • Treat hypoglycemia
<b>Notes</b>	Complications: sepsis, multi-system organ failure, hepatic failure, DIC, death (rare)	Selenium may be protective against cholestasis Strong familial predisposition Correlates with oral contraceptive sensitivity	Complications include death (mother and fetus) if untreated	Recovery begins with delivery Persistent or increasing hyperbilirubinemia and complications

## Urinary Tract Infection (UTI)

### Etiology

- increased urinary stasis from mechanical and hormonal (progesterone) factors
- organisms include GBS as well as those that occur in non-pregnant women

### Epidemiology

- most common medical complication of pregnancy
- asymptomatic bacteriuria in 2-7% of pregnant women, more frequently in multiparous women
- note: asymptomatic bacteriuria should be treated in pregnancy due to increased risk of pyelonephritis.

Treat asymptomatic bacteriuria in pregnancy because of increased risk of progression to cystitis, pyelonephritis and probable increased risk of PRETERM LABOUR.

### Clinical Features

- may be asymptomatic
- dysuria, urgency, and frequency in cystitis
- fever, flank pain, costovertebral angle tenderness in pyelonephritis

### Investigations

- urinalysis, urine C&S
- cystoscopy, and renal function tests in recurrent infections

### Management

- uncomplicated UTI
  - first line: amoxicillin (250-500 mg PO q8h x 7 d)
  - alternatives: nitrofurantoin (100 mg PO bid x 7 d)
  - follow with monthly urine cultures
- pyelonephritis
  - hospitalization and IV antibiotics

### Prognosis

- complications if untreated: acute cystitis, pyelonephritis, and possible PPRM
- recurrence is common

## Infections During Pregnancy

Table 13. Infections During Pregnancy

Infection	Agent	Source of Transmission	Greatest Transmission Risk to Fetus	Effects on Fetus	Effects on Mother	Diagnosis	Management
<b>Chicken Pox</b>	Varicella zoster virus (herpes family)	To mom: direct, respiratory To baby: transplacental	13-30 wk GA, and 5 d pre- to 2 d post-delivery	Congenital varicella syndrome (limb aplasia, chorioretinitis, cataracts, cutaneous scars, cortical atrophy, IUGR, hydrops), preterm labour (prematurity)	Fever, malaise, vesicular pruritic lesions	Clinical, $\pm$ vesicle fluid culture, $\pm$ serology	VZIG for mother if exposed, decreases congenital varicella syndrome Note: Do not administer vaccine during pregnancy (live attenuated)
<b>*CMV</b>	DNA virus (herpes family)	To mom: blood/organ transfusion, sexual contact To baby: transplacental, during delivery, breast milk	T1-T3	5-10% develop CNS involvement (mental retardation, cerebral calcification, hydrocephalus, microcephaly, deafness, chorioretinitis)	Asymptomatic or flu-like	Serologic screen; isolate virus from urine or secretion culture	No specific treatment; maintain good hygiene and avoid high risk situations
<b>Erythema Infectiosum (Fifth Disease)</b>	Parvovirus B19	To mom: respiratory, infected blood products To baby: transplacental	10-20 wk GA	Spontaneous abortion (SA), stillbirth, hydrops in utero	Flu-like, rash, arthritis; often asymptomatic	Serology, viral PCR, maternal AFP; if IgM present, follow fetus with U/S for hydrops	If hydrops occurs, consider fetal transfusion

Table 13. Infections During Pregnancy (continued)

Infection	Agent	Source of Transmission	Greatest Transmission Risk to Fetus	Effects on Fetus	Effects on Mother	Diagnosis	Management
<b>Hepatitis B</b>	DNA virus	To mom: blood, saliva, semen, vaginal secretions To baby: transplacental, breast milk	T3 10% vertical transmission if asymptomatic HBsAg +ve; 85-90% if HBsAg and HBeAg +ve	Prematurity, low birth weight, neonatal death	Fever, N/V, fatigue, jaundice, elevated liver enzymes	Serologic screening for all pregnancies	Rx neonate with HBIG and vaccine (at birth, 1, 6 mo); 90% effective
<b>*Herpes Simplex Virus</b>	DNA virus	To mom: intimate mucocutaneous contact To baby: transplacental, during delivery	Delivery (if genital lesions present); less commonly in utero	Disseminated herpes (20%); CNS sequelae (35%); self-limited infection	Painful vesicular lesions	Clinical diagnosis	Acyclovir for symptomatic women, suppressive therapy at 36 wk controversial C/S if active genital lesions, even if remote from vulva
<b>HIV</b>	RNA retrovirus	To mom: blood, semen, vaginal secretions To baby: in utero, during delivery, breast milk	1/3 in utero, 1/3 at delivery, 1/3 breastfeeding	IUGR, preterm labour, premature rupture of membranes	See <a href="#">Infectious Diseases</a> , ID41 	Serology, viral PCR All pregnant women are offered screening	Triple antiretroviral therapy decreases transmission to <1% Elective C/S: no previous antiviral Rx or monotherapy only, viral load unknown or >500 RNA copies/mL, unknown prenatal care, patient request
<b>*Rubella</b>	ssRNA togavirus	To mom: respiratory droplets (highly contagious) To baby: transplacental	T1	SA or congenital rubella syndrome (hearing loss, cataracts, CV lesions, MR, IUGR, hepatitis, CNS defects, osseous changes)	Rash (50%), fever, posterior auricular or occipital lymphadenopathy, arthralgia	Serologic testing; all pregnant women screened (immune if titre >1:16); infection if IgM present or >4x increase in IgG	No specific treatment; offer vaccine following pregnancy Do not administer during pregnancy (live attenuated)
<b>Syphilis</b>	Spirochete ( <i>Treponema pallidum</i> )	To mom: sexual contact To baby: transplacental	T1-T3	Risk of PTL, multisystem involvement, fetal death	See <a href="#">Infectious Diseases</a> , ID25 	VDRL screening for all pregnancies; if positive, requires confirmatory testing	Pen G 2.4 M U IM 1 dose if early syphilis 3 doses if late syphilis, monitor VDRL monthly If Pen G allergic: Clindamycin 900mg IV q8h
<b>*Toxoplasmosis</b>	Protozoa ( <i>Toxoplasma gondii</i> )	To mom: raw meat, unpasteurized goat's milk, cat feces/urine To baby: transplacental	T3 (but most severe if infected in T1); only concern if primary infection during pregnancy	Congenital toxoplasmosis (chorioretinitis, hydrocephaly, intracranial calcification, MR, microcephaly) NB: 75% initially asymptomatic at birth	Majority subclinical; may have flu-like symptoms	IgM and IgG serology; PCR of amniotic fluid	Self-limiting in mother; spiramycin decreases fetal morbidity but not rate of transmission

\* Indicates TORCH infection

## Venous Thromboembolism (VTE)

### Epidemiology

- incidence 0.5-3/1,000 pregnancies occurring with approximately equal frequency in all three trimesters and postpartum

### Risk Factors

- previous VTE, age >35, obesity, infection, bedrest/immobility, shock/dehydration, thrombophilias (see [Hematology](#), H31)

**Table 14. Risk Factors for VTE Specific to Pregnancy**

Hypercoagulability	Stasis	Endothelial
Increased factors: II, V, VII, VIII, IX, X, XII, fibrinogen Increased platelet aggregation Decreased protein S, tPA, factors XI, XIII	Increased resistance to activated protein C Antithrombin can be normal or reduced Increased venous distensibility Decreased venous tone 50% decrease in venous flow in lower extremity by T3 Uterus is mechanical impediment to venous return	Vascular damage at delivery (C/S or SVD) Uterine instrumentation Peripartum pelvic surgery

**Virchow's Triad for VTE**

- Hypercoagulable state
- Stasis
- Endothelial damage

**Clinical Features**

- most DVTs occur in the iliofemoral or calf veins with a predilection for the left leg
- signs of a pulmonary embolism are non-specific (as in non-pregnant women)
- unexplained spontaneous fetal loss

**Investigations**

- duplex venous Doppler sonography for DVT
- CXR and V/Q scan or Spiral CT for PE

**Management**

- before initiating treatment, obtain a baseline CBC, including platelets, and aPTT
- warfarin is contraindicated during pregnancy due to its potential teratogenic effects
- unfractionated heparin
  - bolus of 5,000 IU followed by an infusion of ~30,000 IU/24h
  - measure aPTT 6 h after the bolus
  - maintain aPTT at a therapeutic level (1.5-2 x normal)
  - repeat q24h once therapeutic
  - heparin-induced thrombocytopenia (HIT) uncommon (3%) but serious complication
  - LMWH can also be used in pregnancy
- compression stockings
- poor evidence to support a recommendation for or against avoidance of prolonged sitting
- VTE prophylaxis:
  - women on long-term anticoagulation: full therapeutic anticoagulation throughout pregnancy and for 6-12 wk postpartum
  - women with a non-active PMHx of VTE: unfractionated heparin regimens suggested
- routine VTE prophylaxis:
  - insufficient evidence in pregnancy to recommend routine use of LMWH
  - current prophylaxis regimens for acquired thrombophilias (e.g. APS syndrome) include low dose Aspirin® in conjunction with prophylactic heparin

## Bleeding in Pregnancy

### First and Second Trimester Bleeding

**Approach to the Patient with Bleeding in T1/T2**

- **history**
  - risk factors for ectopic pregnancy (previous ectopic pregnancies, history of STI/PID, IUD use, previous pelvic surgery, smoking)
  - previous spontaneous abortion
  - recent trauma
  - characteristics of the bleeding (including any tissue passed)
  - characteristics of the pain (cramping pain suggests SA)
  - history of coagulopathy
  - gynecological/obstetric history
  - dizziness (significant blood loss, may be associated with ruptured ectopic)
  - fever (may be associated with septic abortion)
- **physical**
  - vitals (including orthostatic changes)
  - abdomen (SFH, tenderness, presence of contractions)
  - perineum (signs of trauma, genital lesions)
  - speculum exam (cervical os open or closed, presence of active bleeding/clots/tissue)
  - pelvic exam (uterine size, adnexal mass, uterine/adnexal tenderness)

**Bleeding in Pregnancy Definitions**

- First trimester bleeding: vaginal bleeding within the first 12 wk
- Second trimester bleeding: <20 wk

**Differential Diagnosis**

- Physiologic bleeding: spotting, due to implantation of placenta – reassure and check serial  $\beta$ -hCGs
- Abortion (threatened, inevitable, incomplete, complete) (see Table 15)
- Abnormal pregnancy (ectopic, molar) (see [Gynecology](#), *Hydatidiform Mole* G48)
- Trauma (post-coital or after pelvic exam)
- Genital lesion (e.g. cervical polyp, neoplasms)

### Investigations

- $\beta$ -hCG (lower than expected for GA in spontaneous abortion (SA), ectopic pregnancy)
- U/S (confirm intrauterine pregnancy and fetal viability)
- CBC
- group and screen

### Treatment

- IV resuscitation for hemorrhagic shock
- treat the underlying cause

## Spontaneous Abortions

- see *Termination of Pregnancy*, OB11 for therapeutic abortions

**Table 15. Classifications of Spontaneous Abortions**

Type	History	Clinical	Management ( $\pm$ Rhogam <sup>®</sup> )
<b>Threatened</b>	Vaginal bleeding $\pm$ cramping	Cervix closed and soft U/S shows viable fetus	Watch and wait <5% go on to abort
<b>Inevitable</b>	Increasing bleeding and cramps $\pm$ rupture of membranes	Cervix closed until products start to expel, then external os opens U/S variable but usually nonviable fetus	a) Watch and wait b) Misoprostol 400-800 $\mu$ g PO/PV c) D&C $\pm$ oxytocin
<b>Incomplete</b>	Extremely heavy bleeding and cramps $\pm$ passage of tissue noticed	Cervix open U/S products of conception	a) Watch and wait b) Misoprostol 400-800 $\mu$ g PO/PV c) D&C $\pm$ oxytocin
<b>Complete</b>	Bleeding and complete passage of sac and placenta	Cervix open U/S no products of conception	No D&C – expectant management
<b>Missed</b>	No bleeding (fetal death in utero)	Cervix closed U/S may show SGA, no fetal heart activity; nonviable fetus	a) Watch and wait b) Misoprostol 400-800 $\mu$ g PO/PV c) D&C $\pm$ oxytocin
<b>Recurrent</b>	3+ consecutive spontaneous abortions		Evaluate mechanical, genetic, environmental and other risk factors
<b>Septic</b>	Contents of uterus infected – infrequent		D&C IV broad spectrum antibiotics

### Etiology of Recurrent Pregnancy Loss

#### MAKE ME

Type	History
<b>Mechanical</b>	Uterine anomalies <ul style="list-style-type: none"> <li>• Congenital (septate uterus)</li> <li>• Leiomyoma</li> <li>• Endometrial polyps</li> <li>• Intrauterine adhesions</li> </ul>
<b>Autoimmune</b>	Immunologic Factors <ul style="list-style-type: none"> <li>• Antiphospholipid syndrome (blood tests: lupus anticoagulant, anti-cardiolipin Ab, anti-<math>\beta</math>2 glycoprotein-I)</li> </ul>
<b>Karyotype</b>	<ul style="list-style-type: none"> <li>• Aneuploidy</li> <li>• Chromosomal rearrangements</li> <li>• Check both parents</li> <li>• Young mother, <math>\geq 3</math> miscarriages, Fhx miscarriage/stillbirth/malformation</li> </ul>
<b>Endocrine</b>	Poorly controlled disease: <ul style="list-style-type: none"> <li>• Thyroid (associated with high antibody/hormone levels)</li> <li>• Diabetes mellitus (secondary to hyperglycemia, maternal vascular disease)</li> <li>• PCOS</li> </ul>
<b>Maternal Infection</b>	No infectious agent has been proven to cause recurrent pregnancy loss, though some cause sporadic loss (Listeria, toxoplasmosis, CMV, HSV)
<b>Environment</b>	Obesity, smoking, alcohol use, and caffeine consumption may contribute

### Management of Abortions

- Always rule out an ectopic
- Always check Rh; if negative, give Rhogam<sup>®</sup>
- Always ensure patient is hemodynamically stable

### Clinical Features of Ectopic Pregnancy

#### 4Ts and 1S

**Temperature**  $>38^{\circ}\text{C}$  (20%)

**Tenderness:** abdominal (90%)  $\pm$  rebound (45%)

**Tenderness** on bimanual examination, cervical motion tenderness

**Tissue:** palpable adnexal mass (50%) (half have contralateral mass due to lutein cyst)

**Signs of pregnancy** (e.g. Chadwick's sign, Hegar's sign)

More than half of patients with ectopic pregnancy have no risk factors.

## Ectopic Pregnancy

### Definition

- embryo implants outside of the endometrial cavity

### Epidemiology

- 1/100 pregnancies
- fourth leading cause of maternal mortality, leading cause of death in first trimester
- increase in incidence over the last 3 decades
- three commonest locations for ectopic pregnancy: ampullary (70%), isthmic (12%), fimbrial (11%)

### Etiology

- 50% due to damage of fallopian tube cilia following PID
- intrinsic abnormality of the fertilized ovum
- conception late in cycle
- transmigration of fertilized ovum to contralateral tube

**Figure 3. Sites of ectopic pregnancy implantation**

**Ampullary (70%) >> isthmal (12%) > fimbrial (11%) > ovarian (3%) > interstitial (2%) > abdominal (1)**

### Risk Factors

- previous ectopic pregnancy
- gynecologic:
  - IUD use – increased risk of ectopic if pregnancy occurs
  - history of PID (especially infection with *C. trachomatis*), salpingitis
  - infertility
  - clomiphene citrate (for induction of ovulation)
- previous procedures:
  - any surgery on fallopian tube (for previous ectopic, tubal ligation, etc.)
  - abdominal surgery for ruptured appendix, etc.
  - IVF pregnancies following ovulation induction (7% ectopic rate)
- smoking
- structural:
  - uterine leiomyomas
  - adhesions
  - abnormal uterine anatomy (e.g. T-shaped uterus)

### Investigations

- serial  $\beta$ -hCG levels; normal doubling time with intrauterine pregnancy is 1.6-2.4 d in early pregnancy
  - rise of <20% of  $\beta$ -hCG is 100% predictive of a nonviable pregnancy
  - prolonged doubling time, plateau or decreasing levels before 8 wk implies nonviable gestation but does not provide information on location of implantation
  - 85% of ectopic pregnancies demonstrate abnormal  $\beta$ -HCG doubling
- ultrasound
  - U/S is only definitive if fetal cardiac activity is detected in the tube or uterus
  - intrauterine sac should be visible when serum  $\beta$ -hCG is
    - ♦ >1,500 mIU/mL (transvaginal)
    - ♦ >6,000 mIU/mL or 6 wk GA (transabdominal)
  - specific finding on transvaginal U/S is a tubal ring
- laparoscopy (for definitive diagnosis)

### Treatment

- goals of treatment: conservative (preserve tube if possible), maintain hemodynamic stability
- surgical (laparoscopy)
  - linear salpingostomy if tube salvageable
  - salpingectomy if tube damaged or ectopic is ipsilateral recurrence
  - 15% risk of persistent trophoblast; must monitor  $\beta$ -hCG titres weekly until they reach non-detectable levels
  - consider Rhogam® if Rh negative
  - may require laparotomy if patient is unstable, extensive abdominal surgical history, etc.

#### DDx of Lower Abdominal Pain

- Urinary tract: UTI, kidney stones
- GI: diverticulitis, appendicitis
- Gyn: endometriosis, PID, fibroid (degenerating, infarcted, torsion), ovarian torsion, ovarian neoplasm, ovarian cyst, pregnancy-related

#### If Ectopic Pregnancy Ruptures

- Acute abdomen with increasing pain
- Abdominal distention
- Shock

- medical = methotrexate (for indications see Figure 4)
  - use 50 mg/m<sup>2</sup> body surface area; given in a single IM dose
  - this is 1/5 to 1/6 chemotherapy dose, therefore minimal side effects (reversible hepatic dysfunction, diarrhea, gastritis, dermatitis)
  - follow  $\beta$ -hCG levels weekly until  $\beta$ -hCG is non-detectable
    - ♦ plateau or rising levels suggest persisting trophoblastic tissue (requires further treatment)
  - 82-95% success rate up to 25% will require a second dose
  - tubal patency following methotrexate treatment approaches 80%

### Prognosis

- 9% of maternal deaths during pregnancy
- 40-60% of patients will become pregnant again after surgery
- 10-20% will have subsequent ectopic pregnancy

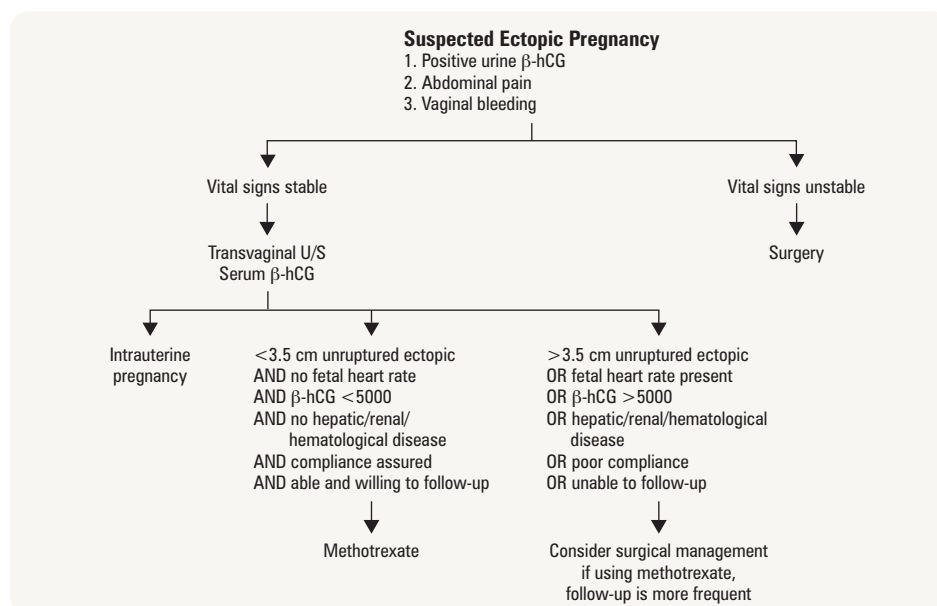

Figure 4. Algorithm for suspected ectopic pregnancy

### Interventions for Tubal Ectopic Pregnancy

Cochrane DB Syst Rev 2007;1:CD000324

**Study:** Cochrane Review of randomized controlled trials comparing treatments in women with tubal ectopic pregnancy.

**Patients:** Women with a diagnosis of tubal ectopic pregnancy.

**Intervention:** Surgery-salpingectomy/salpingostomy by open surgery or by laparoscopy, medical treatment, and expectant management.

**Main outcome:** Primary treatment success, defined as an uneventful decline in serum  $\beta$ -hCG to undetectable levels by the initial treatment.

**Results:** Intramuscular MTX therapy and salpingostomy yielded similar treatment success rates (82-95% for MTX therapy vs. 80-92% for salpingostomy).

## Antepartum Hemorrhage

### Definition

- vaginal bleeding from 20 wk to term

### Differential Diagnosis

- bloody show (shedding of cervical mucous plug) – most common etiology in T3
- placenta previa
- abruptio placentae – most common pathological etiology in T3
- vasa previa
- cervical lesion (cervicitis, polyp, ectropion, cervical cancer)
- uterine rupture
- other: bleeding from bowel or bladder, placenta accreta, abnormal coagulation

### Key Questions to Ask in Antepartum Hemorrhage

- How much bleeding?
- Are there contractions/cramping/pain?
- Description? Colour, clotting, etc.

Table 16. Comparison of Placenta Previa versus Abruptio Placentae

	Placenta Previa	Abruptio Placentae
<b>Definition</b>	Abnormal location of the placenta near, partially or completely over the internal cervical os	Premature separation of a normally implanted placenta after 20 wk GA
<b>Etiology</b>	Idiopathic	Idiopathic
<b>Epidemiology</b>	0.5-0.8% of all pregnancies	1-2% of all pregnancies
<b>Risk factors</b>	<ul style="list-style-type: none"> <li>• History of placenta previa (4-8% recurrence risk)</li> <li>• Multiparity</li> <li>• Increased maternal age</li> <li>• Multiple gestation</li> <li>• Uterine tumour (e.g. fibroids) or other uterine anomalies</li> <li>• Uterine scar due to previous abortion, C/S, D&amp;C, myomectomy</li> </ul>	<ul style="list-style-type: none"> <li>• Previous abortion (recurrence rate 5-16%)</li> <li>• Maternal hypertension (chronic or gestational hypertension in 50% of abruptions) or vascular disease</li> <li>• Cigarette smoking (&gt;1 pack/d), excessive alcohol consumption, cocaine</li> <li>• Multiparity and/or maternal age &gt;35</li> <li>• PPRM</li> <li>• Rapid decompression of a distended uterus (polyhydramnios, multiple gestation)</li> <li>• Uterine anomaly, fibroids</li> <li>• Trauma (e.g. motor vehicle collision, maternal battery)</li> </ul>
<b>Bleeding</b>	PAINLESS	PAINFUL

### Levels of Abnormal Placental Invasion:

**Placenta Accreta:** AT myometrium (most common)

**Placenta Increta:** INTO myometrium

**Placenta Percreta:** PASSES through myometrium

## Placenta Previa

### Definition

- placenta implanted in the lower segment of the uterus, presenting ahead of the leading pole of the fetus
- the distance of the placental edge from the internal os is described in “millimeters away” from the internal os or “millimeters of overlap” over the internal os.
- greater than 20 millimeters of overlap over the internal os in the third trimester of pregnancy is highly predictive of the need for a C section.
- any degree of overlap after 35 wk is an indication for a C section

### Clinical Features

- PAINLESS bright red vaginal bleeding (recurrent), may be minimized and cease spontaneously, but can become catastrophic
- mean onset of bleeding is 30 wk GA, but onset depends on degree of previa
- **physical exam**
  - uterus soft and non-tender
  - presenting fetal part high or displaced
  - FHR usually normal
  - shock/anemia correspond to degree of apparent blood loss
- **complications**
  - fetal
    - ♦ perinatal mortality low but still higher than with a normal pregnancy
    - ♦ prematurity (bleeding often dictates early C/S)
    - ♦ intrauterine hypoxia (acute or IUGR)
    - ♦ fetal malpresentation
    - ♦ PPROM
    - ♦ risk of fetal blood loss from placenta, especially if incised during C/S
  - maternal
    - ♦ <1% maternal mortality
    - ♦ hemorrhage and hypovolemic shock, anemia, acute renal failure, pituitary necrosis (Sheehan syndrome)
    - ♦ placenta accreta – especially if previous uterine surgery, anterior placenta previa
    - ♦ hysterectomy

Do NOT perform a vaginal exam until placenta previa has been ruled out by U/S.

### Investigations

- transvaginal U/S is more accurate than transabdominal U/S at diagnosing placenta previa at any gestational age
- if the placenta lies between 20 mm of overlap and 20 mm away from the internal os after 26 wk regular transvaginal ultrasounds should be repeated at regular intervals – continued change in the placental location is likely.

**Kleihauer-Betke Test**  
Quantifies fetal cells in the maternal circulation.

### Management

- goal: keep pregnancy intrauterine until the risk of delivery < risk of continuing pregnancy
- stabilize and monitor
  - maternal stabilization: large bore IV with hydration, O<sub>2</sub> for hypotensive patients
  - maternal monitoring: vitals, urine output, blood loss, bloodwork (hematocrit, CBC, INR/PTT, platelets, fibrinogen, FDP, type and cross match)
  - electronic fetal monitoring
  - U/S assessment: when fetal and maternal condition permit, determine fetal viability, gestational age and placental status/position
- Rhogam® if mother is Rh negative
  - Kleihauer-Betke test to determine extent of fetomaternal transfusion so that appropriate dose of Rhogam® can be given
- GA <37 wk and minimal bleeding: expectant management
  - admit to hospital
  - limited physical activity, no douches, enemas, or sexual intercourse
  - consider corticosteroids for fetal lung maturity
  - delivery when fetus is mature or hemorrhage dictates
- GA ≥37 wk, profuse bleeding or L/S ratio is >2:1: deliver by C/S

## Abruptio Placentae

### Clinical Features

- **classification**
  - total (fetal death inevitable) vs. partial
  - external/revealed/apparent: blood dissects downward toward cervix
  - internal/concealed (20%): blood dissects upward toward fetus
  - most are mixed
- **presentation**
  - **PAINFUL** (80%) vaginal bleeding (bleeding not always present if abruption is concealed), uterine tenderness, uterine contractions
  - pain: sudden onset, constant, localized to lower back and uterus
  - shock/anemia out of proportion to apparent blood loss
  - $\pm$  fetal distress, fetal demise (15% present with demise), bloody amniotic fluid (fetal presentation typically normal)
  - $\pm$  coagulopathy

### Complications

- fetal complications: perinatal mortality 25-60%, prematurity, intrauterine hypoxia
- maternal complications:  $<1\%$  maternal mortality, DIC (in 20% of abruptions), acute renal failure, anemia, hemorrhagic shock, pituitary necrosis (Sheehan syndrome), amniotic fluid embolus

Abruptio placentae is the most common cause of DIC in pregnancy.

### Investigations

- clinical diagnosis, U/S not sensitive for diagnosing abruption (sensitivity = 15%)

### Management

- maternal stabilization: large bore IV with hydration; O<sub>2</sub> for hypotensive patients
- maternal monitoring: vitals, urine output, blood loss, bloodwork (hematocrit, CBC, PTT/PT, platelets, fibrinogen, FDP, type and cross match)
- EFM
- blood products on hand (red cells, platelets, cryoprecipitate) because of DIC risk
- Rhogam® if Rh negative
  - Kleihauer-Betke test may confirm abruption
- mild abruption:
  - GA  $<37$  wk: use serial Hct to assess concealed bleeding, deliver when fetus is mature or when hemorrhage dictates
  - GA  $\geq 37$  wk: stabilize and deliver
- moderate to severe abruption:
  - hydrate and restore blood loss and correct coagulation defect if present
  - vaginal delivery if no contraindication and no evidence of fetal or maternal distress OR fetal demise
  - C/S if live fetus and fetal or maternal distress develops with fluid/blood replacement, labour fails to progress or if vaginal delivery otherwise contraindicated

## Vasa Previa

### Definition

- unprotected fetal vessels pass over the cervical os; associated with velamentous insertion of cord into membranes of placenta or succenturiate (accessory) lobe

### Epidemiology

- 1 in 5,000 deliveries – higher in twin pregnancies

### Clinical Features

- **PAINLESS** vaginal bleeding and fetal distress (tachy- to bradyarrhythmia)
- 50% perinatal mortality, increasing to 75% if membranes rupture (most infants die of exsanguination)

### Investigations

- **Apt test** (NaOH mixed with the blood) can be done immediately to determine if the source of bleeding is fetal (supernatant turns pink) or maternal (supernatant turns yellow)
- **Wright stain** on blood smear and look for nucleated red blood cells (in cord, not maternal blood)

### Management

- emergency C/S (since bleeding is from fetus, a small amount of blood loss can have catastrophic consequences)

Figure 5. Vasa previa

# Multiple Gestation

## Epidemiology

- incidence of twins is 1/80 and triplets 1/6,400 in North America
- 2/3 of twins are dizygotic (fraternal)
  - risk factors for dizygotic twins: IVF, increased maternal age, newly discontinued OCP, ethnicity (e.g. certain African regions)
- monozygous twinning occurs at a constant rate worldwide (1/250)
- determine zygosity by number of placentas, thickness of membranes, sex, blood type

## Clinical Features

Table 17. Complications Associated with Multiple Gestation

Maternal	Utero-placental	Fetal
Hyperemesis gravidarum	Increased PROM/PTL	Prematurity*
GDM	Polyhydramnios	IUGR
Gestational HTN	Placenta previa	Malpresentation
Anemia	Placental abruption	Congenital anomalies
Increased physiological stress on all systems	PPH (uterine atony)	Twin-twin transfusion
Increased compressive symptoms	Umbilical cord prolapse	Increased perinatal morbidity and mortality
C/S	Cord anomalies	Twin interlocking
	(velamentous insertion, 2 vessel cord)	(twin A breech, twin B vertex)
		Single fetal demise

\*Most common cause of perinatal mortality in multiple gestation

## Management

- U/S determination of chorionicity must be done within first trimester (ideally 8-12 wk GA)
- increased antenatal surveillance
  - serial U/S q2-3wk from 28 wk GA to assess growth (uncomplicated diamniotic dichorionic)
  - increased frequency of ultrasounds in monochorionic diamniotic and monochorionic monoamniotic twins
  - Doppler flow studies weekly if discordant fetal growth (>30%)
  - BPP as needed
- may attempt vaginal delivery if twin A presents as vertex, otherwise C/S (40-50% of all twin deliveries, 15% of cases have twin A delivered vaginally and twin B delivered by C/S)
- mode of delivery depends on fetal weight, GA, presentation

### The Ps of Multiple Gestation Complications

#### Increased rates of:

- Puking
- Pallor (anemia)
- Preeclampsia/PIH
- Pressure (compressive symptoms)
- PTL/PROM/PPROM
- Polyhydramnios
- Placenta previa/abruptio
- PPH/APH
- Prolonged labour
- Cord Prolapse
- Prematurity
- Mal Presentation
- Perinatal morbidity and mortality
- Parental distress
- Postpartum depression

Figure 6. Classification of twin pregnancies

\*Indicates time of cleavage

## Twin-Twin Transfusion Syndrome

### Epidemiology

- 10% of monochorionic twins
- concern if >30% discordance in estimated fetal weight

### Etiology

- arterial blood from donor twin passes through placenta into vein of recipient twin

### Clinical Features

- donor twin: IUGR, hypovolemia, hypotension, anemia, oligohydramnios
- recipient twin: hypervolemia, hypertension, CHF, polycythemia, edema, polyhydramnios, kernicterus in neonatal period

### Investigations

- detected by U/S screening, Doppler flow analysis

### Management

- therapeutic serial amniocentesis to decompress polyhydramnios of recipient twin and decrease pressure in cavity and on placenta
- intrauterine blood transfusion to donor twin if necessary
- laparoscopic occlusion of placental vessels

## Growth Discrepancies

### Intrauterine Growth Restriction

#### Definition

- infant weight <10th percentile for GA or <2,500 g

#### Etiology/Risk Factors

- maternal causes
  - malnutrition, smoking, drug abuse, alcoholism, cyanotic heart disease, Type 1 DM, SLE, pulmonary insufficiency, previous IUGR
- maternal-fetal
  - any disease causing placental insufficiency
  - includes gestational HTN, chronic HTN, chronic renal insufficiency, gross placental morphological abnormalities (infarction, hemangiomas)
- fetal causes:
  - TORCH infections, multiple gestation, congenital anomalies

#### Clinical Features

- symmetric/Type I (20%): occurs early in pregnancy
  - inadequate growth of head and body
  - head:abdomen ratio may be normal (>1 up to 32 wk; =1 at 32-34 wk; <1 after 34 wk GA)
  - usually associated with congenital anomalies or TORCH infections
- asymmetric/Type II (80%): occurs late in pregnancy
  - brain is spared, therefore head:abdomen ratio increased
  - usually associated with placental insufficiency
  - more favorable prognosis than Type I
- complications
  - prone to meconium aspiration, asphyxia, polycythemia, hypoglycemia, and mental retardation
  - greater risk of perinatal morbidity and mortality

#### Investigations

- SFH measurements at every antepartum visit
- if mother at high risk or SFH lags >2 cm behind GA:
  - anatomy U/S for BPD, head and abdominal circumference, femur length and fetal weight, AFW (decrease associated with IUGR)
  - $\pm$  BPP
  - Doppler analysis of umbilical cord blood flow

#### Management

- prevention via risk modification prior to pregnancy is ideal
- modify controllable factors: smoking, alcohol, nutrition and treat maternal illness
- bed rest in LLDP
- serial BPP (monitor fetal growth) and determine cause of IUGR, if possible
- delivery when extrauterine existence is less dangerous than continued intrauterine existence (abnormal function tests, absent growth, severe oligohydramnios) especially if GA >34 wk
- liberal use of C/S since IUGR fetus withstands labour poorly

#### TORCH

Toxoplasmosis

Others: e.g. syphilis

Rubella

CMV

HSV

- See Table 13, OB20

#### Differential Diagnosis of

#### Incorrect Uterine Size for Dates

- Inaccurate dates
- Maternal: diabetes mellitus
- Maternal-fetal: polyhydramnios, oligohydramnios
- Fetal: abnormal karyotype, IUGR, macrosomia, fetal anomaly, abnormal lie, multiple gestation

#### Monitoring Fetal Growth with U/S

Done biweekly to show growth beyond the margin of error.

## Macrosomia

### Definition

- infant weight >90th percentile for a particular GA or >4,000 g

### Etiology/Risk Factors

- maternal obesity, GDM, past history of macrosomic infant, prolonged gestation, multiparity

### Clinical Features

- increased risk of perinatal mortality
- CPD and birth injuries (shoulder dystocia, fetal bone fracture) more common
- complications of DM in labour (see *Medical Conditions in Pregnancy*, OB13)

### Investigations

- serial SFH
- further investigations if mother at high risk or SFH >2 cm ahead of GA
- U/S predictors
  - polyhydramnios
  - third trimester AC >1.5 cm/wk
  - HC/AC ratio <10th percentile
  - FL/AC ratio <20th percentile

### Management

- prophylactic C/S is a reasonable option where EFW >5,000 g in non-diabetic woman and EFW >4,500 g in diabetic woman
  - no evidence that prophylactic C/S improves outcomes
- early induction of labour is not recommended for non-diabetic mothers
- risks and benefits of early induction (risk of C/S vs. risk of dystocia) must be weighed in diabetic mothers, as current research is unclear

## Polyhydramnios/Oligohydramnios

Table 18. Polyhydramnios and Oligohydramnios

	Polyhydramnios	Oligohydramnios
<b>Definition</b>	AFI >25 cm U/S: single deepest pocket >8 cm	AFI <5 cm U/S: single deepest pocket ≤2 cm
<b>Etiology</b>	Idiopathic most common Maternal: <ul style="list-style-type: none"> <li>• Type 1 DM: abnormalities of transchorionic flow</li> </ul> Maternal-fetal: <ul style="list-style-type: none"> <li>• Chorioangiomas</li> <li>• Multiple gestation</li> <li>• Fetal hydrops (increased erythroblastosis)</li> </ul> Fetal: <ul style="list-style-type: none"> <li>• Chromosomal anomaly (up to 2/3 of fetuses have severe polyhydramnios)</li> <li>• Respiratory: cystic adenomatoid malformed lung</li> <li>• CNS: anencephaly, hydrocephalus, meningocele</li> <li>• GI: tracheoesophageal fistula, duodenal atresia, facial clefts (interfere with swallowing)</li> </ul>	Idiopathic most common Maternal: <ul style="list-style-type: none"> <li>• Uteroplacental insufficiency (pre-eclampsia, nephropathy)</li> <li>• Medications (ACEI)</li> </ul> Fetal: <ul style="list-style-type: none"> <li>• Congenital urinary tract anomalies (renal agenesis, obstruction, posterior urethral valves)</li> <li>• Demise/chronic hypoxemia (blood shunt away from kidneys to perfuse brain)</li> <li>• IUGR</li> <li>• Ruptured membranes: prolonged amniotic fluid leak</li> <li>• Amniotic fluid normally decreases after 35 wk</li> <li>• Post-dates (AFV normally decreases after 35 wk)</li> </ul>
<b>Epidemiology</b>	Occur in 0.2 to 1.6% of all pregnancies	Occur in ~4.5% of all pregnancies Severe form in <0.7% Common in pregnancies >41 wk (~12%)
<b>Clinical Features and Complications</b>	Uterus large for dates, difficulty palpating fetal parts and hearing FHR Maternal complications: <ul style="list-style-type: none"> <li>• Pressure symptoms from overdistended uterus (dyspnea, edema, hydronephrosis)</li> </ul> Obstetrical complications: <ul style="list-style-type: none"> <li>• Cord prolapse, placental abruption, malpresentation, preterm labour, uterine dysfunction and PPH</li> </ul>	Uterus small for dates Fetal complications: <ul style="list-style-type: none"> <li>• 15-25% have fetal anomalies</li> <li>• Amniotic fluid bands (T1) can lead to Potter's facies, limb deformities, abdominal wall defects</li> </ul> Obstetrical complications: <ul style="list-style-type: none"> <li>• Cord compression</li> <li>• Increased risk of adverse fetal outcomes</li> <li>• Pulmonary hypoplasia (late-onset)</li> <li>• Marker for infants who may not tolerate labour well</li> </ul>

**Table 18. Polyhydramnios and Oligohydramnios (continued)**

	Polyhydramnios	Oligohydramnios
<b>Management</b>	Determine underlying cause: <ul style="list-style-type: none"> <li>• Screen for maternal disease/infection</li> <li>• Complete fetal U/S evaluation</li> </ul> Depends on severity: <ul style="list-style-type: none"> <li>• Mild to moderate cases require no treatment</li> <li>• If severe, hospitalize and consider therapeutic amniocentesis</li> </ul>	Always warrants admission and investigation: <ul style="list-style-type: none"> <li>• R/O ROM</li> <li>• Fetal monitoring (NST, BPP)</li> <li>• U/S Doppler studies (umbilical cord and uterine artery)</li> </ul> Maternal hydration with oral or IV fluids to help increase amniotic fluid Vesicoamniotic shunt: if etiology is related to fetal obstructive uropathy; however, pulmonary function may not be restored with restoration of amniotic fluid Injection of fluid via amniocentesis will improve condition for ~1 wk – may be most helpful for visualizing any associated fetal anomalies Consider delivery if term Amnio-infusion may be considered during labour via intra-uterine catheter
<b>Prognosis</b>	2-5 fold increase in risk of perinatal mortality	Poorer with early onset High mortality related to congenital malformations and pulmonary hypoplasia when diagnosed during T2

## Normal Labour and Delivery

### Definition of Labour

- true labour: regular, painful contractions of increasing intensity associated with progressive **dilatation** and **effacement** of cervix and descent of presenting part, or progression of station
  - preterm (>20 but <36+6 wk GA)
  - term (37-41+6 wk GA)
  - post-term (>42 wk GA)
- false labour: Braxton-Hicks contractions
  - irregular contractions, with unchanged intensity and long intervals, occur throughout pregnancy and not associated with any dilatation, effacement or descent
  - often relieved by rest or sedation

### The Cervix

- dilatation: latent phase: 0-3 cm; active phase: 4-10 cm
- effacement: thinning of the cervix by percentage or length of cervix (cm)
- consistency: firm vs. soft
- position: posterior vs. anterior
- application: contact between the cervix and presenting part (i.e. well or poorly applied)
- see Bishop score (Table 23, OB36)

### The Fetus

- **fetal lie**
  - orientation of the long axis of the fetus with respect to the long axis of the uterus (longitudinal, transverse, oblique)
- **fetal presentation**
  - fetal part presenting at pelvic outlet
    - ♦ breech (complete, frank, footling) (see Figure 9, OB40)
    - ♦ cephalic (vertex, face, asynclitic)
    - ♦ transverse (shoulder)
    - ♦ compound (fetal extremity prolapses along with presenting part)
  - all except vertex are considered malpresentations (see *High Risk Labour and Delivery*, OB38)
- **fetal position**
  - position of presenting part of the fetus relative to the maternal pelvis
    - ♦ OA: most common presentation (“normal”) – left OA most common
    - ♦ OP: most rotate spontaneously to OA; may cause prolonged second stage of labour
    - ♦ OT: leads to arrest of dilatation
  - normally, fetal head enters maternal pelvis and engages in OT position
  - subsequently rotates to OA position (or OP in a small percentage of cases)

#### Maternal Triage Assessment

**ID:** Age, GPA, EDD, GA, GBS, Rh, Ser

**CC**

**HPI:** 4 key questions:

- Contractions: Since when, how close (q x min), how long (x s), how painful
- Bleeding: Since when, how much (pads), colour (pink/mucous = show vs. brownish vs. bright red ± clots), pain?, last U/S, trauma/intercourse?
- Fluid (ROM): Since when, large gush vs. trickle, soaked pants?, clear vs. green vs. red?, continuous?
- FM: As much as usual?, When last movement?, Kick counts (lie still for 1-2 h, cold juice, feel FM – should have 6 movements in 2 h)

**HxPreg:** Any complications (HTN, GDM, infections), IPS/FTS screening, last ultrasound (BPP score, growth/estimated fetal weight, position), last vaginal exam

**POBHx:** Every previous pregnancy and outcome: Year, SVD/CS/miscarriage/abortion, baby size, length of labour, use of vacuum or forceps, complications

**PMHx, Meds, Allergies, SHx**

**O/E:** Maternal vitals, fetal heart tracing (baseline, variability, presence of accelerations/decelerations), Leopold's, vaginal exam, U/S

#### Reference point for describing fetal position:

- Occiput for cephalic presentation
- Sacrum for breech presentation
- Mentum for face presentation

- **attitude**
  - flexion/extension of fetal head relative to shoulders
    - ♦ brow presentation: head partially extended (requires C/S)
    - ♦ face presentation: head fully extended
      - mentum posterior always requires C/S, mentum anterior will deliver vaginally
- **station**
  - position of presenting part relative to ischial spines – determined by vaginal exam
    - ♦ at ischial spines = station 0 = engaged
    - ♦ -5 to -1 cm above ischial spines or
    - ♦ +1 to +5 cm below ischial spines
    - ♦ alternatively stations can be placed on a scale from -3 to +3

Figure 7. Fetal positions

## Four Stages of Labour

### First Stage of Labour

- latent phase
  - uterine contractions typically infrequent and irregular
  - slow cervical dilatation (usually to 3-4 cm) and effacement
- active phase
  - rapid cervical dilatation to full dilatation (nulliparous ~1.2 cm/h, multiparous ~1.5 cm/h)
  - phase of maximum slope on cervical dilatation curve (see Figure 10, OB43)
  - painful, regular contractions q2-3 min, lasting 45-60 s
  - contractions strongest at fundus, weakest at lower segment

### Second Stage of Labour

- from full dilatation to delivery of the baby
- mother feels a desire to bear down and push with each contraction
- women may choose a comfortable position that enhances pushing efforts and delivery
  - upright (semi-sitting, squatting) and LLDP are supported in the literature
- progress measured by descent

### Third Stage of Labour

- separation and expulsion of the placenta
- can last up to 30 min before intervention indicated
- start oxytocin IV drip or give 10 U IM after delivery of anterior shoulder in anticipation of placental delivery, otherwise give after delivery of placenta
- routine oxytocin administration in third stage of labour can reduce the risk of PPH by >40%

#### Course of Normal Labour

Stage	Nulliparous	Multiparous
First	6-18 h	2-10 h
Second	30 min-3 h	5-30 min
Third	5-30 min	5-30 min

#### Signs of Placental Separation

- Gush of blood
- Lengthening of cord
- Uterus becomes globular
- Fundus rises

#### Continuous Support for Women During Childbirth

Cochrane DB Syst Rev 2011;16:CD003766

**Study:** Systematic review of 21 RCTs from 11 countries, 15,061 women in labour.

**Intervention:** Continuous support during labour vs. usual care.

**Outcome:** Effects on mothers and their babies.

**Results:** Continuous intrapartum support increased likelihood of shorter labour, spontaneous vaginal birth, decrease in analgesia use, and a decrease in dissatisfaction with childbirth experience. Greatest benefit when provider is not a health care professional. Continuous support was also associated with decreased likelihood to have a Caesarian or instrumental vaginal birth, regional analgesia, or a baby with a low 5 min APGAR score.

### Fourth Stage of Labour

- first postpartum hour
- monitor vital signs and bleeding
- repair lacerations
- ensure uterus is contracted (palpate uterus and monitor uterine bleeding)
- inspect placenta for completeness and umbilical cord for presence of 2 arteries and 1 vein
- 3rd and 4th stages of labour most dangerous to the mother (i.e. hemorrhage)

## The Cardinal Movements of the Fetus During Delivery

**Figure 8. Cardinal movements of fetus during delivery**

Adapted from illustration in Williams Obstetrics, 19th ed

## Analgesic and Anesthetic Techniques in Labour and Birth

- pain or anxiety leads to high endogenous catecholamines, which produce a direct inhibitory effect on uterine contractility

### Non-pharmacologic Pain Relief Techniques

- reduction of painful stimuli
  - maternal movement, position change, counter-pressure, abdominal compression
- activation of peripheral sensory receptors
  - superficial heat and cold
  - immersion in water during labour
  - touch and massage, acupuncture and acupressure
  - TENS
  - intradermal injection of sterile water
  - aromatherapy
- enhancement of descending inhibitory pathways
  - attention focusing and distraction
  - hypnosis
  - music and audio analgesia
  - biofeedback

### Pharmacologic Methods (see [Anesthesia](#), A22)

- nitrous oxide (e.g. self-administered Entonox®)
- narcotics (usually combined with anti-emetic)
- pudendal nerve block
- perineal infiltration with local anesthetic
- regional anesthesia (epidural block, CSE, spinal)

## Fetal Monitoring in Labour

- see online [Fetal Heart Rate Tutorial](#)

### Vaginal Exam

- membrane status
- cervical effacement (thinning), dilatation, consistency, position, application
- fetal presenting part, position, station
- bony pelvis size and shape
- monitor progress of labour at regular intervals and document in a partogram

### Intrapartum Fetal Monitoring

- intermittent fetal auscultation with Doppler device q15-30min for 1 min in first stage active phase following a contraction, q5min during second stage when pushing has begun
- continuous electronic FHR monitoring reserved for abnormal auscultation, prolonged labour, and labour which is induced or augmented
  - routine use of continuous electronic monitoring shown to lead to higher intervention rates and no improvement in outcome for the neonate
  - techniques for continuous monitoring include external (Doppler) vs. internal (fetal scalp electrode) monitoring
- fetal scalp sampling should be used in conjunction with electronic FHR monitoring and contraction monitoring (CTG) to resolve the interpretation of abnormal or atypical patterns

### Electronic FHR Monitoring

- FHR measured by Doppler; contractions measured by tocometer
- described in terms of baseline FHR, variability (short term, long term) and periodicity (accelerations, decelerations)
- **Baseline FHR**
  - normal range is 110-160 bpm
  - parameter of fetal well-being vs. distress
- **Variability**
  - physiologic variability is a normal characteristic of FHR
  - variability is measured over a 15 min period and is described as: absent, minimal (less than 6 bpm), moderate (6-25 bpm), marked (greater than 25 bpm)
  - normal variability indicates fetal acid-base status is acceptable
  - can only be assessed by electronic fetal monitoring (CTG)
  - variability decreases intermittently even in healthy fetus (see Table 21)
- **Periodicity**
  - accelerations: increase of  $\geq 15$  bpm lasting  $\geq 15$  s, in response to fetal movement or uterine contraction (or  $\geq 10$  bpm lasting  $\geq 10$  s if  $< 32$  wk GA)
  - decelerations: 3 types, described in terms of shape, onset, depth, duration recovery, occurrence, and impact on baseline FHR and variability (see Table 20)

**Table 19. Factors Affecting Fetal Heart Rate**

	<b>Fetal Tachycardia (FHR &gt; 160)</b>	<b>Fetal Bradycardia (FHR &lt; 110)</b>	<b>Decreased Variability</b>
<b>Maternal Factors</b>	Fever Hyperthyroidism Anemia	Hypothermia Hypotension Hypoglycemia	Infection Dehydration
<b>Fetal Factors</b>	Arrhythmia Anemia	Rapid descent Dysrhythmia Heart block	CNS anomalies Dysrhythmia Inactivity/sleep cycle, preterm fetus
<b>Drugs</b>	Sympathomimetics	$\beta$ -blockers Anesthetics	Narcotics, sedatives Magnesium sulphate, $\beta$ -blockers
<b>Uteroplacental</b>	Early hypoxia (abruption, HTN) Chorioamnionitis	Late hypoxia (abruption, HTN) Acute cord prolapse Hypercontractility	Hypoxia

### Fetal Scalp Blood Sampling

- indicated when atypical or abnormal fetal heart rate is suggested by clinical parameters including heavy meconium or moderately to severely abnormal FHR patterns, including unexplained low variability, repetitive late decelerations, complex variable decelerations, fetal cardiac arrhythmias
  - pH  $\geq 7.25$ : normal, repeat if abnormal FHR persists
  - pH 7.21-7.24: repeat assessment in 30 min or consider delivery if rapid fall since last sample
  - pH  $\leq 7.20$ : indicates fetal acidosis, delivery is indicated

#### Continuous CTG as a Form of EFM for Fetal Assessment during Labour

*Cochrane DB Syst Rev 2006;3:CD006066*

**Purpose:** To examine the effectiveness of continuous fetal heart monitoring (cardiotocography) during labour on improving health outcomes.

**Methods:** Systematic review comparing continuous fetal monitoring with no monitoring, intermittent auscultation, and intermittent monitoring.

**Results:** 12 trials (37,000 women) meeting search criteria were identified, of which 2 trials were high quality. Continuous electronic fetal heart monitoring did not have an effect on overall perinatal death rate compared to intermittent auscultation, with a relative risk (RR) of 0.85, 95% CI 0.59-1.23. Continuous monitoring also led to increased incidence of C/S (RR 1.66, 95% CI 1.30 to 2.13,  $n=18,761$ , 10 trials) and instrument assisted vaginal delivery (RR 1.16, 95% CI 1.01 to 1.32,  $n=18,151$ , nine trials). These results appeared consistent regardless if pregnancy was high risk, low risk, or preterm.

**Conclusion:** Continuous fetal cardiotocography does not significantly improve infant mortality or other standards of infant well-being. It increases the incidence of C/S and instrument assisted vaginal delivery.

- contraindications
  - known or suspected fetal blood dyscrasia (hemophilia, von Willebrand disease)
  - active maternal infection (HIV, genital herpes)

**Table 20. Comparison of Decelerations**

<b>Early Decelerations</b> <ul style="list-style-type: none"> <li>• Uniform shape with onset early in contraction, returns to baseline by end of contraction, mirrors contraction</li> <li>• Gradual deceleration</li> <li>• Often repetitive; no effect on baseline FHR or variability</li> <li>• Benign, due to vagal response to head compression</li> </ul>	
<b>Variable Decelerations</b> <ul style="list-style-type: none"> <li>• Variable in shape, onset, and duration</li> <li>• Most common type of periodicity seen during labour</li> <li>• Often with abrupt drop in FHR; usually no effect on baseline FHR or variability</li> <li>• Due to cord compression or, in second stage, forceful pushing with contractions</li> </ul>	
<b>Complicated Variable Decelerations</b> <ul style="list-style-type: none"> <li>• To &lt;70 bpm for &gt;60 s</li> <li>• Loss of variability or decrease in baseline after deceleration</li> <li>• Biphasic deceleration</li> <li>• Slow return to baseline</li> <li>• Baseline tachycardia or bradycardia</li> </ul>	
<b>Late Decelerations</b> <ul style="list-style-type: none"> <li>• Uniform shape with onset late in contraction, nadir after peak of contraction, and slow return to baseline</li> <li>• May cause decreased variability and change in baseline FHR</li> <li>• Due to fetal hypoxia and acidemia, maternal hypotension or uterine hypertonus</li> <li>• Usually a sign of uteroplacental insufficiency (an ominous sign)</li> </ul>	

**Rule of 60s Suggesting Severe Variable Decelerations:**  
 Deceleration to <60 bpm  
 >60 bpm below baseline  
 >60 s in duration with slow return to baseline

**Table 21. Classification of Intrapartum EFM Tracings**

	Normal Tracing (Category 1)	Atypical Tracing* (Category 2)	Abnormal Tracing* (Category 3)
<b>Baseline</b>	110-160 bpm	Bradycardia 100-110 bpm Tachycardia >160 for 30-80 min Rising baseline	Bradycardia <100 bpm Tachycardia >160 bpm for >80 min Erratic baseline
<b>Variability</b>	6-25 bpm ≤5 bpm for <40 min	≤5 bpm for 40-80 min	<5 bpm for >80 min ≥25 bpm for >10 min
<b>Decelerations</b>	None Early decelerations Occasional uncomplicated variable decelerations	Repetitive (≥3) uncomplicated variable decelerations Occasional late decelerations Any prolonged deceleration 2-3 min	Repetitive (≥3) complicated variable decelerations Repetitive late decelerations Any prolonged deceleration >3 min
<b>Accelerations</b>	Accelerations spontaneous or during scalp stimulation	Absent with scalp stimulation	Nearly absent
<b>Action</b>	EFM may be interrupted for ≤30 min if mother/fetus stable	Further assessment required	Action required: review clinical situation, obtain scalp pH, prepare for possible delivery

Adapted from SOGC guidelines, September 2008

\*Previous classification was "reassuring" vs. "non-reassuring", but distinction is now made between tracings that have some concerning changes but do not require immediate action (atypical) versus those with major concerns requiring immediate intervention (abnormal)

#### Approach to the Management of Abnormal FHR

**POISON – ER**  
 Position (LLPD)  
 O<sub>2</sub> (100% by mask)  
 IV fluids (corrects maternal hypotension)  
 Fetal Scalp stimulation  
 Fetal Scalp electrode  
 Fetal Scalp pH  
 Stop Oxygen  
 Notify MD

Vaginal Exam to r/o cord prolapse  
 Rule out fever, dehydration, drug effects, prematurity

- If above fails, consider C/S

### Fetal Oxygenation

- uterine contractions during labour decrease uteroplacental blood flow, which results in reduced oxygen delivery to the fetus
- most fetuses tolerate this reduction in flow and have no adverse effects
- distribution of oxygen to the fetus depends on maternal, uteroplacental and fetal factors

- **fetal response to hypoxia/asphyxia**
  - decreased movement, tone, and breathing activities
  - redistribution of fetal blood flow
    - ♦ increased flow to brain, heart, and adrenals
    - ♦ decreased flow to kidneys, lungs, gut, liver and peripheral tissues
    - ♦ increase in blood pressure
  - transient fetal bradycardia followed by fetal tachycardia
  - anaerobic metabolism (decreased pH)

**Table 22. Factors Affecting Fetal Oxygenation**

Factor	Mechanism	Example
<b>Maternal</b>	Decreased maternal oxygen carrying capacity	Significant anemia (iron deficiency, hemoglobinopathies), carboxyhemoglobin (smokers)
	Decreased uterine blood flow	Hypotension (blood loss, sepsis), regional anesthesia, maternal positioning
	Chronic maternal conditions	Vasculopathies (SLE, Type 1 DM, chronic HTN), antiphospholipid syndrome, cyanotic heart disease, COPD
<b>Uteroplacental</b>	Uterine hypertonus	Placental abruption, hyperstimulation secondary to oxytocin, prostaglandins or normal labour
	Uteroplacental dysfunction	Placental abruption, placental infarction (dysfunction marked by IUGR, oligohydramnios, abnormal Doppler studies), chorioamnionitis, placental edema (diabetes, hydrops), placental senescence (post- dates)
<b>Fetal</b>	Cord compression	Oligohydramnios, cord prolapse or entanglement
	Decreased fetal oxygen carrying capacity	Significant anemia (isoimmunization, feto-maternal bleed), carboxyhemoglobin (exposure to smokers)

## Induction of Labour

### Definition

- artificial initiation of labour before its spontaneous onset for the purpose of delivery of the fetus and placenta

### Prerequisites for Labour Induction

- capability for C/S if necessary
- maternal
  - short, thin, soft, anterior cervix with open os (“inducible” or “ripe”)
  - if cervix is not ripe, use prostaglandin vaginal insert (Cervidil®), prostaglandin gel (Prepidil®), or Foley catheter
- fetal
  - normal fetal heart tracing
  - cephalic presentation
  - adequate fetal monitoring available
- likelihood of success determined by Bishop score
  - cervix considered unfavourable if <6
  - cervix favourable if ≥6
  - score of 9-13 associated with high likelihood of vaginal delivery

**Table 23. Bishop Score**

Cervical characteristic	0	1	2	3
<b>Position</b>	Posterior	Mid	Anterior	–
<b>Consistency</b>	Firm	Medium	Soft	–
<b>Effacement (%)</b>	0-30	40-50	60-70	≥80
<b>Dilatation (cm)</b>	0	1-2	3-4	≥5
<b>Station of fetal head</b>	-3	-2	-1, 0	+1, +2, +3

### Indications

- post-dates pregnancy (generally >41 wk) = most common reason for induction
- maternal factors
  - diabetes mellitus = second most common reason for induction
  - gestational HTN
  - other maternal medical problems, e.g. renal or lung disease
- maternal-fetal factors
  - isoimmunization, PROM, chorioamnionitis, post-term pregnancy

#### Induction vs. Augmentation

**Induction** is the artificial initiation of labour.

**Augmentation** promotes contractions when spontaneous contractions are inadequate.

Induction is indicated when the risk of continuing pregnancy exceeds the risks associated with induced labour and delivery.

#### Consider the Following before Induction

- Indication for induction
- Contraindications
- GA
- Cervical favourability
- Fetal presentation
- Potential for CPD
- Fetal well-being/FHR
- Membrane status

- fetal factors
  - suspected fetal jeopardy as evidenced by biochemical or biophysical indications
  - fetal demise, IUGR

### Risks

- failure to achieve labour and/or vaginal birth
- uterine hyperstimulation and fetal compromise
- maternal side effects to medications
- uterine atony and PPH
- uterine rupture

### Contraindications

- maternal
  - prior classical or inverted T-incision or uterine surgery (e.g. myomectomy)
  - unstable maternal condition
  - active maternal genital herpes
  - invasive cervical carcinoma
  - pelvic structure deformities
- maternal-fetal
  - placenta previa or vasa previa
  - cord presentation
- fetal
  - fetal distress, malpresentation, preterm fetus without lung maturity

#### Evidence for Cervical Ripening Methods (SOGC Guidelines)

- Meta-analysis of five trials has concluded that the use of oxytocin to ripen the cervix is not effective
- Since the best dose and route of misoprostol for labour induction with a live fetus are not known and there are concerns regarding hyperstimulation, the use of misoprostol for induction of labour should be within clinical trials only (Level 1b evidence) or in cases of intrauterine fetal death to initiate labour

#### Intravaginal PGE2 (Cervidil®) Compared to Intravaginal Prostaglandin Gel

4 RCTs have compared the two with varying results, depending on the dosing regime of gel used.

Theoretical advantages of Cervidil®:

- Insertion without a speculum
- Slow, continuous release
- Only one dose required
- Ability to use oxytocin 30 min after removal
- Ability to remove insert if required (i.e. excessive uterine activity)

## Induction Methods

### CERVICAL RIPENING

#### Definition

- use of medications or other means to soften, efface and dilate the cervix to increase likelihood of induction success
- ripening of an unfavourable cervix (Bishop score <6) is warranted prior to induction of labour

#### Methods

- intravaginal prostaglandin PGE2 gel (Prostin® gel): long and closed cervix
  - recommended dosing interval of prostaglandin gel is every 6 to 12 h up to 3 doses
- intravaginal PGE2 (Cervidil®): long and closed cervix, may use if ROM
  - continuous release, can be removed if needed
  - controlled release PGE2
- Foley catheter placement to mechanically dilate the cervix

### INDUCTION OF LABOUR

#### Amniotomy

- artificial rupture of membranes (amniotomy) to stimulate PG synthesis and secretion; may try this as initial measure if cervix is dilated
- few studies address the value of amniotomy alone for induction of labour
- amniotomy plus intravenous oxytocin: more women delivered vaginally at 24 h than amniotomy alone (relative risk = 0.03) and had fewer instrumental vaginal deliveries (relative risk = 5.5)

#### Oxytocin

- oxytocin (Pitocin®): 10 U in 1L NS, run at 0.5-2 mU/min IV increasing by 1-2 mU/min q20-60 min to a max of 36-48 mU/min
  - reduces rate of unsuccessful vaginal deliveries within 24 h when used alone (8.3% vs. 54%, RR 0.16)
  - ideal dosing regime of oxytocin is not known
  - current recommendations: use the minimum dose to achieve active labour and increase q30min as needed
  - reassessment should occur once a dose of 20 mU/min is reached
- potential complications
  - hyperstimulation/tetanic contraction (may cause fetal distress or rupture of uterus)
  - uterine muscle fatigue, uterine atony (may result in PPH)
  - vasopressin-like action causing anti-diuresis

## Augmentation of Labour

- augmentation of labour is used to promote adequate contractions when spontaneous contractions are inadequate and cervical dilatation or descent of fetus fails to occur
- oxytocin (0.5-2 mU/min IV increasing by 1-2 mU/min q20-60 min to a max of 36-48 mU/min)

Oxytocin  $t_{1/2}$  = 3-5 min.

# High Risk Labour and Delivery

## Preterm Labour

### Definition

- labour occurring between 20 and 37 wk gestation

### Etiology

- idiopathic (most common)
- maternal: infection (recurrent pyelonephritis, untreated bacteriuria, chorioamnionitis), genital infection (bacterial vaginosis is associated with a 2-fold increase in relative risk of preterm birth), HTN, DM, chronic illness, mechanical factors, previous obstetric, gynecological and abdominal surgeries, socio-environmental (poor nutrition, smoking, drugs, alcohol, stress)
- maternal-fetal: PPRM (common), polyhydramnios, placenta previa or abruption, placental insufficiency
- fetal: multiple gestation, congenital abnormalities of fetus, fetal hydrops
- uterine: incompetent cervix, excessive enlargement (hydramnios), malformations (leiomyomas, septate uterus)

### Epidemiology

- preterm labour complicates about 10% of pregnancies

### Risk Factors and Prediction of PTL

- maternal risk scoring using above etiologies fails to identify up to 70% of preterm deliveries and is therefore of limited use
- prior history of spontaneous PTL: most important risk factor
- prior history cervical excisions or mechanical dilatation
- cervical length: measured by transvaginal U/S (cervical length >30 mm has high negative predictive value for PTL before 34 wk)
- identification of bacterial vaginosis (Rx metronidazole) and ureaplasma urealyticum (Rx erythromycin) infections: routine screening not supported by current data but it is reasonable to screen high risk women
- fetal fibronectin: a glycoprotein in amniotic fluid and placental tissue functioning to maintain integrity of chorionic-decidual interface in asymptomatic women
  - positive if >50 ng/mL
  - in symptomatic women (i.e. preterm contractions), fetal fibronectin is most effectively combined with U/S detecting cervical length
  - if cervical length is not short and fetal fibronectin is negative, preterm labour is highly unlikely

Positive fetal fibronectin in cervicovaginal fluid (>50 ng/mL) at 24 wk gestation predicted spontaneous PTL at <34 wk with sensitivity of 23%, specificity of 97%, PPV of 25%, NPV of 96%.

### Clinical Features

- regular contractions (2 in 10 min)
- cervix >2 cm dilated or 80% effaced or documented change in cervix

### Management

#### A. Initial

- transfer to appropriate facility if stable
- hydration (NS at 150 mL/h)
- bed rest in LLDP
- sedation (morphine)
- avoid repeated pelvic exams (increased infection risk)
- U/S examination of fetus (GA, BPP, position, placenta location, estimated fetal weight)
- prophylactic antibiotics; controversial but may help delay delivery, important to consider if PPRM

#### B. Suppression of Labour – Tocolysis

- does not inhibit preterm labour completely, but may buy time to allow for betamethasone valerate (Celestone®) and/or transfer to appropriate centre
- requirements (all must be satisfied)
  - preterm labour
  - live, immature fetus, intact membranes, cervical dilatation of <4 cm
  - absence of maternal or fetal contraindications
- contraindications
  - maternal: bleeding (placenta previa or abruption), maternal disease (hypertension, diabetes, heart disease), preeclampsia or eclampsia, chorioamnionitis
  - fetal: erythroblastosis fetalis, severe congenital anomalies, fetal distress/demise, IUGR, multiple gestation (relative)
- tocolytic procedure
  - should be used only for <48 h and/or until transfer to an appropriate facility for care of the premature infant

- agents
  - calcium channel blockers: Nifedipine
    - 20 mg PO loading dose followed by 20 mg PO 90 min later. 20 mg can be continued q3-8h for 72 h or to a max of 180 mg
    - 10 mg PO q20min x 4 doses
  - prostaglandin synthesis inhibitors: Indomethacin
    - 1st line for early preterm labour (<30 wk GA) or polyhydramnios
    - 50-100 mg PO loading dose followed by 25 mg q4-6h
    - Magnesium sulphate was previously used for tocolysis. Currently, its primary use in obstetrics is limited to neuroprotection.

### C. Enhancement of Fetal Pulmonary Maturity

- betamethasone valerate (Celestone\*) 12 mg IM q24h x 2 or dexamethasone 6 mg IM q12h x 4
  - 28-34 wk GA: reduces incidence of RDS
  - 24-28 wk GA: reduces severity of RDS, overall mortality and rate of IVH
  - specific maternal contraindications: active TB

### D. Cervical Cerclage

- definition: placement of cervical sutures at the level of the internal os, usually at the end of the first trimester and removed in the third trimester
- indications: cervical incompetence (i.e. cervical dilation and effacement in the absence of increased uterine contractility)
  - emerging evidence indicates that progesterone suppositories are superior to cerclage in preventing preterm labour late in pregnancy
- diagnosis of cervical incompetence
  - obstetrical Hx: silent cervical dilation
  - ability of cervix to hold an inflated Foley catheter during a hysterosonogram
- proven benefit in the prevention of PTL in women with primary structural abnormality of the cervix (e.g. conization of the cervix, connective tissue disorders)
- benefit is variable in those with secondary cervical incompetence causing premature ripening of the cervix (e.g. infection, abnormal placentation)

### Prognosis

- prematurity is the leading cause of perinatal morbidity and mortality
- 30 wk or 1,500 g (3.3 lb) = 90% survival
- 33 wk or 2,000 g (4.4 lb) = 99% survival
- morbidity due to asphyxia, hypoxia, sepsis, RDS, intraventricular cerebral hemorrhage, thermal instability, retinopathy of prematurity, bronchopulmonary dysplasia, necrotizing enterocolitis

### Prevention of Preterm Labour

- currently there are no agents approved by Health Canada to arrest preterm labour
- preventative measures: good prenatal care, identify pregnancies at risk, treat silent vaginal infection or UTI, patient education
- transvaginal ultrasound of cervical length is recommended only for high-risk pregnancies

#### Cerclage for Short Cervix on Ultrasonography in Women With Singleton Gestations and Previous Preterm Birth

*Obstet Gynecol* 2011;117:663-671

**Purpose:** To determine if cerclage prevents preterm birth (<35 wk gestation) and perinatal mortality and morbidity among women with previous spontaneous preterm birth, asymptomatic singleton gestation, and short cervical length (<25 mm before 24 wk gestation) on transvaginal ultrasonography.

**Methods:** Meta-analysis of randomized trials identified using searches on MEDLINE, PUBMED, EMBASE and the Cochrane Library.

**Results:** 5 trials included. Preterm birth was significantly lower among women receiving cerclage versus those not (RR = 0.70, 95% CI: 0.55, 0.89). Cerclage also significantly reduced preterm birth before 24, 28, 32, and 37 wk of gestation. Perinatal mortality and morbidity were significantly lower in the cerclage group (RR = 0.64, 95% CI: 0.45, 0.91).

**Conclusions:** Cerclage significantly prevents preterm birth and perinatal mortality and morbidity in this specific group of women.

#### Membrane Status Determined by

- Pooling of fluid on speculum exam
- Increase pH of vaginal fluid (nitrazine test)
- Ferning of fluid under light microscopy
- Decreased AFV on U/S

#### L/S Ratio (Lecithin:Spingomyelin Ratio)

Lecithin levels increase rapidly after 35 wk gestation, whereas sphingomyelin levels remain relatively constant. The L/S ratio is a measure of fetal lung maturity – less than 2:1 indicates pulmonary immaturity. Presence of blood or meconium in the amniotic fluid can affect the ratio.

## Premature Rupture of Membranes

### Definitions

- PROM or amniorrhexis: rupture of membranes prior to labour at any GA
- prolonged ROM: >24 h elapsed between rupture of membranes and onset of labour
- preterm ROM: ROM occurring before 37 wk gestation (associated with PTL)
- PPROM: rupture of membranes before 37 wk AND prior to onset of labour

### Risk Factors

- maternal: multiparity, cervical incompetence, infection (cervicitis, vaginitis, STI, UTI), family history of PROM, low socioeconomic class/poor nutrition
- fetal: congenital anomaly, multiple gestation
- other risk factors associated with PTL

### Clinical Features

- history of fluid gush or continued leakage

### Investigations

- sterile speculum exam (avoid introduction of infection)
  - pooling of fluid in the posterior fornix
  - may observe fluid leaking out of cervix on cough/Valsalva (“cascade”)
- nitrazine (amniotic fluid turns nitrazine paper blue)
  - low specificity as can be positive with blood, urine or semen
- ferning (high salt in amniotic fluid evaporates, looks like ferns under microscope)
- U/S to r/o fetal anomalies, assess GA and BPP

## Management

- admit for expectant management and monitor vitals q4h, daily BPP and WBC count
- avoid introducing infection with examinations (do NOT do a bimanual exam)
- cultures (cervix for GC, lower vagina for GBS)
- assess fetal lung maturity by L/S ratio of amniotic fluid
  - consider administration of betamethasone valerate (Celestone®) to accelerate maturity if <32 wk and no evidence of infection
  - consider tocolysis for 48 h to permit administration of steroids if PPROM induces labour
- if not in labour or labour not indicated, consider antibiotics (controversial)
  - studies show broad spectrum coverage increases the time to onset of labour from PROM by 5-7 d with no increase in maternal or neonatal morbidity or mortality
- deliver urgently if evidence of fetal distress and/or chorioamnionitis

**Table 24. PROM Management**

Degree of Prematurity	Management
<24 wk	Consider termination (poor outcome due to pulmonary hypoplasia)
24-25 wk	Individual consideration with counselling of parents re: risks to preterm infants
26-34 wk	Expectant management as prematurity complications are significant
34-36 wk	"Grey zone" where risk of death from RDS and neonatal sepsis is the same
≥37 wk	Induction of labour since the risk of death from sepsis is greater than RDS

## Prognosis

- varies with gestational age
- 90% of women with PROM at 28-34 wk GA go into spontaneous labour within 1 wk
- 50% of women with PROM at <26 wk GA go into spontaneous labour within 1 wk
- complications: cord prolapse, intrauterine infection (chorioamnionitis), premature delivery, limb contracture

## Breech Presentation

### Definition

- fetal buttocks or lower extremity is the presenting part as determined on U/S (see Figure 9)
- complete (10%): flexion at hips and knees
- frank (60%): flexion at hips, extension at knees
- most common type of breech presentation
- most common breech presentation to be delivered vaginally
- footling (30%): may be single or double with extension at hip(s) and knee(s) so that foot is the presenting part

### Epidemiology

- occurs in 3-4% of pregnancies at term (25% before 28 wk)

### Risk Factors

- maternal: pelvis (contracted), uterus (shape abnormalities, intrauterine tumours, fibroids), extrauterine tumours causing compression, grand multiparity
- maternal-fetal: placenta (previa), amniotic fluid (poly/oligohydramnios)
- fetal: prematurity, multiple gestation, congenital malformations (found in 6% of breeches; 2-3% if in vertex presentations), abnormalities in fetal tone and movement, aneuploidy

### Management

- ECV: repositioning of fetus within uterus under U/S guidance
  - overall success rate of 65%
  - criteria: <37 wk, singleton, unengaged presenting part, reactive NST
  - contraindications: previous T3 bleed, prior classical C/S, previous myomectomy, oligohydramnios, PROM, placenta previa, abnormal U/S, suspected IUGR, hypertension, uteroplacental insufficiency, nuchal cord
  - risks: abruption, cord compression
  - method: tocometry, followed by ultrasound guided transabdominal manipulation of fetus with consistent fetal heart monitoring
  - if patient Rh negative, give Rhogam® prior to procedure
  - good prognostic factors (for a successful version)
    - ♦ multiparous, good fluid volume, small baby, skilled obstetrician
- pre- or early labour ultrasound to assess type of breech presentation, fetal growth, estimated weight, attitude of fetal head; if ultrasound unavailable, recommend C/S
- trial of labour and elective C/S should be presented as options with the risks and benefits outlined; obtain informed consent

**A. Complete Breech**

**B. Frank Breech**

**C. Footling Breech**

© Crista Mason 2004

**Figure 9. Types of breech presentation**

#### Criteria for Vaginal Breech Delivery

- Frank or complete breech, GA >36 wk
- EFW 2,500-3,800 g based on clinical and U/S assessment (5.5-8.5 lb)
- Fetal head flexed
- Continuous fetal monitoring
- 2 experienced obstetricians, assistant, and anesthetist present
- Ability to perform emergency C/S within 30 min if required

- method for vaginal breech delivery:
  - encourage effective maternal pushing efforts
  - at delivery of after-coming head, assistant must apply suprapubic pressure to flex and engage fetal head
  - delivery can be spontaneous or assisted; avoid fetal traction
  - apply fetal manipulation only after spontaneous delivery to level of umbilicus
- C/S recommended if: the breech has not descended to the perineum in the second stage of labour after 2 h, in the absence of active pushing, or if vaginal delivery is not imminent after 1 h of active pushing
- contraindications to vaginal breech delivery:
  - cord presentation
  - clinically inadequate maternal pelvis
  - fetal factors incompatible with vaginal delivery (see OB37)

### Prognosis

- regardless of route of delivery, breech infants have lower birth weights and higher rates of perinatal mortality, congenital anomalies, abruption and cord prolapse

## Vaginal Birth After Cesarean (VBAC) aka Trial of Labour After Cesarean (TOLAC)

- recommended after previous low transverse incision
- success rate varies with indication for previous C/S (generally 60-80%)
- risk of uterine rupture (<1% with low transverse incision)

### Contraindications

- previous classical, inverted T, or unknown uterine incision, or complete transection of uterus (6% risk of rupture)
- history of hysterotomy or previous uterine rupture
- multiple gestation
- non-vertex presentation or placenta previa
- inadequate facilities or personnel for emergency C/S

## Prolonged Pregnancy

### Definition

- pregnancy beyond 42 wk GA

### Epidemiology

- 41 wk GA: up to 27%
- 42 wk GA: 4-14%

### Etiology

- most cases idiopathic
- anencephalic fetus with no pituitary gland
- placental sulfatase deficiency (X-linked recessive condition in 1/2,000-1/6,000 infants) – rare

### Clinical Features

- postmaturity syndrome: 10-20% of post-term pregnancies (fetal weight loss, reduction in subcutaneous fat, scaling, dry skin from placental insufficiency, long thin body, open-eyed, alert and worried look, long nails, palms and soles wrinkled)
- with increasing GA, higher rates of: intrauterine infection, asphyxia, meconium aspiration syndrome, placental insufficiency, placental aging and infarction, macrosomia, dystocia, fetal distress, operative deliveries

### Management

- GA 40-41 wk: expectant management
  - no evidence to support IOL or C/S unless other risk factors for morbidity are present (see prognosis)
- GA >41 wk: offer IOL if vaginal delivery is not contraindicated
  - IOL shown to decrease C/S, fetal heart rate changes, meconium staining, macrosomia and death when compared with expectant management
- GA >41 wk and expectant management elected: serial fetal surveillance
  - fetal movement count by the mother
  - BPP q3-4d
  - If AFI is decreased, labour will be induced

#### Vaginal Delivery of Breech Presentation

SOGG Clinical Practice Guideline, JOGC, 2009

**Objective:** To discuss risks and benefits of trial of labour versus planned C/S, with selection criteria, management and delivery techniques for trial of vaginal breech birth.

**Evidence:** Randomized trials, prospective cohort studies and select cohort studies from Medline search for long-term outcomes and epidemiology of vaginal breech delivery.

**Summary:** Higher risk of perinatal mortality and short-term neonatal morbidity can be associated with vaginal breech birth as compared to elective C/S. However, careful case selection (including term singleton breech fetuses and clinically adequate maternal pelvis) and labour management may achieve a similar safety level as elective C/S (approx. 2 per 1000 births perinatal mortality, approx. 2% short-term neonatal morbidity). Specific protocols for vaginal breech delivery should be followed: continuous fetal heart monitoring, assessment for adequate progress in labour, no induction of labour recommended, emergency C/S available if required and health care providers with requisite skills and experience. Informed consent for the preferred delivery method should be obtained.

#### VBAC

- Rate of VBAC ranges from 60-82%
- No significant difference in maternal deaths or hysterectomies between VBAC or C/S
- Uterine rupture more common in VBAC group
- Evidence regarding fetal outcome is lacking

Safety of vaginal birth after Cesarean section: A systematic review. *Obstet Gynecol* 2004;103:420-9

**Prognosis**

- if >41 wk, perinatal mortality 2-3x higher (due to progressive uteroplacental insufficiency)
- morbidity increased with hypertension in pregnancy, DM, abruption, IUGR and multiple gestation

## Intrauterine Fetal Death

**Definition**

- fetal death in utero after 20 wk GA

**Epidemiology**

- 1% of pregnancies

**Etiology**

- 50% idiopathic
- 50% secondary to HTN, DM, erythroblastosis fetalis, congenital anomalies, umbilical cord or placental complications, intrauterine infection, APS

**Clinical Features**

- decreased perception of fetal movement by mother
- SFH and maternal weight not increasing
- absent fetal heart tones (not diagnostic)
- high MSAFP

**Management**

- diagnosis: absent cardiac activity and fetal movement on U/S required for diagnosis
- determine secondary cause
  - maternal: HbA1c, Kleihauer-Betke, VDRL, ANA, antibody screens, INR/PTT, serum/urine toxicology screens, cervical and vaginal cultures, TORCH screen
  - fetal: chromosomes, cord blood, skin biopsy, genetics evaluation, autopsy
  - placenta: pathology, bacterial cultures

**Treatment**

- induction of labour
- monitor for maternal coagulopathy (10% risk of DIC)
- parental psychological care as per hospital protocol
- comprehensive discussion within 3 mo about final investigation and post-mortem results, help make plans for future pregnancies

**DIC: Generalized Coagulation and Fibrinolysis Leading to Depletion of Coagulation Factors****Obstetrical Causes**

- Abruption
- Gestational HTN
- Fetal demise
- PPH

**DIC-specific Bloodwork**

- Platelets
- aPTT and PT
- FDP
- Fibrinogen

**Treatment**

- Treat underlying cause
- Supportive
  - Fluids
  - Blood products
    - FFP, platelets, cryoprecipitate
- Consider anti-coagulation as VTE prophylaxis

## Complications of Labour and Delivery

### Meconium in Amniotic Fluid

**Epidemiology**

- present early in labour in 10% of pregnancies
- in general, meconium may be present in up to 25% of all labours; usually NOT associated with poor outcome, but extra care is required at time of delivery to avoid aspiration

**Etiology**

- likely cord compression ± uterine hypertonus
- may indicate undiagnosed breech
- increasing meconium during labour may be a sign of fetal distress

**Features**

- consistency and colour:
  - light yellow/green or dark green-black in colour.
  - may be watery or thicker

**Treatment**

- call respiratory therapy, neonatology or pediatrics to delivery room
- oropharynx suctioning upon head expulsion or immediately after delivery if baby not breathing spontaneously (do NOT stimulate infant before)
- consider amnioinfusion of ~800 mL of IV NS over 50-80 min during active stage of labour and a maintenance dose of ~3 mL/min until delivery
- closely monitor FHR for signs of fetal distress

Dark green or black meconium is associated with lower APGARs and increased risk of meconium aspiration.

## Abnormal Progression of Labour (Dystocia)

### Definition

- expected patterns of descent of the presenting part and cervical dilatation fail to occur in the appropriate time frame; can occur in all stages of labour (see Figure 10)
- during active phase:  $>4$  h of  $<0.5$  cm/h
- during 2nd phase:  $>1$  h with no descent during active pushing

### Etiology

- Power (leading cause): contractions (hypotonic, incoordinate), inadequate maternal expulsive efforts
- Passenger: fetal position, attitude, size, anomalies (hydrocephalus)
- Passage: pelvic structure (CPD), maternal soft tissue factors (tumours, full bladder or rectum, vaginal septum)
- Psyche: hormones released in response to stress may contribute to dystocia. Psychological and physiological stress should be evaluated as part of the management once dystocia has been diagnosed

Provided there are no contraindications, oxytocin is utilized to improve uterine contraction strength and/or frequency.

#### The 4 Ps of Dystocia

**P**ower  
**P**assenger  
**P**assage  
**P**syche

Figure 10. Normal and abnormal courses of the first stage of labour

### Arrest Disorder (Curve C)

- arrest of dilatation
  - dilatation progress does not occur for  $\geq 2$  h in a patient who has entered the active phase
  - arrest usually occurs at a cervical dilatation of 5-8 cm
- arrest of descent
  - no progress in station for  $>1$  h during second stage
  - should search for factors causing CPD (nearly 50% require C/S)
  - CPD diagnosed if adequate contractions measured by intrauterine pressure catheter (IUPC) with no descent/dilatation for  $>2$  h
  - if CPD ruled out, IV oxytocin and amniotomy can be attempted

### Protraction Disorders (Curve D)

- protraction of dilatation: slope of cervical dilatation  $<1.2$  cm/h in primigravidas or  $<1.5$  cm/h in multigravidas
- protraction of descent: a rate of descent of  $<1.0$  cm/h in primigravidas or  $2.0$  cm/h in multigravidas
- treatment: oxytocin augmentation if contractions are inadequate  $\pm$  amniotomy

### Prolonged Latent Phase (Curve E)

- $\geq 20$  h in primigravidas or  $\geq 14$  h in multigravidas during which labour has not progressed to the active phase
- most often due to false labour (avoid amniotomy for fear of false labour and increased risk of intrauterine infection)
- premature or excessive use of sedation or analgesia may play a role
- careful search for factors of CPD should be made
- management: oxytocin augmentation if diagnosis of labour is certain, otherwise rest  $\pm$  sedation

### Risks of Dystocia

- inadequate progression of labour is associated with an increased incidence of:
  - maternal stress
  - maternal infection
  - postpartum hemorrhage
  - need for neonatal resuscitation

Gynaecoid  
(50% obstetrically ideal)

Android (20%)

Anthropoid (25%)

Platypelloid (5%)

© Bonnie Tang 2012

Figure 11. Types of pelvis

- 1/3 of protraction disorders develop into 2<sup>nd</sup> arrest of dilatation due to CPD
- 2/3 of protraction disorders progress through labour to vaginal delivery

## Shoulder Dystocia

### Definition

- impaction of anterior shoulder of fetus against symphysis pubis after fetal head has been delivered
- life threatening emergency

### Etiology/Epidemiology

- incidence 0.15-1.4% of deliveries
- occurs when breadth of shoulders is greater than biparietal diameter of the head

### Risk Factors

- maternal: obesity, diabetes, multiparity
- fetal: prolonged gestation, macrosomia
- labour
  - prolonged 2nd stage
  - prolonged deceleration phase (8-10 cm)
  - instrumental midpelvic delivery

### Clinical Features

- “turtle sign”: head delivered but retracts against inferior portion of pubic symphysis
- complications
  - chest compression by vagina or cord compression by pelvis can lead to hypoxia
  - brachial plexus injury (Erb's palsy: C5-C7; Klumpke's palsy: C8-T1)
    - ♦ 90% resolve within 6 mo
  - fetal fracture (clavicle, humerus, cervical spine)
  - maternal perineal injury, may result in PPH

### Treatment

- goal: to displace anterior shoulder from behind symphysis pubis; follow a stepwise approach of maneuvers until goal achieved (see sidebar)
- other options:
  - cleidotomy (deliberate fracture of neonatal clavicle)
  - Zavanelli maneuver: replacement of fetus into uterine cavity and emergent C/S
  - symphysiotomy

### Prognosis

- 1% risk of long term disability for infant

#### Approach to the Management of Shoulder Dystocia

##### ALARMER

Apply suprapubic pressure and ask for help

Legs in full flexion (McRobert's maneuver)

Anterior shoulder disimpaction (suprapubic pressure)

Release posterior shoulder by rotating it anteriorly with hand in the vagina under adequate anesthesia

Manual corkscrew i.e. rotate the fetus by the posterior shoulder until the anterior shoulder emerges from behind the maternal symphysis

Episiotomy

Rollover (on hands and knees)

\*Note that suprapubic pressure and McRoberts maneuver together will resolve 90% of cases

## Umbilical Cord Prolapse

### Definition

- descent of the cord to a level adjacent to or below the presenting part, causing cord compression between presenting part and pelvis

### Etiology/Epidemiology

- increased incidence with prematurity/PROM, fetal malpresentation (~50% of cases), low-lying placenta, polyhydramnios, multiple gestation, CPD
- incidence: 0.17-0.63%

### Clinical Features

- visible or palpable cord
- FHR changes (variable decelerations, bradycardia or both)

### Treatment

- emergency C/S
- O<sub>2</sub> to mother, monitor fetal heart
- alleviate pressure of the presenting part on the cord by placing digit in vagina (maintain this position until C/S)
- keep cord warm and moist by replacing it into the vagina ± applying warm saline soaks
- position mother in Trendelenburg or knee-to-chest position
- if fetal demise or too premature (<22 wk), allow labour and delivery

#### Umbilical Cord Accident Causes

- Nuchal cord
  - Type A (looped)
  - Type B (hitched)
- Body loop
- Single artery
- True knot
- Torsion
- Velamentous
- Short cord <35 cm
- Long cord >80 cm

## Uterine Rupture

### Etiology/Epidemiology

- associated with previous uterine scar (in 40% of cases), hyperstimulation with oxytocin, grand multiparity and previous intrauterine manipulation
- generally occurs during labour, but can occur earlier with a classical incision
- 0.5-0.8% incidence, up to 12% with classical incision

### Clinical Features

- prolonged fetal bradycardia – most common presentation
- acute onset abdominal pain
- hyper or hypotonic uterine contractions
- vaginal bleed

### Risk Factors:

- uterine scarring (i.e. previous uterine surgeries including Cesarean, perforation with D&C)
- excessive uterine stimulation (i.e. protracted labour, oxytocin)
- uterine trauma (i.e. operative equipment, ECV)
- multiparity
- uterine abnormalities

### Treatment

- rule out placental abruption
- immediate delivery for fetal survival
- maternal stabilization (may require hysterectomy)

### Complications

- maternal mortality 1-10%
- maternal hemorrhage, shock, DIC
- amniotic fluid embolus
- hysterectomy if uncontrollable hemorrhage
- fetal distress, associated with 50% fetal mortality

#### Maternal Mortality Causes

- Thromboembolism
- Cardiac event
- Suicide
- Sepsis
- Ectopic pregnancy
- Hypertension
- Amniotic-fluid embolism
- Hemorrhage

\* In Canada (2005), lifetime risk of maternal death is 1 in 11,000

## Amniotic Fluid Embolus

### Definition

- amniotic fluid debris in maternal circulation triggering an anaphylactoid immunologic response

### Etiology/Epidemiology

- rare intrapartum or immediate postpartum complication
- 60-80% maternal mortality rate, accounts for 10% of all maternal deaths
- leading cause of maternal death in induced abortions and miscarriages
- 1/8,000-1/80,000 births

### Risk Factors

- placental abruption
- rapid labour
- multiparity
- uterine rupture
- uterine manipulation

### Differential Diagnosis

- pulmonary embolus, drug-induced anaphylaxis, septic shock, eclampsia, HELLP syndrome, abruption, chronic coagulopathy

### Clinical Features

- sudden onset of respiratory distress, cardiovascular collapse (hypotension, hypoxia) and coagulopathy
- seizure in 10%
- ARDS and left ventricular dysfunction seen in survivors

### Management

- supportive measures (high flow O<sub>2</sub>, ventilation support, fluid resuscitation, inotropic support, ± intubation), coagulopathy correction
- ICU admission

## Chorioamnionitis

### Definition

- infection of the chorion, amnion and amniotic fluid typically due to ascending infection by organisms of normal vaginal flora

### Etiology/Epidemiology

- incidence 1-5% of term pregnancies and up to 25% in preterm deliveries
- ascending from vagina
- predominant microorganisms include GBS, Bacteroides and *Prevotella* species, *E. coli* and anaerobic *Streptococcus*

### Risk Factors

- prolonged ROM, long labour, multiple vaginal exams during labour, internal monitoring
- bacterial vaginosis and other vaginal infections

### Clinical Features

- maternal fever, maternal or fetal tachycardia, uterine tenderness, foul and purulent cervical discharge

### Investigations

- CBC: leukocytosis
- amniotic fluid: leukocytes or bacteria

### Treatment

- IV antibiotics
  - ampicillin (2 g IV q6h) and gentamicin (1.5 mg/kg q8h)
  - anaerobic coverage i.e. clindamycin if C/S
- expedient delivery regardless of gestational age

### Complications

- bacteremia of mother or fetus, wound infection if C/S, pelvic abscess, infant meningitis

#### Clinical Features of Chorioamnionitis

- Temperature
- Tachycardia (maternal or fetal)
- Tenderness (uterine)
- Foul discharge

#### Prerequisites for Operative Vaginal Delivery

##### ABCDEFGHIJK

Anesthesia (adequate)

Bladder empty

Cervix fully dilated and effaced with ROM

Determine position of fetal head

Equipment ready (including facilities for emergent C/S)

Fontanelle (posterior fontanelle midway between thighs)

Gentle traction

Handle elevated

Incision (episiotomy)

once Jaw visible remove forceps

Knowledgeable operator

## Operative Obstetrics

### Operative Vaginal Delivery

#### Definition

- forceps or vacuum extraction

#### Indications

- fetal
  - atypical or abnormal fetal heart rate tracing
  - consider if second stage is prolonged as this may be due to poor contractions or failure of fetal head to rotate
- maternal
  - need to avoid voluntary expulsive effort (e.g. cardiac/cerebrovascular disease)
  - exhaustion, lack of cooperation and excessive analgesia may impair pushing effort

### Forceps

#### Outlet Forceps Position

- head visible between labia in between contractions
- sagittal suture in or close to AP diameter
- rotation cannot exceed 45°

#### Low Forceps Position

- presenting part at station +2 or greater
- subdivided based on whether rotation less than or greater than 45 degrees

#### Mid Forceps Position

- presenting part below spines but above station +2
- rarely done

#### Types of Forceps

- Simpson forceps for OA presentations
- Kielland (rotational) forceps when rotation of head to OA is recessing
- Piper forceps for breech

Figure 12. Types of forceps

## Vacuum Extraction

- traction instrument used as alternative to forceps delivery; aids maternal pushing

**Table 25. Advantages and Disadvantages of Forceps versus Vacuum Extraction**

	Forceps	Vacuum Extraction
<b>Advantages</b>	Higher overall success rate for vaginal delivery Decreased incidence of fetal morbidity	Easier to apply Less anesthesia required Less maternal soft-tissue injury compared to forceps
<b>Disadvantages</b>	Greater incidence of maternal injury	Contraindicated if fetus at risk for coagulation defect Suitable only for vertex presentations Maternal pushing required Contraindicated in preterm delivery
<b>Complications</b>	Maternal: anesthesia risk, lacerations, injury to bladder, uterus or bone, pelvic nerve damage, PPH, infections Fetal: fractures, facial nerve palsy, trauma to face/scalp, intracerebral hemorrhage, cephalohematoma, cord compression	Increased incidence of cephalohematoma and retinal hemorrhages compared to forceps Subglial hemorrhage, subaponeurotic hemorrhage, soft tissue trauma

### Limits for Trial of Vacuum

- After 3 pulls over 3 contractions with no progress, after 3 pop-offs with no obvious cause
- 20 min and delivery is not imminent

### Muscles of Perineal Body

- Superficial transverse perineal
- Bulbocavernosus
- External anal sphincter

## Lacerations

- first degree: involves skin and vaginal mucosa but not underlying fascia and muscle
- second degree: involves fascia and muscles of the perineal body but not the anal sphincter
- third degree: involves the anal sphincter but does not extend through it
- fourth degree: extends through the anal sphincter into the rectal mucosa

## Episiotomy

### Definition

- incision in the perineal body at the time of delivery
- essentially a controlled second degree laceration
- midline: incision through central tendinous portion of perineal body and insertions of superficial transverse perineal and bulbocavernosus muscle
  - better healing but increased risk of deep tear
- mediolateral: incision through bulbocavernosus, superficial transverse perineal muscle, and levator ani
  - reduced risk of extensive tear but poorer healing and more pain
  - easier to repair

### Indications

- to relieve obstruction of the unyielding perineum
- instrumental delivery
- controversial between practitioners as to whether it is preferable to make a cut or let the perineum tear as needed
- current evidence suggests letting perineum tear and then repair as needed (restricted use)

### Complications

- infection, hematoma, extension into anal musculature or rectal mucosa, fistula formation, incontinence

## Cesarean Delivery

### Epidemiology

- incidence 20-25%

### Indications

- maternal: obstruction, active herpetic lesion on vulva, invasive cervical cancer, previous uterine surgery, underlying maternal illness (eclampsia, HELLP syndrome, heart disease)
- maternal-fetal: failure to progress, placental abruption or previa, vasa previa
- fetal: abnormal fetal heart tracing, malpresentation, cord prolapse, certain congenital anomalies

### Risk Factors for Primary and Subsequent Anal Sphincter Lacerations

*Am J Obstet Gynecol* 2007;196:344

**Objective:** Assess effects of pregnancy, delivery method and parity on risk of primary and secondary anal sphincter laceration in women with 1st vaginal delivery (VD), VBAC or 2nd VD.

**Methods:** Retrospective cohort study of all deliveries at one hospital from 1995-2002.

**Conclusion:** 20,674 live singleton deliveries were included. Women with first VD and VBAC both had OR 5.1 for laceration compared to 2nd VD. Factors that significantly increased risk of laceration for all 3 groups were: forceps and midline episiotomy. 2nd stage of labour >2 h only increased risk for 1st VD. Factors that had no significant increase in risk: infant birth weight >3,500 g, vacuum delivery. Women with prior anal sphincter laceration are at 3 times increased risk for subsequent sphincter laceration, compared with women with prior vaginal delivery without sphincter laceration.

### Restrictive vs. Routine Episiotomies with Vaginal Births

*Cochrane DB Syst Rev* 2009;1:CD000081

**Study:** This systematic review and meta-analysis of 8 RCTs assessed the effects of restrictive (only done for fetal indications or if severe perineal trauma was judged to be imminent) and routine (liberally done to prevent any tear) use of episiotomy during vaginal birth.

**Patients:** Of the 2709 patients in the routine episiotomy group, 2035 (75%) women had episiotomies. In the restrictive episiotomy group, 776 (28%) of the 2733 women had episiotomies.

**Results:** Restrictive episiotomies appear to have less severe perineal trauma (RR 0.67), less suturing (RR 0.71), and fewer healing complications at 7 d (RR 0.69) compared to routine episiotomies.

There is no difference for pain measures, dyspareunia, urinary incontinence, and severe vaginal or perineal trauma, but there was an increased risk of anterior perineal trauma (RR 1.84) with restrictive episiotomy. Similar results were obtained when comparing restrictive versus routine mediolateral versus midline episiotomy.

**Conclusions:** Compared to routine use, restrictive use of episiotomy during vaginal delivery appears to be more beneficial.

## Types of Cesarean Incisions

- skin
  - transverse (aka Pfannenstiel)
    - ♦ decreased exposure and slower entry
    - ♦ improved strength and cosmesis
  - vertical midline
    - ♦ rapid peritoneal entry and increased exposure
    - ♦ increased dehiscence
- uterine
  - low transverse (most common): in noncontractile segment
    - ♦ decreased chance for rupture in subsequent pregnancies
  - low vertical
    - ♦ used for very preterm infants, poorly developed maternal lower uterine segment
  - classical (rare): in thick, contractile segment
    - ♦ used for transverse lie, fetal anomaly, >2 fetuses, lower segment adhesions, obstructing fibroid

## Risks/Complications

- anesthesia
- hemorrhage (average blood loss ~1,000 cc)
- infection (UTI, wound, endometritis)
- injury to surrounding structures (bowel, bladder, ureter, uterus)
  - single dose prophylactic antibiotic should be used (e.g. cefazolin 1-2 g)
- thromboembolism
- increased recovery time/hospital stay
- maternal mortality (<0.1%)

### Common OR Questions

#### 7 layers to dissect

Skin, fatty layer, fascia, muscle separation (rectus abdominus), peritoneum, bladder flap, uterus

#### Layers of the rectus sheath

Above the arcuate line: external oblique, internal oblique, rectus abdominis, internal oblique, transversus abdominis  
Below the arcuate line: external oblique, internal oblique, transversus abdominis, rectus abdominis

**Name of the obliterated umbilical ligament**  
Urachus

# Puerperal Complications

- puerperium: 6 wk period of adjustment after pregnancy when pregnancy-induced anatomic and physiologic changes are reversed

## Postpartum Hemorrhage

### Definition

- loss of >500 mL of blood at the time of vaginal delivery, or >1,000 mL with C/S
- early – within first 24 h postpartum
- late – after 24 h but within first 6 wk

### Epidemiology

- incidence 5-15%

### Etiology (4 Ts)

#### 1. Tone

- uterine atony
  - ♦ most common cause of PPH
  - ♦ avoid by giving oxytocin with delivery of the anterior shoulder or placenta
  - ♦ occurs within first 24 h
- due to:
  - ♦ labour (prolonged, precipitous, induced, augmented)
  - ♦ uterus (infection, over-distention)
  - ♦ placenta (abruption, previa)
  - ♦ maternal factors (grand multiparity, gestational HTN)
  - ♦ halothane anesthesia

#### 2. Tissue

- retained placental products
- retained blood clots in an atonic uterus
- gestational trophoblastic neoplasia

#### 3. Trauma

- laceration (vagina, cervix, uterus), episiotomy, hematoma (vaginal, vulvar, retroperitoneal), uterine rupture, uterine inversion

#### 4. Thrombin

- coagulopathy
  - ♦ most identified prior to delivery (low platelets increases risk)
  - ♦ includes hemophilia, DIC, Aspirin® use, ITP, TTP, vWD (most common)
  - ♦ therapeutic anti-coagulation

Uterine atony is the most common cause of PPH.

### DDx of Early PPH – 4 Ts

Tone (atony)  
Tissue (retained placenta, clots)  
Trauma (laceration, inversion)  
Thrombin (coagulopathy)

### DDx of Late PPH

Retained products  
± endometritis  
Sub-involution of uterus

**Investigations**

- assess degree of blood loss and shock by clinical exam
- explore uterus and lower genital tract for evidence of tone, tissue or trauma
- may be helpful to observe red-topped tube of blood – no clot in 7-10 min indicates coagulation problem

**Management**

- ABCs
- 2 large bore IVs and crystalloids
- CBC, coagulation profile, cross and type 4 units pRBCs
- treat underlying cause

**Medical Therapy**

- oxytocin 20 U/L NS or RL IV continuous infusion
  - in addition can give 10 U IMM after delivery of the placenta
- methylergonavine maleate (ergotamine) 0.25 mg IM/IMM q5min up to 1.25 mg; can be given as IV bolus of 0.125 mg (may exacerbate HTN)
- carboprost (Hemabate®), a synthetic PGF-1  $\alpha$  analog 0.25 mg IM/IMM q15min to max 2 mg (major prostaglandin side effects and contraindicated in cardiovascular, pulmonary, renal and hepatic dysfunction)

**Local Control**

- bimanual compression: elevate the uterus and massage through patient's abdomen
- uterine packing (mesh with antibiotic treatment)
- Bakri Balloon for tamponade: may slow hemorrhage enough to allow time for correction of coagulopathy or for preparation of an OR

**Surgical Therapy (Intractable PPH)**

- D&C (beware of vigorous scraping which can lead to Asherman's syndrome)
- embolization of uterine artery or internal iliac artery by interventional radiologist
- laparotomy with bilateral ligation of uterine artery (may be effective), internal iliac artery (not proven), ovarian artery, or hypogastric artery
- hysterectomy last option with angiographic embolization if post-hysterectomy bleeding

## Retained Placenta

**Definition**

- placenta undelivered after 30 min postpartum

**Etiology**

- placenta separated but not delivered
- abnormal placental implantation (placenta accreta, placenta increta, placenta percreta)

**Risk Factors**

- placenta previa, prior C/S, post-pregnancy curettage, prior manual placental removal, uterine infection

**Clinical Features**

- incomplete placenta removed
- risk of postpartum hemorrhage and infection

**Investigations**

- explore uterus
- assess degree of blood loss

**Management**

- 2 large bore IVs, type and screen
- Brant maneuver (firm traction on umbilical cord with one hand applying suprapubic pressure to avoid uterine inversion by holding uterus in place)
- oxytocin 10 IU in 20 mL NS into umbilical vein
- manual removal if above fails
- D&C if required

## Uterine Inversion

### Definition

- inversion of the uterus through cervix  $\pm$  vaginal introitus

### Etiology/Epidemiology

- often iatrogenic (excess cord traction with fundal placenta)
- excessive use of uterine tocolytics
- more common in grand multiparous (lax uterine ligaments)
- 1/1500-1/2000 deliveries

### Clinical Features

- can cause profound vasovagal response with vasodilation and hypovolemic shock
- shock may be disproportionate to maternal blood loss

### Management

- urgent management essential, call anesthesia
- ABCs: initiate IV crystalloids
- can use tocolytic drug (see *Management of Preterm Labour*, OB38) or nitroglycerin IV to relax uterus and aid replacement
- replace uterus without removing placenta
- remove placenta manually and withdraw slowly
- IV oxytocin infusion (only after uterus replaced)
- re-explore uterus
- may require GA  $\pm$  laparotomy

## Postpartum Pyrexia

### Definition

- fever  $>38^{\circ}\text{C}$  on any 2 of the first 10 d postpartum, except the first day

### Etiology

- endometritis
- wound infection secondary to C/S
- mastitis/engorgement
- UTI
- atelectasis
- pneumonia

### Investigations

- detailed history and physical exam, relevant cultures
- for endometritis: blood and genital cultures

### Treatment

- depends on etiology
  - infection: empiric antibiotics, adjust when sensitivities available
    - ♦ endometritis: clindamycin + gentamycin IV
    - ♦ mastitis: cloxacillin or cefazolin
    - ♦ wound infection: cephalixin
  - DVT: anticoagulants
- prophylaxis against post-C/S endometritis: begin antibiotic immediately after cord clamping and administer only 1-3 doses – cefazolin is most common choice

### ENDOMETRITIS

- definition: infection of uterine myometrium and parametrium
- clinical features: fever, chills, abdominal pain, uterine tenderness, foul-smelling discharge or lochia
- treatment: depends on infection severity; oral antibiotics if well, IV with hospitalization in moderate to severe cases

### VENOUS THROMBOEMBOLISM

- see *Venous Thromboembolism*, OB21

#### Etiology of Postpartum Pyrexia

##### B-5W

**Breast:** engorgement, mastitis

**Wind:** atelectasis, pneumonia

**Water:** UTI

**Wound:** episiotomy, C/S site infection

**Walking:** DVT, thrombophlebitis

**Womb:** endometritis

#### Risk Factors for Endometritis

C/S, intrapartum chorioamnionitis, prolonged labour, prolonged ROM, multiple vaginal examinations

## Mastitis

- definition: inflammation of mammary glands
- must r/o inflammatory carcinoma, as indicated
- differentiate from mammary duct ectasia: mammary duct(s) beneath nipple clogged and dilated ± ductal inflammation ± nipple discharge (thick, grey to green), often postmenopausal women

**Table 26. Lactational versus Non-Lactational Mastitis**

	Lactational	Non-Lactational
<b>Epidemiology</b>	More common than non-lactational Often 2-3 wk postpartum	Periductal mastitis most common Mean age 32 yr
<b>Etiology</b>	<i>S. aureus</i>	May be sterile May be infected with <i>S. aureus</i> or other anaerobes Smoking is risk factor May be associated with mammary duct ectasia
<b>Symptoms</b>	Unilateral localized pain Tenderness Erythema	Subareolar pain May have subareolar mass Discharge (variable colour) Nipple inversion
<b>Treatment</b>	Heat or ice packs Continued nursing/pumping Antibiotics (dicloxacillin/cephalexin) (Erythromycin if pen-allergic)	Broad-spectrum antibiotics and I&D Total duct excision (definitive)
<b>Abscess</b>	Fluctuant mass Purulent nipple discharge Fever, leukocytosis Discontinue nursing, IV antibiotics (nafcillin/oxacillin), I&D usually required	If mass does not resolve, FNA to exclude cancer and U/S to assess presence of abscess Treatment includes antibiotics, aspiration or I&D (tends to recur) May develop mammary duct fistula A minority of non-lactational abscesses may occur peripherally in breast with no associated periductal mastitis (usually <i>S. aureus</i> )

## Postpartum Mood Alterations

### POSTPARTUM BLUES

- 85% of new mothers, onset day 3-10; extension of the “normal” hormonal changes and adjustment to a new baby
- self-limited, should resolve by 2 wk
- manifested by mood lability, depressed affect, increased sensitivity to criticism, tearfulness, fatigue, irritability, poor concentration/despondency

### POSTPARTUM DEPRESSION

- definition: major depression occurring in a woman within 6 mo of childbirth (see [Psychiatry](#), PS12)
- epidemiology: 10-20%, risk of recurrence 50%
- risk factors
  - personal or family history of depression (including PPD)
  - prenatal depression or anxiety
  - stressful life situation
  - poor support system
  - unwanted pregnancy
  - colicky or sick infant
- clinical features: suspect if the “blues” last beyond 2 wk, or if the symptoms in the first two wk are severe (e.g. extreme disinterest in the baby, suicidal or homicidal/infanticide ideation)
- assessment: Edinburgh Postnatal Depression Scale or other
- treatment: antidepressants, psychotherapy, supportive care, ECT if refractory
- prognosis: interferes with bonding and attachment between mother and baby so it can have long term effects

### POSTPARTUM PSYCHOSIS

- definition: onset of psychotic symptoms over 24-72 h within first month postpartum, can present in the context of depression
- epidemiology: rare (0.2%)

# Postpartum Care

## Postpartum Office Visit at 6 Weeks

### Care of Baby

- assess weight, feeding, immunization
- encourage breastfeeding if no contraindications

### Care of Mother (The 10 Bs)

- Be careful: do not use douches or tampons for 4-6 wk post-delivery
- Be fit: encourage gradual increases in walking, Kegel exercises
- Birth control: assess for use of contraceptives; breastfeeding is NOT an effective method of birth control (see [Gynecology](#), GY19 for more detail about different contraceptive options postpartum)
- Bladder: assess for urinary incontinence, maintain high fluid intake
- Bleeding: (see *Lacerations*, OB47), 300 µg of RhIG should be given if Rh+ fetus and Rh- mother or extensive bleeding at delivery
- Blood pressure: especially if gestational HTN
- Blood tests: glucose, CBC (for anemia as sign of hematomas, retained placenta)
- Blues: (see *Postpartum Mood Alterations*, OB51)
- Bowel: fluids and high-fibre foods, bulk laxatives; for hemorrhoids/perineal tenderness: pain meds, doughnut cushion, Sitz baths, ice compresses
- Breast and pelvic exam: watch for Staphylococcal or Streptococcal mastitis/abscess, ± Pap smear at 6 wk

### Physiological Changes Postpartum

- uterus weight rapidly diminishes through catabolism, cervix loses its elasticity and regains firmness
  - should involute ~1 cm below umbilicus per day in first 4-5 d, reaches non-pregnant state in 4-6 wk postpartum
- ovulation resumes in ~45 d for non-lactating women and within 3-6 mo for lactating women
- lochia: normal vaginal discharge postpartum
  - decreases and changes in colour from red (lochia rubra; presence of erythrocytes) → yellow (lochia serosa) → white (lochia alba; residual leukorrhea) over 3-6 wk
  - foul smelling lochia suggests endometritis

### Breastfeeding Problems

- inadequate milk: consider domperidone
- breast engorgement: cool compress, manual expression/pumping
- nipple pain: clean milk off nipple after feeds, moisture cream, topical steroid if needed
- mastitis: treat promptly (see *Postpartum Pyrexia*, OB50)
- inverted nipples: makes feeding difficult
- maternal medications: may require pediatric consultation (see *Breastfeeding and Drugs*, OB53)

### Bladder Dysfunction

- pelvic floor prolapse can occur after vaginal delivery
- stress or urge urinary incontinence common
- increased risk with instrumental delivery or prolonged second stage
- conservative management: pelvic floor retraining with Kegel exercises, vaginal cones or pessaries, lifestyle modifications (e.g. limit fluid, caffeine intake)
- surgical management: minimally invasive procedures (tension-free vaginal tape, transobturator tape, midurethral sling) (see [Gynecology](#), GY35)

### Puerperal Pain

- “after pains” common in first 3 d due to uterine contractions; encourage simple analgesia
- ice packs can be used on perineum if painful
- encourage regular analgesia and stool softener

The acronym “**BUBBLES**” for what to ask about when rounding on postpartum care. Modify this for C/S or vaginal delivery

**B**aby care and breastfeeding (latch, amount)

**U**terus – firm or boggy?

**B**ladder function – Voiding well? Dysuria?

**B**owel function – Passing gas or stool? Constipated?

**L**ochia or discharge – Any blood?

**E**pisiotomy/laceration/incision – Pain controlled?

**S**ymptoms of VTE – Dyspnea? Calf pain?

## Breastfeeding and Drugs

**Table 27. Drug Safety During Breastfeeding**

Safe During Breastfeeding	Contraindicated to Breastfeeding
Analgesics (e.g. acetaminophen, NSAIDs)	Chloramphenicol (bone marrow suppression)
Anticoagulants (e.g. heparin)	Sulphonamides (in G6PD deficiency, can lead to hemolysis)
Antidepressants (e.g. sertraline, fluoxetine, TCAs)	Nitrofurantoin (in G6PD deficiency, can lead to hemolysis)
Antiepileptics (e.g. phenytoin, carbamazepine, valproic acid)	Tetracycline
Antihistamines	Lithium
Antimicrobials (e.g. penicillins, aminoglycosides, cephalosporins)	Anti-neoplastics and immunosuppressants
β-adrenergics (e.g. propranolol, labetalol)	Psychotropic drugs (relative contraindication)
Insulin	
Steroids	
OCP (low dose) – although may decrease breast milk production	

### Breastfeeding: Contraindicated Drugs

#### BREAST

Bromocriptine/Benzodiazepines  
Radioactive isotopes/Rizatriptan  
Ergotamine/Ethosuximide  
Amiodarone/Amphetamines  
Stimulant laxatives/Sex hormones  
Tetracycline/Tretinoin

## Common Medications

**Table 28. Common Medications**

Drug Name (Brand Name)	Dosing Schedule	Indications/Comments
betamethasone valerate (Celestone®)	12 mg IM q24h x 2 doses	Enhancement of fetal pulmonary maturity for PTL
carboprost (Hemabate®)	0.25 mg IM/IMM q15min; max 2 mg	Treatment of uterine atony
cefazolin	2 g IV then 1 g q8h	GBS prophylaxis (penicillin allergic and not at risk for anaphylaxis)
clindamycin	900 mg IVCV q8h	GBS prophylaxis (penicillin allergic and at risk for anaphylaxis)
dexamethasone	6 mg IM q12h x 4 doses	Enhancement of fetal pulmonary maturity for PTL
dinoprostone (Cervidil®: PGE <sub>2</sub> impregnated thread)	10 mg PV (remove after 12h) max of 3 doses	Induction of labour Advantage: can remove if uterine hyperstimulation
doxylamine succinate (Diclectin®)	2 tabs qhs + 1 tab qAM + 1 tab qPM max of 8 tabs/d	Each tablet contains 10 mg doxylamine succinate with vitamin B <sub>6</sub> Used for hyperemesis gravidarum
erythromycin	500 mg IV q6h	GBS prophylaxis (penicillin allergic and at risk for anaphylaxis)
folic acid	0.4-1 mg PO OD x 1-3 mo preconception and T1 5 mg PO OD with past Hx of NTD	Prevention of oNTD
methotrexate	50 mg/m <sup>2</sup> IM or 50 mg PO x 1 dose	For ectopic pregnancy or medical abortion
methylergonavine maleate (Ergotamine®)	0.25 mg IM/IMM q5min up to 1.25 mg or IV bolus 0.125 mg	Treatment of uterine atony
misoprostol (Cytotec®)	800-1000 µg PR x 1 dose 400 µg PO x 1 dose or 800 µg PV x 1 dose, 3 to 7 d after methotrexate	For treatment of PPH For medical abortion Also used for NSAID-induced ulcers (warn patients of contraindications)
oxytocin (Pitocin®)	0.5-2.0 mU/min IV, or 10 U/L NS incr. by 1-2 mU/min q20-60min max of 36-48 mU/min 10 U IM at delivery of anterior shoulder and of placenta 20 U/L NS or RL IV continuous infusion	Augmentation of labour (also induction of labour)  Prevention of uterine atony  Treatment of uterine atony
Penicillin G	5 million U IV then 2.5 million U IV q4h until delivery	GBS prophylaxis
PGE <sub>2</sub> gel (Prostin® gel)	0.5 mg PV q6-12h; max of 3 doses	Induction of labour
Rh IgG (Rhogam®)	300 µg IM x 1 dose	Given to Rh negative women • Routinely at 28 wk GA • Within 72 h of birth of Rh +ve fetus positive • Positive Kleihauer-Betke test • With any invasive procedure in pregnancy • Ectopic pregnancy • Antepartum hemorrhage • Miscarriage or TA (dose: 50 µg IM only)

### Common Discharge Medications

Oxycodone IR 5-10 mg PO q4-6h PRN  
Docusate sodium 100 mg PO bid

Misoprostol (Cytotec®) is also indicated to protect against NSAID-induced gastric ulcers in non-pregnant individuals. The use of misoprostol for cytoprotection is contraindicated in pregnancy. Warn female patients of this contraindication.

## Acronyms

(BC) VA	(best corrected) visual acuity	GAT	Goldmann applanation tonometry	POAG	primary open angle glaucoma
AION	anterior ischemic optic neuropathy	GCA	giant cell arteritis	PRK	photorefractive keratectomy
ARMD	age-related macular degeneration	HRT	Heidelberg retinal tomography	PVD	posterior vitreous detachment
BRAO	branch retinal artery occlusion	INO	internuclear ophthalmoplegia	RA	rheumatoid arthritis
BRVO	branch retinal vein occlusion	IOL	intraocular lens	RAPD	relative afferent pupillary defect
C:D	cup to disc ratio	IOP	intraocular pressure	RD	retinal detachment
CMV	cytomegalovirus	LASIK	laser-assisted in situ keratomileusis	ROP	retinopathy of prematurity
CRAO	central retinal artery occlusion	OHT	ocular hypertension	RPE	retinal pigment epithelium
D	diopter	PACG	primary angle-closure glaucoma	SLE	systemic lupus erythematosus
DR	diabetic retinopathy	PDR	proliferative diabetic retinopathy	SPK	superficial punctate keratitis
EOM	extraocular movement	PDT	photodynamic therapy	VEGF	vascular endothelial growth factor
FML	fluoromethalone	PERLA	pupils equal, round, and reactive to light and accommodation	YAG	Yttrium aluminium garnet

## Basic Anatomy Review

Figure 1. Anatomy of the eye

Figure 2. Layers of the retina

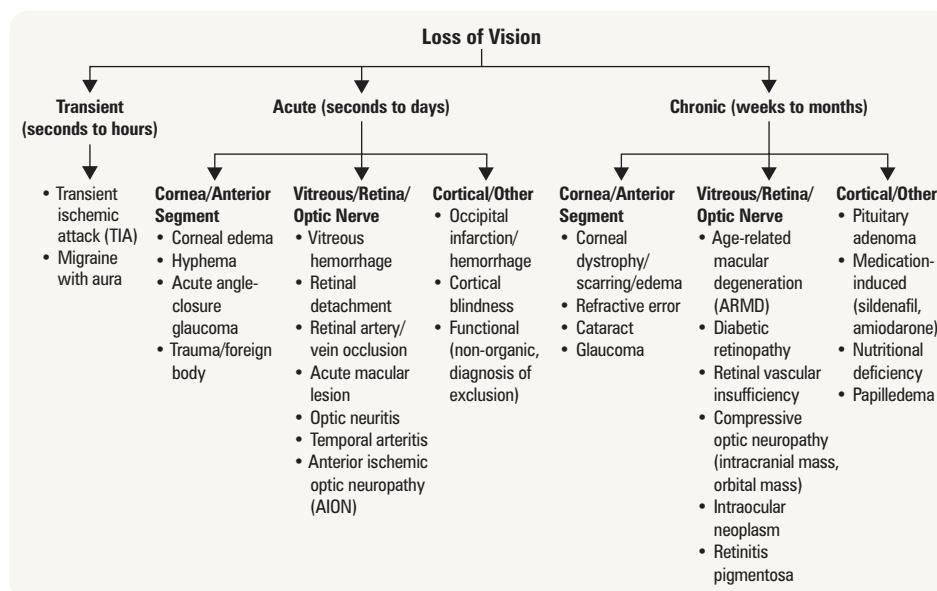

Figure 3. Tear drainage from the eye (lacrimal apparatus)

## Differential Diagnoses of Common Presentations

### Loss of Vision

#### Top 3 DDx of Acute Loss of Vision

- Trauma/foreign body
- Retinal artery/vein occlusion
- Retinal detachment

#### Top 3 DDx of Chronic Loss of Vision

- Reversible**
  - Cataract
  - Refractive error
  - Corneal dystrophy

- Irreversible**
  - ARMD
  - Glaucoma
  - Diabetic retinopathy

Note: Anti-VEGF treatment for exudative ARMD and diabetic macular edema may reverse some vision loss.

Figure 4. Loss of vision

## Red Eye

- lids/orbit/lacrimal system
  - hordeolum/chalazion
  - blepharitis
  - entropion/ectropion
  - foreign body/laceration
  - dacryocystitis/dacryoadenitis
- conjunctiva/sclera
  - subconjunctival hemorrhage
  - conjunctivitis
  - dry eyes
  - pterygium
  - episcleritis/scleritis
  - preseptal/orbital cellulitis
- cornea
  - foreign body (including contact lens)
  - keratitis
  - abrasion, laceration
  - ulcer
- anterior chamber
  - anterior uveitis (iritis, iridocyclitis)
  - acute angle-closure glaucoma
  - hyphema (blood in anterior chamber)
  - hypopyon (pus in anterior chamber)
- other
  - trauma
  - post-operative
  - endophthalmitis

## Ocular Pain

- differentiate from eye fatigue (asthenopia)
- herpes zoster prodrome
- trauma/foreign body
- keratitis
- corneal abrasion, corneal ulcer
- acute angle-closure glaucoma
- acute uveitis
- scleritis, episcleritis
- optic neuritis

## Floaters

- age-related vitreous syneresis (shrinkage and collapse of vitreous gel)
- posterior vitreous detachment (PVD)
- vitreous hemorrhage
- retinal tear/detachment
- posterior uveitis

## Flashes of Light (Photopsia)

- PVD
- retinal tear/detachment
- migraine with aura

## Photophobia (Severe Light Sensitivity)

- corneal abrasion, corneal ulcer
- keratitis
- acute angle-closure glaucoma
- iritis
- meningitis, encephalitis
- migraine
- subarachnoid hemorrhage (SAH)

## Diplopia (Double Vision)

- binocular diplopia (occurs with both eyes open, eliminated with occlusion of either eye)
  - strabismus, CN palsy (III, IV, VI) 2° to ischemia, diabetes, tumour, trauma, myasthenia gravis, muscle restriction/entrapment, thyroid ophthalmopathy, internuclear ophthalmoplegia (INO) 2° to multiple sclerosis, brainstem infarct
- monocular diplopia (occurs with one eye open, remains with occlusion of unaffected eye)
  - refractive error, strands of mucus in tear film, keratoconus, cataracts, dislocated lens, peripheral iridotomy

## Ocular Problems in the Elderly

- blepharitis
- ptosis
- entropion, ectropion
- dry eyes, epiphora (excessive tearing)
- presbyopia
- cataracts
- glaucoma
- age-related macular degeneration
- retinal artery/vein occlusion
- temporal arteritis (arteritic ischemic optic neuropathy)

## Ocular Problems in the Contact Lens Wearer

- superficial punctate keratitis (SPK) from dry eyes
- solution hypersensitivity
- tight lens syndrome
- corneal abrasion
- giant papillary conjunctivitis/contact lens allergy
- sterile corneal infiltrates (immunologic)
- infected ulcers (*Pseudomonas*, *Acanthamoeba*)

## Acute Painless Vision Loss

- vitreous hemorrhage
- retinal artery/vein occlusion
- retinal detachment
- anterior ischemic optic neuropathy (AION)
- optic neuritis
- amaurosis fugax

Table 1. Common Differential Diagnoses of Red Eye

	Conjunctivitis	Acute Iritis	Acute Angle-Closure Glaucoma	Keratitis (Corneal Abrasion/Ulcer)
<b>Discharge</b>	Bacteria: purulent Virus: serous Allergy: mucous	No	No	Profuse tearing
<b>Pain</b>	No	++ (tender globe)	+++ (nausea)	++ (on blinking)
<b>Photophobia</b>	No	+++	+	++
<b>Blurred Vision</b>	No	++	+++	Varies
<b>Pupil</b>	Normal	Smaller	Fixed in mid-dilation	Same or smaller
<b>Injection</b>	Conjunctiva with limbal pallor	Ciliary flush	Diffuse	Diffuse
<b>Cornea</b>	Normal	Keratic precipitates	Cloudy	Infiltrate, edema, epithelial defects
<b>Intraocular pressure</b>	Normal	Varies	Increased markedly	Normal or increased
<b>Anterior chamber</b>	Normal	+++ Cells and flare	Shallow	Cells and flare or normal
<b>Other</b>	Large, tender pre-auricular node(s) if viral	Posterior synechiae	Coloured halos Nausea and vomiting	

Not every red eye has conjunctivitis.

## Ocular Emergencies

These require urgent consultation to an ophthalmologist for management

### Sight Threatening

- lid/globe lacerations
- chemical burn
- corneal ulcer
- gonococcal conjunctivitis
- acute iritis
- acute angle-closure glaucoma
- CRAO
- intraocular foreign body
- retinal detachment (especially when macula threatened)
- endophthalmitis

### Life Threatening

- proptosis (r/o cavernous sinus fistula or thrombosis)
- CN III palsy with dilated pupil (intracranial aneurysm or neoplastic lesion)
- papilledema (must r/o intracranial mass lesion)
- orbital cellulitis
- temporal (giant cell) arteritis
- leukocoria: white reflex (absent red reflex, must rule out retinoblastoma)

## The Ocular Examination

### Visual Acuity – Distance

- Snellen Acuity (Figure 5) =  $\frac{\text{testing distance (usually 20 feet or 6 metres)}}{\text{smallest line patient can read on the chart}}$ 
  - e.g. 20/40 = what the patient can see at 20 feet (numerator), what a “normal” person can see at 40 feet (denominator)
- testing hierarchy for low vision: Snellen acuity (20/x) → counting fingers at a given distance (CF) → hand motion (HM) → light perception with projection (LP with projection) → light perception (LP) → no light perception (NLP)
- legal blindness is BCVA that is  $\leq 20/200$  in best eye
- minimum visual requirements to operate a non-commercial automobile in Ontario are: with both eyes open and examined together, 20/50 BCVA

### Visual Acuity – Near

- use pocket vision chart (Rosenbaum Pocket Vision Screener)
- record Jaeger (J) or Point number and testing distance (usually 30 cm) e.g. J2 @ 30 cm
- conversion to distance VA possible (e.g. immobile patient, no distance chart available)

### Example 1

SC  
V 20/40 -1  
20/80 +2 → 20/25 PH

### Example 2

CC  
V CF 3'  
HM

**Note:** RIGHT EYE visual acuity always listed on top.

V Vision  
SC Without correction  
CC With correction  
20/40 -1 All except one letter of 20/40  
20/80 +2 All of 20/80 plus two letters of 20/70  
PH Visual acuity with pinhole correction  
CF Counting fingers  
HM Hand motion

Figure 5. Ophthalmology nomenclature for VA

OD = oculus dexter = right eye  
OS = oculus sinister = left eye  
OU = oculus uterque = both eyes

Snellen visual acuity of 20/20 equates to “normal” vision.

### Normal Infant and Child Visual Acuity

- 6-12 mo: 20/120
- 1-2 yr: 20/80
- 2-4 yr: 20/20

### Visual Acuity for Infants, Children, Non-English Speakers, and Dysphasics

- newborns
  - VA cannot be tested
- 3 mo-3 yr (can only assess visual function, not acuity)
  - test each eye for fixation symmetry using an interesting object
  - normal function noted as "CSM" = central, steady, and maintained
- 3 yr until alphabet known
  - pictures or letter cards/charts such as HOTV or Sheridan-Gardner test (children point to optotypes on a provided matching card)
  - tumbling "E" chart

### Colour Vision

- test with Ishihara pseudoisochromatic plates
- record number of correctly identified plates presented to each eye, specify incorrect plates
- important for testing optic nerve function (e.g. optic neuritis, chloroquine use, thyroid ophthalmopathy)
- note: red-green colour blindness is sex-linked and occurs in 7-10% of males

### VISUAL FIELDS

- test "visual fields by confrontation" (4 quadrants, each eye tested separately) for estimation of visual field loss (Figure 6)
- accurate, quantifiable assessment with automated visual field testing (Humphrey or Goldmann) or Tangent Screen
- use Amsler grid (each eye individually) to test for central or paracentral scotomas (island-like gaps in the vision) in patients with ARMD

### PUPILS

- use reduced room illumination with patient focusing on distant object to prevent "near reflex"
- examine pupils for shape, size, symmetry, and reactivity to light (both direct and consensual response)
- test for relative afferent pupillary defect (RAPD) with swinging flashlight test
- test pupillary constriction portion of near reflex by bringing object close to patient's nose
- "normal" pupil testing often noted as PERLA (pupils equal, round, and reactive to light and accommodation)

### ANTERIOR CHAMBER DEPTH

- shine light tangentially from temporal side
- if >2/3 of nasal side of iris in shadow → shallow anterior chamber

### The van Herick method

- shine thin angled slit beam onto the peripheral cornea of each eye
- estimate depth between the posterior surface of the cornea and the iris as a proportion of corneal thickness
- follow-up with gonioscopy for ratios  $\leq 1/4$

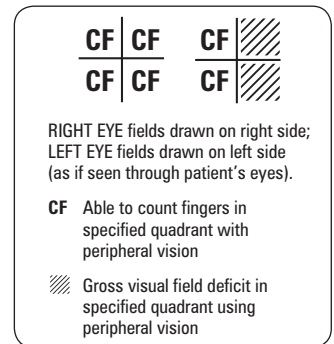

### Gonioscopy

- allows direct visualization of the angle structures
- angle considered open if trabecular meshwork, scleral spur, and iris processes are visualized
- angle considered narrow (occludable) if only *Schwalbe's* line or a small portion of the trabecular meshwork is seen

### EXTRAOCULAR MUSCLES

#### Alignment

- Hirschberg corneal reflex test
  - examine in primary position of gaze (i.e. straight ahead) with patient focusing on distant object
  - shine light into patient's eyes from ~30 cm away
  - corneal light reflex should be symmetric and at the same position on each cornea
- strabismus testing as indicated (cover test, cover-uncover test, prism testing) (see *Strabismus*, OP38)

**Figure 6. Ophthalmology nomenclature for visual fields by confrontation**

For patients with dark irides, test pupils using an ophthalmoscope focused on the red reflex. This will provide a better view than using a penlight.

#### Ocular Changes for Near Fixation

- Eye convergence
- Pupil constriction
- Lens accommodation

#### 4 Ps of InsPection

**Pupil:** shape, size, symmetry  
**Position:** esotropia, exotropia, central  
**Ptosis**  
**Primary nystagmus**

**Figure 7. Estimation of anterior chamber depth**

## Movement

- examine movement of eyeball through six cardinal positions of gaze (Figure 8)
- ask patient if diplopia is present in any position of gaze
- observe for horizontal, vertical, or rotatory nystagmus (rhythmic, oscillating movements of the eye)
- resolving horizontal nystagmus at end-gaze is usually normal
- see sidebar for cranial nerve innervation of extraocular muscles

## Diplopia

- major symptom associated with dysfunction of extraocular muscles or abnormalities of the motor nerves innervating these muscles
- must determine whether diplopia is monocular or binocular
- determine whether diplopia was sudden onset (due to an acute event such as ischemia) or gradual (due to progressive process such as tumour or inflammation)
- with myasthenia gravis, diplopia and ptosis usually worsen on prolonged upgaze; can rule out with a Tensilon® test (see [Neurology](#), N32)
- if suspect compressive lesion (most commonly seen with CN III palsy with a blown pupil), need MRI and angiography to rule out aneurysm or tumour
- new-onset diplopia that disappears with occlusion of either eye (binocular diplopia) needs urgent referral while chronic binocular diplopia and monocular diplopia should be referred non-urgently

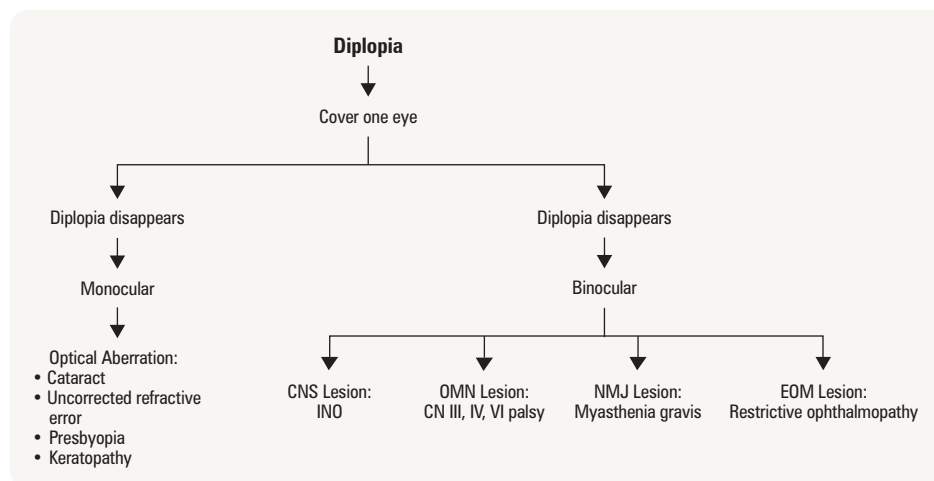

Figure 9. Diplopia

## EXTERNAL EXAMINATION

- four Ls
  - lymph nodes (preauricular, submandibular)
  - lids
  - lashes
  - lacrimal system

## SLIT-LAMP EXAMINATION

- systematically examine all structures of the anterior segment and anterior vitreous (for structures see Figure 1)
- when necessary, use:
  - fluorescein dye: stains Bowman's membrane in de-epithelialized cornea; dye appears green with cobalt blue filtered light
  - Rose Bengal dye: stains devitalized corneal epithelium
- special lenses (78 or 90 D) used with the slit-lamp allow a binocular, stereoscopic view of the fundus and vitreous

Figure 8. Diagnostic positions of gaze for isolated primary actions of extraocular muscles

### Extraocular Muscle Innervations

LR6 SO4 AE3

Lateral Rectus via CN VI

Superior Oblique via CN IV

All Else via CN III (superior, medial, and inferior rectus, inferior oblique)

### Aqueous Flare

- Resembles dust particles in a beam of light
- Results from protein leaking from blood vessels
- Distinguish from aqueous cells (individual cells in anterior chamber)

**Note:** RIGHT EYE drawn on the left, LEFT EYE drawn on the right (as if looking at patient's face).

- LLL Lids, lashes, lacrimal
- SC Sclera, conjunctiva
- K Cornea
- AC Anterior chamber
- d+q Deep (not shallow) and quiet (no cells in AC)
- NS Nuclear sclerosis (cataract)

Figure 10. Slit-lamp examination note

## TONOMETRY

- measurement of intraocular pressure (IOP) (Figure 11)
- normal range is 10-21 mmHg (average 15 mmHg)
- IOP has diurnal variation, so always record the time of day at which the measurement was taken
- commonly measured by:
  - Goldmann applanation tonometry (GAT): gold standard, performed using the slit-lamp with special tip (prism)
  - Tono-Pen®: benefit is portability and use of disposable probe tips. Use when cornea is scarred/asymmetric (GAT inaccurate)
  - air puff (non-contact and least reliable)
- use topical anesthetic for GAT and Tono-Pen®

Figure 11. Tonometry

## OPHTHALMOSCOPY/FUNDOSCOPY

- performed with:
  - direct ophthalmoscope (monocular with small field of view, only posterior pole visualized)
  - slit-lamp with 78 or 90 D lens (binocular view, visualization to mid-periphery of retina)
  - indirect ophthalmoscopy with headlamp and 20 or 28 D lens (binocular view, visualization of entire retina to ora serrata/edge of retina)
- best performed with pupils dilated (see Table 11 for list of mydriatics and cycloplegics)
  1. assess red reflex
    - ♦ light reflected off the retina produces a “red reflex” when viewed from ~1 foot away
    - ♦ anything that interferes with the passage of light will diminish the red reflex (e.g. large vitreous hemorrhage, cataract)
  2. examine the posterior segment of the eye (Figure 10)
    - ♦ vitreous
    - ♦ optic disc (colour, C:D ratio, sharpness of disc margin)
    - ♦ macula (~2 disc diameters temporal to disc), fovea (foveal light reflex)
    - ♦ retinal vessels
    - ♦ retinal background
- contraindications to pupillary dilatation
  - shallow anterior chamber – can precipitate acute angle-closure glaucoma
  - iris-supported anterior chamber lens implant
  - potential neurologic abnormality requiring pupil evaluation
  - use caution with cardiovascular disease – mydriatics may cause tachycardia

### Central Corneal Thickness (CCT)

Average CCT = 550 µm

By GAT, IOP is over estimated with thick corneas and under estimated with thin corneas.

### Desired Myers Pattern on GAT

Note: Thick Myers overestimate the IOP and are a result of excess fluorescein

### Quick Tips for Direct Ophthalmoscopy

- Examine in a dark room
- Ask patient to focus on a distant object
- Match ophthalmoscope light aperture to size of pupil (i.e. smaller aperture for undilated eye)
- Use moderate light intensity
- Use your left/right eye and hand to examine patient's left/right eye respectively
- Get in close! Proximity to patient's eye is key. You may rest your hand on the patient's cheek

### Structures Responsible for Refractive Power

- Cornea (2/3)
- Lens (1/3)

### Myopia

LMN

Long globe

Myopic

Negative correction/Nearsighted

# Optics

## REFRACTION

- two techniques used
  - flash/streak retinoscopy: refractive error determined objectively by the examiner using lenses and retinoscope
  - manifest: subjective trial using loose lenses or a phoropter (device the patient looks through that is equipped with lenses)
- a typical lens prescription would contain:
  - sphere power in D (measurement of refractive power of lens, equal to reciprocal of focal length in meters)
  - cylinder power in D to correct astigmatism (always positive value)
  - axis of cylinder in degrees
  - “add” (bifocal/progressive reading lens) for presbyopes
  - e.g. -1.50 + 1.00 x 120 degrees, add +2.00

## REFRACTIVE EYE SURGERY

- permanently alters corneal refractive properties by ablating tissue to change curvature of the cornea
- used for correction of myopia, hyperopia, and astigmatism
- common types include PRK and LASIK (see *Surgical Ophthalmology*, OP44)
- potential risks/side-effects: infection, under/overcorrection, decreased night vision (nyctalopia), corneal haze, dry eyes, regression, complete sever of corneal flap (LASIK only)

Table 2. Optics

	Pathophysiology	Clinical Features	Treatment	Complications
<b>Emmetropia</b>	<ul style="list-style-type: none"> <li>Image of distant objects focus exactly on the retina (Figure 12)</li> </ul>	<ul style="list-style-type: none"> <li>No refractive error</li> </ul>		
<b>Myopia</b>	<ul style="list-style-type: none"> <li>Globe too long relative for refractive mechanisms, or refractive mechanisms too strong</li> <li>Light rays from distant object focus in front of retina → blurring of (distance) vision (Figure 12)</li> </ul>	<ul style="list-style-type: none"> <li>"Nearsightedness"</li> <li>Usually presents in 1st or 2nd decade, stabilizes in 2nd and 3rd decade; rarely begins after age 25 except in patients with diabetes or cataracts</li> <li>Blurring of distance vision; near vision usually unaffected</li> <li>Prevalence: 30-40% in U.S. population</li> </ul>	<ul style="list-style-type: none"> <li>Correct with negative diopter/concave/"negative" lenses to diverge light rays</li> <li>Refractive eye surgery</li> </ul>	<ul style="list-style-type: none"> <li>Retinal tear/detachment, macular hole, open angle glaucoma</li> <li>Other complications that are not prevented with refractive correction</li> </ul>
<b>Hyperopia</b>	<ul style="list-style-type: none"> <li>Globe too short relative to refractive mechanisms, or refractive mechanisms too weak</li> <li>Light rays from distant object focus behind retina → blurring of near ± distant vision (Figure 12)</li> <li>May be developmental or due to any etiology that shortens globe</li> </ul>	<ul style="list-style-type: none"> <li>"Farsightedness"</li> <li>Youth: usually do not require glasses (still have sufficient accommodative ability to focus image on retina), but may develop accommodative esotropia (see <i>Strabismus</i>, OP38)</li> <li>30s-40s: blurring of near vision due to decreased accommodation, may need reading glasses</li> <li>&gt;50s: blurring of distance vision due to severely decreased accommodation</li> </ul>	<ul style="list-style-type: none"> <li>When symptomatic, correct with positive diopter/convex/"plus" lenses to converge light rays</li> <li>Refractive eye surgery</li> </ul>	<ul style="list-style-type: none"> <li>Angle-closure glaucoma, particularly later in life as lens enlarges</li> </ul>

<b>Anisometropia</b>	<ul style="list-style-type: none"> <li>Difference in refractive errors between eyes</li> </ul>			<ul style="list-style-type: none"> <li>Second most common cause of amblyopia in children</li> </ul>

Figure 12. Emmetropia and refractive errors

Figure 13. Correction of refractive errors

## Imaging Modalities

- **adaptive optics scanning laser ophthalmology – optical coherence tomography (SLO-OCT)**
  - combines the surface detail of confocal ophthalmoscopy with the internal detail of OCT
  - allows 3D OCT images, volume and area maps, and retinal thickness maps, at the resolution of living rods and cones
  - can visualize photoreceptors, nerve fibres and blood cells in retinal capillaries
- **CT, MRI**
  - orbital imaging, particularly in orbital trauma and neuro-ophthalmology
- **fluorescein angiography**
  - non-invasive evaluation of vascular pattern of the fundus
  - commonly used in ARMD, DR, retinal vascular diseases
- **indocyanine green angiography**
  - uses infra-red light and intravenous ICG dye for imaging of choroidal structure
  - particularly useful to detect polypoidal vasculopathy (variant of ARMD) more commonly present among Asian patients

- **Heidelberg retinal tomograph (HRT)**
  - confocal scanning laser tomography of retinal nerve head and surrounding nerve fibre layer
  - used to assess extent of structural glaucomatous changes
- **optical coherence tomography (OCT)**
  - non-invasive, cross-sectional, high-resolution imaging of vitreous, retinal layers, optic nerve
  - commonly used to assess macular edema/holes/cysts, ARMD progression, epi-retinal membrane, retinal detachment (RD)
- **anterior segment optical coherence tomography (AS-OCT)**
  - non-invasive, cross-sectional, high-resolution imaging of cornea, aqueous, iris and lens
- **perimetry**
  - quantitative evaluation of visual fields, used to screen for scotomas and monitor progression (e.g. in glaucoma)
- **ultrasonography**
  - evaluation of orbit in real-time. A-scans (one-dimensional), B-scans (two-dimensional), and Doppler are all used (e.g. large RDs, foreign bodies, monitoring intraocular tumours)

## The Orbit

### Globe Displacement

Table 3. Exophthalmos (Proptosis) and Enophthalmos

	Exophthalmos (Proptosis)	Enophthalmos
<b>Definition</b>	<ul style="list-style-type: none"> <li>• Anterior displacement (protrusion) of the globe               <ul style="list-style-type: none"> <li>▪ Exophthalmos generally refers to an endocrine etiology or protrusion of &gt;18 mm (as measured by a Hertel exophthalmometer)</li> <li>▪ Proptosis generally refers to other etiologies (e.g. cellulitis) or protrusion of &lt;18 mm</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Posterior displacement (retraction) of the globe</li> </ul>
<b>Investigations</b>	<ul style="list-style-type: none"> <li>• CT/MRI head/orbits, ultrasound orbits, thyroid function tests</li> </ul>	<ul style="list-style-type: none"> <li>• CT/MRI orbits</li> </ul>
<b>Etiology</b>	<ul style="list-style-type: none"> <li>• Note: rule out pseudoexophthalmos (e.g. lid retraction)</li> <li>• Graves' disease (unilateral or bilateral, most common cause in adults)</li> <li>• Orbital cellulitis (unilateral, most common cause in children)</li> <li>• 1° or 2° orbital tumours</li> <li>• Orbital/retrobulbar hemorrhage</li> <li>• Cavernous sinus thrombosis or fistula</li> </ul>	<ul style="list-style-type: none"> <li>• "Blow-out" fracture (see <i>Ocular Trauma</i>, OP42)</li> <li>• Orbital fat atrophy</li> <li>• Congenital abnormality</li> <li>• Metastatic disease</li> </ul>

### Preseptal Cellulitis

- infection of soft tissue anterior to orbital septum

#### Etiology

- usually follows periorbital trauma or dermal infection

#### Clinical Features (Table 4)

#### Treatment

- systemic antibiotics (suspect *H. influenzae* in children; *S. aureus* or *Streptococcus* in adults)
  - e.g. amoxicillin-clavulanic acid
- if severe or child <1 yr, treat as orbital cellulitis

### Orbital Cellulitis

- **OCULAR and MEDICAL EMERGENCY**
- inflammation of orbital contents posterior to orbital septum
- common in children, elderly, and immunocompromised

#### Etiology

- usually 2° to sinus/facial/tooth infections or trauma, can also arise from preseptal cellulitis

#### Clinical Features (Table 4)

#### Treatment

- admit, blood cultures x2, orbital CT, IV antibiotics (ceftriaxone + vancomycin) for 1 wk
- surgical drainage of abscess with close follow-up, especially in children

#### Periorbital and Orbital Cellulitis Before and After the Advent of Haemophilus influenzae type B Vaccination

*Ophthalmol* 2000;107:1450-1453  
**Study:** Retrospective case series.

**Patients:** 315 pediatric inpatients in Massachusetts with a discharge diagnosis of periorbital or orbital cellulitis.

**Results:** Prior to the introduction of the Hib vaccine, 11.7% of cases were culture positive for Hib. After the vaccination program was initiated, the case rate dropped to 3.5% ( $P=0.028$ ). All cases of orbital cellulitis were associated with sinusitis, and cases of periorbital cellulitis were most commonly associated with upper respiratory tract infections or sinusitis.

Orbital cellulitis is life-threatening if untreated (mortality of 17-20% without antibiotic use). Prompt diagnosis and treatment is essential.

### Complications

- optic nerve inflammation, cavernous sinus thrombosis, meningitis and brain abscess with possible loss of vision, death

**Table 4. Clinical Features of Preseptal and Orbital Cellulitis**

Finding	Preseptal Cellulitis	Orbital Cellulitis
Fever	May be present	Present
Lid edema	Moderate to severe	Severe
Conjunctival injection	Absent	Present
Chemosis	Absent or mild	Marked
Proptosis	Absent	Present
Pain on eye movement	Absent	Present
Ocular mobility	Normal	Decreased
Vision	Normal	Diminished $\pm$ diplopia
RAPD	Absent	May be seen
Leukocytosis	Moderate	Marked
ESR	Normal or elevated	Elevated
Additional findings	Skin infection	Sinusitis, dental abscess

## Lacrimal Apparatus

- tear film made up of three layers
  - outer oily layer (reduces evaporation): secreted by the Meibomian glands
  - middle watery layer (forms the bulk of the tear film): constant secretion from conjunctival glands and reflex secretion by lacrimal gland with ocular irritation or emotion
  - inner mucinous layer (aids with tear adherence to cornea): secreted by conjunctival goblet cells
- tears drain from the eyes through the upper and lower lacrimal puncta  $\rightarrow$  superior and inferior canaliculi  $\rightarrow$  lacrimal sac  $\rightarrow$  nasolacrimal duct  $\rightarrow$  nasal cavity behind inferior concha (Figure 3)

## Dry Eye Syndrome (Keratoconjunctivitis Sicca)

### Etiology

- aqueous-deficient (lacrimal pathology)
  - Sjögren Syndrome (autoimmune etiology e.g. rheumatoid arthritis, SLE)
  - non-Sjögren Syndrome (idiopathic age-related disease; lacrimal gland scarring e.g. trachoma; decreased secretion e.g. contact lenses, CN VII palsy, anticholinergics, antihistamines, diuretics,  $\beta$ -blockers)
- evaporative (normal lacrimal function, excessive evaporation of aqueous layer)
  - Meibomian gland dysfunction (posterior blepharitis)
  - vitamin A deficiency (xerophthalmia with goblet cell dysgenesis)
  - eyelid abnormalities e.g. ectropion, CN VII palsy (decreased blinking)
  - preserved topical ocular medications
  - contact lenses, allergic conjunctivitis
- overlap of mixed etiologies common

### Clinical Features

- dry eyes, red eyes, foreign body sensation, blurred vision, tearing
- slit-lamp exam: decreased tear meniscus, decreased tear break up time (normally should be 10 s), SPK
- surface damage observed with fluorescein/Rose Bengal staining
- decreased distance in Schirmer's test

### Complications

- erosions and scarring of cornea

### Treatment

- medical: preservative-free artificial tears up to q1h and ointment at bedtime (preservative toxicity becomes significant if used more than q1h PRN)
  - for severe cases, cyclosporine ophthalmic emulsion 0.05% (Restasis®) can be used
- procedural: punctal occlusion (punctal plug insertion), lid taping, tarsorrhaphy (sew lids together) if severe
- treat underlying cause

Long term use of artificial tears with preservatives should be avoided when treating dry eyes.

## Epiphora (Excessive Tearing)

### Etiology

- emotion, pain
- environmental stressor (cold, wind, pollen, sleep deprivation)
- lid/lash malposition: ectropion, entropion, trichiasis
- inflammatory: conjunctivitis, uveitis, keratitis, corneal foreign body
- dry eyes (reflex tearing)
- lacrimal drainage obstruction (congenital failure of canalization, aging, rhinitis, dacryocystitis)
- paradoxical gustatory lacrimation reflex (crocodile tears)

### Investigations

- using fluorescein dye, examine for punctal reflux by pressing on canaliculi
- Jones dye test: fluorescein placed in conjunctival cul-de-sac, and cotton applicator placed in nose to detect flow (i.e. rule out lacrimal drainage obstruction)

### Treatment

- lid repair for ectropion or entropion
- eyelash removal for trichiasis
- punctal irrigation
- nasolacrimal duct probing (infants)
- tube placement: temporary (Crawford) or permanent (Jones)
- surgical: dacryocystorhinostomy (see *Surgical Ophthalmology*, OP44) – forming a new connection between the lacrimal sac and the nasal cavity

Excessive tearing can be caused by dry eyes – if the tear quality is insufficient, “reflex tearing” may occur.

## Dacryocystitis

- acute or chronic infection of the lacrimal sac
- most commonly due to obstruction of the nasolacrimal duct
- commonly associated with *S. aureus*, *S. pneumoniae*, *Pseudomonas* species

### Clinical Features

- pain, swelling, redness over lacrimal sac at medial canthus
- epiphora, crusting,  $\pm$  fever
- digital pressure on the lacrimal sac may extrude pus through the punctum
- in the chronic form, epiphora may be the only symptom

### Treatment

- warm compresses, nasal decongestants, systemic and topical antibiotics
- if chronic, obtain cultures by aspiration
- once infection resolves, consider dacryocystorhinostomy (see *Surgical Ophthalmology*, OP44)

## Dacryoadenitis

- inflammation of the lacrimal gland (outer third of upper eyelid)
- acute causes: *S. aureus*, mumps, EBV, herpes zoster, *N. gonorrhoeae*
- chronic causes (often bilateral): lymphoma, leukemia, sarcoidosis, tuberculosis, thyroid ophthalmopathy

### Clinical Features

- pain, swelling, tearing, discharge, redness of the outer region of the upper eyelid
- chronic form is more common and may present as painless enlargement of the lacrimal gland

### Treatment

- supportive: warm compresses, oral NSAIDs
- systemic antibiotics if bacterial cause
- if chronic, treat underlying disorder

## Lids and Lashes

### Lid Swelling

#### Etiology

- commonly due to allergy, with shriveling of skin between episodes
- dependent edema on awakening (e.g. CHF, renal or hepatic failure)
- orbital venous congestion due to mass or cavernous sinus fistula
- dermatochalasis (loose skin due to aging or heredity)
- lid cellulitis, thyroid disease (e.g. myxedema), trauma, chemosis

## Ptosis

- drooping of upper eyelid

### Etiology

- aponeurotic: disinsertion or dehiscence of levator aponeurosis (most common)
  - associated with advancing age, trauma, surgery, pregnancy, chronic lid swelling
- mechanical
  - incomplete opening of eyelid due to mass or scarring
- neuromuscular
  - myasthenia gravis (neuromuscular palsy), myotonic dystrophy
  - CN III palsy
  - Horner's syndrome (see *Constricted Pupil*, Horner's Syndrome, OP32)
- congenital
- pseudoptosis (e.g. dermatochalasis, enophthalmos, contralateral exophthalmos)

### Treatment

- surgery

## Trichiasis

- eyelashes turned inwards
- may result from chronic inflammatory lid diseases (e.g. blepharitis), Stevens-Johnson syndrome, trauma, burns
- patient complains of red eye, foreign body sensation, tearing
- may result in corneal ulceration and scarring

### Treatment

- topical lubrication, eyelash plucking, electrolysis, cryotherapy

## Entropion

- lid margin turns in towards globe causing tearing, foreign body sensation, and red eye
- most commonly affects lower lid
- may cause abrasions with 2° corneal scarring

### Etiology

- involutional (aging)
- cicatricial (herpes zoster, surgery, trauma, burns)
- orbicularis oculi muscle spasm
- congenital

### Treatment

- lubricants, evert lid with tape, surgery

#### Testing for Entropion

Forced lid closure: Ask patient to tighten lid then open. In entropion, lid rolls inwards.

## Ectropion

- lid margin turns outward from globe causing tearing and possibly exposure keratitis

### Etiology

- involutional (aging)
- paralytic (CN VII palsy)
- cicatricial (burns, trauma, surgery)
- mechanical (lid edema, tumour, herniated fat)
- congenital

### Treatment

- topical lubrication, surgery

#### Testing for Ectropion

Snapback test: Pull eyelid inferiorly. In ectropion, lid remains away from globe.

## Hordeolum (Stye)

- acute inflammation of eyelid gland: either Meibomian glands (internal lid) or glands of Zeis (modified sweat gland) or Moll (modified sebaceous gland in external lid)
- infectious agent is usually *S. aureus*
- painful, red swelling of lid

### Treatment

- warm compresses, lid care, gentle massage
- topical antibiotics (e.g. erythromycin ointment bid)
- usually resolves in 2-5 d

## Chalazion

- chronic granulomatous inflammation of Meibomian gland often preceded by an internal hordeolum
- acute inflammatory signs are usually absent
- differential diagnosis: basal cell carcinoma, sebaceous cell adenoma, Meibomian gland carcinoma

### Treatment

- warm compresses
- if no improvement after 1 mo, consider incision and curettage
- chronic recurrent lesion must be biopsied to rule out malignancy

#### Hordeolum vs. Chalazion

Hordeolums are due to an infectious etiology, whereas chalazions are granulomatous inflammation.

## Blepharitis

- inflammation of lid margins

### Etiology

- two main types
  - staphylococcal (*S. aureus*): ulcerative, dry scales
  - seborrheic: no ulcers, greasy scales

### Clinical Features

- itching, tearing, foreign body sensation
- thickened, red lid margins, crusting, discharge with pressure on lids ("toothpaste sign")

### Complications

- recurrent chalazia
- conjunctivitis
- keratitis (from poor tear film)
- corneal ulceration and neovascularization

### Treatment

- warm compresses and lid scrubs with diluted "baby shampoo"
- topical or systemic antibiotics as needed
- if severe, ophthalmologist may prescribe a short course of topical corticosteroids

## Xanthelasma

- eyelid xanthoma (lipid deposits in dermis of lids)
- appear as pale, slightly elevated yellowish plaques or streaks
- most commonly on the medial upper lids, often bilateral
- associated with hyperlipidemia (approximately 50% of patients)
- common in the elderly, more concerning in the young

### Treatment

- excision for cosmesis only, commonly recurs

## Conjunctiva

- thin, vascular mucous membrane/epithelium
- bulbar conjunctiva: lines sclera to limbus (junction between cornea and sclera)
- palpebral (tarsal) conjunctiva: lines inner surface of eyelid

## Pinguecula

- yellow-white subepithelial deposit of hyaline and elastic tissue adjacent to the nasal or temporal limbus, sparing the cornea
- associated with sun and wind exposure, aging
- common, benign, sometimes enlarges slowly
- may be irritating due to abnormal tear film formation over the deposits
- surgery for cosmesis only
- irritative symptoms may be treated with lubricating drops

## Pterygium

- fibrovascular triangular encroachment of epithelial tissue onto the cornea, usually nasally
- may induce astigmatism, decrease vision
- excision for chronic inflammation, threat to visual axis, cosmesis
- irritative symptoms may be treated with lubricating drops
- one-third recur after excision, lower recurrence with conjunctival autograft (5%)

## Subconjunctival Hemorrhage

- blood beneath the conjunctiva, otherwise asymptomatic
- idiopathic or associated with trauma, Valsalva maneuver, bleeding disorders, hypertension
- give reassurance if no other ocular findings, resolves spontaneously in 2-3 wk
- if recurrent, consider medical/hematologic work-up

## Conjunctivitis

### Etiology

- infectious
  - bacterial, viral, chlamydial, fungal, parasitic
- non-infectious
  - allergic: atopic, seasonal, giant papillary conjunctivitis (contact lens wearers)
  - toxic: irritants, dust, smoke, irradiation
  - 2° to another disorder: dacryocystitis, dacryoadenitis, cellulitis, Kawasaki's disease

### Clinical Features

- red eye (conjunctival injection often with limbal pallor), chemosis, subepithelial infiltrates
- itching, foreign body sensation, tearing, discharge, crusting of lashes in the morning, lid edema
- preauricular and/or submandibular nodes
- follicles: pale lymphoid elevations of the conjunctiva
- papillae: fibrovascular elevations of the conjunctiva with central network of finely branching vessels (cobblestone appearance)

- Enlarged lymph nodes suggest infectious etiology, especially viral or chlamydial conjunctivitis
- Temporal conjunctival lymphatics drain to preauricular nodes, and nasal to submandibular nodes

- Follicles are usually seen in viral and chlamydial conjunctivitis
- Papillae are usually seen in allergic and bacterial conjunctivitis

## ALLERGIC CONJUNCTIVITIS

### Atopic

- associated with rhinitis, asthma, dermatitis, hay fever
- small papillae, chemosis, thickened and erythematous lids, corneal neovascularization
- seasonal (pollen, grasses, plant allergens)
- treatment: cool compresses, antihistamine, mast cell stabilizer (e.g. ketotifen, olopatadine)

### Types of Discharge

- Allergic: mucoid
- Viral: watery
- Bacterial: purulent
- Chlamydial: mucopurulent

### Giant Papillary Conjunctivitis

- immune reaction to mucus debris on lenses in contact lens wearers
- large papillae form on superior palpebral conjunctiva
- treatment: clean, change or discontinue use of contact lens

### Vernal Conjunctivitis

- large papillae (cobblestones) form on superior palpebral conjunctiva with corneal ulcers and keratitis
- seasonal (warm weather)
- occurs in children, lasts for 5-10 yr then resolves
- treatment: consider topical steroid, topical cyclosporine (by ophthalmologist)

## VIRAL CONJUNCTIVITIS

- serous discharge, lid edema, follicles
- subepithelial corneal infiltrates
- may be associated with rhinorrhea
- preauricular node often palpable and tender
- initially unilateral, often progresses to the other eye
- mainly due to adenovirus – highly contagious for up to 12 d

### Treatment

- cool compresses, topical lubrication
- usually self-limiting (7-12 d)
- proper hygiene is very important

**BACTERIAL CONJUNCTIVITIS**

- purulent discharge, lid swelling, papillae, conjunctival injection, chemosis
- common agents include *S. aureus*, *S. pneumoniae*, *H. influenzae* and *M. catarrhalis*
- in neonates or if sexually active must consider *N. gonorrhoeae* (invades cornea to cause keratitis)
- *Chlamydia trachomatis* is the most common cause in neonates (see *Chlamydial Conjunctivitis*, below)

**Treatment**

- topical broad-spectrum antibiotic
- systemic antibiotics if indicated, especially in neonates and children
- usually a self-limited course of 10-14 d if no treatment, 1-3 d with treatment

**CHLAMYDIAL CONJUNCTIVITIS**

- caused by *Chlamydia trachomatis*
- affects neonates (ophthalmia neonatorum) on day 3-5, sexually active individuals
- causes trachoma and inclusion conjunctivitis

**Trachoma**

- leading infectious cause of blindness in the world
- severe keratoconjunctivitis leads to corneal abrasion, ulceration, and scarring
- initially, follicles on superior palpebral conjunctiva
- treatment: topical and systemic tetracycline

**Inclusion Conjunctivitis**

- chronic conjunctivitis with follicles and subepithelial infiltrates
- most common cause of conjunctivitis in newborns
- prevention: topical erythromycin at birth
- treatment: topical and systemic tetracycline, doxycycline or erythromycin

**Antibiotics versus Placebo for Acute Bacterial Conjunctivitis**

Cochrane DB Syst Rev 2006;2:CD001211

**Study:** Cochrane systematic review and meta-analysis of 5 heterogeneous trials investigating the efficacy of topical antibiotic treatment for bacterial conjunctivitis.

**Patients:** 1034 participants randomized to topical antibiotic treatment or placebo.

**Results:** Topical antibiotics are beneficial in improving early (days 2 to 5) clinical and microbiological remission rates, with respective risk ratios (RR) of 1.24 and 1.77, respectively. Later (days 6 to 10) cure rates are lower than earlier values, with a clinical RR of 1.11 and a microbiological RR of 1.56. Most cases would, however, clinically resolve spontaneously on days 2-5 with placebo treatment only (65%). There were no reported serious outcomes in either group.

**Conclusion:** Topical antibiotic treatment of acute bacterial conjunctivitis is associated with a significantly improved rate of early clinical and microbiological remission, although most cases are self-limiting, and serious sight-threatening complications are rare.

## Sclera

- white fibrous outer protective coat of the eye, composed of irregularly distributed collagen bundles
- continuous with the cornea anteriorly and the dura of the optic nerve posteriorly
- episclera is a thin layer of vascularized tissue between the sclera and conjunctiva

## Episcleritis

- immunologically mediated inflammation of episclera
- 1/3 bilateral; simple (80%) or nodular (20%)
- more frequent in women than men (3:1)

**Etiology**

- mostly idiopathic
- in 1/3 of cases, associated with collagen vascular diseases, infections (herpes zoster, herpes simplex, syphilis), inflammatory bowel disease, rosacea, atopy

**Clinical Features**

- usually asymptomatic; may have discomfort, heat sensation, red eye (often interpalpebral), rarely pain
- sectoral or diffuse injection of radially-directed vessels, chemosis, small mobile nodules
- blanches with topical phenylephrine (constricts superficial conjunctival vessels)

**Treatment**

- generally self limited, recurrent in 2/3 of cases
- topical steroid for 3-5 d if painful (prescribed and monitored by ophthalmologist)

To differentiate between episcleritis and scleritis, place a drop of phenylephrine 2.5% (Mydrin®; AK-Dilate®) in the affected eye. Re-examine the vascular pattern 10-15 min later. Episcleral vessels should blanch. Scleral vessels should not.

## Scleritis

- usually bilateral: diffuse, nodular, or necrotizing
- anterior scleritis: pain radiating to face, may cause scleral thinning, in some cases necrotizing
- posterior scleritis: rapidly progressive blindness, may cause exudative RD
- more common in women and elderly

### Etiology

- may be a manifestation of systemic disease
- collagen vascular disease, e.g. SLE, rheumatoid arthritis, ankylosing spondylitis
- granulomatous, e.g. tuberculosis, sarcoidosis, syphilis
- metabolic, e.g. gout, thyrotoxicosis
- infectious, e.g. *S. aureus*, *S. pneumoniae*, *P. aeruginosa*, herpes zoster
- chemical or physical agents (e.g. thermal, alkali, or acid burns)
- idiopathic

### Clinical Features

- severe pain, photophobia, red eye, decreased vision
- pain is best indicator of disease progression
- inflammation of scleral, episcleral, and conjunctival vessels
- may have anterior chamber cells and flare, corneal infiltrate, scleral thinning
- sclera may have a blue hue (best seen in natural light), due to rearranged scleral fibres
- scleral edema or thinning
- failure to blanch with topical phenylephrine

### Treatment

- systemic NSAID or steroid (topical steroids are not effective)
- treat underlying etiology

#### Scleromalacia Perforans

- Asymptomatic anterior necrotizing scleritis without inflammation
- Strongly associated with rheumatoid arthritis
- May result in scleral thinning
- Traumatic perforation can easily occur – examine eye very gently

## Cornea

- function
  - transmission of light
  - refraction of light (2/3 of total refractive power of eye)
  - barrier against infection, foreign bodies
- transparency due to avascularity, uniform structure and deturgescence (relative dehydration)
- 5 layers (anterior to posterior): epithelium, Bowman's membrane, stroma, Descemet's membrane, endothelium (dehydrates the cornea; dysfunction leads to corneal edema)
- extensive sensory fibre network (V1 distribution); therefore abrasions and inflammation (keratitis) are very painful

## Foreign Body

- foreign material in or on cornea
- may have associated rust ring if metallic
- patients may note tearing, photophobia, foreign body sensation, red eye
- signs include foreign body, conjunctival injection, epithelial defect that stains with fluorescein, corneal edema, anterior chamber cells/flare

### Complications

- abrasion, infection, scarring, rust ring, 2° iritis

### Treatment

- remove under magnification using local anesthetic and sterile needle or refer to ophthalmology (depending on depth and location)
- treat as per corneal abrasion

Foreign body behind lid may cause multiple vertical corneal epithelial abrasions due to blinking.

Topical analgesics should only be used to facilitate examination. They should NEVER be used as treatment for any ocular problem.

NEVER patch abrasion if patient wears contact lenses (prone to *Pseudomonas* infection).

Corneal abrasions from organic matter (e.g. twig, finger nail, etc.) have higher recurrence, even years later.

## Corneal Abrasion

- epithelial defect usually due to trauma (e.g. fingernails, paper, twigs), contact lens (Figure 14)

### Clinical Features (Table 5)

- pain, redness, tearing, photophobia, foreign body sensation
- de-epithelialized area stains with fluorescein dye
- pain relieved with topical anesthetic

### Complications

- infection, ulceration, recurrent erosion, 2° iritis

### Treatment

- topical antibiotic (drops or ointment)
- consider topical NSAID, cycloplegic (relieves pain and photophobia by paralyzing ciliary muscle), patch
- most abrasions clear spontaneously within 24-48 h

## Recurrent Erosions

- recurrent episodes of pain, photophobia, foreign body sensation with a spontaneous corneal epithelial defect
- usually occurs upon awakening
- associated with improper adherence of epithelial cells to the underlying basement membrane

### Etiology

- previous traumatic corneal abrasion
- corneal dystrophy
- idiopathic

### Treatment

- as for corneal abrasion until re-epithelialization occurs
- topical hypertonic saline ointment at bedtime for 3 mo, topical lubrication
- bandage contact lens, anterior stromal puncture or phototherapeutic keratectomy for chronic recurrences

## Corneal Ulcer

### Etiology

- local necrosis of corneal tissue due to infection
- infection is usually bacterial, rarely viral, fungal or protozoan (*Acanthamoeba*)
- 2° to corneal exposure, abrasion, foreign body, contact lens use (50% of ulcers)
- also associated with conjunctivitis, blepharitis, keratitis, vitamin A deficiency

### Clinical Features

- pain, photophobia, tearing, foreign body sensation, decreased VA (if central ulcer)
- corneal opacity that necroses and forms an excavated ulcer with infiltrative base
- overlying corneal epithelial defect that stains with fluorescein
- may develop corneal edema, conjunctival injection, anterior chamber cells/flare, hypopyon, corneal hypoesthesia (in viral keratitis)
- bacterial ulcers may have purulent discharge, viral ulcers may have watery discharge

### Complications

- decreased vision, corneal perforation, iritis, endophthalmitis

### Investigations

- Seidel test: fluorescein drop on the cornea under cobalt blue filter is used to detect penetrating lesions. Any aqueous leakage will change dark orange dye to bright yellow-green at site of wound

### Treatment

- urgent referral to ophthalmology
- culture prior to treatment
- topical antibiotics every hour
- must treat vigorously to avoid complications

**Table 5. Corneal Abrasion vs. Corneal Ulcer**

	Abrasion	Ulcer
<b>Time Course</b>	Acute (instantaneous)	Subacute (days)
<b>History of Trauma</b>	Yes	Not usually
<b>Cornea</b>	Clear	White, necrotic area
<b>Iris Detail</b>	Clear	Obscured
<b>Corneal Thickness</b>	Normal	May have crater defect/thinning
<b>Extent of Lesion</b>	Limited to epithelium	Extension into stroma

## Herpes Simplex Keratitis

- usually HSV type 1 (90% of population are carriers)
- may be triggered by stress, fever, sun exposure, immunosuppression

### Clinical Features

- pain, tearing, foreign body sensation, red eye, may have decreased vision, eyelid edema
- corneal hypoesthesia
- dendritic (thin and branching) lesion in epithelium that stains with fluorescein

### Corneal Abrasion: To Patch or Not to Patch

Patching for corneal abrasion. *Cochrane DB Syst Rev* 2006;2:CD004764  
Patching is not indicated for simple corneal abrasions, measuring less than 10 mm. There is no improvement in healing rates on days 1-3, no changes in reported pain and no difference in the use of antibiotics between the patch and non-patch groups.

**Figure 14. Corneal abrasion vs. ulcer**

### Abrasion vs. Ulcer on Slit Lamp

An abrasion appears clear while an ulcer is more opaque.

### Antiviral Treatment and other Therapeutic Interventions for Herpes Simplex Virus Epithelial Keratitis

*Cochrane DB Syst Rev* 2010;12:CD002898  
Rates of corneal re-epithelialization after acute HSV corneal epithelial keratitis are similar after treatment with trifluridine or acyclovir, and significantly better than after treatment with idoxuridine or vidarabine. Brivudine and ganciclovir are not inferior to acyclovir. Combining an antiviral agent with Interferon or corneal epithelial debridement did not improve outcomes overall, but did hasten corneal healing. Debridement with concomitant antiviral treatment was more effective than debridement alone.

**Complications**

- corneal scarring (can lead to loss of vision)
- chronic interstitial keratitis due to penetration of virus into stroma
- 2° iritis, 2° glaucoma

**Treatment**

- topical antiviral such as trifluridine, consider systemic antiviral such as acyclovir
- dendritic debridement
- NO STEROIDS initially – may exacerbate condition
- ophthalmologist must exercise caution if adding topical steroids for chronic keratitis or iritis

**Figure 15. Trigeminal distribution****Herpes Zoster**

- dermatitis of the forehead (CN V1 territory) may involve globe
- Hutchinson's sign: if tip of nose is involved (nasociliary branch of V1) then eye will be involved in approximately 75% of cases
- if no nasal involvement, eye is involved in 1/3 of patients

**Clinical Features**

- pain, tearing, photophobia, red eye
- corneal edema, pseudodendrite, superficial punctate keratitis
- corneal hypoesthesia

**Complications**

- corneal keratitis, ulceration, perforation and scarring
- 2° iritis, 2° glaucoma, cataract
- muscle palsies (rare) due to CNS involvement
- occasionally severe post-herpetic neuralgia

**Treatment**

- oral antiviral (acyclovir, valacyclovir, or famciclovir) immediately
- topical steroids, cycloplegia as indicated for keratitis, iritis
- erythromycin ointment if conjunctival involvement

Steroid treatment for ocular disorders should only be prescribed and supervised by an ophthalmologist, as they can impair corneal healing and exacerbate herpetic keratitis.

**Keratoconus**

- bilateral paracentral thinning and bulging (ectasia) of the cornea to form a conical shape
- usually sporadic, but associated with Down's syndrome, atopy, contact lens use (theorized to be related to chronic vigorous eye rubbing)
- associated with breaks in Descemet's and Bowman's membrane
- results in irregular astigmatism, scarring, stromal edema

**Treatment**

- attempt correction with spectacles or contact lens
- cross-linking treatment may halt or slow disease progression
- intrastromal corneal ring segments can help flatten the corneal cone
- penetrating keratoplasty (corneal transplant) 90% successful
- post-operative complications: endophthalmitis, graft rejection, graft failure, graft dehiscence

To detect keratoconus, look for bulging of the lower eyelid when the patient looks downward (Munson's sign).

**Arcus Senilis**

- hazy white ring in peripheral cornea, <2 mm wide, clearly separated from limbus
- common, bilateral, benign corneal degeneration due to lipid deposition, part of the aging process
- may be associated with hypercholesterolemia if age <40 yr, check lipid profile
- no associated visual symptoms, no complications, no treatment necessary

**Kayser-Fleischer Ring**

- brown-yellow-green pigmented ring in peripheral cornea, starting inferiorly
- due to deposition of copper pigment in Descemet's membrane
- associated with Wilson's disease
- no associated symptoms or complications of ring
- treat underlying disease

## The Uveal Tract

- uveal tract (from anterior to posterior)= iris, ciliary body, choroid
- vascularized, pigmented middle layer of the eye, between the sclera and the retina

## Uveitis

- uveal inflammation which may involve one or all three parts of the tract
- idiopathic or associated with autoimmune, infectious, granulomatous, malignant causes
- should be managed by an optometrist or ophthalmologist
- anatomically classified as anterior uveitis, intermediate uveitis, posterior uveitis or panuveitis based on primary site of inflammation

**Figure 16. Conjunctival hyperemia vs. ciliary flush**

**Table 6. Anatomic Classification of Uveitis**

	Anterior Uveitis (Iritis)	Intermediate Uveitis	Posterior Uveitis
<b>Location</b>	<ul style="list-style-type: none"> <li>• Inflammation of iris, usually accompanied by cyclitis (inflammation of ciliary body), both = iridocyclitis</li> <li>• Usually unilateral</li> </ul>	<ul style="list-style-type: none"> <li>• The vitreous is the major site of the inflammation</li> </ul>	<ul style="list-style-type: none"> <li>• Inflammation of the choroid and/or retina</li> </ul>
<b>Etiology</b> 	<ul style="list-style-type: none"> <li>• Usually idiopathic</li> <li>• Connective tissue diseases (see <a href="#">Rheumatology</a>, RH8) <ul style="list-style-type: none"> <li>▪ HLA-B27: reactive arthritis, ankylosing spondylitis, psoriatic arthritis, inflammatory bowel disease</li> <li>▪ Non-HLA-B27: juvenile idiopathic arthritis</li> </ul> </li> <li>• Infectious: syphilis, Lyme disease, toxoplasmosis, TB, HSV, herpes zoster</li> <li>• Other: sarcoidosis, trauma, large abrasion, post ocular surgery</li> </ul>	<ul style="list-style-type: none"> <li>• Mostly idiopathic, 2° causes include sarcoidosis, Lyme disease and multiple sclerosis</li> </ul>	<ul style="list-style-type: none"> <li>• Bacterial: syphilis, tuberculosis</li> <li>• Viral: herpes simplex virus, cytomegalovirus in AIDS</li> <li>• Fungal: histoplasmosis, candidiasis</li> <li>• Parasitic: toxoplasmosis (most common cause), toxocara</li> <li>• Immunosuppression may predispose to any of the above infections</li> <li>• Autoimmune: Behçet's disease (triad of oral ulcers, genital ulcers, and posterior uveitis)</li> <li>• Malignancies (masquerade syndrome): metastatic lesions, malignant melanoma</li> </ul>
<b>Clinical Features</b>	<ul style="list-style-type: none"> <li>• Photophobia (due to reactive spasm of inflamed iris muscle), ocular pain, tenderness of the globe, brow ache (ciliary muscle spasm), decreased VA (in severe cases with hypopyon), lacrimation</li> <li>• Ciliary flush (perilimbal conjunctival injection), miosis (spasm of sphincter muscle)</li> <li>• Anterior chamber "cells" (WBC in anterior chamber due to anterior segment inflammation) and "flare" (protein precipitates in anterior chamber 2° to inflammation), hypopyon (collection of neutrophilic exudates inferiorly in the anterior chamber)</li> <li>• Occasionally keratic precipitates (clumps of cells on corneal endothelium)</li> <li>• Iritis typically reduces IOP because ciliary body inflammation causes decreased aqueous production; however, severe iritis, or iritis from herpes simplex and zoster may cause an inflammatory glaucoma (trabeculitis)</li> </ul>	<ul style="list-style-type: none"> <li>• Insidious onset of blurred vision, accompanied by vitreous floaters</li> <li>• Initial symptoms are usually unilateral but inflammatory changes are usually bilateral and asymmetric</li> <li>• Associated with anterior uveitis, most severe cases of 2° intermediate uveitis</li> <li>• Vitreous cells, condensations, and snowballs (vitreous aggregates of inflammatory cells)</li> <li>• Posterior segment 'snowbank' = grey-white fibrovascular plaque at the pars plana</li> </ul>	<ul style="list-style-type: none"> <li>• Painless as choroid has no sensory innervation</li> <li>• Often no conjunctival or scleral injection present</li> <li>• Decreased VA</li> <li>• Floaters (debris and inflammatory cells)</li> <li>• Vitreous cells and opacities</li> <li>• Hypopyon formation</li> </ul>
<b>Complications</b>	<ul style="list-style-type: none"> <li>• Inflammatory glaucoma</li> <li>• Posterior synechiae <ul style="list-style-type: none"> <li>▪ Adhesions of posterior iris to anterior lens capsule</li> <li>▪ Indicated by an irregularly shaped pupil</li> <li>▪ If occurs 360°, entraps aqueous in posterior chamber, iris bows forward "iris bombe" → angle closure glaucoma</li> </ul> </li> <li>• Peripheral anterior synechiae (rare): adhesions of iris to cornea → secondary angle closure glaucoma</li> <li>• Cataracts</li> <li>• Band keratopathy (with chronic iritis) <ul style="list-style-type: none"> <li>▪ Superficial corneal calcification keratopathy</li> </ul> </li> <li>• Macular edema with chronic iritis</li> </ul>	<ul style="list-style-type: none"> <li>• Cystoid macular edema (30% of cases), cataract, and glaucoma</li> </ul>	<ul style="list-style-type: none"> <li>• Macular edema</li> <li>• Vitritis</li> <li>• Neovascularization</li> <li>• Visual field loss/scotoma</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>• Mydriatics: dilate pupil to prevent formation of posterior synechiae and to decrease pain from ciliary spasm</li> <li>• Steroids: topical, sub-tenon or systemic</li> <li>• Systemic analgesia</li> <li>• Extensive medical workup may be indicated to r/o 2° causes</li> </ul>	<ul style="list-style-type: none"> <li>• Systemic or sub-tenon/intravitreal steroids and immunosuppressive agents</li> <li>• Vitrectomy, cryotherapy or laser photocoagulation to the "snowbank"</li> </ul>	<ul style="list-style-type: none"> <li>• Steroids: sub-tenon, intravitreal or systemic if indicated (e.g. threat of vision loss)</li> </ul>

## Lens

- consists of an outer capsule surrounding a soft cortex and a firm inner nucleus

## Cataracts

- any opacity of the lens, regardless of etiology
- most common cause of reversible blindness worldwide
- types: nuclear sclerosis, cortical, posterior subcapsular

### Etiology

- acquired
  - age-related (over 90% of all cataracts)
  - cataract associated with systemic disease (may have juvenile onset)
    - ♦ diabetes mellitus
    - ♦ metabolic disorders (e.g. Wilson's disease, galactosemia, homocystinuria)
    - ♦ hypocalcemia
  - traumatic (may be rosette shaped)
  - intraocular inflammation (e.g. uveitis)
  - toxic (steroids, phenothiazines)
  - radiation
- congenital
  - high myopia
  - present with altered red reflex or leukocoria
  - treat promptly to prevent amblyopia

### Clinical Features

- gradual, painless, progressive decrease in VA
- glare, dimness, halos around lights at night, monocular diplopia
- "second sight" phenomenon: patient is more myopic than previously noted, due to increased refractive power of the lens (in nuclear sclerosis only)
  - patient may read without previously needed reading glasses
- diagnose by slit-lamp exam, and by noting changes in red reflex using ophthalmoscope
- may impair view of retina during funduscopy

### Treatment

- medical: attempt correction of refractive error, no strong evidence suggesting benefit of vitamin supplementation
- surgical: definitive treatment
  - indications for surgery
    - ♦ to improve visual function in patients whose visual loss leads to functional impairment (no need to wait for "ripe" cataract, may postpone surgery as long as one eye has sufficient vision)
    - ♦ to aid management of other ocular disease (e.g. cataract that prevents adequate retinal exam or laser treatment of DR)
    - ♦ congenital or traumatic cataracts
  - phacoemulsification (phaco = lens)
    - ♦ most commonly used surgical technique (see *Surgical Ophthalmology*, OP44)
  - post-operative complications
    - ♦ RD, endophthalmitis, dislocated IOL, macular edema, glaucoma
    - ♦ with new foldable IOLs that have truncated edges, <10% of patients get posterior capsular opacification, which should be treated with YAG laser

### Prognosis

- excellent if not complicated by other ocular disease

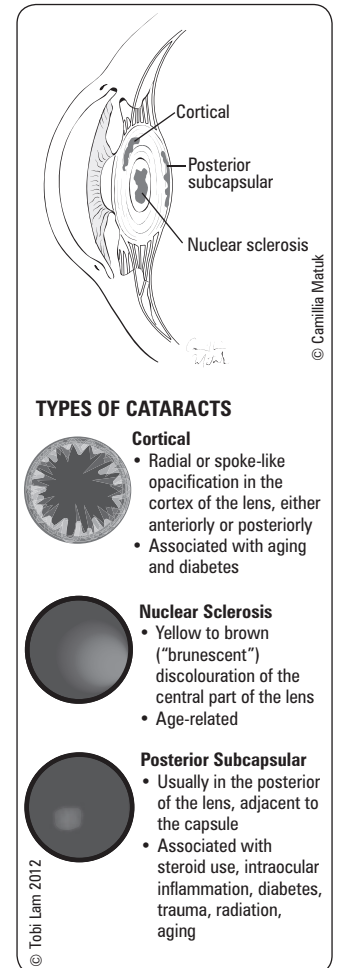

Figure 17. Types of cataracts

## Dislocated Lens (Ectopia Lentis)

### Etiology

- associated with Marfan's Syndrome, Ehlers-Danlos type VI, homocystinuria, syphilis, lens coloboma (congenital cleft due to failure of ocular adnexa to complete growth)
- traumatic

**Clinical Features**

- decreased VA
- may get unilateral diplopia
- iridodonesis (quivering of iris with movement)
- direct ophthalmoscopy may elicit abnormal red reflex

**Complications**

- cataract, glaucoma, uveitis

**Treatment**

- surgical correction  $\pm$  lens replacement

## Vitreous

- clear gel (99% water plus collagen fibrils, glycosaminoglycans, and hyaluronic acid) that fills the posterior segment of eye
- normally adherent to optic disc, pars plana, and along major retinal blood vessels

## Posterior Vitreous Detachment (PVD)

**Etiology**

- central vitreous commonly shrinks and liquefies with age (syneresis)
- during syneresis, molecules that hold water condense causing vitreous floaters
- liquid vitreous moves between posterior vitreous gel and retina
- vitreous is peeled away and separates from the internal limiting membrane of the neurosensory retina posterior to the vitreous base

**Clinical Features**

- floaters, flashes of light

**Complications**

- traction at areas of abnormal vitreoretinal adhesions may cause retinal tears/detachment
- retinal tears/detachment may cause vitreous hemorrhage if bridging retinal blood vessel is torn
- complications more common in high myopes and following ocular trauma (blunt or perforating)

**Treatment**

- acute onset of PVD requires a dilated fundus exam to r/o retinal tears/detachment
- no specific treatment available for floaters/flashes of light

**Floaters:** "bugs", "cobwebs", or "spots" of vitreous condensation that change with eye position.

**Weiss' Ring:** formed by glial tissue around the optic disc that remains attached to the detached posterior vitreous.

Although most floaters are benign, new or markedly increased floaters or flashes of light require a dilated fundus exam to r/o retinal tears/detachment.

## Vitreous Hemorrhage

- bleeding into the vitreous cavity

**Etiology**

- proliferative diabetic retinopathy (PDR)
- retinal tear/detachment
- PVD
- retinal vein occlusion
- trauma

**Clinical Features**

- sudden loss of VA
- may be preceded by many floaters and/or flashes of light
- ophthalmoscopy: no red reflex if large hemorrhage, retina not visible due to blood in vitreous

**Treatment**

- ultrasound (B-scan) to r/o retinal detachment
- expectant: in non-urgent cases (e.g. no retinal detachment), blood usually resorbs in 3-6 mo
- surgical: vitrectomy  $\pm$  retinal detachment repair  $\pm$  retinal endolaser to possible bleeding sites/vessels

Any time a vitreous or retinal hemorrhage is seen in a child, must r/o child abuse.

## Endophthalmitis and Vitritis

- intraocular infection: acute, subacute, or chronic

### Etiology

- most commonly a postoperative complication; risk following cataract surgery is <0.1%
- also due to penetrating injury to eye (risk is 3-7%), endogenous spread, and intravitreal injections
- etiology usually bacterial, may be fungal

### Clinical Features

- painful, red eye, photophobia, discharge
- severely reduced VA, lid edema, proptosis, corneal edema, anterior chamber cells/flare, hypopyon, reduced red reflex
- may have signs of a ruptured globe (severe subconjunctival hemorrhage, hyphema, decreased IOP, etc.)

### Treatment (see *Ocular Trauma*, OP42)

- **OCULAR EMERGENCY:** presenting vision best indicates prognosis
- LP or worse: admission, immediate vitrectomy and intravitreal antibiotics to prevent loss of vision
- HM or better: vitreous tap for culture and intravitreal antibiotics
- topical fortified antibiotics

Remember to inquire about tetanus status in post-traumatic endophthalmitis.

**Endophthalmitis Vitrectomy Study**  
Endophthalmitis Vitrectomy Study Group. Results of the Endophthalmitis Vitrectomy Study. *Arch Ophthalmol* 1995;113:1479-1496  
For treatment of post-cataract surgery endophthalmitis:  
• Intravitreal antibiotics preferred over systemic antibiotics  
• Vitrectomy indicated only if vision LP or worse

## Retina

- composed of two parts (Figure 2)
  - neurosensory retina: comprises 9 of the 10 retinal layers, including the photoreceptors and the ganglion cell layer
  - retinal pigmented epithelium (RPE) layer: external to neurosensory retina
- macula: rich in cones (for colour vision); most sensitive area of retina; looks darker due to lack of retinal vessels and thinning of retina in this region; 15° temporal and slightly below the optic disc
- fovea: centre of macula; responsible for acute, fine vision
- optic disc: slightly oval vertically, pinkish colour with centrally depressed yellow cup (normal cup:disc ratio is <0.5), retinal artery and vein pass through cup
- ora serrata: irregularly-shaped, anterior margin of the retina (can only be visualized with indirect ophthalmoscopy of the far peripheral retina, or through a Goldmann 3 mirror lens)

Figure 18. Retina

## Central Retinal Artery Occlusion (CRAO)

### Etiology

- emboli from carotid arteries or heart (e.g. arrhythmia, endocarditis, valvular disease)
- thrombus
- temporal arteritis

### Clinical Features

- sudden, painless (except in GCA), severe monocular loss of vision
- RAPD
- patient may have experienced transient episodes in the past (amaurosis fugax)
- fundoscopy
  - "cherry-red spot"
  - retinal pallor
  - narrowed arterioles, boxcarring (segmentation of blood in arteries)
  - cotton-wool spots (retinal infarcts)
  - cholesterol emboli (Hollenhorst plaques) – usually located at arteriole bifurcations
  - after ~6 wk cherry-red spot recedes and optic disc pallor becomes evident

### Treatment

- **OCULAR EMERGENCY:** attempt to restore blood flow within 2 h
- the sooner the treatment = better prognosis (irreversible retinal damage if >90 min of complete CRAO)
  - massage the globe (compress eye with heel of hand for 10 s, release for 10 s, repeat for 5 min) to dislodge embolus
  - decrease intraocular pressure
    - ♦ topical  $\beta$ -blockers
    - ♦ inhaled oxygen-carbon dioxide mixture
    - ♦ IV acetazolamide
    - ♦ IV mannitol (draws fluid from eye)
    - ♦ drain aqueous fluid – anterior chamber paracentesis (carries risk of endophthalmitis)
  - treat underlying cause to prevent CRAO in other eye

**Hallmark of CRAO**  
"Cherry-red spot" located at centre of macula (visualisation of unaffected highly vascular choroid through the thin fovea).

Treatment for a central retinal artery occlusion (CRAO) must be initiated within 2 h of symptom onset for any hope of restoring vision.

## Branch Retinal Artery Occlusion (BRAO)

- only part of the retina becomes ischemic resulting in a visual field loss
- more likely to be of embolic etiology than CRAO; need to search for source
- management: ocular massage to dislodge embolus if VA is affected

## Central/Branch Retinal Vein Occlusion (CRVO/BRVO)

- second most frequent “vascular” retinal disorder after DR
- usually a manifestation of a systemic disease (e.g. hypertension, diabetes mellitus)
- thrombus occurs within the lumen of the blood vessel

### Predisposing Factors

- arteriosclerotic vascular disease
- hypertension
- diabetes mellitus
- glaucoma
- hyperviscosity (e.g. polycythemia rubra vera, sickle-cell disease, lymphoma, leukemia)
- drugs (e.g. oral contraceptive pill, diuretics)

### Clinical Features

- painless, monocular, gradual or sudden visual loss
- $\pm$  RAPD
- fundoscopy
  - “blood and thunder” appearance
  - diffuse retinal hemorrhages, cotton-wool spots, venous engorgement, swollen optic disc, macular edema
- two fairly distinct groups
  - venous stasis/non-ischemic retinopathy
    - ♦ no RAPD, VA approximately 20/80
    - ♦ mild hemorrhage, few cotton wool spots
    - ♦ resolves spontaneously over weeks to months
    - ♦ may regain normal vision if macula intact
  - hemorrhagic/ischemic retinopathy
    - ♦ usually older patient with deficient arterial supply
    - ♦ RAPD, VA approximately 20/200, reduced peripheral vision
    - ♦ more hemorrhages, cotton wool spots, congestion
    - ♦ poor visual prognosis

### Complications

- degeneration of retinal pigment epithelium
- neovascularization of retina and iris (2° rubeosis), leading to 2° glaucoma
- vitreous hemorrhage
- macular edema

### Treatment

- no treatment available to restore vision in CRVO/BRVO
- treat underlying cause/contributing factor
- fluorescein angiography to determine extent of retinal non-perfusion (risk of neovascularization)
- retinal laser photocoagulation, or intravitreal anti-VEGF injection to reduce retinal or iris neovascularization and prevent neovascular glaucoma
- macular grid laser photocoagulation for the treatment of macular edema in BRVO, not CRVO, intravitreal or slow-release biodegradable corticosteroid, or anti-VEGF injection is effective in the treatment of macular edema in both CRVO and BRVO

#### Branch Vein Occlusion Study (BVOS)

Branch Vein Occlusion Study Group: Argon laser photocoagulation for macular edema in branch vein occlusion. *Am J Ophthalmol* 1984;98:271-282  
BVOS showed that argon laser treatment improves sight significantly in patients with macular edema following BRVO. The treatment also decreases the risk of vitreous hemorrhage.

The “blood and thunder” appearance on fundoscopy is very characteristic of a CRVO.

There is an 8-10% risk of developing CRVO or BRVO in other eye.

#### GENEVA phase 3 Trials In BRVO and CRVO

*Ophthalmology* 2010;117:1134-1146  
Randomized sham-controlled trial of dexamethasone intravitreal implant in patients with macular edema due to retinal vein occlusion.  
Dexamethasone intravitreal implant reduces the risk of vision loss and improves the speed and incidence of visual improvement in eyes with macular edema 2° to BRVO and CRVO.

Superotemporal retina is the most common site for horseshoe tears.

## Retinal Detachment (RD)

- cleavage in the plane between the neurosensory retina and the retinal pigment epithelium (RPE)
- three types
  - rhegmatogenous (most common)
    - ♦ caused by a tear or hole in the neurosensory retina, allowing fluid from the vitreous to pass into the subretinal space
    - ♦ tears may be caused by posterior vitreous detachment (PVD), degenerative retinal changes, trauma or iatrogenically
    - ♦ incidence increases with advancing age, in high myopes and after ocular surgery/trauma
  - tractional
    - ♦ caused by traction (due to vitreal, epiretinal, or subretinal membrane) pulling the neurosensory retina away from the underlying RPE
    - ♦ found in conditions such as DR, CRVO, sickle cell disease, ROP, and ocular trauma
  - exudative
    - ♦ caused by damage to the RPE resulting in fluid accumulation in the subretinal space
    - ♦ main causes are intraocular tumours, posterior uveitis, central serous retinopathy

### Clinical Features

- sudden onset
- flashes of light
  - due to mechanical stimulation of the retinal photoreceptors
- floaters
  - hazy spots in the line of vision which move with eye position, due to drops of blood from torn vessels bleeding into the vitreous
- curtain of blackness/peripheral field loss
  - darkness in one field of vision when the retina detaches in that area
- loss of central vision (if macula “off”)
- decreased IOP (usually 4-5 mmHg lower than the other, normal eye)
- ophthalmoscopy: detached retina is grey-white with surface blood vessels, loss of red reflex
- $\pm$  RAPD

### Treatment

- prophylactic: symptomatic tear (flashes or floaters) can be sealed off with laser/cryotherapy, with the goal of preventing progression to detachment
- therapeutic
  - rhegmatogenous
    - ♦ scleral buckle procedure (see *Surgical Ophthalmology*, OP44)
    - ♦ pneumatic retinopexy (see *Surgical Ophthalmology*, OP44)
    - ♦ both treatments above are used in combination with localization of retinal tears/holes and subsequent treatment with cryotherapy or laser to create adhesions between the RPE and the neurosensory retina
    - ♦ vitrectomy plus injection of gas or silicone oil in cases of recurrent detachment
  - tractional
    - ♦ vitrectomy  $\pm$  membrane removal/scleral buckling/injection of intraocular gas or silicone oil as necessary
  - exudative
    - ♦ treat underlying cause

### Complications

- loss of vision, vitreous hemorrhage, recurrent retinal detachment
- a retinal detachment is an emergency, especially if the macula is still attached (macula “on”)
- prognosis for visual recovery varies inversely with the amount of time the retina is detached and whether the macula is attached or not

## Retinitis Pigmentosa

- worldwide incidence between 1/3500 and 1/7000 people
- many forms of inheritance, most commonly autosomal recessive (60%)
- hereditary degenerative disease of the retina manifested by rod > cone photoreceptor degeneration and retinal atrophy

### Clinical Features

- night blindness, decreased peripheral vision (“tunnel vision”), decreased central vision (macular changes), glare (from cataract)

### Investigations

- fundoscopy: areas of “bone-spicule” pigment clumping in mid-periphery of retina, narrowed retinal arterioles, pale optic disc
- electrophysiological tests: electroretinography (ERG) and electrooculography (EOG) assist in diagnosis

### Treatment

- no treatments available to reverse the condition; cataract extraction improves visual function; vitamin A and vitamin E supplementation can reduce progression of disease in some patients

## Leber’s Congenital Amaurosis

- worldwide incidence 1/80,000
- inherited degeneration, autosomal recessive
- symptoms: resting nystagmus, sluggish or no papillary response, severe vision loss/blindness
- diagnosis: 11 types, confirmed by genetic testing
- management: no treatments available to reverse the conditions for most forms; one form (LCA2) shown to be successfully treatable by gene replacement using adeno-associated virus

#### Berson et al. A Randomized Trial of Vitamin A and Vitamin E Supplementation for Retinitis Pigmentosa

*Arch Ophthalmol* 1993;111:761-772

**Objective:** To determine if vitamin A and/or vitamin E supplementations influence the progression of retinitis pigmentosa.

**Methods:** Randomized, controlled, double-blind trial. Eligible patients 18-49 yr of age ( $n = 601$ ) were assigned to one of four intervention groups: 15 000 IU/d of vitamin A and 3 IU/d vitamin E, 15 000 IU/d of vitamin A and 400 IU/d of vitamin E, 75 IU/d of vitamin A and 3 IU/d of vitamin E (trace vitamins), or 75 IU/d of vitamin A and 400 IU/d of vitamin E. Cone electroretinogram amplitude was the outcome measure. A subset of patients was identified to have higher initial cone electroretinogram amplitude ( $n = 354$ ). Patients were followed-up for a mean duration of 5.2 yr.

**Results:** Groups that received 15 000 IU/d of vitamin A had slower decline of retinal function compared to those who did not receive vitamin A ( $p = 0.01$ ). Among patients with higher initial cone electroretinogram amplitude, groups receiving 15 000 IU/d of vitamin A were less likely to have a decline in amplitude of  $\geq 50\%$  from baseline than those who did not ( $p = 0.01$ ). Groups receiving 400 IU/d of vitamin E were more likely to have a decline in amplitude than those who did not ( $p = 0.03$ ). **Conclusion:** Daily 15 000 IU supplementation of vitamin A may protect against retinal function decline while daily 400 IU supplementation of vitamin E may exacerbate retinal function decline among patients with retinitis pigmentosa.

#### Triad of Retinitis Pigmentosa

##### APO

Arteriolar narrowing  
Perivascular bony-spicule pigmentation  
Optic disc pallor

#### Retinitis Pigmentosa Inherited Forms

- Autosomal recessive: most common
- Autosomal dominant: best prognosis
- X-linked: worst prognosis

#### Age-dependent Effects of Gene Therapy for Leber’s Congenital Amaurosis: A Phase 1 Dose-escalation Trial

*Lancet* 2009;374:1597-605

**Objective:** To evaluate the effect of gene therapy on retinal and visual function among patients with Leber’s congenital amaurosis.

**Methods:** Phase 1 trial. Patients aged 8-44 ( $n = 12$ ) with RPE65-associated Leber’s congenital amaurosis received a single subretinal injection of adeno-associated virus (AAV) containing the gene encoding the protein needed for isomerohydrolase activity of the retinal pigment epithelium (RPE65) (AAV2-hRPE65v2) in the worst eye at low, medium, or high dose. Patients were assessed before and after injections. Outcomes were subjective and objective measures of vision.

**Results:** AAV2-hRPE65v2 was tolerated. No serious adverse events were recorded. Visual improvement was noted for all patients. All patients reported improved vision in dimly lit environments. Visual fields improved in all patients. Pupillary light responses were increased by at least 2 log unit for all patients. Greatest visual improvement was noted in children.

**Conclusion:** AAV2-hRPE65v2 is safe and improves vision among patients with Leber’s congenital amaurosis.

## Age-Related Macular Degeneration (ARMD)

- leading cause of irreversible blindness in the western world, associated with increasing age, usually bilateral
- 10% of people >65 yr old have some degree of ARMD
- female > male
- degenerative changes are concentrated at the macula, thus only central vision is lost; peripheral vision (important for navigation) is maintained so patients can usually maintain an independent lifestyle

### Classification

- **Non-Exudative/“Dry” (Non-Neovascular) ARMD**
  - most common type of ARMD (90% of cases)
  - slowly progressive loss of visual function
  - drusen: yellow-white deposits between the retinal pigment epithelium (RPE) and Bruch's membrane (area separating inner choroidal vessels from RPE)
  - RPE atrophy: coalescence of depigmented RPE, clumps of focal hyperpigmentation or hypopigmentation
  - may progress to neovascular ARMD
- **Exudative/“Wet” (Neovascular) ARMD**
  - 10% of ARMD, but 80% of ARMD that results in severe visual loss
  - choroidal neovascularization: drusen predisposes to breaks in Bruch's membrane causing subsequent growth and proliferation of choroidal capillaries
  - may lead to serous detachment of overlying RPE and retina, hemorrhage and lipid precipitates into subretinal space
  - can also lead to an elevated subretinal mass due to fibrous metaplasia of hemorrhagic retinal detachment
  - leads to disciform scarring and severe central visual loss

### Risk Factors

- female
- increased age
- family history
- smoking
- Caucasian race
- blue irides

### Clinical Features

- variable degree of progressive central visual loss
- metamorphopsia (distorted vision characterized by straight parallel lines appearing convergent or wavy) due to macular edema

### Investigations

- Amsler grid: held at normal reading distance with glasses on, assesses macular function
- fluorescein angiography: assess degree of neovascularization – pathologic new vessels leak dye

### Treatment

- non-neovascular “dry” ARMD
  - monitor, Amsler grid allows patients to check for metamorphopsia
  - low vision aids (e.g. magnifiers, closed-circuit television)
  - anti-oxidants, green leafy vegetables
  - sunglasses/visors
  - see Age-related Eye Disease Study (AREDS) sidebar
- neovascular “wet” ARMD
  - see *Common Medications*, OP44
  - laser photocoagulation for neovascularization
  - 50% of choroidal neovascularization cannot be treated initially
  - no definitive treatment for disciform scarring
  - PDT with verteporfin (Visudyne®)
    - ♦ IV injection of verteporfin followed by low intensity laser to area of choroidal neovascularization
  - intravitreal injection of anti-vascular endothelial growth factor (anti-VEGF)
    - ♦ pegaptanib (Macugen®), ranibizumab (Lucentis®), bevacizumab (Avastin®) (see OP45)

#### Age-related Eye Disease Study (AREDS)

The Age-Related Eye Disease Research Group:  
A randomized, placebo-controlled, clinical trial of high-dose supplementation with vitamins C and E, β-carotene, and zinc for age-related macular degeneration and vision loss. AREDS Report No. 8. *Arch Ophthalmol* 2001;119:1417-1436  
AREDS studied the effect of high-dose combination of vitamin C, vitamin E, β-carotene, and zinc in patients with and without ARMD. Those who are already affected by ARMD showed 19% decrease in risk of further visual loss, whereas high dose supplementation showed no benefit in patients with early or no ARMD.

#### Wet ARMD Lesions on Fluorescein Angiography

Classic: well-defined leakage  
Occult: mottled or ill-defined leakage

#### Drusen vs. Exudate

Drusen: hyaline material secreted by RPE seen frequently in ARMD typically in peri-macular region  
Hard/Soft Exudates: lipid deposits in the retina associated with diabetic retinopathy and hypertension

#### Ranibizumab and Bevacizumab for Neovascular Age-Related Macular Degeneration

CATT Research Group. *NEJM* 2011;364:1897-1908  
**Study:** A multicentre, single-blind, randomized control trial comparing the effects of ranibizumab and bevacizumab on visual acuity in patients with age-related macular degeneration (ARMD).  
**Patients:** 1208 patients aged 50 or more with previously untreated ARMD and visual acuity between 20/25 and 20/320.  
**Intervention:** Intravitreal injections of ranibizumab vs. intravitreal injections of bevacizumab.  
**Results:** The monthly use of either bevacizumab or ranibizumab results in the same visual acuity outcome. This finding holds true for the mean visual acuity and the proportion of patients who gain 15 letters, lose 15 letters, or remain stable. Equivalent visual-acuity outcomes were observed with both the monthly and the as-needed regimens of ranibizumab.  
**Conclusion:** This study supports the use of either bevacizumab or ranibizumab for the treatment of neovascular ARMD. The continued global use of intravitreal bevacizumab is an equally effective, low-cost alternative to ranibizumab.

# Glaucoma

## Definition

- progressive optic neuropathy involving characteristic structural changes to optic nerve head with associated visual field changes
- commonly associated with high IOP, but not required for diagnosis

## Background

- aqueous is produced by the ciliary body and flows from the posterior chamber to the anterior chamber through the pupil, and drains into the episcleral veins via the trabecular meshwork and the Canal of Schlemm (Figure 20)
- an isolated increase in IOP is termed ocular hypertension (or glaucoma suspect) and these patients should be followed for increased risk of developing glaucoma (10% if IOP 20-30 mmHg; 40% if IOP 30-40 mmHg; and most if IOP >40 mmHg)
- pressures >21 mmHg are more likely to be associated with glaucoma; however, up to 50% of patients with glaucoma do not have IOP >21 mmHg
- loss of peripheral vision most commonly precedes central loss
- sequence of events: gradual pressure rise → increased C:D ratio → visual field loss

## Investigations

- medical and family history
- VA testing
- slit lamp exam to assess anterior chamber depth
- ophthalmoscopy to assess the disc features
- tonometry by applanation or indentation to measure IOP
- visual field testing
- pachymetry to measure corneal thickness
- future follow-up includes optic disc examination, IOP measurement, and visual field testing to monitor course of disease

### Anti-angiogenic Therapy with Anti-vascular Endothelial Growth Factor Modalities for Neovascular Age-related Macular Degeneration

*Cochrane DB Syst Rev* 2008;2:CD005139

**Study:** Cochrane systematic review of RCTs investigating the use of anti-VEGF (vascular endothelial growth factor) modalities for the treatment of wet age-related macular degeneration (AMD).

**Patients:** Classic or occult wet type AMD.  
**Interventions:** Pegaptanib/Macugen® (aptamer comprised of ribonucleic acids that bind VEGF), ranibizumab/Lucentis® (anti VEGF fragment antibody) and verteporfin/Visudyne® photodynamic therapy (PDT).

**Results:** The MARINA trial showed that the pooled relative risk (RR) for a gain of 15 or more letters of visual acuity was 5.81 for ranibizumab versus placebo, while the FOCUS trial showed that the pooled RR for a gain of 15 or more letters at one year was 4.44 for a combination of ranibizumab + verteporfin PDT versus verteporfin PDT alone.

**Conclusion:** Ranibizumab offers significant benefit for the treatment of wet AMD with significant improvements in best corrected visual acuity at one year.

**Figure 20. Aqueous flow and sites of potential resistance**

**Figure 19. Glaucomatous damage**

## Primary Open Angle Glaucoma (POAG)

- most common form, >95% of all glaucoma cases
- due to obstruction of aqueous drainage within the trabecular meshwork and its drainage into the Canal of Schlemm
- insidious and asymptomatic, screening is critical for early detection

### Major Risk Factors

- elevated intraocular pressure (>21 mmHg)
- age: prevalence at 40 yr is 1-2% and at 80 yr is 10%
- ethnicity: African descent
- familial (2-3x increased risk); polygenic

### Minor Risk Factors

- myopia
- hypertension
- diabetes
- hyperthyroidism (Graves' disease)
- chronic topical ophthalmic steroid use in steroid responders – yearly eye exams recommended if >4 wk of steroid use
- previous ocular trauma
- anemia/hemodynamic crisis (ask about blood transfusions in past)

### Clinical Features

- asymptomatic initially
- insidious, painless, gradual rise in IOP due to restriction of aqueous outflow
- bilateral, but usually asymmetric
- earliest signs are optic disc changes
  - increased C:D ratio (vertical C:D >0.6)
  - significant C:D asymmetry between eyes (>0.2 difference)
  - thinning, notching of the neuroretinal rim
  - flame shaped disc hemorrhage
  - 360° of peripapillary atrophy
  - nerve fibre layer defect
  - large vessels become nasally displaced
- visual field loss
  - slow, progressive, irreversible loss of peripheral vision
  - paracentral defects, arcuate scotoma and nasal step are characteristics (Figure 19)
  - late loss of central vision if untreated

### Treatment

- medical treatment: decrease IOP by increasing the drainage and/or decreasing the production of aqueous (see *Glaucoma Medications*, Table 12, OP45)
  - increase aqueous outflow
    - ♦ topical cholinergics
    - ♦ topical prostaglandin analogues
    - ♦ topical  $\alpha$ -adrenergics
  - decrease aqueous production
    - ♦ topical  $\beta$ -blockers
    - ♦ topical and oral carbonic anhydrase inhibitor
    - ♦ topical  $\alpha$ -adrenergics
- laser trabeculoplasty, cyclophotocoagulation in order to achieve selective destruction of ciliary body (for refractory cases)
- trabeculectomy (see *Surgical Ophthalmology*, OP44)
- serial optic nerve head examinations, IOP measurements, and visual field testing to monitor disease course

## Normal Tension Glaucoma

- POAG with IOP in normal range
- often found in women >60 but may occur earlier
- damage to optic nerve may be due to vascular insufficiency

### Treatment

- treat reversible causes

Average IOP =  $15 \pm 3$  mmHg  
 Normal cup:disc  $\leq 0.4$   
 Suspect glaucoma if C:D ratio >0.6, C:D ratio between eyes >0.2, or cup approaches disc margin

### Open- and Closed-Angle Glaucoma

POAG	PACG
<ul style="list-style-type: none"> <li>• Common (95%)</li> <li>• Chronic course</li> <li>• Painless eye without redness</li> <li>• Moderately <math>\uparrow</math> IOP</li> <li>• Normal cornea and pupil</li> <li>• No N/V</li> <li>• No halos around light</li> </ul>	<ul style="list-style-type: none"> <li>• Rare (5%)</li> <li>• Acute onset</li> <li>• Painful red eye</li> <li>• Extremely <math>\uparrow</math> IOP</li> <li>• Hazy cornea</li> <li>• Mid-dilated pupil unreactive to light</li> <li>• <math>\pm</math> N/V, abdominal pain</li> <li>• Halos around light</li> </ul>

### Risk Factors for POAG

#### A FIAT

Age  
 Family History  
 IOP  
 African descent  
 Thin Cornea

### Reduction of Intraocular Pressure and Glaucoma Progression

*Arch Ophthalmol* 2002;120:1268-1279

**Study:** Randomized controlled clinical trial.

**Patients:** 255 participants, mainly selected through a population screening protocol, aged 50-80 with newly detected open-angle glaucoma, visual field defects, and a median intraocular pressure (IOP) of 20 mmHg.

**Intervention:** Participants were randomized to either topical  $\beta$ -blocker (betaxolol) plus argon, laser trabeculoplasty, or no initial treatment, with close observation for both groups. Median follow-up was 6 yr.

**Main Outcome:** Glaucoma progression as defined by visual field and optic disc abnormalities.

**Results:** IOP was reduced by 25% (mean 5.1 mmHg) in the treatment group. Glaucoma progression was evident in 62% of individuals in the control group vs. only 45% in the treatment group ( $p=0.007$ ). The progression was significantly later in the treatment group vs. the controls.

### The Ocular Hypertension Treatment Study

*Arch Ophthalmol-Chic* 2002;120:701-713

**Study:** Randomized clinical trial.

**Patients:** 1636 patients with no evidence of glaucomatous damage, aged 40 to 80 yr, and with intraocular pressure (IOP) between 24-32 mmHg in one eye and between 21-32 mmHg in the other eye.

**Intervention:** Randomized to observation or treatment with commercially available topical ocular hypotensive medication.

**Main Outcome:** Development of visual field abnormality or optic disc deterioration attributed to primary open-angle glaucoma (POAG).

**Results:** Mean reduction in IOP in the medication group was  $22.5\% \pm 9.9\%$  versus  $4.0\% \pm 11.6\%$  in the observation group. At 5 yr the probability of developing POAG was 4.4% in the medication group and 9.5% in the observation group ( $p<0.0001$ ).

**Conclusions:** Topical ocular hypotensive medication was effective in delaying or preventing the onset of POAG in individuals with elevated IOP.

## Secondary Open Angle Glaucoma

- increased IOP 2° to ocular/systemic disorders that obstruct the trabecular meshwork
  - steroid-induced glaucoma
  - traumatic glaucoma
  - pigmentary dispersion syndrome
  - pseudoexfoliation syndrome

## Primary Angle-Closure Glaucoma

- 5% of all glaucoma cases
- peripheral iris bows forward in an already susceptible eye with a shallow anterior chamber obstructing aqueous access to the trabecular meshwork
- sudden forward shift of the lens-iris diaphragm causes pupillary block, and results in inability of the aqueous to flow from the posterior chamber to the anterior chamber resulting in a sudden rise in IOP

### Risk Factors

- hyperopia: small eye, big lens – large lens crowds the angle
- age >70
- female
- family history
- more common in people of Asian and Inuit descent
- mature cataracts
- shallow anterior chamber
- pupil dilation (topical and systemic anticholinergics, stress, darkness)

### Clinical Features

- red, painful eye = **RED FLAG**
- unilateral, but other eye increased risk
- decreased visual acuity, vision acutely blurred from corneal edema
- halos around lights
- nausea and vomiting, abdominal pain
- fixed, mid-dilated pupil
- corneal edema with conjunctival injection
- marked increase in IOP; may be noticeable even to palpation (>40 mmHg)
- shallow anterior chamber ± cells in anterior chamber

### Complications

- irreversible loss of vision within hours to days if untreated
- permanent peripheral anterior synechiae, resulting in permanent angle closure

### Treatment

- refer to ophthalmologist – acute angle closure glaucoma is an **EMERGENCY**
  - laser iridotomy
  - aqueous suppressants and hyperosmotic agents
- medical treatment (see *Glaucoma Medications*, Table 12, OP45)
  - miotic drops (pilocarpine) to reverse pupillary block
  - decrease IOP
    - topical  $\beta$ -blockers
    - topical adrenergics
    - topical cholinergics
      - pilocarpine 1-4% q15min, up to q5min
    - systemic carbonic anhydrase inhibitors
      - IV acetazolamide 250-500 mg
    - systemic hyperosmotic agents
      - oral glycerine 1 g/kg
      - IV mannitol 1 g/kg

## Secondary Angle-Closure Glaucoma

### Uveitis

- inflamed iris adheres to lens (posterior synechiae)

### Neovascular Glaucoma

- abnormal blood vessels develop on surface of iris (rubeosis iridis), in the angle, and within the trabecular meshwork
- due to retinal ischemia associated with proliferative diabetic retinopathy or CRVO
- treatment with laser therapy to retina reduces neovascular stimulus to iris vessels

#### Rule of Fours

1/4 of general population using topical steroid for 4 wk, 4 x/d will develop an increase in IOP.

#### Collaborative Normal Tension Glaucoma Study

*Curr Opin Ophthalmol* 2003;14:86-90

Treatment aimed at lowering IOP by 30% in patients with normal tension glaucoma tends to reduce the rate of visual field loss. Due to variability in disease progression and a significant group that shows no visual field loss at 5 yr despite no treatment, further studies are needed to delineate which subgroups may benefit most from treatment.

#### Medical Interventions for Primary Open Angle Glaucoma and Ocular Hypertension

*Cochrane DB Syst Rev* 2007;4:CD003167

**Study:** Cochrane systematic review of 26 trials and meta-analysis of 10 trials investigating the effectiveness of topical pharmacological therapies for primary open angle glaucoma (POAG) or ocular hypertension (OHT).

**Patients:** 4979 participants randomized in 26 trials. Patients had OHT with intraocular pressure (IOP) >21 mmHg or open angle glaucoma.

**Intervention:** Topical eye medications, including  $\beta$ -blockers, dorzolamide, brimonidine, pilocarpine and epinephrine versus each other and placebo.

**Main outcome:** Reduction of progression or prevention of onset of visual field defects.

**Results:** Meta-analysis on all trials that tested drugs against placebo or untreated controls demonstrated that lowering IOP reduces incidence of glaucomatous visual field defects, with an odds ratio of 0.62 (95% CI 0.47-0.81). However, this result is of limited practical use since different therapies were pooled. No single drug demonstrated significant visual field protection. However, as a class,  $\beta$ -blockers showed borderline significance in reducing onset of glaucoma in patients with OHT when compared to placebo, with an OR of 0.67 (95% CI 0.45-1.00).

**Conclusion:** Lowering IOP can reduce progression of visual field defects in patients with OHT.

## Pupils

- pupil size is determined by the balance between the sphincter muscle and the dilator muscle
- sphincter muscle is innervated by the parasympathetic nervous system
  - carried by CN III: pre- and post-ganglionic fibres synapse in ciliary ganglion, and use acetylcholine as the neurotransmitter
- dilator muscle is innervated by the sympathetic nervous system (SNS)
  - first order neuron = hypothalamus → brainstem → spinal cord
  - second order/preganglionic neuron = spinal cord → sympathetic trunk via internal carotid artery → superior cervical ganglion in neck
  - third order/postganglionic fibres originate in the superior cervical ganglion, neurotransmitter is noradrenaline
    - ♦ as a diagnostic test, 4-10% cocaine prevents the re-uptake of noradrenaline, and will cause dilation of normal pupil, but not one with loss of sympathetic innervation (Horner's Syndrome)
  - see Figure 8 in [Neurology](#), N6

### 5 Targets of Retinal Signals

- Pre-tectal nucleus (pupillary reflex/eye movements)
- Lateral geniculate body of thalamus
- Superior colliculus (eye movements)
- Suprachiasmatic nucleus (optokinetic)
- Accessory optic system (circadian rhythm)

## Pupillary Light Reflex

- light shone directly into eye travels along optic nerve (CN II, afferent limb) → optic tracts → bilateral midbrain
- impulses enter bilaterally in midbrain via pretectal area and Edinger-Westphal nuclei
- nerve impulses then travel down CN III (efferent limb) bilaterally to reach the ciliary ganglia, and finally to the iris sphincter muscle, which results in the direct and consensual light reflexes

## Pupil Abnormalities

### Denervation Hypersensitivity

- when post-ganglionic fibres are damaged, the understimulated end-organ develops an excess of neuroreceptors and becomes hypersensitive
- postganglionic parasympathetic lesions (i.e. Adie's pupil)
  - pupil will constrict with 0.125% pilocarpine (cholinergic agonist), normal pupil will not
- postganglionic sympathetic lesions (this test is used to differentiate between pre- and post-ganglionic lesions in Horner's syndrome)
  - pupil will dilate with 0.125% adrenaline, normal pupil will not

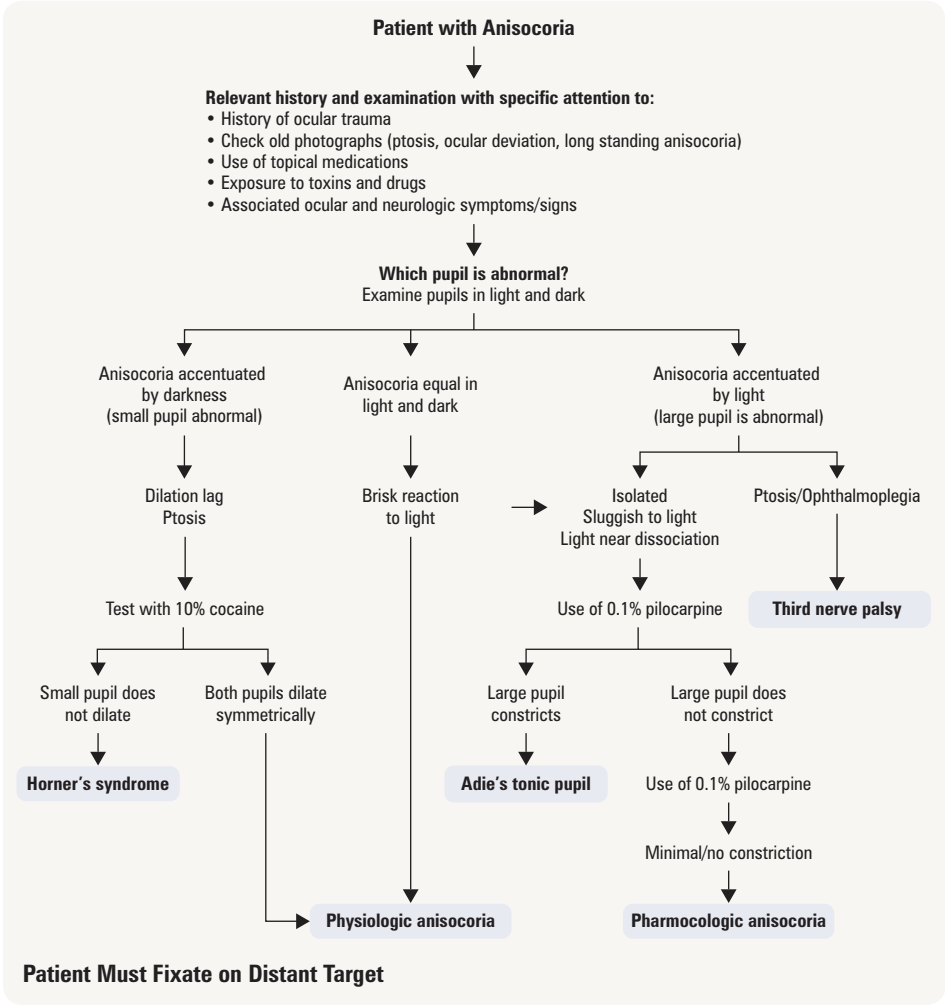

### Local Disorders of Iris

- posterior synechiae (adhesions between iris and lens) due to iritis can present as an abnormally shaped pupil
- ischemic damage (e.g. post-acute angle-closure glaucoma) usually occurs at 3 and 9 o'clock positions resulting in a vertically oval pupil that reacts poorly to light
- trauma (e.g. post-intraocular surgery)

### Anisocoria

- unequal pupil size
- idiopathic/physiologic anisocoria
  - 20% of population
  - round, regular, <1 mm difference
  - pupils reactive to light and accommodation
  - responds normally to mydriatics/miotics
- post eye surgery
- see Table 7 for other causes of anisocoria

**Figure 22. Approach to anisocoria**  
Reproduced with permission from: Kedar S, Biousse V, Newman NJ. *Approach to the patient with anisocoria*. In: UpToDate, Rose, BD (ed), UpToDate, Waltham, MA, 2011. Copyright 2011 UpToDate, Inc. For more information visit [www.uptodate.com](http://www.uptodate.com).

**Table 7. Summary of Conditions Causing Anisocoria**

Features	Site of Lesion	Light and Accommodation	Anisocoria	Mydriatics/Miotics	Effect of Pilocarpine
<b>ABNORMAL MIOTIC PUPIL (impaired pupillary dilation)</b>					
<b>Argyll-Robertson Pupil</b>	Irregular, usually bilateral	Midbrain	Poor in light; better to accommodation		Dilates/Constricts
<b>Horner's Syndrome</b>	Round, unilateral, ptosis, anhydrosis, pseudoenophthalmos	Sympathetic system	Both brisk	Greater in dark	Dilates/Constricts
<b>ABNORMAL MYDRIATIC PUPIL (impaired pupillary constriction)</b>					
<b>Adie's Tonic Pupil</b>	Irregular, larger in bright light	Ciliary ganglion	Poor in light, better to accommodation	Greater in light	Dilates/Constricts Constricts (hypersensitivity to dilute pilocarpine)
<b>CN III Palsy</b>	Round	Superficial CN III	± fixed (acutely) at 7-9 mm	Greater in light	Dilates/Constricts Constricts
<b>Mydriatic Pupil</b>	Round, uni- or bilateral	Iris sphincter	Fixed at 7-8 mm	Greater in light	No effect Will not constrict

## Dilated Pupil (Mydriasis)

### Sympathetic Stimulation

- fight or flight response
- mydriatic drugs: epinephrine, dipivefrin (Propine®), phenylephrine

### Parasympathetic Understimulation

- cycloplegics/mydriatics: atropine, tropicamide, cyclopentolate (parasympatholytic)
- CN III palsy
  - eye deviated down and out with ptosis present
  - etiology includes stroke, neoplasm, aneurysm, acute rise in ICP, diabetes mellitus (may spare pupil), trauma
  - CN III palsy will respond to drugs (e.g. pilocarpine), unlike a pupil dilated from medication (mydriatics)

### Acute Angle-Closure Glaucoma

- fixed, mid-dilated pupil

### Adie's Tonic Pupil

- 80% unilateral, females > males
- pupil is tonic or reacts poorly to light (both direct and consensual) but constricts with accommodation
- if decreased deep tendon reflexes may be Adie's syndrome
- caused by benign lesion in ciliary ganglion; results in denervation hypersensitivity of parasympathetically innervated constrictor muscle
  - dilute (0.125%) solution of pilocarpine will constrict tonic pupil but have no effect on normal pupil
- long-standing Adie's pupils are smaller than unaffected eye

### Trauma

- damage to iris sphincter from blunt or penetrating trauma
- iris transillumination defects may be apparent using ophthalmoscope or slit lamp
- pupil may be dilated (traumatic mydriasis) or irregularly shaped from tiny sphincter ruptures

## Constricted Pupil (Miosis)

### Senile Miosis

- decreased sympathetic stimulation with age

### Parasympathetic Stimulation

- local or systemic medications such as:
  - cholinergic agents: pilocarpine, carbachol
  - cholinesterase inhibitor: phospholine iodide
  - opiates, barbiturates

### Horner's Syndrome

- lesion in sympathetic pathway
- difference in pupil size greater in dim light, due to decreased innervation of adrenergics to iris dilator muscle
- associated with ptosis, anhidrosis of ipsilateral face/neck
- application of cocaine 4-10% (blocks reuptake of noradrenaline) to eye does not result in pupil dilation (vs. physiologic anisocoria), therefore confirms diagnosis
- hydroxyamphetamine 1% (stimulates noradrenaline release) will dilate pupil if central or preganglionic lesion, not postganglionic lesion
- postganglionic lesions result in denervation hypersensitivity, which will cause pupil to dilate with 0.125% adrenaline, whereas normal pupil will not
- causes: carotid or subclavian aneurysm, brainstem infarct, demyelinating disease, cervical or mediastinal tumour, Pancoast tumour, goiter, cervical lymphadenopathy, surgical sympathectomy, Lyme disease, cervical ribs, tabes dorsalis, cervical vertebral fractures

### Iritis

- miotic pupil initially
- later, may be irregularly shaped pupil due to posterior synechiae
- later stages non-reactive to light

CN III palsy with pupillary involvement may be associated with a posterior communicating artery aneurysm.

Figure 23. CNIII lesions with and without mydriasis

### Horner's MAP

Miosis  
Anhidrosis  
Ptosis

**Argyll-Robertson Pupil**

- both pupils irregular and <3 mm in diameter,  $\pm$  ptosis
- does not respond to light stimulation
- responds to accommodation (light-near dissociation)
- suggestive of neurosyphilis or other conditions (DM, encephalitis, MS, chronic alcoholism, CNS degenerative diseases)

**Other Causes**

- optic neuritis, retinal lesions

**Argyll-Robertson Pupil****ARP-PRA**

Accommodation Reflex Present  
Pupillary Reflex Absent

**Relative Afferent Pupillary Defect (RAPD)**

Cataracts never produce an RAPD.

It is possible to have RAPD and normal vision at the same time, e.g. in damaged superior colliculus caused by thalamic hemorrhage.

Differentiate RAPD from physiologic pupillary athetosis ("hippus"), which is rapid, rhythmic fluctuations of the pupil, with equal amplitude in both eyes.

**Figure 24. Relative afferent pupillary defect**

- also known as Marcus Gunn pupil
- impairment of direct pupillary response to light, caused by a lesion in visual afferent (sensory) pathway anterior to optic chiasm
- DDx: large retinal detachment, BRAO, CRAO, CRVO, advanced glaucoma, optic nerve compression, optic neuritis (most common)
- does not occur with media opacity (e.g. corneal edema, cataracts)
- pupil reacts poorly to light and better to accommodation
- test: swinging flashlight
  - if light is shone in the affected eye, direct and consensual response to light is decreased
  - if light is shone in the unaffected eye, direct and consensual response to light is normal
  - if the light is moved quickly from the unaffected eye to the affected eye, "paradoxical" dilation of both pupils occurs
  - observe red reflex, especially in patients with dark irides
- if the defect is bilateral there is no RAPD, as dilation is measured relative to the other eye

## Malignancies

- uncommon site for 1° malignancies
- eye usually affected secondarily by cancer or cancer treatments
- see *Retinoblastoma*, OP41

### Lid Carcinoma

#### Etiology

- basal cell carcinoma (rodent ulcer) (90%)
  - spread via local invasion, rarely metastasizes
  - ulcerated centre, indurated base with pearly rolled edges, telangiectasia
- squamous cell carcinoma (<5%)
  - spread via local invasion, may also spread to nodes and metastasize
  - ulceration, keratosis of lesion
- sebaceous cell carcinoma (1-5%)
  - often masquerades as chronic blepharitis or recurrent chalazion
  - highly invasive, metastasize
- Kaposi's sarcoma, malignant melanoma, Merkel cell tumour, metastatic tumour

#### Treatment

- incisional or excisional biopsies
- may require cryotherapy, radiotherapy, chemotherapy, immunotherapy
- surgical reconstruction

### Malignant Melanoma

- most common 1° intraocular malignancy in adults
- more prevalent in Caucasians
- arise from uveal tract, 90% choroidal melanoma
- hepatic metastases predominate

#### Treatment

- imaging to investigate spread
- depending on the size of the tumour, either radiotherapy, enucleation, limited surgery

### Metastases

- most common intraocular malignancy in adults
- most commonly from breast and lung in adults, neuroblastoma in children
- usually infiltrate the choroid, but may also affect the optic nerve or extraocular muscles
- may present with decreased or distorted vision, irregularly shaped pupil, iritis, hyphema

#### Treatment

- local radiation, chemotherapy
- enucleation if blind, painful eye

## Ocular Manifestations of Systemic Disease

### HIV/AIDS

- up to 75% of patients with AIDS have ocular manifestations

#### External Ocular Signs

- Kaposi's sarcoma
  - 2° to human herpes virus 8 (HHV-8), affects conjunctiva of lid or globe
  - numerous vascular skin malignancies
  - DDx: subconjunctival hemorrhage (non-clearing), hemangioma
- multiple molluscum contagiosum
- herpes simplex keratitis
- herpes zoster keratitis

## Retina

- HIV retinopathy (most common)
  - cotton wool spots in >50% of HIV patients
  - intraretinal hemorrhage
- CMV retinitis
  - ocular opportunistic infection that develops in late stages of HIV when severely immunocompromised (CD4 count  $\leq 50$ )
  - a necrotizing retinitis, with retinal hemorrhage and vasculitis, “brushfire” or “pizza pie” appearance
  - presents with scotomas (macular involvement and retinal detachment), blurred vision, and floaters
  - untreated infection will progress to other eye in 4-6 wk
  - treatment: virostatic agents (e.g. gancyclovir or foscarnet) via IV or intravitreal injection
- necrotizing retinitis
  - from herpes simplex virus, herpes zoster, toxoplasmosis
- disseminated choroiditis
  - *Pneumocystis carinii*, *Mycobacterium avium intracellulare*, *Candida*

## Other Systemic Infections

- herpes zoster
  - see *Herpes Zoster*, OP19
- candidal endophthalmitis
  - fluffy, white-yellow, superficial retinal infiltrate that may eventually result in vitritis
  - may present with inflammation of the anterior chamber
  - treatment: systemic amphotericin B, oral fluconazole
- toxoplasmosis
  - focal, grey-yellow-white, chorioretinal lesions with surrounding vasculitis and vitreous infiltration (vitreous cells)
  - can be congenital (transplacental) or acquired (caused by *Toxoplasma gondii* protozoa transmitted through raw meat and cat feces)
  - congenital form more often causes visual impairment (more likely to involve the macula)
  - treatment: pyrimethamine, sulfonamide, folinic acid, or clindamycin. Consider adding steroids if severe inflammation (vitritis, macular or optic nerve involvement)

## Diabetes Mellitus (DM)

- see *Endocrinology*, E6
- most common cause of blindness in young people in North America
- consider DM if unexplained retinopathy, cataract, extraocular muscle palsy, optic neuropathy, sudden change in refractive error
- loss of vision due to:
  - progressive microangiopathy leading to macular edema
  - progressive diabetic retinopathy  $\rightarrow$  neovascularization  $\rightarrow$  traction  $\rightarrow$  retinal detachment and vitreous hemorrhage
  - rubeosis iridis (neovascularization of the iris) leading to neovascular glaucoma (poor prognosis)
  - macular ischemia

Macular edema is the most common cause of visual loss in patients with background DR.

## DIABETIC RETINOPATHY (DR)

### Background

- altered vascular permeability (loss of pericytes, breakdown of blood-retinal barrier, thickening of basement membrane)
- predisposition to retinal vessel obstruction (CRAO, CRVO, and BRVO)

### Classification

- **non-proliferative:** increased vascular permeability and retinal ischemia
  - microaneurysms
  - dot and blot hemorrhages
  - hard exudates (lipid deposits), non-specific for DR
  - macular edema
- **advanced non-proliferative (or pre-proliferative):**
  - non-proliferative findings plus:
    - ♦ venous beading (in  $\geq 2$  of 4 retinal quadrants)
    - ♦ intraretinal microvascular anomalies (IRMA) in 1 of 4 retinal quadrants
      - IRMA: dilated, leaky vessels within the retina
    - ♦ cotton wool spots (nerve fibre layer infarcts)

### Presence of DR in:

#### Type 1 DM

- 25% after 5 yr
- 60% after 10 yr
- >80% after 15 yr

#### Type 2 DM

- 20% at time of diagnosis
- 60% after 20 yr

- **proliferative:**

- 5% of patients with diabetes will reach this stage
- neovascularization of iris, disc, retina to vitreous
  - ♦ neovascularization of iris (rubeosis iridis) can lead to neovascular glaucoma
  - ♦ vitreous hemorrhage from bleeding, fragile new vessels, fibrous tissue can contract causing tractional retinal detachment
- high risk of severe visual loss 2° to vitreous hemorrhage, retinal detachment

### Screening Guidelines for Diabetic Retinopathy

- type 1 DM
  - screen for retinopathy beginning annually 5 yr after disease onset
  - annual screening indicated for all patients over 12 yr and/or entering puberty
- type 2 DM
  - initial examination at time of diagnosis, then annually
- pregnancy
  - ocular exam in 1st trimester, close follow-up throughout as pregnancy can exacerbate DR
  - gestational diabetics are not at risk for diabetic retinopathy

### Treatment

- Diabetic Control and Complications Trial (DCCT)
  - tight control of blood sugar decreases frequency and severity of microvascular complications
- blood pressure control
- focal laser for clinically significant macular edema, intravitreal injection of corticosteroid or anti-VEGF for foveal involved diabetic macular edema
- panretinal laser photocoagulation for proliferative diabetic retinopathy: reduces neovascularization, hence reducing the angiogenic stimulus from ischemic retina by decreasing retinal metabolic demand → reduces risk of blindness
- vitrectomy for non-clearing vitreous hemorrhage and retinal detachment in proliferative diabetic retinopathy
- vitrectomy before vitreous hemorrhage does not improve the visual prognosis

### Lens Changes

- earlier onset of senile nuclear sclerosis and cortical cataract
- may get hyperglycemic cataract, due to sorbitol accumulation (rare)
- changes in blood glucose levels (poor control) can suddenly cause refractive changes by 3-4 diopters

### Extraocular Muscle Palsy

- usually CN III infarct
- pupil usually spared in diabetic CN III palsy, but ptosis is observed
- may involve CN IV and VI
- usually recover within few months

### Optic Neuropathy

- visual acuity loss due to infarction of optic disc/nerve

Clinically significant macular edema is defined as thickening of the retina at or within 500  $\mu\text{m}$  of the centre of the macula.

**The Effect of Intensive Treatment of Diabetes on the Development and Progression of Long-term Complications of Insulin-dependent Diabetes Mellitus**  
*NEJM* 1993;329:977-986

DCCT trial shows intensive glycemic control will reduce the risk of diabetic retinopathy by 76%, and reduce the risk of worsening diabetic retinopathy by 54%.

**Early Treatment Diabetic Retinopathy Study Aspirin® Effects on Mortality and Morbidity in Patients with Diabetes Mellitus**  
*ETDRS Report 14. JAMA* 1992;268:1292-1300

#### ETDRS Demonstrates

- No benefit of Aspirin® in reduction in risk of progression of diabetic retinopathy, no increased risk of hemorrhage either
- Early treatment using panretinal photocoagulation reduces the risk of visual loss
- Clinically significant macula edema should be treated by focal laser

**Expanded 2-year Follow-up of Ranibizumab plus Prompt or Deferred Laser or triamcinolone plus Prompt Laser for Diabetic Macular Edema**  
*Ophthalmology* 2011;118:609-614

Ranibizumab (Lucentis®) with prompt or deferred laser is more effective than intravitreal corticosteroid injections + laser or laser alone with sustained efficacy up to 24 mo.

Figure 25. DM vs. HTN retinopathy

## Hypertension

- retinopathy is the most common ocular manifestation
- chronic HTN retinopathy: arteriovenous (AV) nicking, blot retinal hemorrhages, microaneurysms, cotton wool spots
- acute HTN retinopathy: retinal arteriolar spasm, superficial retinal hemorrhage, cotton wool spots, optic disc edema

**Table 8. Keith-Wagener-Barker Classification**

<b>Group 1</b>	Mild arterial narrowing
<b>Group 2</b>	Obvious arterial narrowing with focal irregularities
<b>Group 3</b>	Group 2 characteristics plus: Cotton-wool spots Hemorrhage and/or exudate
<b>Group 4</b>	Group 3 plus papilledema

## Multiple Sclerosis (MS)

- see [Neurology](#), N46

### Clinical Features

- blurred vision and decreased colour vision: 2° to optic neuritis
- central scotoma: due to damage to papillomacular bundle of retinal nerve fibres
- diplopia: 2° to INO
- RAPD, ptosis, nystagmus, uveitis, optic atrophy, optic neuritis
- white matter demyelinating lesions of optic nerve on MRI

### Treatment

- IV steroids with taper to oral form for optic neuritis
  - DO NOT treat with oral steroids in isolation as this increases likelihood of eventual development of MS

#### Optic Neuritis Treatment Trial (ONTT)

**Optic Neuritis Study Group: The Optic Neuritis Treatment Trial. Three-year follow-up Results**  
*Arch Ophthalmol* 1995;113:136-137

ONTT recruited patients with acute new onset optic neuritis and studied outcome of three treatment regimes: oral steroid x 14 d, IV steroid x 3 d + oral steroid x 11 d, and placebo x 14 d. They found that oral steroid increases risk of recurrence, IV + oral steroid expedites recovery, and "no treatment" was a viable therapeutic option. Furthermore, brain MRI is most valuable in prediction of onset of MS.

## TIA/Amaurosis Fugax

- sudden, transient blindness from intermittent vascular compromise
- ipsilateral carotid most frequent embolic source
- typically monocular, lasting <5-10 min
- Hollenhorst plaques (glistening microemboli seen at branch points of retinal arterioles)

## Graves' Disease

- ophthalmopathy occurs despite control of thyroid gland status
- ocular manifestations occur 2° to sympathetic overdrive and/or specific inflammatory infiltrate of the orbital tissue

### Clinical

- initial inflammatory phase is followed by a quiescent cicatricial phase

### Treatment

- treat hyperthyroidism
- monitor for corneal exposure and maintain corneal hydration
- manage diplopia, proptosis and compressive optic neuropathy with one or a combination of:
  - steroids (during acute phase)
  - orbital bony decompression
  - external beam radiation of the orbit
- consider strabismus and/or eyelid surgical procedures once acute phase subsides

The most common cause of unilateral or bilateral proptosis in adults is Graves' disease.

#### Progression of Signs and Symptoms of Graves' Ophthalmopathy

##### NO SPECS

No signs/symptoms  
Only signs (lid retraction, lid lag)  
Soft tissue swelling (periocular edema)  
Proptosis (exophthalmos)  
Extraocular muscle weakness (causing diplopia)  
Corneal exposure  
Sight loss

## Connective Tissue Disorders

- RA, juvenile idiopathic arthritis, SLE, Sjogren's syndrome, ankylosing spondylitis, polyarteritis nodosa
- most common ocular manifestation: dry eyes (keratoconjunctivitis sicca)

## Giant Cell Arteritis (GCA)/Temporal Arteritis

- see [Rheumatology](#), RH20

### Clinical

- more common in women >60 yr
- abrupt monocular loss of vision, pain over the temporal artery, jaw claudication, scalp tenderness, constitutional symptoms, and past medical history of polymyalgia rheumatica
- ischemic optic atrophy
  - 50% lose vision in other eye if untreated

### Diagnosis

- temporal artery biopsy + increased ESR (ESR can be normal, but likely 80-100 in first hour), CRP
- if biopsy of one side is negative, biopsy the other side

### Treatment

- high dose corticosteroid to relieve pain and prevent further ischemic episodes
- if diagnosis of GCA is suspected clinically: start treatment + perform temporal artery biopsy to confirm diagnosis within 2 wk of initial presentation (**DO NOT WAIT TO TREAT**)

#### ESR in Temporal Arteritis

Males > age/2

Females > (age + 10) / 2

#### Does this Patient have Temporal Arteritis?

JAMA 2002;287:92-101

**Rule in:** jaw claudication and diplopia on history, temporal artery beading, prominence of the artery and tenderness over the artery on exam.

**Rule out:** no temporal artery abnormalities on exam, normal ESR.

## Sarcoidosis

- granulomatous uveitis with large “mutton fat” keratic precipitates and posterior synechiae
- neurosarcoidosis: optic neuropathy, oculomotor abnormalities, visual field loss

### Treatment

- steroids and mydriatics

## Pediatric Ophthalmology

### Strabismus

- ocular misalignment in one or both eyes, found in 3% of children
- object not visualized simultaneously by fovea of each eye
- terms used to describe strabismus depend upon:
  - direction of deviation relative to the fixating eye
  - conditions under which it presents: ‘latent’, ‘manifest’ misalignment
  - change with the position of gaze: ‘comitant’ (usually nonparalytic), ‘incomitant’ (usually occurs with paralytic or restrictive strabismus)
- often presents with parental concern about a wandering eye, crossing eye, or poor vision
- elicit a detailed family history of strabismus, amblyopia, type of eyeglasses and history of wear, extraocular muscle surgery or other eye surgery, and genetic diseases to identify children at higher risk
- distinguish from pseudostrabismus (prominent epicanthal folds, hypertelorism, markedly positive or negative angle  $\kappa$ )
- complications: amblyopia, cosmesis

### HETEROTROPIA

- manifest deviation
- deviation not corrected by the fusion mechanism (i.e. deviation is apparent when the patient is using both eyes)

### Types

- exo- (lateral deviation), eso- (medial deviation)
- hyper- (upward deviation), hypo- (downward deviation)
- esotropia = “crossed-eyes”; exotropia = “wall-eyed”

### Differentiate from Pseudostrabismus

- prominent epicanthal folds: give appearance of esotropia but Hirschberg test is normal, more common in Asians
- markedly elevated angle  $\kappa$  (the angle formed by the pupillary axis and the visual axis at the centre of the pupil)
  - caused by the failure of optical axis of the eye and the visual axis to coincide
  - a small positive (up to 5°) angle  $\kappa$  is physiologic
  - a large positive angle  $\kappa$  (nasally deviated fovea) simulates eso-appearance
  - a large negative angle  $\kappa$  (temporally deviated fovea) gives an exo-appearance

Strabismus in children under 4 mo of age sometimes resolves, particularly if the deviation is intermittent, variable or measures less than 40 prism diopters

### Tests

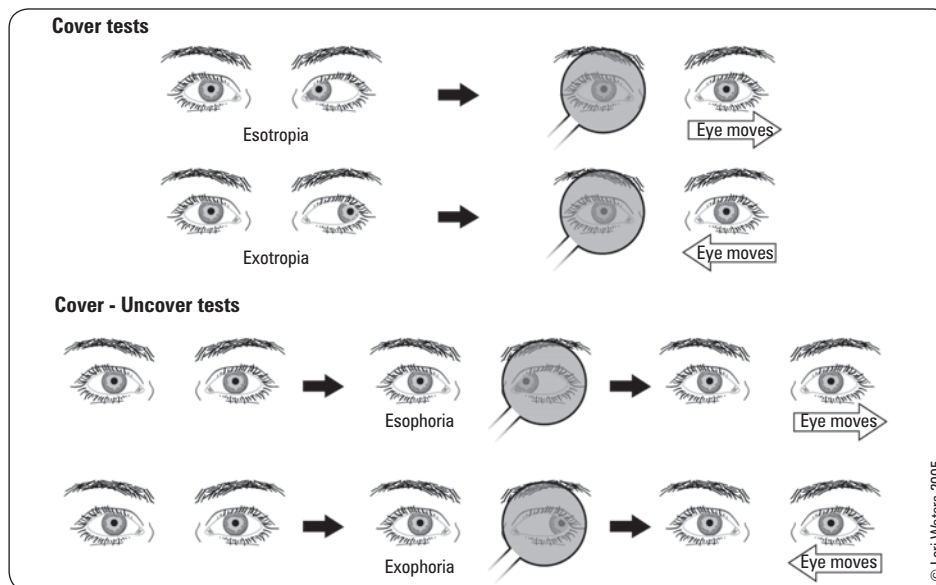

- Hirschberg test (corneal light reflex): positive if the light reflex on both corneas is asymmetrical
  - light reflex lateral to central cornea indicates esodeviation; light reflex medial to central cornea indicates exodeviation
  - false positives occur if visual axis and anatomic pupillary axis of the eye are not aligned (angle  $\kappa$ )
- cover test (Figure 26)
- the deviation can be quantified using prisms

### HETEROPHORIA

- latent deviation
- deviation corrected in the binocular state by the fusion mechanism (i.e. deviation not seen when patient is focusing with both eyes)
- Hirschberg test will be normal (light reflexes symmetrical)
- very common – majority are asymptomatic
- may be exacerbated or become manifest with asthenopia (eye strain, fatigue)

### Tests

- cover-uncover test
- alternate cover test
  - alternating the cover between both eyes reveals the total deviation, both latent and manifest
  - maintain cover over one eye for 2-3 s before rapidly shifting to other eye

All children with strabismus and/or possible reduced vision require prompt referral to an ophthalmologist.

Figure 26. Cover and cover-uncover tests for detection of tropias and phorias

Table 9. Paralytic vs. Non-Paralytic Strabismus

Clinical Characteristics	Paralytic Strabismus	Nonparalytic Strabismus
<b>Definition</b>	Incomitant strabismus	Concomitant strabismus
<b>Onset</b>	Often sudden but may be gradual or congenital	Usually gradual or shortly after birth; rarely sudden
<b>Age of onset</b>	Any age; most often acquired	Usually during infancy
<b>Etiology</b>	Reduction or restriction in range of eye movements due to: <ul style="list-style-type: none"> <li>• Neural (CN III, IV, VI): ischemia (e.g. DM), MS, aneurysm, brain tumour, trauma</li> <li>• Muscular: myasthenia gravis (neuromuscular junction pathology), Graves' disease</li> <li>• Structural: restriction or entrapment of extraocular muscles due to orbital inflammation, tumour, fracture of the orbital wall</li> </ul>	Develops early in childhood No restriction in range of eye movements Monocular, alternating, or intermittent
<b>Diplopia</b>	Common	Uncommon; image from the misaligned eye is suppressed (see <i>Amblyopia</i> , OP40)
<b>Visual acuity in other eye</b>	Usually unaffected in the other eye, unless CN II is involved	Deviated eye may become amblyopic if not treated when the child is young Amblyopia treatment rarely successful after age 8-10 yr Amblyopia usually does not develop if child has alternating strabismus or intermittency, which allows neural pathways for both eyes to develop
<b>Possibility of amblyopia</b>	Uncommon	Common
<b>Neurologic findings or systemic disease</b>	May be present	Usually absent

**Accommodative Esotropia**

- normal response to approaching object is the triad of the near reflex: convergence, accommodation and miosis
- hyperopes must constantly accommodate – excessive accommodation can lead to esotropia in young children via over-activation of the near reflex
- average age of onset is 2.5 yr
- usually reversible with correction of refractive error

**Non-accommodative Esotropia**

- accounts for 50% of childhood strabismus
- most are idiopathic
- may be due to monocular visual impairment (e.g. cataract, corneal scarring, anisometropia, retinoblastoma) or divergence insufficiency (ocular misalignment that is greater at distance fixation than at near fixation)

## Amblyopia

**Definition**

- a neurodevelopmental visual disorder with unilateral (or less commonly, bilateral) reduction of best corrected visual acuity that cannot be attributed only and directly to the effect of a structural abnormality of the eye. It is caused by abnormal visual experience early in life and cannot be remedied immediately by spectacle glasses alone
- in approximately half of the cases, amblyopia is secondary to strabismus (mainly esotropia). Other causes may include uncorrected refractive errors, anisometropia (asymmetric refractive errors), and concomitant structural ocular problems

**Detection**

- “Holler Test”: young child upset if good eye is covered
- quantitative visual acuity by age 3-4 yr using picture charts and/or matching game (Sheridan-Gardiner), testing each eye separately
- amblyopia treatment less successful after age 8-10 yr, but a trial should be given no matter what age
- prognosis: 90% will have good vision restored and maintained if treated <4 yr old

**Etiology and Management**

- strabismus
  - correct with glasses for accommodative esotropia (50% of children experience relief of their esotropia with glasses and will not require surgery)
  - occlusion of unaffected eye forces brain to use previously strabismic eye; aims to bring vision in previously suppressed eye to normal before surgery
  - surgery: recession (weakening) – moving muscle insertion further back on the globe; or resection (strengthening) – shortening the muscle
  - botulinum toxin for single muscle weakening
  - after ocular alignment is restored (glasses, surgery, botulinum toxin), patching is frequently necessary to maintain vision until approximately age 8 yr
- anisometropia
  - amblyopia usually in the more hyperopic eye
  - the more emmetropic (normal refraction) eye receives a clear image while the less emmetropic eye receives a blurred image; input from the blurred eye is cortically suppressed and visual pathway fails to develop normally
  - treat with glasses to correct refractive error
  - patching is required if visual acuity difference persists after 4-8 wk of using glasses
- deprivation amblyopia
  - occlusion due to ptosis, cataract, retinoblastoma, corneal opacity
  - occlusion amblyopia: prolonged patching of good eye may cause it to become amblyopic

**Occlusion Therapy**

- patching the good eye to force the brain to use the non-dominant eye and redevelop its vision
- atropine cycloplegic drops to impair accommodation and blur vision of the better seeing eye

**Risks**

- permanent loss of vision in the affected eye
- possibility of injury to ‘remaining’ good eye
  - safety glasses or polycarbonate lenses recommended if visual acuity in worse eye is less than 20/50
- loss of stereopsis

## Leukocoria

- white reflex (red reflex is absent)

### Differential Diagnosis

- cataract
- retinoblastoma
- retinal coloboma
- ROP
- persistent hyperplastic primary vitreous
- Coat's disease (exudative retinal telangiectasis)
- toxocariasis
- retinal detachment

## Retinoblastoma

- most common primary intraocular malignancy in children
- incidence: 1/15 000; sporadic or genetic transmission; screening of siblings/offspring essential
- unilateral or bilateral (in 1/3 of cases)
- malignant – direct or hematogenous spread
- diagnosis
  - often presents with leukocoria or strabismus
  - U/S or CT scan may demonstrate calcified mass (present in most cases)

### Treatment

- radiotherapy, chemotherapy combined with laser, cryopexy, and/or enucleation

## Retinopathy of Prematurity (ROP)

- vasoproliferative retinopathy that is a major cause of blindness in the developed world

### Risk Factors

- non-black race (black infants have lower risk of developing ROP)
- low gestational age, birth weight <1500 g
- high oxygen exposure after birth

### Classification (ROP Staging)

- stage 1: faint demarcation line at the junction between the vascularized and avascular retina
- stage 2: elevated ridge
- stage 3: extra-retinal fibrovascular tissue extending into vitreous
- stage 4: partial retinal detachment (4A: macula “on”; 4B: macula “off”)
- stage 5: total retinal detachment
- plus (+) disease: dilatation and tortuosity of retinal vessels
- threshold disease: stage 3+ in zones 1 or 2 with 5 continuous or 8 cumulative clock hours of ROP involvement

### Treatment

- threshold disease is treated with cryotherapy or laser (laser is now the standard treatment, with better refractive outcome), off label anti-VEGF intravitreal injections (see sidebar)
- ROP beyond threshold level is either watched carefully (usually stage 4A) or treated with vitrectomy/scleral buckle

### Prognosis

- higher incidence of myopia among ROP infants, even if treated successfully
- stage 4B and 5 have poor prognosis for visual outcome despite treatment

## Nasolacrimal System Defects

- congenital obstruction of the nasolacrimal duct (failure of canalization), usually occurs at 1-2 mo of age
- epiphora, crusting, discharge, recurrent conjunctivitis
- can have reflux of mucopurulent material from lacrimal punctum when pressure is applied over lacrimal sac
- treatment: massage over lacrimal sac at medial corner of eyelid
- vast majority spontaneously resolve in 9-12 mo, otherwise consider referral for duct probing

### Retinal Zones (Figure 27)

- Zone I: circle with radius twice the distance from the disc to the macula (most difficult to treat)
- Zone II: annulus from zone I to nasal extent of retina (nasal ora serrata)
- Zone III: remaining retina

Figure 27. Zones of the retina in ROP

### Efficacy of Intravitreal Bevacizumab for Stage 3+ Retinopathy of Prematurity (ROP)

NEJM 2011;364:603-615

**Study:** Randomized controlled clinical trial.

**Patients:** 150 infants born at gestational age ≤30 wk and birth weight ≤1500 g.

**Intervention:** Randomized to conventional laser therapy or intravitreal bevacizumab monotherapy.

**Main Outcome:** Recurrence of ROP in one or both eyes requiring retreatment before 54 wk postmenstrual age.

**Results:** ROP recurrence was lower in the bevacizumab group [6 of 140 eyes (4%)] versus the laser-therapy group [32 of 146 eyes (22%)] ( $p = 0.002$ ). A significant treatment effect was found for zone I retinopathy of prematurity ( $p = 0.003$ ).

**Conclusions:** Intravitreal bevacizumab monotherapy is beneficial for infants with zone I state 3+ ROP and allows continued development of peripheral retinal vessels following treatment.

## Ophthalmia Neonatorum

- newborn conjunctivitis in first month of life
- causes:
  - toxic: silver nitrate, erythromycin
  - infectious: bacterial (e.g. *Neisseria gonorrhoeae* – most common, *Chlamydia trachomatis*), herpes simplex virus
- diagnose using stains and cultures
- treatment: systemic antibiotics with possible hospitalization if infectious etiology
- topical prophylaxis, most commonly with erythromycin (or silver nitrate), is required by law at birth

Gonococcal infection is the most serious threat to sight as it can rapidly penetrate corneal epithelium, causing corneal ulceration.

## Congenital Glaucoma

- due to inadequate development of the filtering mechanism of the anterior chamber angle

### Clinical Features

- cloudy cornea, increased IOP
- photophobia, epiphora
- buphthalmos (large cornea, “ox eye”, 2° to increased IOP), blepharospasm

### Treatment

- filtration surgery is required soon after birth to prevent blindness

Epiphora in children – r/o congenital glaucoma!

## Ocular Trauma

### Blunt Trauma

- caused by blunt object such as fist, squash ball
- history: injury, ocular history, drug allergy, tetanus status
- exam: VA first, pupil size and reaction, EOM (diplopia), external and slit lamp exam, ophthalmoscopy
- if VA normal or slightly reduced, globe less likely to be perforated
- if VA reduced may be perforated globe, corneal abrasion, lens dislocation, retinal tear
- bone fractures
  - blow out fracture: restricted EOM, diplopia, enophthalmos (sunken eye)
  - ethmoid fracture: subcutaneous emphysema of lid
- lids: swelling, laceration, emphysema
- conjunctiva: subconjunctival hemorrhage
- cornea: abrasion – detect with fluorescein staining and cobalt blue filter using slit lamp or ophthalmoscope
- anterior chamber: assess depth, hyphema, hypopyon
- iris: prolapse, iritis
- lens: cataract, dislocation
- retinal tear/detachment

Always test VA first – medicolegal protection.

### Refer if you observe any of these signs

- Decreased VA
- Shallow anterior chamber
- Hyphema
- Abnormal pupil
- Ocular misalignment
- Retinal damage

### Management of Suspected Globe Rupture

**CAN'T** forget  
CT orbits  
Ancef (cefazolin) ± Aminoglycoside IV  
NPO  
Tetanus status

### Post-traumatic Infectious Endophthalmitis

*Surv Ophthalmol* 2011;56:214-251  
Delayed primary repair (>24 h after open globe injury) increases risk for post-traumatic endophthalmitis in the absence of an intraocular foreign body (IOFB).  
If IOFB present, early vitrectomy and IOFB removal must be performed within 24 h of injury.  
Extreme pain with hypopyon and vitritis indicate endophthalmitis until proven otherwise, and samples must be obtained.  
Treat with empirical intravitreal and intravenous antibiotic guided by nature of trauma, and adjust based on culture.

### Penetrating Trauma

- include ruptured globe ± prolapsed iris, intraocular foreign body
- rule out intraocular foreign body, especially if history of “metal striking metal”, orbit CT
- initial management: REFER IMMEDIATELY
  - ABCs
  - don't press on eye globe!
  - don't check IOP if possibility of globe rupture
  - check vision, diplopia
  - apply rigid eye shield to minimize further trauma
  - keep head elevated 30-45° to keep IOP down
  - keep NPO
  - tetanus status
  - give IV antibiotics
    - ♦ selecting appropriate agents depends on the mechanism of injury. Gram positive bacteria are more commonly involved than gram negatives. Retained intraocular foreign objects increase the risk of infections with *Bacillus* species, whereas exposure to vegetable matter increased the risk of a fungal etiology

## Hyphema

- blood in anterior chamber often due to damage to root of the iris
- may occur with blunt trauma

### Treatment

- refer to ophthalmology
  - shield and bedrest x 5 d or as determined by ophthalmologist
  - sleep with head upright
- may need surgical drainage if hyphema persists or if re-bleed

### Complications

- risk of re-bleed highest on days 2-5, resulting in 2° glaucoma, corneal staining, and iris necrosis
- never prescribe Aspirin®, as it increases the risk of a re-bleed

#### Shaken Baby Syndrome

Syndrome of findings characterized by absence of external signs of abuse with respiratory arrest, seizures, or coma. Ocular exam findings are important diagnostically for Shaken Baby Syndrome. These findings include extensive retinal and vitreous hemorrhages that occur during the shaking process and are extremely rare in accidental trauma. A detailed fundoscopic exam or an ophthalmology referral should be conducted for all infants in whom abuse is suspected.

## Blow-Out Fracture

- see [Plastic Surgery](#), PL31
- blunt trauma causing fracture of orbital floor and herniation of orbital contents into maxillary sinus
- orbital rim remains intact
- inferior rectus and/or inferior oblique muscles may be incarcerated at fracture site
- infraorbital nerve courses along the floor of the orbit and may be damaged

### Clinical Features

- pain and nausea at time of injury
- diplopia, restriction of EOM
- infraorbital and upper lip paresthesia (CN V2)
- enophthalmos (sunken eye), periorbital ecchymoses

### Investigations

- plain films: Waters' view and lateral
- CT: anteroposterior and coronal view of orbits

### Treatment

- refrain from coughing, blowing nose
- systemic antibiotics may be indicated
- surgery if fracture >50% orbital floor, diplopia not improving, or enophthalmos >2 mm
- may delay surgery if the diplopia improves

#### Classic Signs of Blow-Out

- Enophthalmos
- Decreased upgaze (IR trapped)
- Cheek anesthetized (infraorbital nerve trapped)

## Chemical Burns

- alkali burns have a worse prognosis than acid burns because acids coagulate tissue and inhibit further corneal penetration
- poor prognosis if cornea opaque, likely irreversible stromal damage
- even with a clear cornea initially, alkali burns can progress for weeks (thus, very guarded prognosis)

### Treatment

- immediately irrigate at site of accident with water or buffered solution
  - IV drip for at least 20-30 min with eyelids retracted in emergency department
  - swab upper and lower fornices to remove possible particulate matter
- do not attempt to neutralize because the heat produced by the reaction will damage the cornea
- cycloplegic drops to decrease iris spasm (pain) and prevent 2° glaucoma (due to posterior synechiae formation)
- topical antibiotics and patching
- topical steroids (by ophthalmologist) to decrease inflammation, use for less than 2 wk (in the case of a persistent epithelial defect)

Fluorescein lights up alkali so you can detect it and assess whether it has been removed.

## Surgical Ophthalmology

- **dacryocystorhinostomy (DCR)**: excision of bone covering the nasolacrimal sac to restore tear drainage
- **LASIK (laser-assisted in-situ keratomileusis)**: a microkeratome is used to create a corneal flap followed by laser remodeling of the stroma to correct refractive error
- **trabeculectomy**: creation of a new outflow tract from anterior chamber to under conjunctiva; fibrosis prevented with mitomycin C or 5-FU injection during surgery
- **phacoemulsification (cataract extraction)**: the use of ultrasonic waves to break up and aspirate a cataract followed by replacement with an artificial lens implant
- **vitrectomy**: the use of small trochars to enter the posterior segment and remove vitreous; commonly used to treat vitreous hemorrhage and retinal detachment
- **pneumatic retinopexy**: intraocular injection of air or an expandable gas in order to tamponade a retinal break for repair of retinal detachment
- **scleral buckle**: a band is secured on the outside of the globe that indents the eye wall, thereby relieving vitreous traction on the retina around any tears/holes and allowing the tears/holes to remain sealed

## Ocular Drug Toxicity

**Table 10. Drugs with Ocular Toxicity**

Amiodarone	Corneal microdeposits and superficial keratopathy (vortex keratopathy) Rare: ischemic optic neuropathy
Atropine, benzotropine	Pupillary dilation (risk of angle closure glaucoma)
Bisphosphonates (Fosamax®, Actonel®)	Inflammatory eye disease (iritis, scleritis, episcleritis)
Chloroquine, hydroxychloroquine	Bull's eye maculopathy Vortex keratopathy
Chlorpromazine	Anterior subcapsular cataract
Contraceptive pills	Decreased tolerance to contact lenses Migraine Optic neuritis Central vein occlusion
Digitalis	Yellow vision Blurred vision
Ethambutol	Optic neuropathy
Haloperidol (Haldol®)	Oculogyric crises Blurred vision
Indomethacin	Superficial keratopathy
Interferon	Retinal hemorrhages and cotton wool spots
Isoniazid	Optic neuropathy
Nalidixic acid	Papilledema
Steroids	Posterior subcapsular cataracts Glaucoma Papilledema (systemic steroids) Increased severity of HSV infections (geographic ulcers) Predisposition to fungal infections
Sulphonamides, NSAIDs	Stevens-Johnson syndrome
Tamsulosin (Flomax®)	Intraoperative Floppy Iris Syndrome, which can complicate cataract surgery
Tetracycline	Papilledema (associated with pseudotumour cerebri)
Thioridazine	Pigmentary degeneration of retina
Vigabatrin	Retinal deposition with macular sparing, peripheral visual field loss
Vitamin A intoxication	Papilledema
Vitamin D intoxication	Band keratopathy

## Common Medications

### TOPICAL OCULAR DIAGNOSTIC DRUGS

#### Fluorescein Dye

- water soluble orange-yellow dye
- green under cobalt blue light (ophthalmoscope or slit lamp)
- absorbed in areas of epithelial loss (ulcer or abrasion)
- also stains mucus and contact lenses

#### Rose Bengal Stain

- stains devitalized epithelial cells and mucus

### Anesthetics

- e.g. proparacaine HCl 0.5%, tetracaine 0.5%
- indications: removal of foreign body and sutures, tonometry, examination of painful cornea
- toxic to corneal epithelium (inhibit mitosis and migration) and can lead to corneal ulceration and scarring with prolonged use, therefore **NEVER** prescribe

### Mydriatics

- dilate pupils
- two classes
  - cholinergic blocking (e.g. tropicamide – Mydracyl®)
    - ♦ dilation plus cycloplegia (loss of accommodation) by paralysis of iris sphincter and the ciliary body
    - ♦ indications: refraction, ophthalmoscopy, therapy for iritis
  - adrenergic stimulating (e.g. phenylephrine HCl 2.5%)
    - ♦ stimulate pupillary dilator muscles, no effect on accommodation
    - ♦ usually used with tropicamide for additive effects
    - ♦ side effects: hypertension, tachycardia, arrhythmias

**Table 11. Mydriatic Cycloplegic Drugs and Duration of Action**

Drugs	Duration of Action
Tropicamide (Mydracyl®) 0.5%, 1%	4-5 h
Cyclopentolate HCl 0.5%, 1%	3-6 h
Homatropine HBr 1%, 2%	3-7 d
Atropine sulfate 0.5%, 1%	1-2 wk
Scopolamine HBr 0.25%, 5%	1-2 wk

## GLAUCOMA MEDICATIONS

**Table 12. Glaucoma Medications**

Drug Category	Dose	Effect	Comment/Side Effects
<b>α-Agonist</b> <b>Non-selective</b> <ul style="list-style-type: none"> <li>• epinephrine HCl 1% (Epifrin®)</li> <li>• dipivalyl epinephrine 0.1% (Propine®)</li> </ul> <b>α<sub>2</sub>-selective</b> <ul style="list-style-type: none"> <li>• brimonidine 0.2% (Alphagan®)</li> <li>• apraclonidine 0.5% (Lopidine®)</li> </ul>	1 gtt OS/OD bid/tid	1. Non-selective: ↓ aqueous production + ↑ TM outflow 2. Selective: ↓ aqueous production + ↑ uveoscleral outflow	1. Non-selective: mydriasis, macular edema, tachycardia 2. Selective: contact allergy, hypotension in children
<b>β-Blocker</b> <b>Non-selective</b> <ul style="list-style-type: none"> <li>• timolol (Timoptic®)</li> <li>• levobunolol (Betagan®)</li> </ul> <b>β<sub>1</sub>-selective</b> <ul style="list-style-type: none"> <li>• betaxolol (Betoptic®)</li> </ul>	1 gtt OS/OD qd/bid	↓ aqueous production	<b>Bronchospasm (caution in asthma/COPD)</b> ↑ CHF Bradycardia Hypotension Depression Heart block Impotence
<b>Carbonic Anhydrase Inhibitor</b> <ul style="list-style-type: none"> <li>• dorzolamide (Trusopt®)</li> <li>• brinzolamide (Azopt®)</li> <li>• oral: acetazolamide (Diamox®)</li> </ul>	1 gtt OS/OD tid Diamox®: 500 mg PO bid	↓ aqueous production	<b>Must ask about sulfa allergy</b> Generally local side effects with topical preparations Oral: diuresis, fatigue, paresthesias, GI upset, etc.
<b>Parasympathomimetic</b> (cholinergic stimulating) <ul style="list-style-type: none"> <li>• pilocarpine (Pilopine®)</li> <li>• carbachol (Isopto Carbachol®)</li> </ul>	1-2 gtt OS/OD tid/qid	↑ TM outflow	Miosis ↓ night vision ↑ GI motility Brow ache Headache ↓ heart rate
<b>Prostaglandin Analogues</b> <ul style="list-style-type: none"> <li>• latanoprost (Xalatan®)</li> <li>• travaprost (Travatan®)</li> <li>• bimatoprost (Lumigan®)</li> </ul>	1 gtt OS/OD qhs	↑ uveoscleral outflow (uveoscleral responsible for 20% of drainage)	Iris colour change Periorbital skin pigmentation Lash growth Conjunctival hyperemia

Cosopt® = timolol + dorzolamide; Xalatan® = timolol + latanoprost; Combigan® = timolol + brimonidine; DuoTrav® = timolol + travaprost; gtt = drop, gttS = drops

## WET AGE-RELATED MACULAR DEGENERATION MEDICATIONS

### Vascular Endothelial Growth Factors (VEGF) Inhibitors

- block vascular endothelial growth factor which prevents ocular angiogenesis and further development of choroidal neovascularization
- administered via intravitreal injections
- pegaptanib (Macugen®) is a selective anti-VEGF targeting VEGF isoform 165 (no longer widely used)
- ranibizumab (Lucentis®) is a non-selective anti-VEGF agent
- bevacizumab (Avastin®) is another non-selective anti-VEGF agent but is only FDA approved for metastatic breast cancer, colorectal cancer and non-small cell lung cancer. Therefore, its ophthalmologic use is off-label

**TOPICAL OCULAR THERAPEUTIC DRUGS****NSAIDs**

- used for less serious chronic inflammatory conditions
- e.g. ketorolac (Acular®), diclofenac (Voltaren®), nepafenac (Nevanac®) drops

**Anti-Histamines**

- used to relieve red and itchy eye, often in combination with decongestants
- sodium cromoglycate – stabilizes membranes

**Decongestants**

- weak adrenergic stimulating drugs (vasoconstrictor)
- e.g. naphazoline, phenylephrine (Isopto Frin®)
- rebound vasodilation with overuse; rarely can precipitate angle closure glaucoma

**Antibiotics**

- indications: bacterial conjunctivitis, keratitis, or blepharitis
- commonly as topical drops or ointments, may give systemically
- e.g. sulfonamide (sodium sulfacetamide, sulfisoxazole), gentamicin (Garamycin®), erythromycin, tetracycline, bacitracin, polymyxin B, fluoroquinolones (ciprofloxacin [Ciloxan®], ofloxacin [Ocuflox®], moxifloxacin [Vigamox®], gatifloxacin [Zymar®])

**Corticosteroids**

- e.g. fluorometholone (FML®), betamethasone, dexamethasone (Maxidex®), prednisolone (Predsol® 0.5%, Pred Forte® 1%), rimexolone (Vexol®), loteprednol etabonate 0.5% (Lotamax®)
- primary care physicians should avoid prescribing topical corticosteroids due to risk of glaucoma, cataracts, and reactivation of HSV keratitis
- complications
  - potentiates HSV keratitis and fungal keratitis as well as masks symptoms
  - increased IOP, more rapidly in steroid responders (within weeks)
  - posterior subcapsular cataract (within months)

Figure 3. Nerves and arteries of lower limbs

## Differential Diagnosis of Joint Pain

Figure 4. Intrinsic vs. extrinsic joint pain

# Fractures – General Principles

## Fracture Description

### 1. Integrity of Skin/Soft Tissue

- closed: skin/soft tissue over and near fracture is intact
- open: skin/soft tissue over and near fracture is lacerated or abraded, fracture exposed to outside environment
  - signs: continuous bleeding from puncture site or fat droplets in blood are suggestive of an open fracture

### 2. Location (Figure 5)

- epiphyseal: end of bone, forming part of the adjacent joint
- metaphyseal: the flared portion of the bone at the ends of the shaft
- diaphyseal: the shaft of a long bone (proximal, middle, distal)
- physis: growth plate

### 3. Orientation/Fracture Pattern (Figure 6)

- transverse: fracture line perpendicular to long axis of bone; direct high energy force
- oblique: angular fracture line; angular or rotational force
- butterfly: fracture site fragment which looks like a butterfly
- segmental: a separate segment of bone bordered by fracture lines; high energy
- spiral: complex, multi-planar fracture line; rotational force, low energy
- comminuted/multi-fragmentary: more than 2 fracture fragments
- intra-articular: fracture line crosses articular cartilage and enters joint
- avulsion: tendon or ligament tears/pulls fragment off bone; often in children, high energy
- compression/impacted: impaction of bone, e.g. vertebrae, proximal tibia
- torus: a buckle fracture of one cortex, often in children (Figure 51, OR38)
- green-stick: an incomplete fracture of one cortex, often in children (Figure 51, OR38)
- pathologic: fracture through bone weakened by disease/tumour

### 4. Displacement (Figure 6)

- nondisplaced: fracture fragments are in anatomic alignment
- displaced: fracture fragments are not in anatomic alignment
- distracted: fracture fragments are separated by a gap
- angulated: direction of fracture apex, e.g. varus/valgus
- translated: percentage of overlapping bone at fracture site
- rotated: fracture fragment rotated about long axis of bone

Figure 6. Fracture types

Figure 5. Schematic diagram of the long bone

#### X-Ray Rule of 2s

- 2 sides = bilateral
- 2 views = AP + lateral
- 2 joints = joint above + below
- 2 times = before + after reduction

#### Varus/Valgus Angulation

- Varus** = Apex away from midline
- Valgus** = Apex toward midline

#### Displacement

Refers to position of the distal fragment relative to the proximal fragment.

#### Quick Nerve Exam

- "Thumbs Up": PIN (Radial Nerve)
- "OK Sign": AIN (Median Nerve)
- "Spread Fingers": Ulnar Nerve

#### Reasons for Splinting

- Pain control
- Reduces further damage to vessels, nerves, and skin
- Decreases risk of inadvertently converting closed to open fracture
- Facilitates patient transport

## Management of Fractures

- ABCs, primary survey and secondary survey (ATLS protocol)
  - rule out other fractures/injuries
  - rule out open fracture (see sidebar on OR8)
- AMPLE history: Allergies, Medications, Past medical history, Last meal, Events surrounding injury
  - consider pathologic fracture with history of only minor trauma
- analgesia
- imaging
- splint extremity

1. obtain the reduction (refer to Table 27 for appropriate IV sedation)
  - closed reduction
    - ♦ apply traction in the long axis of the limb
    - ♦ reverse the mechanism that produced the fracture
    - ♦ reduce with IV sedation and muscle relaxation (fluoroscopy can be used if available)
  - indications for open reduction:
    - ♦ NO CAST
    - ♦ other indications include:
      - failed closed reduction
      - not able to cast or apply traction due to site (e.g. hip fracture)
      - pathologic fractures
      - potential for improved function with ORIF
  - re-check neurovascular status after reduction and obtain post-reduction x-ray
2. maintain the reduction
  - external stabilization: splints, casts, traction, external fixator
  - internal stabilization: percutaneous pinning, extramedullary fixation (screws, plates, wires), intramedullary fixation (rods)
  - follow-up: evaluate bone healing
3. rehabilitate to regain function and avoid joint stiffness

#### Indications for Open Reduction

##### NO CAST

Non-union  
Open fracture  
Neurovascular Compromise  
Intra-Articular fracture  
Salter-Harris 3,4,5  
PolyTrauma

## Fracture Healing

### Normal Healing

Weeks 0-3	Hematoma, macrophages surround fracture site
Weeks 3-6	Osteoclasts remove sharp edges, callus forms within hematoma
Weeks 6-12	Bone forms within the callus, bridging fragments
Months 6-12	Cortical gap is bridged by bone
Years 1-2	Normal architecture is achieved through remodelling

Figure 8. Stages of Bone Healing

### Evaluation of Healing: Tests of Union

- clinical: no longer tender to palpation or stressing on physical exam
- x-ray: trabeculae cross fracture site, visible callus bridging site on at least 3 of 4 cortices

## General Fracture Complications

Table 2. General Fracture Complications

	Early	Late
<b>Local</b>	Compartment syndrome Neurological injury Vascular injury Infection Implant failure Fracture blisters	Mal/non-union AVN Osteomyelitis HO Post-traumatic osteoarthritis Joint stiffness/adhesive capsulitis CRPS type I/RSD
<b>Systemic</b>	Sepsis DVT PE ARDS secondary to fat embolism Hemorrhagic shock	

## Orthopedic X-Ray Imaging

### General Principles

- x-ray 1 joint above and 1 below
- obtain at least 2 orthogonal views ± specialized views

Figure 7. Heterotopic ossification of femoral diaphysis after femur fracture and intramedullary nailing

#### Heterotopic Ossification

The formation of bone in abnormal locations (e.g. in muscle), secondary to pathology.

#### Avascular Necrosis

Ischemia to bone due to disrupted blood supply; commonly in bones covered by cartilage or with distal to proximal blood supply.

#### Fracture Blister

Formation of vesicles or bullae that occur on edematous skin overlying a fractured bone.

#### CRPS/RSD

An exaggerated response to an insult in the extremities; characterized by symptoms of hyperalgesia and allodynia, with signs of autonomic dysfunction (temperature asymmetry, mottling, hair or nail changes).

**Table 3. Orthopedic X-Ray Imaging**

Site	Injury	X-Ray views
Shoulder	Anterior dislocation	AP
	Posterior dislocation	Axillary ± stress view with 10lb in hand
	Acromioclavicular	Trans-scapular
	Frozen shoulder	Zanca view (10-15 cephalic tilt)
Arm	Humerus #	AP
		Lateral
		Trans-scapular
		Axillary
Elbow/Forearm	Supracondylar #	AP
	Radial head #	Lateral
	Monteggia #	
	Night stick #	
	Galeazzi #	
Wrist	Colles' #	AP
	Smith #	Lateral
	Scaphoid #	Scaphoid (wrist extension and ulnar deviation x 2wk)
Pelvis	Pelvic #	AP pelvis
		Inlet and outlet views
		Judet views (obturator and iliac oblique for acetabular fracture)
Hip	Femoral head/neck #	AP
	Intertrochanteric #	Lateral
	Arthritis	Frog-leg
	SCFE	
Knee	Knee Dislocation	AP standing, lateral
	Femur/tibia #	Skyline – tangential view with knees flexed at 45° to see patellofemoral joint
	Patella #	
	Patella dislocation	
	Patella femoral syndrome	
	Tibia shaft #	
Ankle	Ankle #	AP
		Lateral
		Mortise view: ankle at 15° of internal rotation
Foot	Talar #	AP
	Calcaneal #	Lateral
Spine	Compression #	AP spine
	Burst #	AP odontoid
	Cervical spine #	Lateral
		Oblique
		Swimmer's view: lateral view with arm abducted 180° to evaluate C7-T1 junction if lateral view is inadequate
		Lateral flexion/extension view: evaluate subluxation of cervical vertebrae

## Orthopedic Emergencies

### Trauma Patient Work-Up

#### Etiology

- high energy trauma e.g. motor vehicle accident, fall from height
- may be associated with spinal injuries or life-threatening visceral injuries

#### Clinical Presentation

- local swelling, tenderness, deformity of the limbs, and instability of the pelvis or spine
- decreased level of consciousness, hypotension/hypovolemia
- consider involvement of alcohol or other substances

#### Investigations

- trauma survey (see [Emergency Medicine](#), ER2)
- x-rays: lateral cervical spine, AP chest, AP pelvis, AP and lateral of all bones suspected to be injured
- other views of pelvis: AP, inlet and outlet; Judet views for acetabular fracture (see Table 18 for classification of pelvic fractures)

#### Orthopedic Emergencies

##### VON CHOP

- Vascular compromise
- Open fracture
- Neurological compromise/cauda equina syndrome
- Compartment syndrome
- Hip dislocation
- Osteomyelitis/septic arthritis
- Unstable Pelvic fracture

#### Buck's Traction

A system of weights, pulleys, and ropes that are attached to the end of a patient's bed exerting a longitudinal force on the distal end of a fracture, improving its length, alignment, and rotation.

### Treatment

- ABCDEs and initiate resuscitation for life threatening injuries
- assess genitourinary injury (rectal exam/vaginal exam mandatory)
- external or internal fixation of all fractures
- DVT prophylaxis

### Complications

- **hemorrhage – life threatening** (may produce signs and symptoms of hypovolemic shock)
- fat embolism syndrome (SOB, hypoxemia, petechial rash, thrombocytopenia and neurological symptoms)
- venous thrombosis – DVT and PE
- bladder/bowel injury
- neurological damage
- persistent pain/stiffness/limp/weakness in affected extremities
- post-traumatic osteoarthritis of joints with intra-articular fractures
- sepsis if missed open fracture

## Open Fractures

### Definition

- fractured bone and hematoma in communication with the external environment

### Emergency Measures

- removal of obvious foreign material
- irrigate with normal saline if grossly contaminated
- cover wound with sterile dressings
- immediate IV antibiotics (see Table 4)
- tetanus toxoid or immunoglobulin as needed
- reduce and splint fracture
- NPO and prepare for OR (bloodwork, consent, ECG, CXR)
  - operative irrigation and debridement within 6-8 h to decrease risk of infection
  - traumatic wound often left open to drain but vacuum-assisted closure dressing may be used
  - re-examine with repeat I&D in 48 h

**Table 4. Gustilo Classification of Open Fractures**

Gustilo Grade	Length of Open Wound	Description	Prophylactic Antibiotic Regimen
I	<1 cm	Minimal contamination and soft tissue injury Simple or minimally comminuted fracture	First generation cephalosporin (cefazolin) for 3 d If allergy use fluoroquinolone If MRSA +ve use vancomycin
II	1-10 cm	Moderate contamination Soft tissue injury	First generation cephalosporin (cefazolin) for 3 d plus Gram-negative coverage (gentamicin) for at least 3 d
III*	>10 cm	IIIA: Extensive soft tissue injury with adequate ability of soft tissue to cover wound IIIB: Extensive soft tissue injury with periosteal stripping and bone exposure; inadequate soft tissue to cover wound IIIC: Vascular injury/compromise	As per Grade II For soil contamination, penicillin is added for clostridial coverage

\*Any high energy, comminuted fracture, shot gun, farmyard/soil/water contamination, exposure to oral flora, or fracture more than 8 h old is immediately classified as Grade III

33% of patients with open fractures have multiple injuries.

### Antibiotics for Preventing Infection in Open Limb Fractures

*Cochrane DB Syst Rev 2004;1:CD003764*

**Purpose:** To review the evidence regarding the effectiveness of antibiotics in the initial treatment of open fractures of the limbs.

**Methods:** Randomized or quasi randomized controlled trials comparing antibiotic treatment with placebo or no treatment in preventing acute wound infection were identified and reviewed. Data were extracted and pooled for analysis.

**Results:** Eight studies (n=1106) were reviewed. The use of antibiotics had a protective effect against early infection compared with no antibiotics or placebo (RRR=0.43, 95% CI: 0.29, 0.65; ARR=0.07, 95% CI: 0.03=0.10).

**Conclusions:** Antibiotics reduce the incidence of early infections in open fractures of the limbs.

## Cauda Equina Syndrome

- see [Neurosurgery](#), NS26

Cauda equina syndrome is a surgical emergency.

## Compartment Syndrome

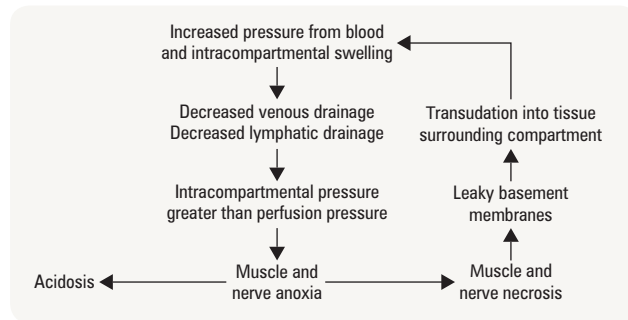

### Definition

- increased interstitial pressure in an anatomical compartment (forearm, calf) where muscle and tissue are bounded by fascia and bone (fibro-osseous compartment) with little room for expansion
- interstitial pressure exceeds capillary perfusion pressure leading to muscle necrosis (in 4-6 h) and eventually nerve necrosis

### Etiology

- intracompartmental: fracture (particularly tibial shaft fractures, pediatric supracondylar fractures, and forearm fractures), crush injury, ischemia-reperfusion injury
- extracompartmental: constrictive dressing (circumferential cast, poor positioning during surgery), circumferential burn

**Figure 9. Pathogenesis of compartment syndrome**

### Clinical Features

- pain with active contraction of compartment
- pain with passive stretch
- swollen, tense compartment
- suspicious history
- **5 Ps:** late sign (see sidebar) – do not wait for these to develop to make the diagnosis!

### Investigations

- usually not necessary as compartment syndrome is a clinical diagnosis
- in children or unconscious patients where clinical exam is unreliable, compartment pressure monitoring with catheter AFTER clinical diagnosis is made (normal = 0 mmHg; elevated  $\geq 30$  mmHg or  $\leq 30$  mmHg of diastolic BP)

### Treatment

- non-operative
  - remove constrictive dressings (casts, splints), elevate limb at the level of the heart
- operative
  - urgent fasciotomy
  - 48-72 h post-op: wound closure  $\pm$  necrotic tissue debridement

### Complications

- rhabdomyolysis, renal failure secondary to myoglobinuria
- Volkmann's ischemic contracture: ischemic necrosis of muscle, followed by secondary fibrosis and finally calcification; especially following supracondylar fracture of humerus

#### 5 Ps of Compartment Syndrome

**Pain:** out of proportion for injury and not relieved by analgesics

- Increased pain with passive stretch of compartment muscles (most specific sign)

**Pallor:** late finding

**Paresthesia**

**Paralysis:** late finding

**Pulselessness:** late finding

Most important sign is increased pain with passive stretch. Most important symptom is pain out of proportion to injury.

Rapid progression of signs and symptoms (over hours) necessitates need for serial examinations.

## Articular Cartilage

### Properties

- 2-4 mm layer covering ends of articulating bones, provides nearly frictionless surface
- avascular (nutrition from synovial fluid), aneural, alymphatic
- composed of: collagen (90% is type II; gives tensile strength), water, proteoglycans (gives compressive strength), and chondrocytes

### ARTICULAR CARTILAGE DEFECTS

#### Etiology

- overt trauma, repetitive minor trauma (such as patellar maltracking); common sports injury
- degenerative conditions such as early stage osteoarthritis or osteochondritis dissecans

#### Clinical Features

- similar to symptoms of osteoarthritis (joint line pain with possible effusion, etc.)
- often have predisposing factors, such as ligament injury, malalignment of the joint (varus/valgus), obesity, bone deficiency (avascular necrosis, osteochondritis dissecans, ganglion bone cysts), inflammatory arthropathy, and familial osteoarthropathy
- may have symptoms of locking or catching related to the torn/displaced cartilage

#### Investigations

- x-ray (to rule out bony defects and check alignment)
- MRI
- diagnostic arthroscopy (treatment is often guided by what is seen during arthroscopy)

**Table 5. Outerbridge Classification of Chondral Defects**

Grade	Chondral Damage
I	Softening and swelling of cartilage
II	Fragmentation and fissuring <1/2 inch in diameter
III	Fragmentation and fissuring >1/2 inch in diameter
IV	Erosion of cartilage down to bone

**Treatment**

- individualized; must take into account patient factors (age, skeletal maturity, activity level, etc.) and defect factors (Outerbridge classification, subchondral bone involvement, etc.)
- non-operative: rest, NSAIDs, bracing
- operative: microfracture, osteochondral grafting (autograft or allograft), autologous chondrocyte implantation

**Osteomyelitis****Treatment**

Acute Osteomyelitis	Chronic Osteomyelitis
IV antibiotics; started empirically and adjusted after obtaining blood and aspirate cultures ± surgery for abscess	Surgical debridement Antibiotics: both local (e.g. antibiotic beads) and systemic (IV)

**Plain Film Findings of Osteomyelitis**

- Soft tissue swelling
- Lytic bone destruction\*
- Periosteal reaction (formation of new bone, especially in response to #)\*

\*Generally not seen on plain films until 10-12 d after onset of infection.

**Septic Joint****Etiology**

- most commonly caused by *Staphylococcus aureus* in adults
- consider coagulase-negative *Staphylococcus* in patients with prior joint replacement
- consider *Neisseria gonorrhoeae* in sexually active adults
- most common route of infection is hematogenous
- risk factors: age >80 yr, DM, RA, prosthetic joint, recent joint surgery, skin infection/ulcer, IV drug use, alcoholism, previous intra-articular corticosteroid injection

**Clinical Presentation**

- inability/refusal to bear weight, localized joint pain, erythema, warmth, swelling, pain on active and passive ROM, ± fever

**Investigations**

- x-ray (to r/o fracture, tumour, metabolic bone disease), ESR, CRP, WBC, blood cultures
- joint aspirate: WBC >80,000 with >90% neutrophils, protein level >4.4 mg/dL, joint glucose level << blood glucose level, no crystals, positive Gram stain results
- listen for heart murmur (to r/o infective endocarditis)

**Treatment**

- IV antibiotics, empiric therapy (based on age and risk factors), adjust following joint aspirate C&S results
- for small joints: needle aspiration, serial if necessary until sterile
- for major joints such as knee, hip, or shoulder: urgent decompression and surgical drainage

Acute osteomyelitis is a medical emergency which requires an early diagnosis and appropriate antimicrobial and surgical treatment.

**Plain Film Findings in a Septic Joint**

- Early (0-3 d): usually normal  
May show soft-tissue swelling or joint space widening from localized edema
- Late (4-6 d): joint space narrowing and destruction of cartilage

Serial C-reactive protein (CRP) can be used to monitor response to therapy.

**Shoulder****Shoulder Dislocation****Prognosis**

- recurrence rate depends on age of 1st dislocation: <20 yr = 65-95%; 20-40 yr = 60-70%; >40 yr = 2-4%

**Specific Complications**

- rotator cuff or capsular tear, shoulder stiffness
- injury to axillary nerve/artery, brachial plexus
- recurrent/unreduced dislocation (most common complication)

**Investigations**

- anterior dislocation x-rays (AP, trans-scapular, axillary views)
- posterior dislocation x-rays (AP, trans-scapular, axillary) or CT scan

**There are 4 Joints in the Shoulder:**  
glenohumeral, acromioclavicular (AC), sternoclavicular (SC), scapulothoracic.

Shoulder passive ROM: abduction – 180°, adduction – 45°, flexion – 180°, extension – 45°, int. rotation – level of T4, ext. rotation – 40-45°.

Table 6. Anterior and Posterior Shoulder Dislocation

	Anterior Shoulder Dislocation (>90%)	Posterior Shoulder Dislocation (5%)
<b>MECHANISM</b>	Abducted arm is externally rotated/hyperextended, or blow to posterior shoulder Involuntary, usually traumatic; voluntary, atraumatic	Adducted, internally rotated, flexed arm FOOSH 3 Es (epileptic seizure, EtOH, electrocution) Blow to anterior shoulder
<b>CLINICAL FEATURES</b>		
<b>Symptoms</b>	Pain, arm slightly abducted and externally rotated with inability to internally rotate	Pain, arm is held in adduction and internal rotation; external rotation is blocked
<b>Shoulder Exam</b>	<p>"Squared off" shoulder</p> <p>+ve apprehension test: patient looks apprehensive with gentle shoulder abduction and external rotation to 90° since humeral head is pushed anteriorly and recreates feeling of anterior dislocation (Figure 13)</p> <p>+ve relocation test: a posteriorly directed force applied during the apprehension test relieves apprehension since anterior subluxation is prevented</p> <p>+ve sulcus sign: presence of subacromial indentation with distal traction on humerus indicates inferior shoulder instability (Figure 13)</p>	<p>Anterior shoulder flattening, prominent coracoid, palpable mass posterior to shoulder</p> <p>+ve posterior apprehension ("jerk") test: with patient supine, flex elbow 90° and adduct, internally rotate the arm while applying a posterior force to the shoulder; patient will "jerk" back with the sensation of subluxation (Figure 13)</p> <p>Note: the posterior apprehension test is used to test for recurrent posterior instability, NOT for acute injury</p>
<b>Neurovascular Exam Including</b>	<p>Axillary nerve: sensory patch over deltoid and deltoid contraction</p> <p>Musculocutaneous nerve: sensory patch on lateral forearm and biceps contraction</p>	Full neurovascular exam as per anterior shoulder dislocation
<b>RADIOGRAPHIC FINDINGS</b>		
<b>Axillary View</b>	Humeral head is anterior	Humeral head is posterior
<b>Trans-scapular 'Y' View</b>	<p>Humeral head is anterior to the centre of the "Mercedes-Benz sign" (Figure 11)</p> <p>Humeral head is posterior to centre of "Mercedes-Benz sign" (Figure 11)</p>	
<b>AP View</b>	Sub-coracoid lie of the humeral head is most common	Partial vacancy of glenoid fossa (vacant glenoid sign) and >6 mm space between anterior glenoid rim and humeral head (positive rim sign), humeral head may resemble a lightbulb due to internal rotation (lightbulb sign)
<b>Hill-Sachs and Bony Bankart Lesions</b>	<p>± Hill-Sachs lesion: compression fracture of posterior humeral head due to forceful impaction of an anteriorly dislocated humeral head against the glenoid rim (Figure 12)</p> <p>± bony Bankart lesion: avulsion of the anterior glenoid labrum (with attached bone fragments) from the glenoid rim (Figure 12)</p>	<p>± reverse Hill-Sachs lesion (75% of cases): divot in anterior humeral head</p> <p>± reverse bony Bankart lesion: avulsion of the posterior glenoid labrum from the bony glenoid rim</p>
<b>TREATMENT</b>	<p>Closed reduction with IV sedation and muscle relaxation</p> <p>Traction-countertraction: assistant stabilizes torso with a folded sheet wrapped across the chest while the surgeon applies gentle steady traction (Figure 13)</p> <p>Stimson: while patient lies prone with arm hanging over table edge, hang a 5 lb weight on wrist for 15-20 min</p> <p>Hippocratic method: place heel into patient's axilla and apply traction to arm</p> <p>Cunningham's method: low risk, low pain; if not successful try above methods</p> <p>Obtain post-reduction x-rays</p> <p>Check post-reduction NVS</p> <p>Sling x 3 wk (avoid abduction and ext. rotation), followed by shoulder rehabilitation (dynamic stabilizer strengthening)</p>	<p>Closed reduction with sedation and muscle relaxation</p> <p>Inferior traction on a flexed elbow with pressure on the back of the humeral head</p> <p>Obtain post-reduction x-rays</p> <p>Check post-reduction NVS</p> <p>Sling in abduction and external rotation x 3 wk, followed by shoulder rehabilitation (dynamic stabilizer strengthening)</p>

**Factors Causing Shoulder Instability**

- Shallow glenoid
- Loose capsule
- Ligamentous laxity

**Frequency of Dislocations:**

- Anterior shoulder > Posterior shoulder
- Posterior hip > Anterior hip

The glenohumeral joint is the most commonly dislocated joint in the body since stability is sacrificed for motion.

Figure 10. Shoulder joints

**Posterior Shoulder Dislocation**

Up to 60-80% of are missed on initial presentation due to poor physical exam and radiographs.

Figure 11. Mercedes-Benz

Figure 12. Posterior view of anterior dislocation causing Hill-Sachs and Bankart lesions

Figure 13. Shoulder maneuvers

## Rotator Cuff Disease

- rotator cuff consists of 4 muscles (Table 7) that act to stabilize humeral head within the glenoid fossa (see Figure 14)

Table 7. Rotator Cuff Muscles

Muscle	Muscle Attachments		Nerve Supply	Muscle Function
	Proximal	Distal		
<b>Supraspinatus</b>	Scapula	Greater tuberosity of humerus	Suprascapular nerve	Abduction
<b>Infraspinatus</b>	Scapula	Greater tuberosity of humerus	Suprascapular nerve	External rotation
<b>Teres Minor</b>	Scapula	Greater tuberosity of humerus	Axillary nerve	External rotation
<b>Subscapularis</b>	Scapula	Lesser tuberosity of humerus	Subscapular nerve	Internal rotation and adduction

## SPECTRUM OF DISEASE: IMPINGEMENT, TENDONITIS, MICRO OR MACRO TEARS

### Etiology

- impingement: “painful arc syndrome”, compression of rotator cuff tendons (primarily supraspinatus) and subacromial bursa between the head of the humerus and the undersurface of acromion, AC joint and CA ligament leads to bursitis, tendonitis and if left untreated, can lead to rotator cuff thinning and tear
- anything that leads to a narrow subacromial space
  - glenohumeral muscle weakness leading to abnormal motion of humeral head
  - scapular muscle weakness leading to abnormal motion of acromion
  - acromial abnormalities such as congenital narrow space or osteophyte formation

### Clinical Features

- night pain and difficulty sleeping on affected side
- pain worse with active motion
- weakness and loss of range of motion especially between 90°-130° (e.g. trouble with overhead activities)
- tenderness to palpation over greater tuberosity
- rule out bicep tendinosis: Speed and Yergason's tests; SLAP lesion: O'Brien's test

Table 8. Rotator Cuff Special Tests (Figure 15)

Test	Examination	Positive Test
<b>Jobe's Test</b>	Supraspinatus: place the shoulder in 90° of abduction and 30° of forward flexion and internally rotate the arm so that the thumb is pointing toward the floor	Weakness with active resistance suggests a supraspinatus tear
<b>Lift-off Test</b>	Subscapularis: internally rotate arm so dorsal surface of hand rests on lower back. Patient instructed to actively lift hand away from back against examiner resistance. (use Belly Press Test if too painful)	Inability to actively lift hand away from back suggests a subscapularis tear

Figure 14. Muscles of the rotator cuff

### Rotator Cuff Muscles

#### SITS

Supraspinatus  
Infraspinatus  
Teres minor  
Subscapularis

**Table 8. Rotator Cuff Special Tests (Figure 15) (continued)**

Test	Examination	Positive Test
<b>Posterior-Cuff Test</b>	Infraspinatus and teres minor: arm positioned at patient's side in 90° of flexion. Patient instructed to externally rotate arm against the resistance of the examiner	Weakness with active resistance suggests posterior cuff tear
<b>Neer's Test</b>	Rotator cuff impingement: passive shoulder flexion	Pain elicited between 130-170° suggests impingement
<b>Hawkins-Kennedy Test</b>	Rotator cuff impingement: shoulder flexion to 90° and passive internal rotation	Pain with internal rotation suggests impingement
<b>Painful Arc Test</b>	Rotator cuff tendinopathy: patient instructed to actively abduct the shoulder	Pain with abduction greater than 90° suggests tendinopathy

**Screening Out Rotator Cuff Tears**

- No night pain (SN 87.7%)
- No painful arc (SN 97.5%)
- No impingement signs (SN 97.2%)
- No weakness

Returning to the bedside: Using the history and physical examination to identify rotator cuff tears. *JAM Geri Soc* 2000;48:1633-1637

**Ruling in Rotator Cuff Tears – 98% probability of rotator cuff tear if all 3 of the following are present:**

- Supraspinatus weakness
- External rotation weakness
- Positive impingement sign(s)

Diagnosis of rotator cuff tears. *Lancet* 2001; 357:769-770

**Figure 15. Rotator cuff tests****Investigations**

- x-rays: AP view may show high riding humerus relative to glenoid, evidence of chronic tendonitis
- MRI: coronal/sagittal oblique and axial orientations are useful for assessing full/partial tears and tendinopathy ± arthrogram: geyser sign (injected dye leaks out of joint through rotator cuff tear)
- arthrogram: see full thickness tear, difficult to assess partial thickness tears

**Treatment and Prognosis**

- mild ("wear")
  - treatment is non-operative (physiotherapy, NSAIDs)
- moderate ("tear")
  - non-operative treatment ± steroid injection
- severe ("repair")
  - impingement that is refractory to 2-3 mo physio and 1-2 injections
  - may require arthroscopic or surgical repair, i.e. acromioplasty, rotator cuff repair

## Acromioclavicular Joint Pathology

- 2 main ligaments attach clavicle to scapula: AC and CC ligaments

### Mechanism

- fall onto shoulder with adducted arm (fall onto tip of shoulder)

### Clinical Features

- palpate step deformity between distal clavicle and acromion (with dislocation)
- pain with adduction of shoulder and/or palpation over AC joint
- limited ROM

### Investigations

- x-rays: AP, Zanca view (10-15° cephalic tilt), axillary ± stress views (10 lb weight in patient's hand)

### Treatment

- non-operative (**most common**): sling 1-3 wk, ice, analgesia, rehabilitation
- operative
  - indications: AC and CC ligaments are both torn and/or clavicle displaced posteriorly
  - procedure: excision of lateral clavicle with AC/CC ligament reconstruction

Pneumothorax or pulmonary contusion are potential complications of severe acromioclavicular joint dislocation.

**Table 9. Rockwood Classification of Acromioclavicular Joint Separation**

Grade	Features	Treatment
I	Joint sprain, absence of complete tear of either ligament	Non-operative
II	Complete tear of AC ligament, incomplete tear of CC ligament, without marked elevation of lateral clavicular head	Non-operative
III	Complete tear of AC and CC ligaments, >5 mm elevation at AC joint, superior aspect of acromion is below the inferior aspect of the clavicle	Most non-operative, operative as per indications above Will heal with step deformity, although most fully functional in 4-6 mo
IV-VI	Based on the anatomical structure the displaced clavicle is in proximity with	Operative in most cases

## Clavicle Fracture

- incidence: proximal (5%), middle (80%), or distal (15%) third of clavicle
- common in children (unites rapidly without complications)

### Mechanism

- fall on shoulder (87%), direct trauma to clavicle (7%), FOOSH (6%)

### Clinical Features

- pain and tenting of skin
- arm is clasped to chest to splint shoulder and prevent movement

### Treatment

- evaluate neurovascular status of entire upper limb
- medial and middle third clavicle fractures
  - figure-of-eight sling x 1-2 wk
  - early ROM and strengthening once pain subsides
  - if ends overlap >2 cm consider ORIF
- distal third clavicle fractures
  - undisplaced (with ligaments intact): sling x 1-2 wk
  - displaced (CC ligament injury): ORIF

### Specific Complications (see General Fracture Complications, OR6)

- cosmetic bump usually only complication
- shoulder stiffness, weakness with repetitive activity
- pneumothorax, brachial plexus injuries and subclavian vessel (all very rare)

#### Associated Injuries with Clavicle Fractures

- Up to 9% of clavicle fractures are associated with other fractures (most commonly rib fractures)
- Majority of brachial plexus injuries are associated with proximal third fractures

## Frozen Shoulder (Adhesive Capsulitis)

### Definition

- disorder characterized by progressive pain and stiffness of the shoulder usually resolving spontaneously after 18 mo

**Mechanism**

- primary adhesive capsulitis
  - idiopathic, usually associated with diabetes mellitus
  - usually resolves spontaneously in 9-18 mo
- secondary adhesive capsulitis
  - due to prolonged immobilization
  - shoulder-hand syndrome: CRPS/RSD characterized by arm and shoulder pain, decreased motion, and diffuse swelling
  - following myocardial infarction, stroke, shoulder trauma
  - poorer outcomes

**Clinical Features**

- gradual onset (weeks to months) of diffuse shoulder pain with:
  - decreased active and passive ROM
  - pain worse at night and often prevents sleeping on affected side
  - increased stiffness as pain subsides: continues for 6-12 mo after pain has disappeared

**Investigations**

- x-rays may be normal, or may show demineralization from disease

**Treatment**

- Freezing Phase
  - active and passive ROM (physiotherapy)
  - ♦ NSAIDs and steroid injections if limited by pain
- Thawing Phase
  - manipulation under anaesthesia and early physiotherapy
  - ♦ arthroscopy for debridement/decompression

**Conditions Associated with an Increased Incidence of Adhesive Capsulitis**

- Prolonged immobilization (most significant)
- Female gender
- Age > 49 yr
- Diabetes mellitus (5x)
- Cervical disc disease
- Hyperthyroidism
- Stroke
- Myocardial infarction
- Trauma and surgery

Anatomic neck fractures disrupt blood supply to the humeral head and AVN of the humeral head may ensue.

## Humerus

### Proximal Humeral Fracture

**Mechanism**

- young: high energy trauma (MVC)
- elderly: FOOSH from standing height in osteoporotic individuals

**Clinical Features**

- proximal humeral tenderness, deformity with severe fracture, swelling, painful ROM, bruising extends down arm later

**Investigations**

- test axillary nerve function (deltoid contraction and skin over deltoid)
- x-rays: AP, trans-scapular, axillary are essential
- CT scan: to evaluate for articular involvement and fracture displacement

**Classification**

- Neer classification is based on 4 fracture fragments (see *Neer Classification* sidebar)
- displaced: displacement >1 cm and/or angulation >45°
- the Neer system regards displacement, not the fracture line, as meeting criteria for a 'part' in the classification scheme
- ± dislocated/subluxed: humeral head dislocated/subluxed from glenoid

**Treatment**

- treat osteoporosis if needed
- non-operative (nondisplaced or minimally displaced)
  - broad arm sling immobilization (nondisplaced): begin ROM in 7-10 d to prevent stiffness
  - closed reduction (minimally displaced) with sling immobilization x 2 wk, gentle ROM
- operative
  - ORIF (anatomic neck fractures, displaced, associated dislocated glenohumeral joint)
  - hemiarthroplasty may be necessary, especially in elderly

**Specific Complications** (see *General Fracture Complications*, OR6)

- AVN, axillary nerve palsy, malunion, post-traumatic arthritis

**Figure 16. Fractures of the proximal humerus**

**Neer Classification****Based on 4 parts of humerus**

- Greater Tuberosity
- Lesser Tuberosity
- Humeral Head
- Shaft

**Two-part fracture:** any of the 4 parts with 1 displaced

**Three-part fracture:** displaced fracture of surgical neck + displaced greater tuberosity or lesser tuberosity

**Four-part fracture:** displaced fracture of surgical neck + both tuberosities

70-80% of proximal humeral fractures are non-displaced and managed non-operatively. Of displaced fractures, 20% are two-part, 5% are three-part, and <1% are four-part.

## Humeral Shaft Fracture

### Mechanism

- direct blows/MVC (most common), FOOSH, twisting injuries, metastases (in elderly)

### Clinical Features

- pain, swelling,  $\pm$  shortening, motion/crepitus at fracture site
- must test radial nerve function before and after treatment: look for drop wrist, sensory impairment dorsum of hand

### Investigations

- x-rays: AP and lateral radiographs of the humerus including the shoulder and elbow joints

### Treatment

- in general, humeral shaft fractures are treated non-operatively
- non-operative (**most common**)
  - $\pm$  reduction; can accept deformity due to compensatory range of motion of shoulder
  - hanging cast (weight of arm in cast provides traction across fracture site) with collar and cuff sling immobilization until swelling subsides, then Sarmiento functional brace, followed by ROM
- operative
  - indications: open fracture, neurovascular injury, unacceptable fracture alignment, polytrauma, segmental fracture, pathological fracture, "floating elbow" (simultaneous unstable humeral and forearm fractures), intra-articular
  - ORIF: plating (most common), intramedullary rod insertion, external fixation

### Specific Complications (see General Fracture Complications, OR6)

- radial nerve palsy: expect spontaneous recovery in 3-4 mo, otherwise send for EMG
- non-union: most frequently seen in middle 1/3
- decreased ROM
- compartment syndrome

#### Acceptable Humeral Shaft Deformities for Non-operative Treatment

- $<20^\circ$  anterior angulation
- $<30^\circ$  varus angulation
- $<3$  cm of shortening

Risk of radial nerve and brachial artery injury!

## Elbow

## Supracondylar Fracture

- most common in pediatric population (peak age  $\sim 7$  yr old), rarely seen in adults
- fracture of the distal 1/3 of humerus just proximal to capitulum and trochlea, usually transverse
- AIN injury commonly associated with extension type

### Mechanism

- $>96\%$  are extension injuries via FOOSH (e.g. fall off monkey bars);  $<4\%$  are flexion injuries

### Clinical Features

- pain, swelling, point tenderness
- neurovascular injury: assess median and radial nerve, radial artery (check radial pulse)

### Investigations

- x-rays: AP, lateral of elbow (Figure 17)
- assess for anterior fat pad ('sail sign') or the presence of a posterior fat pad representative of an occult fracture (Figure 18)

### Treatment

- reduction indications: evidence of arterial obstruction, unacceptable angulation, displaced ( $>50\%$ )
- non-operative
  - nondisplaced: long arm plaster slab in  $90^\circ$  flexion x 3 wk
- operative
  - indications: displaced, vascular injury, open fracture
  - requires percutaneous pinning followed by limb cast with elbow flexed  $>90^\circ$
  - in adults, ORIF is necessary

### Specific Complications (see General Fracture Complications, OR6)

- stiffness is most common
- brachial artery injury (kinking can occur if displaced fracture), median or ulnar nerve injury, compartment syndrome (leads to Volkmann's ischemic contracture), malalignment cubitus varus (distal fragment tilted into varus)

#### Three Joints at the Elbow

- Humero-radial joint
- Humero-ulnar joint
- Radioulnar joint

**Figure 17. X-ray of transverse displaced supracondylar fracture of humerus with elbow dislocation**

Normal carrying angle of elbow is approximately  $10^\circ$  of valgus.

## Radial Head Fracture

- a common fracture of the upper limb in young adults

### Mechanism

- FOOSH with elbow extended and forearm pronated

### Clinical Features

- marked local tenderness on palpation over radial head (lateral elbow)
- decreased ROM at elbow, mechanical block to forearm pronation and supination
- pain on pronation/supination

### Investigations

- x-ray: enlarged anterior fat pad ("sail sign") or the presence of a posterior fat pad indicates occult radial head fractures (Figure 18)

**Table 10. Classification and Treatment of Radial Head Fractures**

Mason Class	Radiographic Description	Treatment
1	Undisplaced fracture	Elbow slab or sling x 3-5 d with early ROM
2	Displaced fracture	ORIF if: angulation >30°; involves ≥1/3 of the radial head, or if ≥3 mm of joint incongruity exists
3	Comminuted fracture	Radial head excision ± prosthesis
4	Comminuted fracture with posterior elbow dislocation	Radial head excision ± prosthesis

### Specific Complications (see *General Fracture Complications*, OR6)

- myositis ossificans
- recurrent instability (if medial collateral ligament injured and radial head excised)

#### Terrible Triad

- Radial head fracture
- Coronoid fracture
- Elbow dislocation

**Figure 18. X-ray of fat pad sign**

#### Mason Class 2 Radial Head Fracture

CT reconstruction provides the best detail and ability to appreciate the anatomic orientation of the fracture pattern, enhancing surgical planning and prognosis.

To avoid stiffness do not immobilize elbow joint >2-3 wk.

**Figure 19. Lateral view of elbow**

#### Elbow Dislocation

The radio-capitellar line refers to an imaginary line along the longitudinal axis of the radius that passes through the centre of the capitellum regardless of the degree of elbow flexion. If the radio-capitellar line does not pass through the centre of the capitellum a dislocation should be suspected.

The anterior humeral line refers to an imaginary line drawn along the anterior surface of the humeral cortex that passes through the middle third of the capitellum when extended inferiorly. In subtle supracondylar fractures the anterior humeral line is disrupted, typically passing through the anterior third of the capitellum.

## Olecranon Fracture

### Mechanism

- direct trauma to posterior aspect of elbow (fall onto the point of the elbow)

### Clinical Features

- ± loss of active extension due to avulsion of triceps tendon

### Treatment

- undisplaced (<2 mm, stable): cast x 10-14 d (elbow in 90° flexion) then gentle ROM
- displaced: ORIF (plate and screws or tension band wiring) and early ROM if stable

## Elbow Dislocation

- third most common joint dislocation after shoulder and patella
- usually the radius and ulna are dislocated together, or the radius head dislocates and the ulna remains ("Monteggia")
- anterior capsule and collateral ligaments disrupted

### Mechanism

- elbow hyperextension via FOOSH or valgus/supination stress during elbow flexion
- most commonly occurs in young people (5-25 yr) in sporting events or high speed MVCs
- 90% are posterior/posterolateral, anterior are rare and usually devastating

### Clinical Features

- elbow pain, swelling, deformity
- flexion contracture
- ± absent radial or ulnar pulses

### Treatment

- assess neurovascular status before reduction: brachial artery, median and ulnar nerves (can become entrapped during manipulation)
- closed reduction under conscious sedation (post-reduction x-rays required)
- Parvin's method: patient lies prone with arm hanging down; apply gentle traction downwards on wrist, as olecranon slips distally, gently lift up the arm at elbow to reduce joint
- long-arm splint with forearm in neutral rotation and elbow in 90° flexion
- early ROM (<2 wk)

### Specific Complications (see *General Fracture Complications*, OR6)

- stiffness (loss of extension), intra-articular loose body, neurovascular injury (ulnar nerve, median nerve, brachial artery), radial head fracture
- recurrent instability uncommon

## Epicondylitis

- lateral epicondylitis = “tennis elbow”, inflammation of the common extensor tendon as it inserts into the lateral epicondyle
- medial epicondylitis = “golfer’s elbow”, inflammation of the common flexor tendon as it inserts into the medial epicondyle

### Mechanism

- repeated or sustained contraction of the forearm muscles

### Clinical Features

- point tenderness over humeral epicondyle and/or distal to it
- pain upon resisted wrist extension (lateral epicondylitis) or wrist flexion (medial epicondylitis)
- generally a self-limited condition, but may take 6-18 mo to resolve

### Treatment

- rest, ice, NSAIDs
- use brace/strap
- physiotherapy, stretching and strengthening
- corticosteroid injection
- surgery: percutaneous or open release of common tendon from epicondyle (only after 6-12 mo of conservative therapy)

**Tennis Elbow** = lateral epicondylitis; pain associated with extension of wrist.

### Elbow Joint Injection

Inject at the centre of the triangle formed by the lateral epicondyle, radial head and olecranon.

## Forearm

## Radius and Ulna Fracture

### Mechanism

- commonly a FOOSH or high-energy direct blow
- fractures usually accompanied by displacement due to high force

### Investigations

- x-ray: 1) AP and lateral of forearm; 2) AP, lateral, oblique of elbow and wrist
- CT if fracture is close to joint

### Treatment

- goal is anatomic reduction since imperfect alignment significantly limits forearm pronation and supination
- ORIF with plates and screws; closed reduction with immobilization usually yields poor results for displaced forearm fractures (except in children)

### Complications (see *General Fracture Complications*, OR6)

- soft tissue contracture resulting in limited forearm rotation – surgical release of tissue may be warranted

Figure 20. Monteggia fracture

In all isolated ulna fractures, assess proximal radius to rule out a Monteggia fracture.

### Bado Type Classification of Monteggia Fractures

Based on the direction of displacement of the dislocated radial head, generally the same direction as the apex of the ulnar fracture

Type I: anterior dislocation of radial head (60%)

Type II: posterior dislocation of radial head (15%)

Type III: lateral dislocation of radial head (20%)

Type IV – combined: proximal fracture of the ulna and radius, dislocation of the radial head in any direction (<5%)

## Monteggia Fracture

- more common and better prognosis in the pediatric age group when compared to adults

### Definition

- fracture of the proximal ulna with radial head dislocation and proximal radioulnar joint injury (Figure 20)

### Mechanism

- direct blow on the posterior aspect of the forearm
- hyperpronation
- fall on the hyperextended elbow

### Clinical Features

- decreased rotation of forearm ± palpable lump at the radial head
- ulna angled apex anterior and radial head dislocated anteriorly (rarely the reverse deformity occurs)

### Treatment

- adults: ORIF of ulna with indirect radius reduction in 90% of patients
- splint and early post-op ROM if elbow completely stable, otherwise immobilization in plaster with elbow flexed for 6 wk
- pediatrics: attempt closed reduction and immobilization in plaster with elbow flexed for Bado Type I-III, surgery for Type IV

**Specific Complications** (see *General Fracture Complications*, OR6)

- PIN: most common nerve injury, especially with posterior approach to the radius fixation
- radial head instability/redislocation
- radioulnar synostosis

## Nightstick Fracture

**Definition**

- isolated fracture of ulna without dislocation of radial head

**Mechanism**

- direct blow to forearm (e.g. holding arm up to protect face)

**Treatment**

- non-displaced: below elbow cast (x 10 d) followed by forearm brace (~8 wk)
- displaced: ORIF if >50% shaft displacement or >10° angulation

## Galeazzi Fracture

**Definition**

- fracture of the distal radial shaft with disruption of the DRUJ
- most commonly in the distal 1/3 of radius near junction of metaphysis/diaphysis
- 3x more common than Monteggia fracture

**Mechanism**

- hand FOOSH with axial loading of pronated forearm

**Investigations**

- x-rays
  - shortening of distal radius >5 mm relative to the distal ulna
  - widening of the DRUJ space on AP
  - dislocation of radius with respect to ulna on true lateral

**Treatment**

- ORIF of radius; afterwards assess DRUJ stability by balloting distal ulna relative to distal radius
- if DRUJ is stable and reducible, splint for 10-14 d with early ROM encouraged
- if DRUJ is unstable, ORIF or percutaneous pinning with long arm cast in supination x 6 wk

Figure 21. Nightstick fracture

Figure 22. Galeazzi fracture

For all isolated radius fractures assess DRUJ to rule out a Galeazzi fracture.

## Wrist

### Colles' Fracture

**Definition**

- extra-articular transverse distal radius fracture (about 2 cm proximal to the radiocarpal joint) with dorsal displacement ± ulnar styloid fracture

**Epidemiology**

- most common fracture in those >40 yr, especially in women and those with osteoporotic bone

**Mechanism**

- FOOSH

**Clinical Features**

- “dinner fork” deformity (Figures 23 and 24)
- swelling, ecchymoses, tenderness

**Investigations**

- x-ray: AP and lateral wrist

**Treatment**

- goal is to restore radial height, radial inclination (22°), volar tilt (11°) as well as DRUJ stability and useful forearm rotation
- closed reduction (think opposite of the deformity):
  - hematoma block (sterile prep and drape, local anesthetic injection directly into fracture site) or conscious sedation
  - closed reduction: 1) traction with extension (exaggerate injury), 2) traction with ulnar deviation, pronation, flexion (of distal fragment – not at wrist)
  - dorsal slab/below elbow cast for 5-6 wk
  - x-ray x 1 wk for 3 wk and at cessation of immobilization to ensure reduction is maintained
- obtain post-reduction films immediately; repeat reduction if necessary, consider external fixation or ORIF if failure of adequate closed reduction

Figure 23. Colles' fracture and associated bony deformity

## Smith's Fracture

### Definition

- volar displacement of the distal radius (i.e. reverse Colles' fracture)

### Mechanism

- fall onto the back of the flexed hand

### Treatment

- usually unstable and needs ORIF
- if patient is poor operative candidate, may attempt non-operative treatment
- closed reduction with hematoma block (reduction opposite of Colles')
- long-arm cast in supination x 6 wk

## Complications of Wrist Fractures

- most common complications are poor grip strength, stiffness, and radial shortening
- distal radius fractures in individuals <40 yr of age are usually highly comminuted and are likely to require ORIF
- 80% have normal function in 6-12 mo

**Table 11. Early and Late Complications of Wrist Fractures**

Early	Late
Difficult reduction $\pm$ loss of reduction	Malunion, radial shortening (Figure 24)
Compartment syndrome	Painful wrist secondary to ulnar prominence
Extensor pollicis longus tendon rupture	Frozen shoulder ("shoulder-hand syndrome")
Acute carpal tunnel syndrome	Post-traumatic arthritis
Finger swelling with venous block	Carpal tunnel syndrome
Complications of a tight cast/splint	CRPS/RSD

## Scaphoid Fracture

### Epidemiology

- common in young men; not common in children or in patients beyond middle age
- most common carpal bone injured
- may be associated with other carpal or wrist injuries (e.g. Colle's fracture)

### Mechanism

- FOOSH: impaction of scaphoid on distal radius, most commonly resulting in a transverse fracture through the middle/'waist' (50%), distal (38%), or proximal (12%) scaphoid

### Clinical Features

- pain with wrist movement
- tenderness in the anatomical "snuff box", over scaphoid tubercle, and pain with long axis compression into scaphoid
- usually undisplaced

### Investigations

- x-ray: PA, lateral, scaphoid views with wrist extension and ulnar deviation x 2 wk
- $\pm$  CT or MRI
- bone scan rarely used
- note:** a fracture may not be radiologically evident up to 2 wk after acute injury, so if a patient complains of wrist pain and has anatomical snuff box tenderness but a negative x-ray, treat as if positive for a scaphoid fracture and repeat x-ray 2 wk later to rule out a fracture. If x-ray still negative order CT or MRI

### Treatment

- early treatment critical for improving outcomes
- non-displaced (<1 mm displacement/<15° angulation): long-arm thumb spica cast x 4 wk then short arm cast until radiographic evidence of healing is seen (2-3 mo)
- displaced: ORIF with headless/countersink compression screw is the mainstay treatment, or percutaneous K-wire fixation (uncommon) (Figure 26)

### ORIF Colles' Fracture if Post-reduction Demonstrates:

- Radial shortening >3 mm or,
- Dorsal tilt >10° or,
- Intra-articular displacement/step-off >2 mm

**Figure 24. Normal wrist angles + wrist angles in Colles' fracture**

Note the relative shortening of the radius relative to the ulna on AP view in Colles' fracture

**Figure 25. Carpal bones**

### Scaphoid Fracture Special Tests

Tender snuff box: 100% sensitivity, but 29% specific as positive with many other injuries of radial aspect of wrist with FOOSH.

**Specific Complications** (see *General Fracture Complications*, OR6)

- most common: non-union/mal-union (use bone graft from iliac crest or distal radius with fixation to heal)
- AVN of the proximal fragment
- delayed union (recommend surgical fixation)

**Prognosis**

- fractures of the proximal third of the scaphoid have 70% rate of non-union or AVN
- waist fractures have healing rates of 80-90%
- distal third fractures have healing rates close to 100%

Figure 26. ORIF left scaphoid

## Hand

- see [Plastic Surgery](#), PL22

## Spine

Figure 27. Schematic diagram of vertebral anatomy

Adapted from Moore KL, Agur AMR. *Essential Clinical Anatomy*. 3rd Ed. Philadelphia: Lippincott Williams and Wilkins, 2007, 274

## Fractures of the Spine

- see [Neurosurgery](#), NS33

Table 12. Fracture Type and Column Involvement

Fracture Type	Column Failure	Stable/Unstable	Mechanism
Compression	Anterior	Stable	Compression
Burst	Anterior, middle	± Unstable	High-energy axial loading + flexion
Fracture-dislocation	Anterior, middle, posterior	Unstable	Significant force applied to spine (flexion, extension, distraction, rotation, shear or axial load)
Flexion-distraction	Middle, posterior	± Unstable	MVC (lap belt only) causing flexion and distraction (Chance fracture)

## Cervical Spine

**General Principles**

- C1 (atlas): no vertebral body, no spinous process
- C2 (axis): odontoid = dens
- 7 cervical vertebrae; 8 cervical nerve roots
- nerve root exits above vertebra (i.e. C4 nerve root exits above C4 vertebra), C8 nerve root exits below C7 vertebra
- radiculopathy = impingement of nerve root
- myelopathy = impingement of spinal cord

The proximal pole of the scaphoid receives as much as 100% of its arterial blood supply from the radial artery that enters at the distal pole. A fracture through the proximal third disrupts this blood supply and results in a high incidence of AVN/non-union.

Figure 28. Compression, burst, and dislocation fractures

### Special Testing

- compression test: pressure on head worsens radicular pain
- distraction test: traction on head relieves radicular symptoms
- Valsalva test: Valsalva maneuver increases intrathecal pressure and causes radicular pain

**Table 13. Cervical Radiculopathy/Neuropathy**

Root	C5	C6	C7	C8
<b>Motor</b>	Deltoid Biceps Wrist extension	Biceps Brachioradialis	Triceps Wrist flexion Finger extension	Interossei Digital flexors
<b>Sensory</b>	Axillary nerve (patch over lateral deltoid)	Thumb and index finger	Middle finger	Ring and little finger
<b>Reflex</b>	Biceps	Biceps Brachioradialis	Triceps	Finger jerk

### X-Rays for C-Spine

- AP spine: alignment
- AP odontoid: atlantoaxial articulation
- lateral
  - vertebral alignment: posterior vertebral bodies should be aligned (translation >3.5 mm is abnormal)
  - angulation: between adjacent vertebral bodies (>11° is abnormal)
  - disc or facet joint widening
  - anterior soft tissue space (at C3 should be ≤3 mm; at C4 should be ≤8-10 mm)
- oblique: evaluate pedicles and intervertebral foramen
- ± swimmer's view: lateral view with arm abducted 180° to evaluate C7-T1 junction if lateral view is inadequate
- ± lateral flexion/extension view: evaluate subluxation of cervical vertebrae

### Differential Diagnosis of C-Spine Pain

- neck muscle strain, cervical spondylosis, cervical stenosis, rheumatoid arthritis (spondylitis), traumatic injury, whiplash, myofascial pain syndrome

### C-SPINE INJURY

- see [Neurosurgery](#), NS34

**C-Spine X-Ray in Trauma**  
Must see C7-T1.

#### Canadian C-spine Rule

Used to guide imaging for alert (GCS = 15) and stable patients with suspected C-spine injury  
Obtain radiography if:

- Age ≥65
- Paresthesia in the extremities
- Inability to rotate neck >45° to the left and right
- Dangerous mechanism of injury (e.g. high speed MVC, fall from elevation >5 ft, etc.)

Canadian CT Head and C-Spine (CCC) Study Group.  
Canadian C-Spine Rule Study for alert and stable trauma patients. I. Background and rationale.  
*CEJM* 2002;4:84-90

All trauma patients with suspected C-spine injury require immediate immobilization of C-spine at scene of accident with spine board, C-collar, and sandbags.

## Thoracolumbar Spine

### General Principles

- spinal cord terminates at conus medullaris (L1)
- individual nerve roots exit below pedicle of vertebra (i.e. L4 nerve root exits below L4 pedicle)

### Special Tests

- straight leg raise: passive lifting of leg (30-70°) reproduces radicular symptoms of pain radiating down posterior/lateral leg to knee ± into foot
- Lasegue maneuver: dorsiflexion of foot during straight leg raise makes symptoms worse or, if leg is less elevated, dorsiflexion will bring on symptoms
- femoral stretch test: with patient prone, flexing the knee of the affected side and passively extending the hip results in radicular symptoms of unilateral pain in lumbar region, buttock, or posterior thigh

**Table 14. Lumbar Radiculopathy/Neuropathy**

Root	L4	L5	S1
<b>Motor</b>	Quadriceps (knee extension + hip adduction) Tibialis anterior (ankle inversion + dorsiflexion)	Extensor hallucis longus Gluteus medius (hip abduction)	Peroneus longus + brevis (ankle eversion) Gastrocnemius + soleus (plantar flexion)
<b>Sensory</b>	Medial malleolus	1st dorsal webspace and lateral leg	Lateral foot
<b>Reflex</b>	Knee (Patellar)	Medial hamstring*	Ankle (Achilles)
<b>Test</b>	Femoral stretch	Straight leg raise	Straight leg raise

\*Unreliable

### Differential Diagnosis of Back Pain

1. mechanical or nerve compression (>90%)
  - degenerative (disc, facet, ligament)
  - peripheral nerve compression (disc herniation)
  - spinal stenosis (congenital, osteophyte, central disc)
  - cauda equina syndrome
2. others (<10%)
  - neoplastic (primary, metastatic, multiple myeloma)
  - infectious (osteomyelitis, TB)
  - metabolic (osteoporosis)
  - traumatic fracture (compression, distraction, translation, rotation)
  - spondyloarthropathies (ankylosing spondylitis)
  - referred (aorta, renal, ureter, pancreas)

### DEGENERATIVE DISC DISEASE

- loss of vertebral disc height with age results in:
  - bulging and tears of annulus fibrosus
  - change in alignment of facet joints
  - osteophyte formation
- can cause back-dominant pain
- management
  - non-operative
    - ♦ staying active with modified activity
    - ♦ back strengthening
    - ♦ NSAIDs
    - ♦ do not treat with opioids; no proven efficacy of spinal traction or manipulation
  - operative – rarely indicated
    - ♦ decompression ± fusion
    - ♦ no difference in outcome between non-operative and surgical management at 2 yr

Table 15. Types of Low Back Pain

	Mechanical Back Pain		Direct Nerve Root Compression	
	Disc Origin	Facet Origin	Spinal Stenosis	Root Compression
<b>Pain Dominance</b>	Back	Back	Leg	Leg
<b>Aggravation</b>	Flexion	Extension, standing, walking	Exercise, extension, walking, standing	Flexion
<b>Onset</b>	Gradual	More sudden	Congenital or acquired	Acute leg ± back pain
<b>Duration</b>	Long (weeks, months)	Shorter (days, weeks)	Acute or chronic history (weeks to months)	Short episodes Attacks (minutes)
<b>Treatment</b>	Relief of strain, exercise	Relief of strain, exercise	Relief of strain, exercise	Relief of strain, exercise + surgical decompression if progressive or severe deficit

### SPINAL STENOSIS

- definition: narrowing of spinal canal <10 mm
- etiology: congenital (idiopathic, osteopetrosis, achondroplasia) or acquired (degenerative, iatrogenic – post spinal surgery, ankylosing spondylosis, Paget's disease, trauma)
- clinical features
  - ± bilateral back and leg pain
  - neurogenic claudication (see Table 16)
  - ± motor weakness
  - normal back flexion; difficulty with back extension
- investigations: CT/MRI reveals narrowing of spinal canal, but gold standard = CT myelogram
- treatment
  - non-operative: vigorous physiotherapy (flexion exercises, stretch/strength exercises), NSAIDs, lumbar epidural steroids
  - operative: decompression surgery if conservative methods failed >6 mo

Table 16. Differentiating Claudication

	Neurogenic	Vascular
<b>Aggravation</b>	With standing or exercise Walking distance variable	Walking set distance
<b>Alleviation</b>	Change in position (usually flexion, sitting, lying down)	Stop walking
<b>Time</b>	Relief in ~10 min	Relief in ~2 min
<b>Character</b>	Neurogenic ± neurological deficit	Muscular cramping

Cauda equina syndrome and ruptured aortic aneurysms are causes of low back pain that are considered surgical emergencies.

#### Red Flags for

##### BACK PAIN

Bowel or bladder dysfunction  
Anesthesia (saddle)  
Constitutional symptoms/malignancy  
Chronic disease  
Paresthesias  
Age > 50  
IV drug use  
Neuromotor deficits

Figure 29. Disc herniation causing nerve root compression

Neurogenic claudication is position dependant. Vascular claudication is exercise dependant.

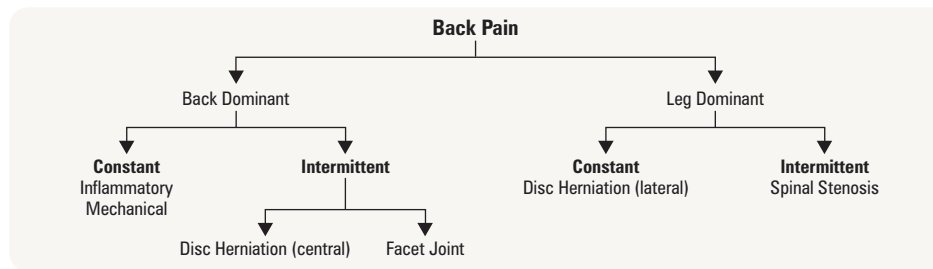

Figure 30. Approach to back pain

### MECHANICAL BACK PAIN

- definition: back pain NOT due to prolapsed disc or any other clearly defined pathology
- clinical features
  - dull backache aggravated by activity
  - morning stiffness
  - no neurological signs
- treatment: symptomatic (analgesics, physiotherapy)
- prognosis: symptoms may resolve in 4-6 wk, others become chronic

### LUMBAR DISC HERNIATION

- definition: tear in annulus fibrosus allows protrusion of nucleus pulposus causing either a central, posterolateral, or lateral disc herniation, most commonly at L5-S1 > L4-5 > L3-4
- etiology: usually a history of flexion-type injury
- clinical features
  - back dominant pain (central herniation) or leg dominant pain (lateral herniation)
  - tenderness between spines at affected level
  - muscle spasm ± loss of normal lumbar lordosis
  - neurological disturbance is segmental and varies with level of central herniation
    - ♦ motor weakness (L4, L5, S1)
    - ♦ diminished reflexes (L4, S1)
    - ♦ diminished sensation (L4, L5, S1)
  - +ve straight leg raise
  - +ve Lasague test
  - bowel or bladder symptoms, decreased rectal tone suggests cauda equina syndrome due to central disc herniation – surgical emergency
- investigations: MRI, consider a post void residual volume to check for urinary retention
- treatment
  - symptomatic
    - ♦ extension protocol (physiotherapy)
    - ♦ NSAIDs
  - 90% resolve in 3 mo. Surgical discectomy reserved for progressive neurological deficit, failure of symptoms to resolve within 3 mo, or cauda equina syndrome due to central disc herniation

### SPONDYLOLYSIS

- definition: defect in the pars interarticularis with no movement of the vertebral bodies
- etiology
  - trauma: gymnasts, weightlifters, backpackers, loggers, labourers
- clinical features: activity-related back pain, pain with unilateral extension (Michelis' test)
- investigations
  - oblique x-ray: "collar" break in the "Scottie dog's" neck
  - bone scan
  - CT scan
- treatment: activity restriction, brace, stretching exercise

### SPONDYLOLISTHESIS

- definition: defect in pars interarticularis causing a forward slip of one vertebra on another usually at L5-S1, less commonly at L4-5
- etiology: congenital (children), degenerative (adults), traumatic, pathological, teratogenic
- clinical features: lower back pain radiating to buttocks

MRI abnormalities (e.g. spinal stenosis, disc herniation) are quite common in both asymptomatic and symptomatic individuals and are not necessarily an indication for intervention without clinical correlation.

#### Sciatica

- Most common symptom of radiculopathy (L4-S3)
- Leg dominant, constant, burning pain
- Pain radiates down leg ± foot
- Most common cause = disc herniation

Figure 31. Spondylolysis, spondylolisthesis

Figure 32. "Scottie dog" fracture

**Table 17. Classification and Treatment of Spondylolisthesis**

Class	Percentage of Slip	Treatment
1	0-25%	Symptomatic operative fusion only for intractable pain
2	25-50	Same as above
3	50-75	Decompression for spondylolisthesis and spinal fusion
4	75-100	Same as above
5	>100	Same as above

**Specific Complications**

- may present as cauda equina syndrome due to roots being stretched over the edge of L5 or sacrum

## Pelvis

### Pelvic Fracture

**Mechanism**

- young: high energy trauma, either direct or by force transmitted longitudinally through the femur
- elderly: fall from standing height, low energy trauma
- lateral compression (most common), vertical shear, or anteroposterior compression fractures

**Clinical Features**

- local swelling, tenderness
- deformity of lower extremity
- pelvic instability

**Investigations**

- x-ray: AP pelvis, inlet and outlet views, Judet views (obturator and iliac oblique for acetabular fracture)
  - 6 cardinal radiographic lines of the acetabulum: ilioischial line, iliopectineal line, tear drop, roof, posterior rim, anterior rim
- CT scan useful for evaluating posterior pelvic injury and acetabular fracture

**Classification****Table 18. Tile Classification of Pelvic Fractures** (see Figure 34)

Type	Stability	Description
<b>A</b>	Rotationally stable Vertically stable	A1: fracture not involving pelvic ring A2: minimally displaced fracture of pelvic ring (e.g. ramus fracture)
<b>B</b>	Rotationally unstable Vertically stable	B1: open book B2: lateral compression – ipsilateral B3: lateral compression – contralateral
<b>C</b>	Rotationally unstable Vertically unstable	C1: unilateral C2: bilateral C3: associated acetabular fracture

**Treatment**

- ABCDEs
- assess genitourinary injury (rectal exam, vaginal exam, hematuria, blood at urethral meatus)
  - if involved, the fracture is considered an open fracture
- stable fractures: non-operative treatment, protected weight bearing
- emergency management
  - IV fluids/blood
  - pelvic binder/sheeting
  - external fixation vs. emergent angiography/embolization
  - $\pm$  laparotomy (if FAST/DPL positive)
- indications for operative treatment
  - unstable pelvic ring injury
  - disruption of anterior and posterior SI ligament
  - symphysis diastasis >2.5 cm
  - vertical instability of the posterior pelvis

**Figure 33. Pelvic columns****Possible Radiological Findings:**

- Pubic rami fractures: superior/inferior
- Pubic symphysis diastasis: common in AP compression (N=5 mm)
- Sacral fractures: common in lateral compression
- SI joint diastasis: common in AP compression (N=1-4 mm)
- Disrupted anterior column (iliopectineal line) or posterior column (ilioischial line)
- "Teardrop" displacement: acetabular fracture
- Iliac, ischial avulsion fractures
- Displacement of the major fragment: superior (VS), open book (APC), bucket handle (LC)

**Type A  
Stable Avulsion Fracture****Type B  
Open Book****Type C  
Unstable Vertical Fracture****Figure 34. Illustration of the Tile classification of pelvic fractures**

**Specific Complications** (see *General Fracture Complications*, OR6)

- **hemorrhage (life-threatening)**
- injury to rectum or urogenital structures
- obstetrical difficulties, sexual and voiding dysfunction
- persistent SI joint pain
- post-traumatic arthritis of the hip with acetabular fractures
- high risk of DVT/PE

## Hip

### Hip Dislocation

- full trauma survey (see [Emergency Medicine, Initial Patient Assessment/Management](#), ER2)
- examine for neurovascular injury PRIOR to open or closed reduction
- reduce hip dislocations ASAP (ideally within 6 h) to decrease risk of AVN of the femoral head
- hip precautions (no extreme hip flexion, adduction, internal or external rotation) for 6 wk post-reduction
- also see *Hip Dislocation after THA*, OR28

**ANTERIOR HIP DISLOCATION**

- mechanism: posteriorly directed blow to knee with hip widely abducted
- clinical features: shortened, abducted, externally rotated limb
- treatment
  - closed reduction under conscious sedation/GA
  - post-reduction CT to assess joint congruity

**POSTERIOR HIP DISLOCATION**

- most frequent type of hip dislocation
- mechanism: severe force to knee with hip flexed and adducted
  - e.g. knee into dashboard in motor vehicle collision (MVC)
- clinical features: shortened, adducted and internally rotated limb
- treatment
  - closed reduction under conscious sedation/GA only if associated femoral neck fracture
  - ORIF if unstable, intra-articular fragments or posterior wall fracture
  - post-reduction CT to assess joint congruity and fractures
  - if reduction is unstable, put in traction x 4-6 wk

**CENTRAL HIP DISLOCATION (rare)**

- traumatic injury where femoral head is pushed medially through acetabulum

**COMPLICATIONS FOR ALL HIP DISLOCATIONS**

- post-traumatic osteoarthritis
- AVN of femoral head
- fracture of femoral head, neck, or shaft
- sciatic nerve palsy in 25% (10% permanent)
- HO
- thromboembolism – DVT/PE

Up to 50% of patients with hip dislocations suffer fractures elsewhere at the time of injury.

**Rochester Method to Reduce Dislocations**

- Patient lying supine with hip and knee flexed on injured side
- Surgeon stands on patient's injured side
- Surgeon passes one arm under patient's flexed knee, reaching to place that hand on patient's other knee (thus supporting patient's injured leg)
- With other hand, surgeon grasps patient's ankle on injured side, applying traction, while assistant stabilizes pelvis
- Reduction via traction, int. rotation, then ext. rotation once femoral head clears acetabular rim

© Janet SM Chan 2009

**Figure 35. Rochester method**

**X-Ray Features of Subcapital Hip Fractures**

- Disruption of Shenton's line (a radiographic line drawn along the upper margin of the obturator foramen, extending along the inferomedial side of the femoral neck)
- Altered neck-shaft angle (normal is 120-130°)

## Hip Fracture

**General Features**

- acute onset of hip pain
- unable to weight-bear
- shortened and externally rotated leg
- painful ROM

Figure 36. Subcapital, intertrochanteric, subtrochanteric fractures

Table 19. Overview of Hip Fractures

Fracture Type	Definition	Mechanism	Special Clinical Features	Investigations	Treatment	Complications
<b>Femoral Neck (Subcapital)</b>	Intracapsular (See <i>Garden Classification</i> , Table 20)	Young: MVC, fall from height Elderly: fall from standing, rotational force	Same as general	X-ray: AP hip, AP pelvis, cross table lateral hip	See Table 20	DVT, non-union, AVN
<b>Intertrochanteric</b> Stable: intact posteromedial cortex Unstable: non-intact posteromedial cortex	Extracapsular fracture including the greater and lesser trochanters and transitional bone between the neck and shaft	Same as femoral neck fracture Direct or indirect force transmitted to the intertrochanteric area	Ecchymosis at back of upper thigh	X-ray: AP pelvis, AP/lateral hip	Closed reduction under fluoroscopy then dynamic hip screw or IM nail	DVT, varus displacement of prox. fragment, malrotation, non-union, failure of fixation device
<b>Subtrochanteric</b>	Fracture begins at or below the lesser trochanter and involves the proximal femoral shaft	Young: high energy trauma Elderly: osteopenic bone + fall, pathological fracture	Ecchymosis at back of upper thigh	X-ray: AP pelvis, AP/lateral hip and femur	Closed/open under fluoroscopy then plate fixation or IM nail	Malalignment, non-union, wound infection

Table 20. Garden Classification of Femoral Neck Fractures

Type	Displacement	Extent	Alignment	Trabeculae	Treatment
I	None	"Incomplete"	Valgus or neutral	Malaligned	Internal fixation to prevent displacement (valgus impacted fracture)
II	None	Complete	Neutral	Aligned	Internal fixation to prevent displacement
III	Some	Complete	Varus	Malaligned	Young: ORIF Elderly: hemi-/total hip arthroplasty
IV	Complete	Complete	Varus	Aligned	Young: ORIF Elderly: hemi-/total hip arthroplasty

Figure 37. Garden classification of femoral neck fractures

**DVT Prophylaxis in Hip Fractures**  
LMWH (i.e. enoxaparin 40 mg SC bid), fondaparinux, low dose heparin on admission, do not give < 12 h before surgery.

**AVN of Femoral Head**

- Distal to proximal blood supply along femoral neck to head (medial and lateral femoral circumflex arteries)
- Susceptible to AVN if blood supply disrupted
- Etiology: femoral neck fracture, chronic systemic steroid use, slipped capital femoral epiphysis, Legg-Calve-Perthes, SLE, RA

## Arthritis of the Hip

### Etiology

- OA, inflammatory arthritis, post-traumatic arthritis, late effects of congenital hip disorders or septic arthritis

### Clinical Features

- pain (groin, medial thigh) and stiffness aggravated by activity
- morning stiffness > 1 h, multiple joint swelling, hand nodules (RA)
- decreased ROM (internal rotation is lost first)
- crepitus
- ± fixed flexion contracture leading to apparent limb shortening (Thomas test)
- ± Trendelenberg sign

**Investigations**

- x-ray
  - OA: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes
  - RA: osteopenia, erosion, joint space narrowing, subchondral cysts, symmetric joint space narrowing
- bloodwork: ANA, RF

**Treatment**

- non-operative: weight reduction, activity modification, physiotherapy, analgesics, walking aids
- operative: realign = osteotomy; replace = arthroplasty; fuse = arthrodesis
- complications with arthroplasty: component loosening, dislocation, HO, thromboembolism, infection, neurovascular injury, limb length discrepancy
- arthroplasty is standard of care in most patients with hip arthritis

**DVT Prophylaxis in Elective THA**  
(continue 10-35 d post-op)  
Fondaparinux, low molecular weight heparin, or coumadin.

## Hip Dislocation after Total Hip Arthroplasty

**Etiology**

- THA that is unstable when hip is flexed, adducted and internally rotated or extended and externally rotated (avoid flexing hip  $>90^\circ$  or crossing legs for approximately 6 wk after surgery)

**Epidemiology**

- occurs in 1-4% of primary THA and 10-16% of revision THAs
- risk factors: neurological impairment, post-traumatic arthritis, revision surgery, substance abuse

**Treatment**

- external abduction splint to prevent hip adduction
- constrained acetabular component for recurrent dislocation if no issue with position of acetabular/femoral implants + knee immobilizer

**Complications**

- sciatic nerve palsy in 25% (10% permanent)
- HO

## Femur

## Femoral Diaphysis Fracture

**Mechanism**

- high energy trauma (MVC, fall from height, gunshot wound)
- in children, can result from low energy trauma (spiral fracture)

**Clinical Features**

- shortened, externally rotated leg (if fracture displaced)
- inability to weight-bear
- often open injury, always a Gustilo III (see Table 4)

**Investigations**

- AP pelvis, AP/lateral hip, femur, knee

**Complications**

- hemorrhage requiring transfusion
- fat embolism leading to ARDS
- extensive soft tissue damage
- ipsilateral hip dislocation/fracture
- nerve injury

**Treatment**

- stabilize patient
- immobilize leg
- ORIF with antegrade or retrograde IM nail, external fixator for unstable patients, open fractures, or highly vascular areas, or plate and screws for open growth plates within 24 h
- early mobilization and strengthening

## Distal Femoral Fracture

### Mechanism

- direct high energy force or axial loading
- three types (Figure 38) in addition to classification as intra-articular or extra-articular

### Clinical Features

- extreme pain
- knee effusion (hemarthrosis)
- shortened, externally rotated leg if displaced

### Treatment

- ORIF if displaced or intra-articular; may choose to manage nonoperatively if nondisplaced or incomplete fracture
- early mobilization and strengthening

### Complications (see *General Fracture Complications*, OR6)

- femoral artery tear
- nerve injury
- extensive soft tissue injury
- angulation deformities

Figure 38. Distal femoral fractures

Figure 39. Diagram of the right tibial plateau

Figure 40. Knee ligament and anatomy

### 6 Degrees of Freedom of the Knee

- Flex. and ext.
- Ext. and int. rotation
- Varus and valgus angulation
- Ant. and post. glide
- Med. and lat. shift
- Compression and distraction

On physical exam of the knee, do not forget to evaluate the hip!

## Knee

### Evaluation of Knee

#### Common Complaints

- general orthopedic history
- also inquire about common knee symptoms
  - locking: mechanical block to extension
    - ♦ torn meniscus/loose body in joint
  - pseudo-locking: limited ROM without mechanical block
    - ♦ effusion, muscle spasm after injury, arthritis
  - painful clicking (audible)
    - ♦ torn meniscus
  - giving way: instability
    - ♦ cruciate ligament or meniscal tear, patellar dislocation

#### Special Tests of the Knee

- **anterior and posterior drawer tests** (see Figure 41)
  - demonstrate ACL and PCL, respectively
    - ♦ knee flexed at 90°, foot immobilized, hamstrings released
    - ♦ if able to sublux tibia anteriorly (anterior drawer test), then ACL may be torn
    - ♦ if able to sublux tibia posteriorly (posterior drawer test), then PCL may be torn
    - ♦ anterior drawer test for ACL: 3.8 positive likelihood ratio, 0.30 negative likelihood ratio
- **Lachmann test**
  - demonstrates torn ACL
  - hold knee in 10–20° flexion, stabilizing the femur
  - try to sublux tibia anteriorly on femur
  - similar to anterior drawer test, more reliable due to less muscular stabilization
  - for ACL: 25.0 positive likelihood ratio, 0.1 negative likelihood ratio
- **Thessaly test**
  - demonstrates meniscal tear
  - patient stands flat footed on one leg while the examiner provides his or her hands for balance. The patient then flexes the knee to 20° and rotates the femur on the tibia medially and laterally three times while maintaining the 20° flexion
  - positive for a meniscal tear if the patient experiences medial or lateral joint line discomfort.
  - for medial meniscus: 29.67 positive likelihood ratio, 0.11 negative likelihood ratio
  - for lateral meniscus: 23.0 positive likelihood ratio, 0.083 negative likelihood ratio
- **posterior sag sign**
  - demonstrates torn PCL
  - may give a false positive anterior draw sign
  - flex knees and hips to 90°, hold ankles and knees
  - view from the lateral aspect
  - if one tibia sags posteriorly compared to the other, its PCL is torn

- **pivot shift sign**
  - demonstrates torn ACL
  - start with the knee in extension
  - internally rotate foot, slowly flex knee while palpating and applying a valgus force
  - normal knee will flex smoothly
  - if incompetent ACL, tibia will sublux anteriorly on femur at start of maneuver. During flexion, the tibia will reduce and externally rotate about the femur (the "pivot")
  - reverse pivot shift (start in flexion, externally rotate, apply valgus and extend knee) suggests torn PCL
  - composite assessment for ACL: 25.0 positive likelihood ratio, 0.04 negative likelihood ratio
  - composite assessment for PCL: 21.0 positive likelihood ratio, 0.05 negative likelihood ratio
- **collateral ligament stress test**
  - palpate ligament for "opening" of joint space while testing
  - with knee in full extension, apply valgus force to test MCL, apply varus force to test LCL
  - repeat tests with knee in 20° flexion to relax joint capsule
  - opening only in 20° flexion due to MCL damage only
  - opening in 20° of flexion and full extension is due to MCL, cruciate, and joint capsule damage
- **tests for meniscal tear**
  - joint line tenderness
    - ♦ joint line pain when palpated
    - ♦ palpate one side at a time and watch patient's eyes
    - ♦ for meniscal tear: 0.9 positive likelihood ratio, 1.1 negative likelihood ratio
  - crouch compression test
    - ♦ joint line pain when squatting (anterior pain suggests patellofemoral pathology)
  - McMurray's test useful collaborative information (see Figure 42)
    - ♦ with knee in flexion, palpate joint line for painful "pop/click"
    - ♦ internally rotate foot, varus stress, and extend knee to test lateral meniscus
    - ♦ externally rotate foot, valgus stress, and extend knee to test medial meniscus
    - ♦ for meniscal tear: 1.3 positive likelihood ratio, 0.8 negative likelihood ratio
  - composite assessment for meniscal tears: 2.7 positive likelihood ratio, 0.4 negative likelihood ratio

## X-Rays

- AP standing, lateral
- skyline: tangential view with knees flexed at 45° to see patellofemoral joint
- 3-foot standing view: useful in evaluating leg length and varus/valgus alignment
- Ottawa Knee Rules (see [Emergency Medicine](#), ER17)

Figure 41. Anterior and posterior drawer test

Figure 42. McMurray test

## Cruciate Ligament Tears

- ACL tear much more common than PCL tear

Table 21. Comparison of ACL and PCL Injuries

	Anterior Cruciate Ligament	Posterior Cruciate Ligament
<b>Anatomy</b>	From medial wall of lateral femoral condyle to the anteromedial and posterolateral intercondyloid eminence of the tibial plateau	Lateral wall of medial femoral condyle to posterior intercondyloid eminence of the tibial plateau
<b>Mechanism</b>	Sudden deceleration Hyperextension and internal rotation of tibia on femur (i.e. "plant and turn")	Sudden posterior displacement of tibia when knee is flexed or hyperextended (e.g. dashboard MVC injury)
<b>History</b>	Audible "pop" Immediate swelling Knee "giving way" Inability to continue activity	Audible "pop" Immediate swelling Pain with push off Cannot descend stairs
<b>Physical</b>	Effusion (hemarthrosis) Posterolateral joint line tenderness Positive anterior drawer Positive Lachmann Pivot shift Test for MCL, meniscal injuries	Effusion (hemarthrosis) Anteromedial joint line tenderness Positive posterior drawer Reverse pivot shift Other ligamentous, bony injuries
<b>Treatment</b>	Stable knee with minimal functional impairment: immobilization 2-4 wk with early ROM and strengthening High demand lifestyle: ligament reconstruction	Unstable knee or young person/high-demand lifestyle: ligament reconstruction Posterior sag

### Knee History

**CLIPS**  
Clicking  
Locking  
Instability  
Pain (location)  
Swelling

Physical examination difficult in acute knee injuries. Immobilize leg and re-examine in one week.

Figure 43. T1 MRI of torn ACL and PCL

## Collateral Ligament Tears

### Mechanism

- valgus force to knee = MCL tear
- varus force to knee = LCL tear

### Clinical Features

- swelling/effusion
- tenderness above and below joint line medially (MCL) or laterally (LCL)
- joint laxity with varus or valgus force to knee
  - laxity with endpoint suggests partial tear
  - laxity with no endpoint suggests a complete tear
- test for other injuries (e.g. O'Donoghue's unhappy triad), common peroneal nerve injury

### Treatment

- partial tear: immobilization x 2-4 wk with early ROM and strengthening
- complete tear: immobilization at 30° flexion
- multiple ligamentous injuries: surgical repair of ligaments

Partial ligamentous tears are much more painful than complete ligamentous tears.

### O'Donoghue's Unhappy Triad

- ACL rupture
- MCL rupture
- Meniscal damage (medial and/or lateral)

### Tissue Sources for ACL Reconstruction

- Hamstring
- Middle 1/3 patellar tendon (bone-patellar-bone)
- Allograft (e.g. cadaver)

ACL tear more common than PCL tear  
MCL tear more common than LCL tear

## Meniscal Tears

- medial tear much more common than lateral tear

### Mechanism

- twisting force on knee when it is partially flexed (e.g. stepping down and turning)
- requires moderate trauma in young person but only mild trauma in elderly due to degeneration

### Clinical Features

- immediate pain, difficulty weight-bearing, instability and clicking
- increased pain with squatting and/or twisting
- effusion (hemarthrosis) with insidious onset (24-48 h after injury)
- joint line tenderness medially or laterally
- locking of knee (if portion of meniscus mechanically obstructing extension)

### Investigations

- MRI, arthroscopy

### Treatment

- if not locked: ROM and strengthening (NSAIDs)
- if locked or failed above: arthroscopic repair/partial meniscectomy

## Quadriceps/Patellar Tendon Rupture

### Mechanism

- sudden forceful contraction of quadriceps during an attempt to stop
- more common in obese patients and those with pre-existing degenerative changes in tendon
  - DM, SLE, RA, steroid use, renal failure on dialysis

### Clinical Features

- inability to extend knee or weight-bear
- possible audible "pop"
- patella in lower or higher position with palpable gap above or below patella respectively
- may have an effusion

### Investigations

- ask patient to straight leg raise
- knee x-ray to rule out patellar fracture
- lateral view: patella alta with patella tendon rupture, patella baja (infera) with quadriceps tendon rupture

### Treatment

- nonoperative treatment for incomplete tears with preserved extension of knee
- surgical repair of tendon indicated for complete ruptures
- early surgical repair: better outcomes compared with delayed repair (>6 wk post injury)
- delayed repair complicated by quadriceps contracture, patella migration, and adhesions

Patella alta = high riding patella  
Patella baja (infera) = low riding patella

## Dislocated Knee

### Mechanism

- high energy trauma
- by definition, caused by tears of multiple ligaments

### Clinical Features

- classified by relation of tibia with respect to femur
  - anterior, posterior, lateral, medial, rotary
- knee instability
- effusion
- pain
- ischemic limb

### Investigations

- x-rays: AP, lateral, skyline
  - associated radiographic findings include tibial plateau fracture dislocations, proximal fibular fractures, and avulsion of fibular head
- ankle brachial index (abnormal if  $<0.9$ )
- arteriogram if abnormal vascular exam (such as abnormal pedal pulses)

### Treatment

- urgent closed reduction
  - complicated by interposed soft tissue
- assessment of peroneal nerve, tibial artery, and ligamentous injuries
- repair of associated injuries; also may need decompressive fasciotomy especially if vascular repair undertaken
- knee immobilization x 6-8 wk

### Specific Complications

- high incidence of associated injuries
  - popliteal artery tear
  - peroneal nerve injury
  - capsular tear
- chronic: instability, stiffness, post-traumatic arthritis

## Patella

### Patellar Fracture

#### Mechanism

- direct blow to the patella: fall, MVC (dashboard)
- indirect trauma by sudden flexion of knee against contracted quadriceps

#### Clinical Features

- marked tenderness
- inability to extend knee or straight leg raise
- proximal displacement of patella
- patellar deformity
- $\pm$  effusion/hemarthrosis

#### Investigations

- x-rays: AP, lateral, skyline
- consider bipartite patella: congenitally unfused ossification centres with smooth margins on x-ray

#### Treatment

- goal: restore extensor mechanism with maximal articular congruency
- non-displaced (step-off  $<2-3$  mm and fracture gap  $<1-4$  mm)
  - straight leg immobilization 1-4 wk with hinged knee brace
  - physiotherapy: quadriceps strengthening when pain has subsided
- displaced: ORIF ( $>2$  mm)
- comminuted: ORIF; may require partial/complete patellectomy
- disrupted extensor mechanism: ORIF

Figure 44. Types of patellar fractures

#### Complications

- Symptomatic wiring
- Hardware failure
- Knee stiffness
- Nonunion
- Infection

## Patellar Dislocation

### Mechanism

- lateral displacement of patella after contraction of quadriceps against a flexed knee

### Risk Factors

- young, female
- obesity
- high-riding patella (patella alta)
- knock-knees (genu valgus)
- Q-angle (quadriceps angle)  $\geq 20^\circ$  (see Figure 45)
- shallow intercondylar groove
- weak vastus medialis
- tight lateral retinaculum

### Clinical Features

- knee catches or gives way with walking
- severe pain, tenderness anteromedially from rupture of capsule
- weak knee extension or inability to extend leg unless patella reduced
- +ve patellar apprehension test
  - patient apprehensive when examiner laterally displaces patella
- often recurrent, self-reducing
- concomitant MCL injury

### Investigations

- x-rays: AP, lateral, skyline view of patella
  - check for fracture of medial patella and lateral femoral condyle

### Treatment

- non-operative first
  - knee immobilization x 4-6 wk
  - progressive weight bearing and isometric quadriceps strengthening
- if recurrent
  - surgical tightening of medial capsule and release of lateral retinaculum, possible tibial tuberosity transfer, or proximal tibial osteotomy

### Patellar Open Reduction and Internal Fixation

- Longitudinal midline excision over patella
- Tension-band wiring fixation
- Preserve patellar bone
- Antibiotic, debridement, early fixation in open fracture

**Figure 45. Q-angle**

The angle between a vertical line through the patella and tibial tuberosity and a line from the ASIS to the patella. The larger the angle the greater the amount of lateral force on the knee (normal  $< 20^\circ$ ).

## Patellofemoral Syndrome (Chondromalacia Patellae)

### Mechanism

- softening, erosion and fragmentation of articular cartilage, predominantly medial aspect of patella
- commonly seen in active young females

### Predisposing Factors

- malalignment causing patellar maltracking (Q angle  $\geq 20^\circ$ , genu valgus)
- post-trauma
- deformity of patella or femoral groove
- recurrent patellar dislocation, ligamentous laxity
- excessive knee strain (athletes)

### Clinical Features

- deep, aching anterior knee pain
  - exacerbated by prolonged sitting (theatre sign), strenuous athletic activities, stair climbing, squatting
- sensation of instability, pseudolocking
- pain with extension against resistance through terminal  $30-40^\circ$
- swelling rare, minimal if present

### Investigations

- x-rays: AP, lateral, skyline

### Treatment

- non-operative
  - continue non-impact activities
  - NSAIDs
  - physiotherapy: quadriceps strengthening
- surgical with refractory patients
  - tibial tubercle elevation
  - arthroscopic shaving/debridement
  - lateral release of retinaculum

Pain with firm compression of patella into medial femoral groove is pathognomonic of patellofemoral syndrome.

# Tibia

## Tibial Plateau Fracture

### Mechanism

- axial loading (e.g. fall from height)
- femoral condyles driven into proximal tibia
- can result from minor trauma in osteoporotics

### Clinical Features

- lateral fractures more common than medial
- medial fractures require higher energy – often have concomitant vascular injuries
- knee effusion
- inability to bear weight
- swelling

### Classification

- Schatzker classification (see sidebar)

### Investigations

- x-rays: AP, lateral
- CT: pre-operative planning

### Treatment

Approach #1 (based on amount of depression seen on x-ray)	If depression on x-ray is <3 mm: Straight leg immobilization x 4-6 wk with progressive ROM weight bearing If depression is >3 mm: ORIF often requiring bone grafting to elevate depressed fragment
Approach #2 (based on varus/valgus instability)	If minimal varus/valgus instability (<15°): Straight leg immobilization x 4-6 wk with progressive ROM weight bearing If significant varus/valgus instability (>15°): ORIF often requiring bone grafting to elevate depressed fragment

### Specific Complications (see General Fracture Complications, OR6)

- ligamentous injuries
- meniscal lesions
- AVN
- infection
- osteoarthritis

#### Schatzker Classification

Type	Description
I	Involvement of lateral plateau split fracture
II	Involvement of lateral plateau: split depression fracture
III	Involvement of lateral plateau: pure depression fracture
IV	Medial plateau fracture
V	Bicondylar plateau fracture
VI	Bicondylar with metaphyseal/diaphyseal involvement

## Tibial Shaft Fracture

### Mechanism

- numerous, including MVC, falls, sporting injuries

### Clinical Features

- open vs. closed
- amount of displacement
- neurovascular status
- most commonly fractured long bone
- most common open fracture

### Investigations

- x-rays: AP, lateral, skyline

### Treatment

- closed
  - minimally displaced: straight leg cast x 4-6 wk with early weight bearing
  - displaced: ORIF with reamed IM nail, plate and screws, or external fixator
- open
  - external fixation or IM nail
  - vascularized coverage of soft tissue defects (often heal poorly)

### Specific Complications (see General Fracture Complications, OR6)

- high incidence of neurovascular injury and compartment syndrome
- poor soft tissue coverage

Tibial shaft fractures have high incidence of compartment syndrome and are often associated with soft tissue injuries.

**Figure 46. Tibial shaft fracture treated with intramedullary nail and screws**

# Ankle

## Evaluation of Ankle and Foot Complaints

### Special Tests

- anterior drawer: examiner attempts to displace the foot anteriorly against a fixed tibia
- talar tilt: foot is stressed in inversion and angle of talar rotation is evaluated by x-ray

### X-Ray

- AP, lateral
- mortise view: ankle at 15° of internal rotation
  - gives true view of ankle joint
  - joint space should be symmetric with no talar tilt
- Ottawa Ankle Rules should guide use of x-ray (see sidebar); nearly 100% sensitivity
- ± CT to better characterize fractures

#### Ottawa Ankle Rules (see [Emergency Medicine, ER17](#))

X-rays are only required if:  
Pain in the malleolar zone AND bony tenderness over the posterior aspect of the medial or lateral malleolus OR inability to weight bear both immediately after injury and in the ER.

## Ankle Fracture

### Mechanism

- pattern of fracture depends on the position of the ankle when trauma occurs
- generally involves
  - ipsilateral ligamentous tears or transverse bony avulsion
  - contralateral shear fractures (oblique or spiral)
- classification systems
  - Danis-Weber (see below)
  - Lauge-Hansen: based on foot's position and motion relative to leg

### Danis-Weber Classification (Figure 47)

- based on level of fibular fracture relative to syndesmosis
- **Type A** (infra-syndesmotic)
  - pure inversion injury
  - avulsion of lateral malleolus below plafond or torn calcaneofibular ligament
  - ± shear fracture of medial malleolus
- **Type B** (trans-syndesmotic)
  - external rotation and eversion (most common)
  - ± avulsion of medial malleolus or rupture of deltoid ligament
  - spiral fracture of lateral malleolus starting at plafond
- **Type C** (supra-syndesmotic)
  - pure external rotation
  - avulsion of medial malleolus or torn deltoid ligament
  - ± posterior malleolus avulsion with posterior tibio-fibular ligament
  - fibular fracture is above plafond (called Maisonneuve fracture if at proximal fibula)
  - frequently tears syndesmosis

### Treatment

- undisplaced: non-weight bearing below knee cast
- indications for ORIF
  - any fracture-dislocation: restore vascularity, minimize articular injury, reduce pain and skin pressure
  - most of type B, and all of type C
  - trimalleolar (medial, posterior, lateral) fractures
  - talar tilt >10°
  - medial clear space on x-ray greater than superior clear space
  - open fracture/open joint injury
- high incidence of post-traumatic arthritis
- wrinkle test: skin shows wrinkles, to determine if soft tissue swelling has resolved to an extent to reduce complications

## Ligamentous Injuries

- see Figure 48 for ankle ligaments

### Medial Ligament Complex (deltoid ligament)

- eversion injury
- usually avulses medial or posterior malleolus and strains syndesmosis

Figure 47. Ring principle of the ankle and Danis-Weber classification

**Lateral Ligament Complex (Anterior Talofibular, Calcaneofibular, Posterior Talofibular)**

- inversion injury
- ATF most commonly and severely injured if ankle is plantar flexed
- swelling and tenderness anterior to lateral malleolus
- ++ ecchymoses
- +ve ankle anterior drawer
- may have significant medial talar tilt on inversion stress x-ray

**Treatment**

- microscopic tear (Grade I)
  - rest, ice, compression, elevation (RICE)
- macroscopic tear (Grade II)
  - strap ankle in dorsiflexion and eversion x 4-6 wk
  - physiotherapy: strengthening and proprioceptive retraining
- complete tear (Grade III)
  - below knee walking cast x 4-6 wk
  - physiotherapy: strengthening and proprioceptive retraining
  - surgical intervention may be required if chronic symptomatic instability develops

**Figure 48. Ankle ligament complexes**

With a history of trauma from axial loading of lower limb always consider spinal injuries, femoral neck, tibial plateau, and talar/calcaneal fractures.

**Calcaneal Fracture Treatment Principles**

- Avoid wound complications
- Restore articular congruity
- Restore normal calcaneal width and height
- Maximum functional recovery may take longer than 12 mo

## Foot

### Talar Fracture

**Mechanism**

- axial loading or hyperdorsiflexion (MVC, fall from height)
- 60% of talus covered by articular cartilage
- tenuous blood supply runs distal to proximal along talar neck
  - high risk of AVN with displaced fractures

**Investigations**

- x-rays: AP, lateral
- CT to better characterize fracture
- MRI can clearly define extent of AVN

**Treatment**

- undisplaced: non-weight bearing below knee cast x 20-24 wk
- displaced: ORIF (high rate of nonunion, AVN)

### Calcaneal Fracture

**Mechanism**

- axial loading: fall from height onto heels
- 10% of fractures associated with compression fractures of thoracic or lumbar spine
- 5% are bilateral

**Physical Examination**

- swelling, bruising on heel/sole
- wider, shortened, flatter heel when viewed from behind
- varus heel

**Investigations**

- x-rays: AP, lateral, oblique (Broden's view)
- loss of Bohler's angle
- CT: assess intra-articular extension

**Treatment**

- closed vs. open reduction is controversial
- non-weight bearing cast x 3 mo with early ROM and strengthening

### Achilles Tendonitis

**Mechanism**

- chronic inflammation from activity or poor-fitting footwear
- may also develop heel bumps (retrocalcaneobursitis)

### Physical Examination

- pain, stiffness and crepitus with ROM
- thickened tendon, palpable bump

### Treatment

- rest, NSAIDs
- gentle stretching, deep tissue calf massage
- orthotics, open back shoes
- shockwave therapy in chronic tendonitis
- DO NOT inject steroids (risk of tendon rupture)

## Achilles Tendon Rupture

### Mechanism

- loading activity, stop-and-go sports (e.g. squash, tennis, basketball)
- secondary to chronic tendonitis, steroid injection

### Clinical Features

- audible pop, sudden pain with push off movement
- sensation of being kicked in heel when trying to plantar flex
- palpable gap
- apprehensive toe off when walking
- weak plantar flexion strength
- Thompson test: with patient prone, squeezing the calf muscles should passively plantar flex the foot to demonstrate intact Achilles tendon
  - +ve test = no passive plantar flexion = ruptured tendon

### Treatment

- low demand or elderly: cast foot in plantar flexion (to relax tendon) x 8-12 wk
- high demand: surgical repair, then cast as above x 6-8 wk

#### Complications of Achilles Tendon Rupture

- Infection
- Sural nerve injury
- Rerupture: surgical repair decreases likelihood of rerupture compared to nonoperative management

The most common site of Achilles tendon rupture is 2-6 cm from its insertion where the blood supply is the poorest.

## Plantar Fasciitis (Heel Spur Syndrome)

### Mechanism

- repetitive strain injury causing microtears and inflammation of plantar fascia
- female:male = 2:1
- common in athletes (especially runners)
- also associated with obesity, DM, seronegative and seropositive arthritis

### Clinical Features

- morning pain and stiffness
- intense pain when walking from rest that subsides as patient continues to walk
- swelling, tenderness over sole
- greatest at medial calcaneal tubercle and 1-2 cm distal along plantar fascia
- pain with toe dorsiflexion (stretches fascia)

### Investigations

- plain radiographs to rule out fractures
- often see bony exostoses (heel spurs) at insertion of fascia into medial calcaneal tubercle (see Figure 49)
- spur is secondary to inflammation, not the cause of pain

### Treatment

- rest, ice, NSAIDs, steroid injection
- physiotherapy: stretching, ultrasound, extracorporeal shockwave therapy
- orthotics with heel cup
  - to counteract pronation and disperse heel strike forces
- endoscopic surgical release of fascia in refractory cases
  - spur removal is not required

Figure 49. X-ray of bony heel spur

## Bunions (Hallux Valgus)

### Mechanism

- valgus alignment on 1st MTP (hallux valgus) causes eccentric pull of extensor and intrinsic muscles
- reactive exostosis forms with thickening of the skin creating a bunion
- most often associated with poor-fitting footwear but can be hereditary
- 10x more frequent in women

### Clinical Features

- painful bursa over medial eminence of 1st metatarsal head
- pronation (rotation inward) of great toe
- numbness over medial aspect of great toe

### Investigations

- x-ray: standing AP/lateral/sesamoid view, non-weight bearing oblique

### Treatment

- indications: painful corn or bunion, overriding 2nd toe
- non-operative first
  - properly fitted shoes (low heel) and toe spacer
- surgical: goal is to restore normal anatomy
  - osteotomy with realignment of 1st MTP joint (Chevron Procedure)
  - arthrodesis

Figure 50. Hallux valgus

## Metatarsal Fracture

- as with the hand, 1st, 4th, 5th MT are relatively mobile, while the 2nd and 3rd are fixed (Table 22)
- use Ottawa Foot Rules to determine need for x-ray (see sidebar)

Table 22. Types of Metatarsal Fractures

Fracture Type	Mechanism	Clinical	Treatment
Avulsion of base of 5th MT	Sudden inversion followed by contraction of peroneus brevis	Tender base of 5th MT	Requires ORIF if displaced
Midshaft 5th MT (Jones fracture)	Stress injury	Painful shaft of 5th MT	*NWB BK cast x 6 wk ORIF if athlete
Shaft 2nd, 3rd MT (March fracture)	Stress injury	Painful shaft of 2nd or 3rd MT	Symptomatic
1st MT	Trauma	Painful 1st MT	ORIF if displaced otherwise NWB BK cast x 3 wk then walking cast x 2 wk
Tarso-MT fracture – dislocation (Lisfranc fracture)	Fall onto plantar flexed foot or direct crush injury	Shortened forefoot prominent base	ORIF

\*NWB BK = Non weight bearing, below knee

**Ottawa Ankle and Foot Rules**  
(see [Emergency Medicine, ER17](#))  
X-rays only required if:  
Pain in the midfoot zone AND bony tenderness over the navicular or base of the fifth metatarsal OR inability to weight bear both immediately after injury and in the ER.

## Pediatric Orthopedics

### Fractures in Children

- type of fracture
  - thicker, more active periosteum results in pediatric specific fractures: greenstick, torus (buckle) and plastic (bowing)
  - adults fracture through both cortices
- epiphyseal growth plate
  - weaker part of bone, susceptible to fractures
  - plate often mistaken for fracture on x-ray and vice versa (x-ray opposite limb for comparison), especially in elbow (see sidebar)
  - tensile strength of bone < ligaments in children, therefore clinician must be confident that fracture and/or growth plate injury have been ruled out before diagnosing a sprain
  - intra-articular fractures have worse consequences in children because they usually involve the growth plate
- anatomic reduction
  - gold standard with adults
  - may cause limb length discrepancy in children (overgrowth)
  - accept greater angular deformity in children (remodeling minimizes deformity)
- time to heal
  - shorter in children
- always be aware of the possibility of child abuse
  - make sure stated mechanism compatible with injury
  - high index of suspicion with fractures in non-ambulating children (<1 yr); look for other signs, including x-ray evidence of healing fractures at different sites and different stages of healing

Greenstick fractures are easy to reduce but can redisplace while in cast due to intact periosteum.

Figure 51. Greenstick (left) and torus (right) fractures

## Stress Fractures

### Mechanism

- insufficiency fracture
  - stress applied to a weak or structurally deficient bone
- fatigue fracture
  - repetitive, excessive force applied to normal bone
- most common in adolescent athletes
- tibia is most common site

### Diagnosis and Treatment

- localized pain and tenderness over the involved bone
- plain films may not show fracture for 2 wk
- bone scan +ve in 12-15 d
- treatment is rest from strenuous activities to allow remodeling (can take several months)

## Evaluation of the Limping Child

- see [Pediatrics](#), P96

## Epiphyseal Injury

**Table 23. Salter-Harris Classification of Epiphyseal Injury**

SALT(E)R-Harris Type	Description	Treatment
I (Straight through; Stable)	Transverse through growth plate	Closed reduction and cast immobilization (except SCFE – ORIF); heals well, 95% do not affect growth
II (Above)	Through metaphysis and along growth plate	Closed reduction and cast if anatomic; otherwise ORIF
III (Low)*	Through epiphysis to plate and along growth plate	Anatomic reduction by ORIF to prevent growth arrest, avoid fixation across growth plate
IV (Through and through)*	Through epiphysis and metaphysis	Closed reduction and cast if anatomic; otherwise ORIF
V (Ram)*	Crush injury of growth plate	High incidence of growth arrest; no specific treatment

\* Types III – IV are more likely to cause growth arrest and progressive deformity

## Slipped Capital Femoral Epiphysis (SCFE)

- type I Salter-Harris epiphyseal injury at proximal hip
- most common adolescent hip disorder, peak incidence at pubertal growth spurt
- risk factors: male, obese, hypothyroid

### Etiology

- multifactorial
  - genetic: autosomal dominant, blacks > caucasians
  - cartilaginous physis thickens rapidly under growth hormone effects
  - sex hormone secretion, which stabilizes physis, has not yet begun
  - overweight: mechanical stress
  - trauma: causes acute slip

### Clinical Features

- acute: sudden, severe pain with limp
- chronic: limp with medial knee or anterior thigh pain
  - +ve Trendelenburg sign on affected side, due to weakened gluteal muscles
- tender over joint capsule
- restricted internal rotation, abduction, flexion
  - Whitman's sign: with flexion there is an oblique external rotation of the hip
- pain at extremes of ROM

### Investigations

- x-rays: AP, frog-leg, lateral radiographs
  - posterior and medial slip
  - disruption of Klein's line (see sidebar)
  - AP view may be normal or show slightly widened growth plate compared with opposite side

### Ossification Centres of the Elbow

#### CRITOE

Capitellum: 1 yr

Radial head: 4 yr

Internal (medial) epicondyle: 6 yr

Trochlea: 8 yr

Olecranon: 10 yr

External (lateral) epicondyle: 12 yr  
(± 1 yr)

#### Type I

#### Type II

#### Type III

#### Type IV

#### Type V

© Kimberly Chin

**Figure 52. Salter-Harris classification**

In slipped capital femoral epiphysis, bilateral involvement occurs in about 25%.

### SCFE – Klein's Line

On AP view, line drawn along supero-lateral border of femoral neck should cross at least a portion of the femoral epiphysis. If it doesn't, suspect SCFE.

### Treatment and Complications

- mild/moderate slip: stabilize physis with pins in current position
- severe slip: ORIF or pin physis without reduction and osteotomy after epiphyseal fusion
- complications: AVN (most common), chondrolysis (loss of articular cartilage, resulting in narrowing of joint space), pin penetration, premature OA, loss of ROM

## Developmental Dysplasia of the Hip

- formerly called congenital dysplasia of the hip
- due to ligamentous laxity, muscular underdevelopment, and abnormal shallow slope of acetabular roof
- spectrum of conditions that lead to hip subluxation and dislocation
  - dislocated femoral head completely out of acetabulum
  - dislocatable head in socket
  - head subluxates out of joint when provoked
  - dysplastic acetabulum, more shallow and more vertical than normal
- painless (if painful suspect septic dislocation)

### Physical Examination

- diagnosis is clinical
  - limited abduction of the flexed hip (<50-60°)
  - affected leg shortening results in asymmetry in skin folds and gluteal muscles, wide perineum
  - Barlow's test (for dislocatable hip)
    - ♦ flex hips and knees to 90° and grasp thigh
    - ♦ fully adduct hips, push posteriorly to try to dislocate hips
  - Ortolani's test (for dislocated hip)
    - ♦ initial position as above but try to reduce hip with fingertips during abduction
    - ♦ positive test: palpable clunk is felt (not heard) if hip is reduced
  - Galeazzi's sign
    - ♦ knees at unequal heights when hips and knees flexed
    - ♦ dislocated hip on side of lower knee
    - ♦ difficult test if child <1 yr
    - ♦ Trendelenburg test and gait useful if older (>2 yr)

### Investigations

- U/S in first few months to view cartilage (bone is not calcified in newborns)
- follow up radiograph after 3 mo
- x-ray signs: false acetabulum, acetabular index >30°, broken Shenton's line, femoral neck above Hilgenreiner's line, ossification centre outside of inner lower quadrant (quadrants formed by intersection of Hilgenreiner's and Perkin's line)

### Treatment and Complications

- 0-6 mo: reduce hip using Pavlik harness to maintain abduction and flexion
- 6-18 mo: reduction under GA, hip spica cast x 2-3 mo (if Pavlik harness fails)
- >18 mo: open reduction; pelvic and/or femoral osteotomy
- complications
  - redislocation, inadequate reduction, stiffness
  - AVN of femoral head

**Figure 53. Barlow's test** (checks if hips are dislocatable) **and Ortolani's test** (checks if hips are dislocated)

#### 5 Fs that Predispose to Developmental Dysplasia of the Hip

Family history  
Female  
Frank breech  
First born  
LeFt hip

Children diagnosed with coxa plana  
<6 yr of age have improved prognosis.

## Legg-Calvé-Perthes Disease (Coxa Plana)

- self-limited AVN of femoral head, presents at 4-10 yr of age
- etiology unknown, 20% bilateral, males > females, 1/10,000
- associations
  - family history
  - low birth weight
  - abnormal pregnancy/delivery
  - history of trauma to affected hip
- key features
  - AVN of proximal femoral epiphysis, abnormal growth of the physis, and eventual remodelling of regenerated bone

### Clinical Features

- child with hip pain and limp
- tender over anterior thigh
- flexion contracture: decreased internal rotation and abduction of hip

## Investigations

- x-rays
  - may be negative early (if high index of suspicion, move to bone scan or MRI)
  - eventually, characteristic collapse of femoral head (diagnostic)

## Treatment

- goal is to preserve ROM and preserve femoral head in acetabulum
- physiotherapy: ROM exercises
- brace in flexion and abduction x 2-3 yr
- femoral or pelvic osteotomy
  - prognosis better in males, <5 yr old, <50% of femoral head involved, abduction >30°
- 50% of involved hips do well with non-operative treatment
- complicated by early onset osteoarthritis and decreased ROM

## Osgood-Schlatter Disease

### Mechanism

- repetitive tensile stress on insertion of patellar tendon over the tibial tuberosity causes minor avulsion at the site and subsequent inflammatory reaction (tibial tubercle apophysitis)

### Clinical Features

- tender lump over tibial tuberosity
- pain on resisted leg extension
- anterior knee pain exacerbated by jumping or kneeling, relieved by rest

### Investigations

- x-rays: fragmentation of the tibial tubercle, ± ossicles in patellar tendon

### Treatment

- benign, self-limited condition
- may restrict activities such as basketball or cycling
- flexibility, isometric strengthening exercises

Most common in adolescent athletes, especially jumping sports.

## Congenital Talipes Equinovarus (Club Foot)

- etiology: intrinsic causes (neurologic, muscular, or connective tissue diseases) vs. extrinsic (intrauterine growth restriction), may be idiopathic, neurogenic, or syndrome-associated
- fixed deformity
- 3 parts to deformity
  - talipes: talus is inverted and internally rotated
  - equinus: ankle is plantar flexed
  - varus: heel and forefoot are in varus (supinated)
- 1-2/1,000 newborns, 50% bilateral, occurrence M>F, severity F>M

### Physical Examination

- examine hips for associated DDH
- examine knees for deformity
- examine back for dysraphism (unfused vertebral bodies)

### Treatment

- correct deformities in the following order (Ponseti Technique):
  - forefoot adduction, ankle inversion, equinus
    - ♦ change strapping/cast q1-2wk
  - surgical release in refractory case (rare)
    - ♦ delayed until 3-4 mo of age
- 3 yr recurrence rate = 5-10%
- mild recurrence common; affected foot is permanently smaller/stiffer than normal foot with calf muscle atrophy

**Figure 54. The club foot – depicting the gross and bony deformity**

## Scoliosis

### Definition

- lateral curvature of spine with vertebral rotation

### Epidemiology

- age: 10-14 yr
- more frequent and more severe in females

Scoliosis screening is not recommended in Canada (Grieg A, et al. 2010; Health Canada, 1994).

### Etiology

- idiopathic: most common (90%)
- congenital: vertebrae fail to form or segment
- neuromuscular: UMN or LMN lesion, myopathy
- postural: leg length discrepancy, muscle spasm
- other: osteochondrodystrophies, neoplastic, traumatic

### Clinical Features

- $\pm$  back pain
- 1° curve where several vertebrae affected
- 2° curves above and below fixed 1° curve to try and maintain normal position of head and pelvis
- asymmetric shoulder height when bent forward
- Adam's test: rib hump when bent forward
- prominent scapulae, creased flank, asymmetric pelvis
- associated posterior midline skin lesions in neuromuscular scolioses
  - café-au-lait spots, dimples, neurofibromas
  - axillary freckling, hemangiomas, hair patches
- associated pes cavus or leg atrophy
- apparent leg length discrepancy

### X-Rays

- 3-foot standing, AP, lateral
  - measure curvature: Cobb angle (Figure 55)
  - may have associated kyphosis

### Treatment

- based on Cobb angle
  - $<20^\circ$ : observe for changes
  - $>20^\circ$  or progressive: bracing (many types) that halt/slow curve progression but do NOT reverse deformity
  - $>40^\circ$ , cosmetically unacceptable or respiratory problems: surgical correction (spinal fusion)

**Figure 55. Cobb angle** – used to monitor the progression of the scoliotic curve

In structural or fixed scoliosis, bending forwards makes the curve more obvious.

Postural scoliosis can be corrected by correcting the underlying problem.

#### Red Flags

- Persistent skeletal pain
- Localized tenderness
- Spontaneous fracture
- Enlarging mass/soft tissue swelling

**Figure 56. Codman's triangle** – a radiographic finding in malignancy, where the partially ossified periosteum is lifted off the cortex by neoplastic tissue

## Bone Tumours

- primary bone tumours are rare after 3rd decade
- metastases to bone are relatively common after 3rd decade

**Table 24. Distinguishing Benign from Malignant Bone Lesions on X-ray**

Benign	Malignant
No periosteal reaction	Acute periosteal reaction <ul style="list-style-type: none"> <li>• Codman's triangle</li> <li>• "Onion skin"</li> <li>• "Sunburst"</li> </ul>
Thick endosteal reaction	Broad border between lesion and normal bone
Well developed bone formation	Varied bone formation
Intraosseous and even calcification	Extrasosseous and irregular calcification

Adapted from: Buckholz RW and Heckman JD. Rockwood and Green's Fractures in Adults. Volume 1. Philadelphia: Lippincott Williams & Wilkins, 2001, 558

### Diagnosis

- pain, swelling, tenderness, rarely regional adenopathy
- routine x-ray findings
  - location (which bone, diaphysis, metaphysis, epiphysis)
  - size
  - lytic/lucent vs. sclerotic
  - involvement (cortex, medulla, soft tissue)
  - matrix (radiolucent, radiodense or calcified)
  - periosteal reaction
  - margin (geographic vs. permeative)
  - any pathological fracture
  - soft tissue swelling
- malignancy is suggested by rapid growth, warmth, tenderness, lack of sharp definition
- staging should include
  - bloodwork including liver enzymes
  - CT chest
  - bone scan
  - bone biopsy
    - ♦ should be referred to specialized centre prior to biopsy
    - ♦ classified into benign, benign aggressive, and malignant
  - MRI of affected bone

## Benign Active Bone Tumours

### BONE-FORMING TUMOURS

#### Osteoid Osteoma

- peak incidence in 2nd and 3rd decades, M:F = 3:1 (young males)
- tibia and femur most common locations
- not known to metastasize
- radiographic findings: small, round radiolucent nidus (<1 cm) surrounded by dense sclerotic bone ("bull's-eye")
- symptoms: produces severe intermittent pain, mostly at night (diurnal prostaglandin production), characteristically relieved by NSAIDs
- treatment: NSAIDs for night pain; surgical resection of nidus

### FIBROUS LESIONS

#### Fibrous Cortical Defect

- occur in as many as 35% of children, peak incidence between 2-20 yr old, higher prevalence in males
- femur and proximal tibia most common locations, 50% of patients have multiple defects usually bilateral, symmetrical
- radiographic findings: circular/oval, eccentric radiolucency near physis; thin smooth/lobulated well-defined sclerotic margin
- treatment: resolves spontaneously

#### Osteochondroma

- 2nd and 3rd decades, M:F = 1.8:1
- most common of all benign bone tumours – 45%
- metaphysis of long bone (usually distal femur, proximal tibia or proximal humerus)
  - radiographic findings: cartilage-capped bony spur on surface of bone ("mushroom" on x-ray)
  - may be multiple (hereditary, autosomal dominant form) – higher risk of malignant change
- generally very slow growing and asymptomatic unless impinging on neurovascular structure
  - growth usually ceases when skeletal maturity is reached
- malignant degeneration occurs in 1-2% (becomes painful or rapidly grows)

#### Enchondroma (Figure 57)

- 2nd and 3rd decades
- 50% occur in the small tubular bones of the hand and foot; others in femur, humerus, ribs
- benign cartilaginous growth, develops in medullary cavity
  - single/multiple enlarged rarefied areas in tubular bones
  - lytic lesion with sharp margination and central calcification
- malignant degeneration to chondrosarcoma occurs in 1-2% (pain in absence of pathologic fracture is an important clue)
- not known to metastasize

Figure 57. T1 MRI of femoral enchondroma

### CYSTIC LESIONS

#### Unicameral/Solitary Bone Cyst

- most common cystic lesion
- children and young adults, peak incidence during first 2 decades, M:F = 2:1
- proximal humerus and femur most common
- symptoms: asymptomatic, or local pain; complete pathological fracture (50% presentations) or incidental detection
- radiographic findings: lytic translucent area on metaphyseal side of growth plate, cortex thinned/expanded; well defined lesion
- treatment: aspiration followed by steroid injection; curettage ± bone graft indicated if re-fracture likely

Figure 58. X-ray of aneurysmal bone cyst. Note the aggressive destruction of bone

## Benign Aggressive Bone Tumours

#### Giant Cell Tumours/Aneurysmal Bone Cyst/Osteoblastoma (Figure 58)

- affects patients of skeletal maturity, peak 3rd decade
- osteoblastoma: found in the distal femur, proximal tibia, distal radius, sacrum, tarsal bones, spinae
- giant cell tumour: pulmonary metastases in 3%
- aneurysmal bone cysts: either solid with fibrous/granular tissue, or blood-filled

- radiographic findings:
  - giant cell tumour: eccentric lytic lesions, in epiphyses adjacent to subchondral bone; may break through cortex; T2 MRI enhances fluid within lesion (hyper-intense signal)
  - aneurysmal bone cyst: expanded with honeycomb shape
  - osteoblastoma: often nonspecific; calcified central nidus with radiolucent halo and sclerosis
- symptoms: local tenderness and swelling, pain may be progressive (giant cell tumours), ± symptoms of nerve root compression (osteoblastoma)
- 15% recur within 2 yr of surgery

### Treatment

- intralesional curettage + bone graft or cement
- wide local excision of expendable bones

## Malignant Bone Tumours

**Table 25. Most Common Malignant Tumour Types for Age**

Age	Tumour
<1	Neuroblastoma
1-10	Ewing's of tubular bones
10-30	Osteosarcoma, Ewing's of flat bones
30-40	Reticulum cell sarcoma, fibrosarcoma, periosteal osteosarcoma, malignant giant cell tumour, lymphoma
>40	Metastatic carcinoma, multiple myeloma, chondrosarcoma

### Osteosarcoma (Figure 59)

- most frequently diagnosed in 2nd decade of life (60%), 2nd most common primary malignancy in adults
- history of Paget's disease, previous radiation treatment
- predilection for sites of rapid growth: distal femur (45%), proximal tibia (20%), and proximal humerus (15%)
  - invasive, variable histology; frequent metastases without treatment (lung most common)
- painful symptoms: progressive pain, night pain, poorly defined swelling, decreased ROM
- radiographic findings:
  - characteristic periosteal reaction: Codman's triangle (Figure 56) or "sunburst" spicule formation (tumour extension into periosteum)
  - destructive lesion in metaphysis may cross epiphyseal plate
- management: complete resection (limb salvage, rarely amputation), neo-adjuvant chemo; bone scan – rule out skeletal metastases, CT chest – rule out pulmonary metastases
- prognosis: 70% (high-grade); 90% (low-grade)

**Figure 59. X-ray of osteosarcoma of distal femur**

### Chondrosarcoma (Figure 60)

- primary (2/3 cases)
  - previous normal bone, patient over 40; expands into cortex to give pain, pathological fracture, flecks of calcification
- secondary (1/3 cases)
  - malignant degeneration of pre-existing cartilage tumour such as enchondroma or osteochondroma
  - younger age group and better prognosis than primary chondrosarcoma
- symptoms: progressive pain, uncommonly palpable mass
- radiographic findings: in medullary cavity, irregular "popcorn" calcification
- treatment: unresponsive to chemotherapy, treat with aggressive surgical resection + reconstruction; regular follow-up x-rays of resection site and chest
- prognosis: 10-yr survival 90% low-grade, 20-40% high-grade

**Figure 60. X-ray of femoral chondrosarcoma**

### Ewing's Sarcoma

- most occur between 5-20 yr old
- florid periosteal reaction in metaphyses of long bone with diaphyseal extension
- metastases frequent without treatment
- signs/symptoms: presents with pain, mild fever, erythema and swelling, anemia, increased WBC, ESR, LDH
- radiographic findings: moth-eaten appearance with periosteal lamellated pattern ("onion-skinning")
- treatment: resection, chemotherapy, radiation
- prognosis – 70%, worst prognostic factor is distant metastases

### Multiple Myeloma

- most common primary malignant tumour of bone in adults (~43%)
- 90% occur in people >40 yr old, M:F = 2:1
- signs/symptoms: bone pain (cardinal early symptom), compression/pathological fractures, renal failure, nephritis, high incidence of infections (e.g. pyelonephritis/pneumonia), systemic (weakness, weight loss, anorexia)
- labs: anemia, thrombocytopenia, increased ESR, hypercalcemia

- radiographic findings: multiple, “punched-out” well-demarcated lesions, no surrounding sclerosis, marked bone expansion
- diagnosis:
  - serum/urine immunoelectrophoresis (monoclonal gammopathy)
  - CT-guided biopsy of lytic lesions at multiple bony sites
- treatment: chemotherapy, radiation, surgery for symptomatic lesions or impending fractures – debulking, internal fixation
- prognosis: most 3 yr after diagnosis
- see [Hematology](#), H47

### Bone Metastases

- 2/3 from breast or prostate; also consider thyroid, lung, kidney
- usually osteolytic; prostate occasionally osteoblastic
- bone scan for MSK involvement, MRI for spinal involvement may be helpful
- stabilization of impending fractures
  - internal fixation, IM rods
  - bone cement

**Table 26. Mirel's Criteria for Impending Fracture Risk and Prophylactic Internal Fixation**

Variable	Number Assigned		
	1	2	3
Site	Upper arm	Lower extremity	Peritrochanteric
Pain	Mild	Moderate	Severe
Lesion	Blastic	Mixed	Lytic
Size	<1/3 bone diameter	1/3-2/3 diameter	>2/3 diameter

#### Signs of Hypercalcemia

"Bones, Stones, Moans, Groans, Psychiatric overtones"

CNS: headache, confusion, irritability, blurred vision

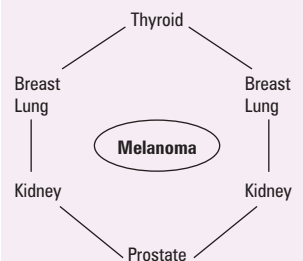

GI: N&V, abdominal pain, constipation, weight loss

MSK: fatigue, weakness, unsteady gait, bone and joint pain

GU: nocturia, polydipsia, polyuria, UTIs

#### Most Common Tumours Metastatic to Bone

#### BLT with a Kosher Pickle

Breast  
Lung  
Thyroid  
Kidney  
Prostate

## Common Medications

**Table 27. Common Medications**

Drug Name	Dosing Schedule	Indications	Comments
cefazolin (Ancef®)	1-2 g IV q8h	Prophylactically before orthopedic surgery	First generation cephalosporin; do not use with penicillin allergy
heparin	5000 IU SC q12h	To prevent venous thrombosis and pulmonary emboli	Monitor platelets, follow PTT which should rise 1.5-2x
LMWH			
dalteparin (Fragmin®)	5000 IU SC OD	DVT prophylaxis esp. in hip and knee surgery	Fixed dose, no monitoring, improved bioavailability, increased bleeding rates
enoxaparin (Lovenox®)	30-40 mg SC bid		
fondaparinux (Arixtra®)	2.5 mg SC OD		
midazolam (Versed®)	0.02 mg/kg IV	Conscious sedation for short procedures	Medication used during fracture reduction – monitor for respiratory depression
fentanyl (Sublimaze®)	0.5-3 µg/kg IV	Conscious sedation for short procedures	Short acting anesthetic used in conjunction with midazolam (Versed®)
triamcinolone (Aristocort®) – an injectable steroid	0.5-1 mL of 25 mg/mL	Suspension (injected into inflamed joint or bursa)	Potent anti-inflammatory effect; increased pain for 24 h, rarely causes fat necrosis and skin depigmentation
naproxen (Aleve®, Naprosyn®)	250-500 mg bid	Pain due to inflammation, arthritis, soft tissue injury	NSAID, may cause gastric erosion and bleeding
misoprostol (Cytotec®)	200 µg qid	Prophylaxis of heterotopic ossification after THA	Use with indomethacin
indomethacin (Indocid®)	25 mg PO tid	Prophylaxis of heterotopic ossification after THA	Use with misoprostol
ibuprofen (Advil®, Motrin®)	200-400 mg tid	Pain (including post-op), inflammation (including arthritis)	NSAID, may cause gastric erosion and bleeding
propofol (Diprivan®)	1-2 mg/kg IV Maint. 0.5 mg/kg	Conscious sedation for short procedures	Short acting anesthetic often used in conjunction with fentanyl (Sublimaze®)

## Basic Anatomy Review

### Ear

Figure 1. Surface anatomy of the external ear; anatomy of ear

Figure 2. Normal appearance of right tympanic membrane on otoscopy

## Nose

Figure 3. Nasal anatomy

Figure 4. Nasal septum and its arterial supply (see *Epistaxis* section for detailed blood supply)

Figure 5. Anatomy of the four paranasal sinuses: maxillary, ethmoid, sphenoid, and frontal

Reprinted from Dhillon R.S, and East C.A. *Ear, Nose and Throat and Head and Neck Surgery*, 2nd ed. Copyright 1999, with permission from Elsevier.

## Throat

Figure 6. Anatomy of a normal larynx; superior view of larynx on indirect laryngoscopy

### Drainage into Nasal Cavity

- **Superior meatus:** sphenoid (via sphenothmoidal recess), posterior ethmoid sinuses
- **Middle meatus:** frontal, maxillary, anterior ethmoid sinuses
- **Inferior meatus:** nasolacrimal duct

- **Nasopharynx:** skull base to soft palate
- **Oropharynx:** soft palate to hyoid bone
- **Laryngopharynx:** hyoid bone to inferior cricoid cartilage

## Head and Neck

**Figure 7. Extratemporal segment of facial nerve**  
Branches of facial nerve (in order from superior to inferior)  
Ten Zebras Broke My Car

**Figure 8. Blood supply to the face**  
Branches of the external carotid artery (in order from inferior to superior)  
Some Angry Lady Figured Out PMS

**Figure 9. Anatomy of the neck**

## Anatomical Triangles of the Neck

### Anterior triangle:

- bounded by anterior border of SCM, midline of neck, and lower border of mandible
- divided into:
  - **submental triangle:** bounded by both anterior bellies of digastric and hyoid bone
  - **digastric triangle:** bounded by anterior and posterior bellies of digastric, and inferior border of mandible
  - **carotid triangle:** bounded by sternocleidomastoid, anterior belly of omohyoid, and posterior belly of digastric
    - ♦ contains: tail of parotid, submandibular gland, hypoglossal nerve, carotid bifurcation, and lymph nodes

### Posterior triangle:

- bounded by posterior border of sternocleidomastoid, anterior border of trapezius, and middle third of clavicle
- divided into:
  - **occipital triangle:** superior to posterior belly of the omohyoid
  - **subclavian triangle:** inferior to posterior belly of omohyoid
- contains: spinal accessory nerve and lymph nodes

### Paired Parasympathetic Ganglia of the Head and Neck

- **Ciliary:** pupillary constriction
- **Pterygopalatine:** lacrimal gland, nasal mucosa
- **Submandibular:** submandibular, sublingual glands
- **Otic:** parotid gland

### Function of Facial Nerve

#### "Ears, Tears, Face, Taste"

**Ears:** stapedius muscle

**Tears:** lacrimation (lacrimal gland) and salivation (parotid)

**Face:** muscles of facial expression

**Taste:** sensory anterior 2/3 of tongue (via chorda tympani)

**Table 1. Lymphatic Drainage of Nodal Groups and Anatomical Triangles of Neck**

Nodal Group/Level	Location	Drainage
1. Suboccipital (S)	Base of skull, posterior	Posterior scalp
2. Retroauricular (R)	Superficial to mastoid process	Scalp, temporal region, external auditory meatus, posterior pinna
3. Parotid-preauricular (P)	In front of ear	External auditory meatus, anterior pinna, soft tissue of frontal and temporal regions, root of nose, eyelids, palpebral conjunctiva
4. Submental (Level IA)	(Midline) Anterior bellies of digastric muscles, tip of mandible, and hyoid bone	Floor of mouth, anterior oral tongue, anterior mandibular alveolar ridge, lower lip
5. Submandibular (Level IB)	Anterior belly of digastric muscle, stylohyoid muscle, body of mandible	Oral cavity, anterior nasal cavity, soft tissues of the mid-face, submandibular gland
6. Upper jugular (Levels IIA and IIB)	Skull base to inferior border of hyoid bone along SCM muscle	Oral cavity, nasal cavity, naso/oro/hypopharynx, larynx, parotid glands
7. Middle jugular (Level III)	Inferior border of hyoid bone to inferior border of cricoid cartilage along SCM muscle	Oral cavity, naso/oro/hypopharynx, larynx
8. Lower jugular* (Level IV)	Inferior border of cricoid cartilage to clavicle along SCM muscle	Hypopharynx, thyroid, cervical esophagus, larynx
9. Posterior triangle** (Levels VA and VB)	Posterior border of SCM, anterior border of trapezius, from skull base to clavicle	Nasopharynx and oropharynx, cutaneous structures of the posterior scalp and neck
10. Anterior compartment*** (Level VI)	(Midline) Hyoid bone to suprasternal notch between the common carotid arteries	Thyroid gland, glottic and subglottic larynx, apex of piriform sinus, cervical esophagus

\*Virchow node: left lower level IV supraclavicular node

\*\*Includes some supraclavicular nodes

\*\*\*Includes pretracheal, precricoid, paratracheal, and perithyroidal nodes

- **Left-sided** enlargement of a supraclavicular node (Virchow's node) may indicate an abdominal malignancy
- **Right-sided** enlargement may indicate malignancy of the mediastinum, lungs, or esophagus
- **Occipital and/or posterior auricular node** enlargement may indicate rubella

**4 Strap Muscles of the Neck**

- Thyrohyoid
- Omohyoid
- Sternothyroid
- Sternohyoid

- STA – Superior thyroid artery  
 CCA – Common carotid artery  
 IJV – Internal jugular vein  
 ITA – Inferior thyroid artery  
 RRLN – Right recurrent laryngeal nerve  
 TC – Thyroid cartilage  
 CC – Cricoid cartilage  
 SPG – Superior parathyroid gland  
 TG – Thyroid gland  
 IPG – Inferior parathyroid gland  
 VN (CN X) – Vagus nerve (CN X)  
 LRLN – Left recurrent laryngeal nerve

**Figure 10. Anatomy of the thyroid gland**

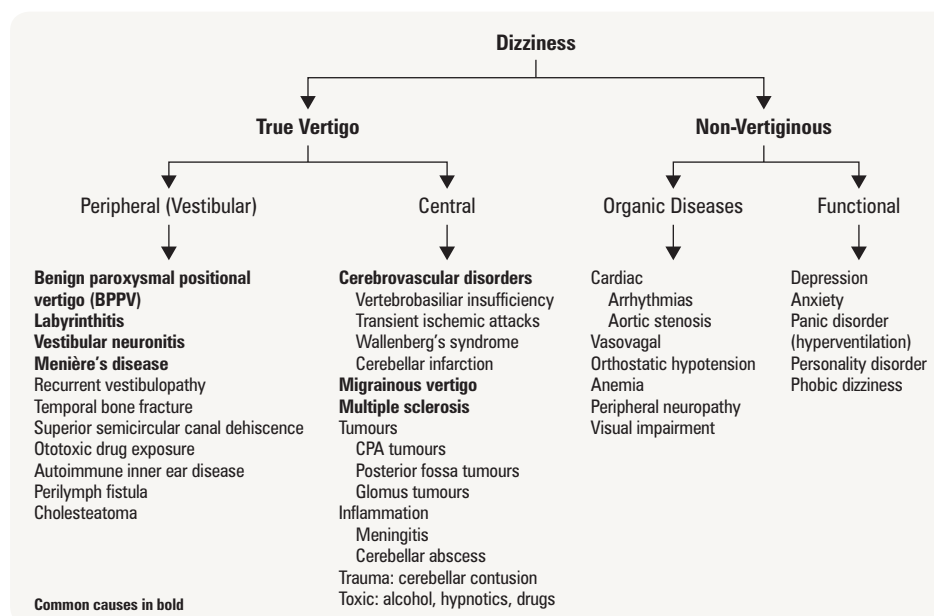

True nystagmus and vertigo caused by a peripheral lesion will never last longer than a couple of weeks because of compensation. Central lesions do not compensate, hence nystagmus and vertigo will persist.

**5 Ds of Vertebrobasilar Insufficiency**

- Drop attacks
- Diplopia
- Dysarthria
- Dizziness
- Dysphagia

## Differential Diagnoses of Common Presenting Problems

### Dizziness

**Figure 11. Differential diagnosis of dizziness**

## Otalgia

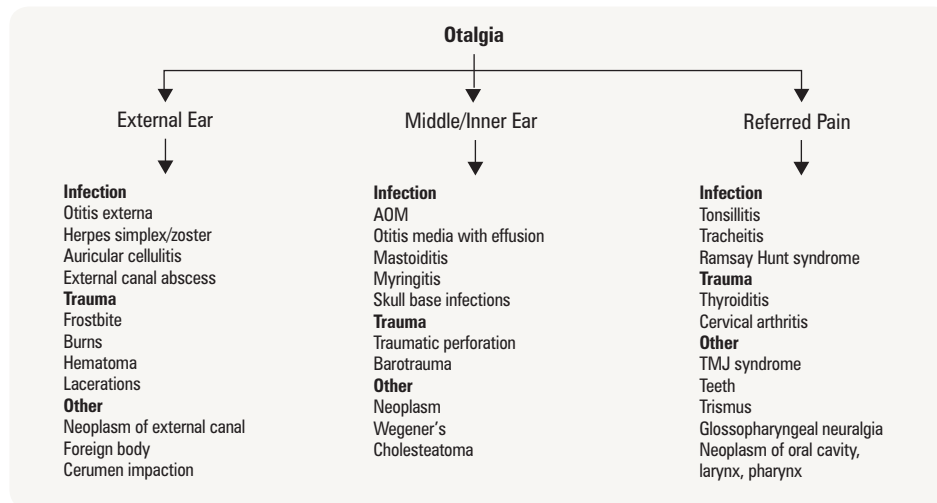

Figure 12. Differential diagnosis of otalgia

## Hearing Loss

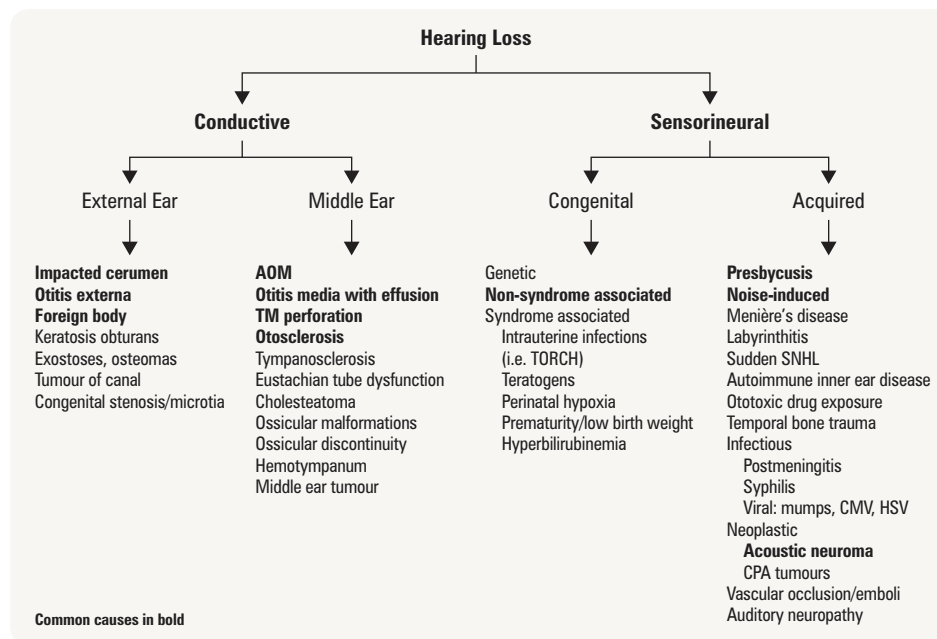

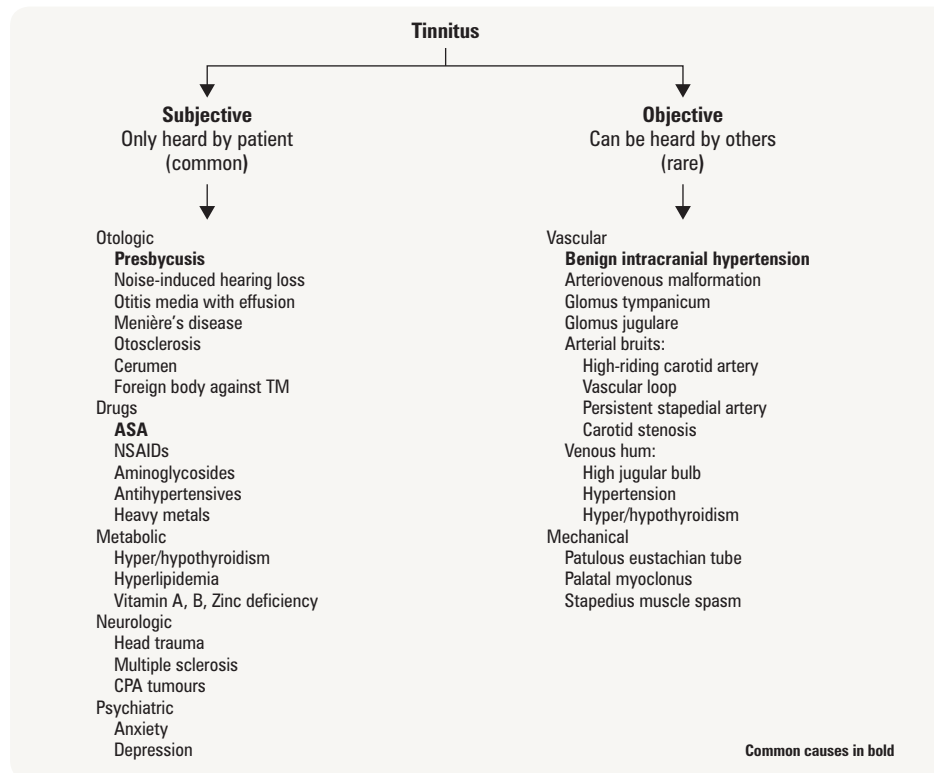

Figure 13. Differential diagnosis of hearing loss

## Tinnitus

Tinnitus is most commonly associated with SNHL.

**Glomus Tympanicum/Jugulare Tumour**  
**Signs and Symptoms**

- Pulsatile tinnitus
- Hearing loss
- Blue mass behind TM
- Brown's sign (blanching of the TM with pneumatic otoscopy)

Figure 14. Differential diagnosis of tinnitus

## Nasal Obstruction

Table 2. Differential Diagnosis of Nasal Obstruction

Acquired	Congenital
<b>Nasal Cavity</b> <ul style="list-style-type: none"> <li>Rhinitis               <ul style="list-style-type: none"> <li>Acute/chronic</li> <li>Vasomotor</li> <li>Allergic</li> </ul> </li> <li>Rhinosinusitis</li> <li>Foreign bodies</li> <li>Enlarged turbinates</li> <li>Tumour               <ul style="list-style-type: none"> <li>Benign: polyps, inverting papilloma</li> <li>Malignant                   <ul style="list-style-type: none"> <li>SCC</li> <li>Esthesioneuroblastoma (olfactory neuroblastoma)</li> <li>Adenocarcinoma</li> </ul> </li> </ul> </li> </ul>	<b>Nasal Cavity</b> <ul style="list-style-type: none"> <li>Nasal dermoid cyst</li> <li>Encephalocele</li> <li>Glioma</li> <li>Choanal atresia</li> </ul>

Neurologic (vocal cord paralysis due to superior ± recurrent laryngeal nerve injury)	<ul style="list-style-type: none"><li>Central lesions<ul style="list-style-type: none"><li>Cerebrovascular accident (CVA)</li><li>Head injury</li><li>Multiple sclerosis (MS)</li><li>Skull base tumours</li><li>Arnold-Chiari malformation</li></ul></li><li>Peripheral lesions<ul style="list-style-type: none"><li>Unilateral</li><li>Lung malignancy</li></ul></li></ul>	<ul style="list-style-type: none"><li>Iatrogenic injury – thyroid, parathyroid surgery, carotid endarterectomy, patent ductus arteriosus (PDA) ligation</li><li>Bilateral<ul style="list-style-type: none"><li>Iatrogenic injury: bilateral thyroid surgery, forceps delivery</li></ul></li><li>Neuromuscular<ul style="list-style-type: none"><li>Myasthenia gravis</li></ul></li></ul>
Functional	<ul style="list-style-type: none"><li>Psychogenic aphonia (hysterical aphonia)</li></ul>	
Congenital	<ul style="list-style-type: none"><li>Laryngomalacia</li><li>Laryngeal web</li><li>Laryngeal atresia</li></ul>	

Lung malignancy is the most common cause of extralaryngeal vocal cord paralysis.

Neck Mass

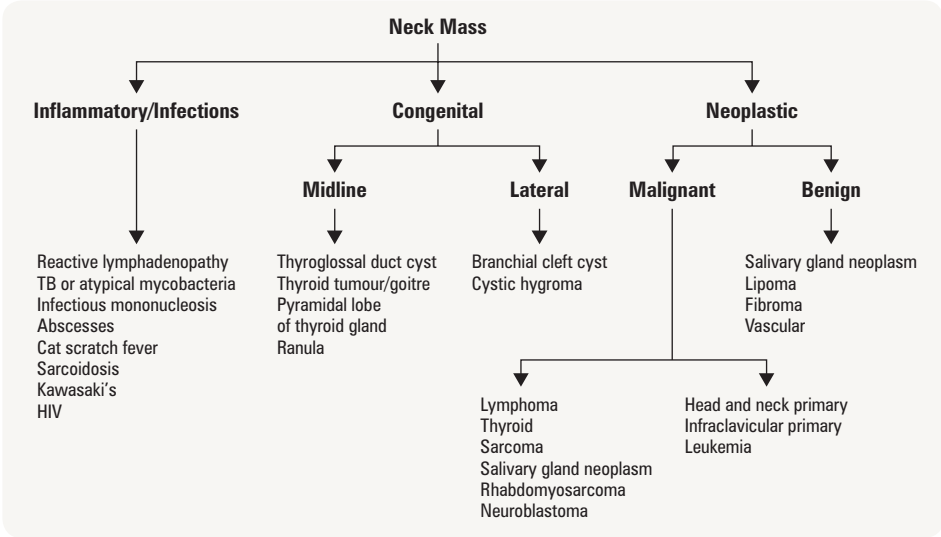

Figure 15. Differential diagnosis of a neck mass

# Hearing

## Normal Hearing Physiology

- **Conductive pathway (external auditory canal to cochlea):** air conduction of sound energy down the EAC → vibration of the tympanic membrane (area effect) → sequential vibration of the middle ear ossicles: malleus, incus, stapes (lever effect) → transmission of amplified vibrations from the stapes footplate in the middle ear to the oval window of the cochlea in the inner ear → pressure differential on cochlear fluid creates movement along the basilar membrane within the cochlea from base to apex
- **Neural pathway (nerve to brain):** basilar membrane vibration stimulates overlying hair cells in the organ of Corti → stimulation of bipolar neurons in the spiral ganglion of the cochlear division of CN VIII → cochlear nucleus → superior olivary nucleus → lateral lemniscus → inferior colliculus → Sylvian fissure of temporal lobe

**Order of the Neural Pathway (with corresponding waves on ABR)**

### E COLI

Eighth cranial nerve (I – II)  
Cochlear nucleus (III)  
Superior Olivary nucleus  
Lateral lemniscus (IV – V)  
Inferior colliculus

## Types of Hearing Loss

### 1. Conductive Hearing Loss (CHL)

- the conduction of sound to the cochlea is impaired
- can be caused by external and middle ear disease

### 2. Sensorineural Hearing Loss (SNHL)

- due to a defect in the conversion of sound into neural signals or in the transmission of those signals to the cortex
- can be caused by disease of the cochlea, acoustic nerve (CN VIII), brainstem, or cortex

### 3. Mixed Hearing Loss

- both a conductive hearing loss and a sensorineural hearing loss are present

### Auditory Acuity

- whispered-voice test: mask one ear and whisper into the other
- tuning fork tests (see Table 4) (audiogram is of greater utility)
- sensitivity depends on which tuning fork used (256 Hz, 512 Hz, 1024 Hz)
  - Rinne test:
    - ♦ 512 Hz tuning fork is struck and held firmly on mastoid process to test BC. The tuning fork is then placed beside the pinna to test AC
    - ♦ If AC > BC → positive Rinne, which is normal
  - Weber test:
    - ♦ 512 Hz tuning fork is held on vertex of head and patient states whether it is heard centrally (Weber negative) or is lateralized to one side (Weber right, Weber left)
    - ♦ can place vibrating fork on patient's chin while they clench their teeth, or directly on teeth to elicit more reliable response
    - ♦ will only lateralize if difference in hearing loss between ears is >6 dB

Weber Test Lateralization = ipsilateral conductive hearing loss or contralateral sensorineural hearing loss. When conductive hearing loss is present, the Weber test is more sensitive in detecting the CHL than the Rinne test.

HL = Intensity x Duration

**Table 4. The Interpretation of Tuning Fork Tests**

Examples	Weber	Rinne
Normal or bilateral sensorineural hearing loss	Central	AC > BC (+) bilaterally
Right-sided conductive hearing loss, normal left ear	Lateralizes to right	BC > AC (–) right
Right-sided sensorineural hearing loss, normal left ear	Lateralizes to left	AC > BC (+) bilaterally
Right-sided severe sensorineural hearing loss or dead right ear, normal left ear	Lateralizes to left	BC > AC (–) right*

\* a vibrating tuning fork on the mastoid stimulates the cochlea bilaterally, therefore in this case, the left cochlea is stimulated by the Rinne test on the right, i.e. a false negative test. These tests are not valid if the ear canals are obstructed with cerumen (i.e. will create conductive loss)

Frequency of Tuning Fork (Hz)	Minimum hearing loss to have NEGATIVE Rinne (BC > AC) (dB)
256	15
512	30
1024	45

## Pure Tone Audiometry

- a threshold is the lowest intensity level at which a patient can hear the tone 50% of the time
- thresholds are obtained for each ear for frequencies 250 to 8000 Hz
- air conduction thresholds are obtained with headphones and measure outer, middle, inner ear, and auditory nerve function
- bone conduction thresholds are obtained with bone conduction oscillators which bypass the outer and middle ear

### Degree of Hearing Loss

- determined on basis of the pure tone average (PTA) at 500, 1000, and 2000 Hz

**Range of Frequencies Audible to Human Ear:**

- 20 to 20000 Hz
- Most sensitive frequencies: 1000 to 4000 Hz
- Range of human speech: 500 to 2000 Hz

Figure 16. Types of hearing loss and associated audiograms of a left ear

## PURE TONE PATTERNS

### 1. Conductive Hearing Loss (CHL) (Figure 16B and 16C)

- BC in normal range
- AC outside of normal range
- gap between AC and BC thresholds >10 dB (an air-bone gap)

### 2. Sensorineural Hearing Loss (SNHL) (Figure 16D and 16E)

- both air and bone conduction thresholds below normal
- gap between AC and BC <10 dB (no air-bone gap)

### 3. Mixed Hearing Loss

- both air and bone conduction thresholds below normal
- gap between AC and BC thresholds >10 dB (an air-bone gap)

Hearing loss most often occurs at higher frequencies. Noise-induced (occupational) HL is seen at 4000 Hz. HL associated with otosclerosis is seen at 2000 Hz (Carhart's notch).

Air conduction thresholds can only be equal to or greater than bone conduction thresholds.

### Degree of Hearing Loss

Decibel Loss	Degree of Hearing Loss
0 to 20 dB	Normal
21 to 40 dB	Mild
41 to 55 dB	Moderate
56 to 70 dB	Moderate – Severe
71 to 90 dB	Severe
≥91 dB	Profound

## Speech Audiometry

### Speech Reception Threshold (SRT)

- lowest hearing level at which patient is able to repeat 50% of two syllable words which have equal emphasis on each syllable (spondee words)
- SRT and best pure tone threshold in the 500 to 2000 Hz range (frequency range of human speech) usually agree within 5 dB. If not, suspect a retrocochlear lesion or functional hearing loss
- used to assess the reliability of the pure tone audiometry

### Speech Discrimination Test

- percentage of words the patient correctly repeats from a list of 50 monosyllabic words
- tested at a level 35 to 50 dB > SRT, therefore degree of hearing loss is taken into account
- patients with normal hearing or conductive hearing loss score >90%
- score depends on extent of SNHL
- rollover effect: a decrease in discrimination as sound intensity increases. Typical of a retrocochlear lesion (e.g. acoustic neuroma)
- investigate further if scores differ more than 20% between ears as asymmetry may indicate a retrocochlear lesion
- used as best predictor of hearing aid response: if patient has HL and problems with word discrimination, hearing aids may not be helpful

## Impedance Audiometry

### Tympanogram

- the Eustachian tube equalizes the pressure between the external and middle ear
- tympanograms graph the compliance of the middle ear system against a pressure gradient ranging from  $-400$  to  $+200$  mmH<sub>2</sub>O
- tympanogram peak occurs at the point of maximum compliance: where the pressure in the external canal is equivalent to the pressure in the middle ear
- normal range:  $-100$  to  $+50$  mmH<sub>2</sub>O

Figure 17. Tympanograms

### Static Compliance

- volume measurement reflecting overall stiffness of the middle ear system
- normal range: 0.3 to 1.6 cc
- negative middle ear pressure and abnormal compliance indicate middle ear pathology
- in a type B curve, ear canal volumes of greater than 2 cc in children and 2.5 cc in adults indicate TM perforation or presence of a patent ventilation tube

### Acoustic Stapedial Reflexes

- stapedius muscle contracts due to loud sound
- acoustic reflex thresholds** = 70 to 100 dB greater than hearing threshold; if hearing threshold >85 dB, reflex likely absent
- stimulating either ear causes bilateral and symmetrical reflexes
- for reflex to be present, CN VII must be intact and no conductive hearing loss in monitored ear
- if reflex is absent without conductive or severe sensorineural loss, suspect CN VII lesion
- acoustic reflex decay test** = ability of stapedius muscle to sustain contraction for 10 s at 10 dB
- normally, little reflex decay occurs at 500 and 1000 Hz
- with cochlear hearing loss, acoustic reflex thresholds are 25 to 60 dB
- with retrocochlear hearing loss (acoustic neuroma), absent acoustic reflexes or marked reflex decay (>50%) within 5 s

## Auditory Brainstem Response (ABR)

- measures neuroelectric potentials (waves) in response to a stimulus in five different anatomic sites (refer to *Order of Neural Pathway* sidebar on OT9). This test can be used to map the lesion according to the site of the defect
- delay in brainstem response suggests cochlear or retrocochlear abnormalities
- does not require volition or co-operation of patient (therefore of value in children and in malingers)

## Otoacoustic Emissions

- objective test of hearing where a series of clicks is presented to the ear and the cochlea generates an echo which can be measured
- often used in newborn screening
- can be used to uncover normal hearing in malingering patients
- absence of emissions can be due to hearing loss or fluid in the middle ear

## Aural Rehabilitation

- dependent on degree of hearing loss, communicative requirements, motivation, expectations, age, and physical and mental abilities
- negative prognostic factors:
  - poor speech discrimination
  - narrow dynamic range (recruitment)
  - unrealistic expectations
- types of hearing aids:
  - BTE: behind the ear (with occlusive mould or open fit which allows natural sound to pass – for milder hearing losses)
  - ITE: in-the-ear, placed in concha
  - ITC: in-the-canal, placed entirely in ear canal
  - CIC: contained-in-canal, placed deeply in ear canal
  - bone conduction – bone-anchored hearing aid (BAHA): attached to the skull
  - contralateral routing of signals (CROS)
- assistive listening devices:
  - direct/indirect audio output
  - infrared, FM radio, or induction loop systems
  - telephone, television, or alerting devices
- cochlear implants:
  - electrode is inserted into the cochlea to allow direct stimulation of the auditory nerve
  - for profound bilateral sensorineural hearing loss not rehabilitated with conventional hearing aids
  - established indication: post-lingually deafened adults, pre- and post-lingually deaf children

**Pre-lingual deafness:** deafness occurring before speech and language are acquired.

**Post-lingual deafness:** deafness occurring after speech and language are acquired.

Pre-lingually deaf infants are the best candidates for aural rehabilitation because they have maximal benefit from ongoing developmental plasticity.

### Bone Anchored Hearing Aids (BAHA)

BAHAs function based on bone conduction and are indicated primarily for patients with conductive hearing loss, unilateral hearing loss, and mixed hearing loss who cannot wear conventional hearing aids. BAHAs consist of a titanium implant, an external abutment, and a sound processor. The sound processor transmits vibrations through the external abutment to the titanium implant and then directly to the cochlea.

## Vertigo

### Evaluation of the Dizzy Patient

- vertigo: illusion of rotational, linear, or tilting movement of self or environment
  - vertigo is produced by peripheral (inner ear) or central (brainstem-cerebellum) stimulation
- it is important to distinguish vertigo from other disease entities that may present with similar complaints of “dizziness” (e.g. cardiovascular, psychiatric, neurological, aging)

**Table 5. Peripheral vs. Central Vertigo**

Symptoms	Peripheral	Central
Imbalance	Moderate-severe	Mild-moderate
Nausea and vomiting	Severe	Variable
Auditory symptoms	Common	Rare
Neurologic symptoms	Rare	Common
Compensation	Rapid	Slow
Nystagmus	Unidirectional Horizontal or rotatory	Bidirectional Horizontal or vertical

**Table 6. Differential Diagnosis of Vertigo Based on History**

Condition	Duration	Hearing Loss	Tinnitus	Aural Fullness	Other Features
Benign paroxysmal positional vertigo (BPPV)	Seconds	–	–	–	
Menière's disease	Minutes to hours Precedes attack	Uni/bilateral, fluctuating	+	Pressure/warmth	
Vestibular neuronitis	Hours to days	–	–	–	
Labyrinthitis	Days	Unilateral	Whistling	–	Recent AOM
Acoustic neuroma	Chronic	Progressive	+	–	Ataxia CN VII palsy

## Benign Paroxysmal Positional Vertigo (BPPV)

### Definition

- acute attacks of transient vertigo lasting **seconds to minutes** initiated by certain head positions, accompanied by torsional (i.e. rotatory) nystagmus (geotropic = fast phase towards the floor)

### Etiology

- due to canalithiasis (migration of free floating otoliths within the endolymph of the semicircular canal) or cupulolithiasis (otolith attached to the cupula of the semicircular canal)
  - can affect each of the 3 semicircular canals, although the posterior canal is affected in >90% of cases

BPPV is the most common cause of episodic vertigo. Patients often are symptomatic when rolling over in bed or moving their head to a position of extreme posterior extension such as looking up at a tall building or getting their hair washed at the hairdresser.

- causes: head injury, viral infection (URTI), degenerative disease, idiopathic
- results in slightly different signals being received by the brain from the two balance organs resulting in sensation of movement

### Diagnosis

- history
- positive Dix-Hallpike maneuver (sensitivity 82%, specificity 71%)

### Dix-Hallpike Positional Testing (see website for video and illustrations)

- the patient is rapidly moved from a sitting position to a supine position with the head hanging over the end of the table, turned to one side at 45° and neck extended 20° holding the position for 20 s
- onset of vertigo and rotary nystagmus indicate a positive test for the dependent side

### Treatment

- reassure patient that process resolves spontaneously
- particle repositioning maneuvers
  - Epley maneuver (performed by MD)
  - Brandt-Daroff exercises (performed by patient)
- surgery for refractory cases
- anti-emetics for nausea/vomiting
- drugs to suppress the vestibular system delay eventual recovery and are therefore not used

Patients can wear Frenzel's magnifying eyeglasses during the Dix-Hallpike maneuver, which inhibit visual fixation and allow for better visualization of the eyes.

### 5 Signs of BPPV Seen with Dix-Hallpike Maneuver

- Geotropic rotatory nystagmus (nystagmus **MUST** be present for a positive test)
- Fatigues with repeated maneuver and fixation
- Reversal of nystagmus upon sitting up
- Latency of ~20 s
- Crescendo/decrecendo vertigo lasting 20 s

### Diagnostic Criteria for Menière's Disease (must have all three):

- Two spontaneous episodes of rotational vertigo ≥20 minutes
- Audiometric confirmation of SNHL (often low frequency)
- Tinnitus and/or aural fullness

**Drop Attacks (Tumarkin's Otolithic Crisis)** are sudden falls occurring without warning and without LOC.

Before proceeding with gentamicin treatment, perform a gadolinium enhanced MRI to rule out CPA tumour as the cause of symptoms.

## Menière's Disease (Endolymphatic Hydrops)

### Definition

- episodic attacks of tinnitus, hearing loss, aural fullness, and vertigo lasting **minutes to hours**

### Proposed Etiology

- inadequate absorption of endolymph leads to endolymphatic hydrops (over accumulation) that distorts the membranous labyrinth

### Epidemiology

- peak incidence 40 to 60 yr
- bilateral in 35% of cases

### Clinical Features

- vertigo, fluctuating low frequency SNHL, tinnitus, and aural fullness
- ± drop attacks (Tumarkin crisis), ± nausea and vomiting
- vertigo disappears with time (minutes to hours), but hearing loss remains
- early in the disease: fluctuating SNHL
- later stages: persistent tinnitus and progressive hearing loss
- attacks come in clusters and can be debilitating to the patient
- triggers: high salt intake, caffeine, stress, nicotine, and alcohol

### Treatment

- acute management may consist of bed rest, antiemetics, antivertiginous drugs [e.g. betahistine (Serc®)], and low molecular weight dextrans (not commonly used)
- long term management may include:
  - medical:
    - ♦ low salt diet, diuretics (e.g. hydrochlorothiazide, triamterene, amiloride)
    - ♦ Serc® prophylactically to decrease intensity of attacks
    - ♦ local application of gentamicin to destroy vestibular end-organ, results in complete SNHL
  - surgical:
    - ♦ selective vestibular neurectomy or transtympanic labyrinthectomy
    - ♦ vestibular implants have recently been introduced, experimentally
- must monitor opposite ear as bilaterality occurs in 35% of cases

## Vestibular Neuronitis

### Definition

- acute onset of disabling vertigo often accompanied by nausea, vomiting, and imbalance without hearing loss that resolves over **days** leaving a residual imbalance that lasts **days to weeks**

### Etiology

- thought to be due to a viral infection (e.g. measles, mumps, herpes zoster)
- ~30% of cases have associated URTI symptoms
- other: microvascular events, diabetes, autoimmune process
- considered to be the vestibular equivalent of Bell's palsy, sudden hearing loss, and acute vocal cord palsy

**Clinical Features**

- acute phase:
  - severe vertigo with nausea, vomiting, and imbalance lasting 1 to 5 d
  - irritative nystagmus (fast phase towards the offending ear)
  - patient tends to veer towards affected side
- convalescent phase:
  - imbalance and motion sickness lasting days to weeks
  - spontaneous nystagmus away from affected side
  - gradual vestibular adaptation requires weeks to months
- incomplete recovery likely with the following risk factors: elderly, visual impairment, poor ambulation
- repeated attacks can occur

**Treatment**

- acute phase:
  - bed rest, vestibular sedatives (Gravol®), diazepam
- convalescent phase:
  - progressive ambulation especially in the elderly
  - vestibular exercises: involve eye and head movements, sitting, standing, and walking

## Labyrinthitis

**Definition**

- acute infection of the inner ear resulting in vertigo and hearing loss

**Etiology**

- may be serous (viral) or purulent (bacterial)
- occurs as a complication of acute and chronic otitis media, bacterial meningitis, cholesteatoma, and temporal bone fractures
- bacterial: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*, *P. aeruginosa*, *P. mirabilis*
- viral: rubella, CMV, measles, mumps, varicella zoster

**Clinical Features**

- sudden onset of vertigo, nausea, vomiting, tinnitus, and unilateral hearing loss, with no associated fever or pain
- meningitis is a serious complication

**Investigations**

- CT head
- if meningitis is suspected: lumbar puncture, blood cultures

**Treatment**

- treat with IV antibiotics, drainage of middle ear ± mastoidectomy

## Acoustic Neuroma (Vestibular Schwannoma)

**Definition**

- schwannoma of the vestibular portion of CN VIII

**Pathogenesis**

- starts in the internal auditory canal and expands into cerebellopontine angle (CPA), compressing cerebellum and brainstem
- when associated with type 2 neurofibromatosis (NF2): bilateral acoustic neuromas, café-au-lait skin lesions, and multiple intracranial lesions

**Clinical Features**

- usually presents with unilateral SNHL or tinnitus
- dizziness and unsteadiness may be present, but true vertigo is rare as tumour growth occurs slowly and thus compensation occurs
- facial nerve palsy and trigeminal (V<sub>1</sub>) sensory deficit (corneal reflex) are late complications

**Diagnosis**

- MRI with gadolinium contrast is the gold standard
- audiogram (to assess SNHL)
- poor speech discrimination relative to the hearing loss
- stapedial reflex absent or significant reflex decay
- ABR – increase in latency of the 5th wave
- vestibular tests: normal or asymmetric caloric weakness (an early sign)

**Treatment**

- expectant management if tumour is very small, or in elderly
- definitive management is surgical excision
- other options: gamma knife, radiation

Acoustic neuroma is the most common intracranial tumour causing SNHL and the most common cerebellopontine angle tumour.

In the elderly, unilateral tinnitus or SNHL is acoustic neuroma until proven otherwise.

# Tinnitus

## Definition

- an auditory perception in the absence of an acoustic stimuli, likely related to loss of input to neurons in central auditory pathways and resulting in abnormal firing

## History

- subjective vs. objective (see Figure 14, OT7)
- continuous vs. pulsatile (vascular in origin)
- unilateral vs. bilateral
- associated symptoms: hearing loss, vertigo, aural fullness, otalgia, otorrhea

## Investigations

- audiology
- if unilateral:
  - ABR, gadolinium enhanced MRI to exclude a retrocochlear lesion
  - CT to diagnose glomus tympanicum (rare)
  - MRI or angiogram to diagnose AVM
- if suspect metabolic abnormality: lipid profile, TSH

## Treatment

- if a cause is found, treat the cause (e.g. drainage of middle ear effusion, embolization or excision of AVM)
- with no treatable cause: 50% will improve, 25% worsen, 25% remain the same
- avoid loud noise, ototoxic meds, caffeine, smoking
- tinnitus clinics
- identify situations where tinnitus is most bothersome (e.g. quiet times), mask tinnitus with soft music or “white noise”
- hearing aid if coexistent hearing loss
- tinnitus instrument: combines hearing aid with white noise masker
- trial of tocainamide

# Diseases of the External Ear

## Cerumen Impaction

### Etiology

- ear wax is a mixture of secretions from ceruminous and pilosebaceous glands, squames of epithelium, dust, and debris

### Risk Factors

- hairy or narrow ear canals, in-the-ear hearing aids, cotton swab usage, osteomata

### Clinical Features

- hearing loss (conductive)
- ± tinnitus, vertigo, otalgia, aural fullness

### Treatment

- ceruminolytic drops (bicarbonate solution, olive oil, glycerine, Cerumenol®, Cerumenex®)
- syringing
- manual debridement (by MD)

Cerumen impaction is the most common cause of conductive hearing loss for those aged 15-50 yr.

### Syringing

#### Indications:

- Totally occlusive cerumen with pain, decreased hearing, or tinnitus

#### Contraindications:

- Active infection
- Previous ear surgery
- Only hearing ear
- TM perforation

#### Complications:

- Otitis externa
- TM perforation
- Trauma
- Pain
- Vertigo
- Tinnitus
- Otitis media

#### Method:

- Establish that TM is intact
- Gently pull the pinna superiorly and posteriorly
- Using warm water, aim the syringe nozzle upwards and posteriorly to irrigate the ear canal

## Exostoses

### Definition

- bony protuberances in the external auditory canal composed of lamellar bone

### Etiology

- possible association with swimming in cold water

### Clinical Features

- usually an incidental finding
- if large, they can cause cerumen impaction or otitis externa

### Treatment

- no treatment required unless symptomatic

## Otitis Externa (OE)

### Etiology

- bacteria (~90% of OE): *Pseudomonas aeruginosa*, *Pseudomonas vulgaris*, *E. coli*, *S. aureus*
- fungus: *Candida albicans*, *Aspergillus niger*

### Risk Factors

- associated with swimming ("swimmer's ear")
- mechanical cleaning (Q-tips®), skin dermatitis, aggressive scratching
- devices that occlude the ear canal: hearing aids, headphones, etc.

### Clinical Features

- acute:
  - pain aggravated by movement of auricle (traction of pinna or pressure over tragus)
  - otorrhea (sticky yellow purulent discharge)
  - conductive hearing loss ± aural fullness 2° to obstruction of external canal by swelling and purulent debris
  - post-auricular lymphadenopathy
  - complicated OE exists if the pinna and/or the periauricular soft tissues are erythematous and swollen
- chronic:
  - pruritus of external ear ± excoriation of ear canal
  - atrophic and scaly epidermal lining, ± otorrhea, ± hearing loss
  - wide meatus but no pain with movement of auricle
  - tympanic membrane appears normal

Pulling on the pinna is extremely painful in otitis externa, but is usually well tolerated in otitis media.

### Treatment

- clean ear under magnification with irrigation, suction, dry swabbing, and C&S
- bacterial etiology
  - antipseudomonal otic drops (e.g. ciprofloxacin) or a combination of antibiotic and steroid (e.g. Cipro HC®)
  - do not use aminoglycoside if the tympanic membrane (TM) is perforated because of the risk of ototoxicity
  - introduction of fine gauze wick (pope wick) if external canal edematous
  - ± 3% acetic acid solution to acidify ear canal (low pH is bacteriostatic)
  - systemic antibiotics if either cervical lymphadenopathy or cellulitis is present
- fungal etiology
  - repeated debridement and topical antifungals (gentian violet, Mycostatin® powder, boric acid, Locacorten®, Vioform® drops)
- ± analgesics
- chronic otitis externa (pruritus without obvious infection) → corticosteroid alone (e.g. diprosalic acid)

## Malignant (Necrotizing) Otitis Externa (Skull Base Osteomyelitis)

### Definition

- osteomyelitis of the temporal bone

### Epidemiology

- occurs in elderly diabetics and immunocompromised patients

### Etiology

- rare complication of otitis externa
- *Pseudomonas* infection in 99% of cases

### Clinical Features

- otalgia and purulent otorrhea that is refractory to medical therapy
- granulation tissue on the floor of the auditory canal

### Complications

- cranial nerve palsies (most commonly VII>X>XI)
- systemic infection, death

### Management

- imaging: high resolution temporal bone CT scan, gadolinium enhanced MRI, technetium scan
- requires hospital admission, debridement, IV antibiotics, hyperbaric O<sub>2</sub>
- may require OR for debridement of necrotic tissue/bone

#### Gallium and Technetium Scans

Gallium scans are used to show sites of active infection. Gallium is taken up by PMNs and therefore only lights up when active infection is present. It will not show the extent of osteomyelitis. Technetium scans provide information about osteoblastic activity and as such are used to demonstrate sites of osteomyelitis. Technetium scans help with diagnosis whereas gallium scans are useful in follow-up.

## Diseases of the Middle Ear

### Acute Otitis Media (AOM) and Otitis Media with Effusion (OME)

- see *Pediatric Otolaryngology*, OT38

### Cholesteatoma

#### Definition

- a cyst composed of keratinizing squamous epithelium occurring in the middle ear, mastoid, and temporal bone
- two types: congenital and acquired

#### Congenital

- presents as a “small white pearl” behind an intact tympanic membrane (anterior and medial to the malleus) or as a conductive hearing loss
- believed to be due to aberrant migration of external canal ectoderm during development
- not associated with otitis media/Eustachian tube dysfunction

#### Acquired (more common)

- generally occurs as a consequence of otitis media and chronic Eustachian tube dysfunction
- frequently associated with retraction pockets in the pars flaccida (1° acquired) and marginal perforations (2° acquired) of the tympanic membrane
- the associated chronic inflammatory process causes progressive destruction of surrounding bony structures

#### Clinical Features

- symptoms:
  - history of otitis media (especially if unilateral), ventilation tubes, ear surgery
  - progressive hearing loss (predominantly conductive although may get sensorineural hearing loss in late stage)
  - otalgia, aural fullness, fever
- signs:
  - retraction pocket in TM, may contain keratin debris
  - TM perforation
  - granulation tissue, polyp visible on otoscopy
  - malodorous, unilateral otorrhea

#### Complications

**Table 7. Complications of Cholesteatoma**

Local	Intracranial
Ossicular erosion: conductive hearing loss	Meningitis
Inner ear erosion: SNHL, dizziness, and/or labyrinthitis	Sigmoid sinus thrombosis
Temporal bone infection: mastoiditis, petrositis	Intracranial abscess (subdural, epidural, cerebellar)
Facial paralysis	

#### Investigations

- audiogram and CT scan

#### Treatment

- there is no conservative therapy for cholesteatoma
- surgical: mastoidectomy ± tympanoplasty ± ossicular reconstruction

#### Mechanisms of Cholesteatoma Formation

- Epithelial migration through TM perforation (2° acquired)
- Invagination of TM (1° acquired)
- Metaplasia of middle ear epithelium or basal cell hyperplasia (congenital)

## Mastoiditis

#### Definition

- infection (usually subperiosteal) of mastoid air cells, most commonly seen approximately two weeks after onset of untreated or inadequately treated acute suppurative otitis media

#### Etiology

- acute mastoiditis caused by the same organisms as AOM: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*, *S. pyogenes*, *S. aureus*, *P. aeruginosa*

Complications of AOM are rare due to rapid and effective treatment of AOM with antibiotics.

**Clinical Features**

- otorrhea
- tenderness to pressure over the mastoid
- retroauricular swelling with protruding ear
- fever, hearing loss,  $\pm$  TM perforation (late)
- CT radiologic findings: opacification of mastoid air cells by fluid and interruption of normal trabeculations of cells (coalescence)

**Treatment**

- IV antibiotics with myringotomy and ventilation tubes – usually all that is required acutely
- cortical mastoidectomy:
  - debridement of infected tissue allowing aeration and drainage
- indications for surgery:
  - failure of medical treatment after 48 h
  - symptoms of intracranial complications
  - aural discharge persisting for 4 wk and resistant to antibiotics

**Classic Triad**

- Otorrhea
- Tenderness to pressure over the mastoid
- Retroauricular swelling with protruding ear

## Otosclerosis

**Definition**

- fusion of stapes footplate to oval window so that it cannot vibrate

**Etiology**

- autosomal dominant, variable penetrance approximately 40%
- female > male, progresses during pregnancy (hormone responsive)

**Clinical Features**

- progressive conductive hearing loss first noticed in teens and 20s (may progress to sensorineural hearing loss if cochlea involved)
- $\pm$  pulsatile tinnitus
- tympanic membrane normal  $\pm$  pink blush (Schwartz's sign) associated with the neovascularization of otosclerotic bone
- characteristic dip at 2000 Hz (Carhart's notch) on audiogram (see Figure 16C, OT10)

Otosclerosis is the 2<sup>nd</sup> most common cause of conductive hearing loss in 15 to 50 year olds (after cerumen impaction).

**Treatment**

- monitor with serial audiograms if coping with loss
- hearing aid (air conduction, bone conduction, BAHA)
- stapedectomy or stapedotomy (with laser or drill) with prosthesis is definitive treatment

## Diseases of the Inner Ear

### Congenital Sensorineural Hearing Loss

**Hereditary Defects**

- non-syndrome associated (70%):
  - often idiopathic, autosomal recessive
  - connexin 26 (GJB2) most common
- syndrome associated (30%):
  - Waardenburg: white forelock, heterochromia iridis (each eye different color), wide nasal bridge and increased distance between medial canthi
  - Pendred: deafness associated with thyroid gland disorders, SLC26A4 gene, enlarged vestibular aqueducts
  - Treacher-Collins: first and second branchial cleft anomalies
  - Alport: hereditary nephritis

**Prenatal TORCH Infections**

- toxoplasmosis, rubella, CMV, herpes simplex, others (e.g. HIV, syphilis)

**Perinatal**

- Rh incompatibility
- anoxia
- hyperbilirubinemia
- birth trauma (hemorrhage into inner ear)

**Postnatal**

- meningitis, mumps, measles

**High Risk Factors (for Hearing Loss in Newborns)**

- low birth weight/prematurity
- perinatal anoxia (low APGARs)
- kernicterus: bilirubin >25 mg/dL
- craniofacial abnormality
- family history of deafness in childhood
- 1st trimester illness: TORCH infections
- neonatal sepsis
- ototoxic drugs
- perinatal infection, including post-natal meningitis
- consanguinity
- 50-75% of newborns with sensorineural hearing loss have at least one of the above risk factors, and 90% of these have spent time in the NICU
- presence of any risk factor: ABR study performed before leaving NICU and at 3 mo adjusted age
- early rehabilitation improves speech and school performance

**Presbycusis****Definition**

- sensorineural hearing loss associated with aging (starting in 5th and 6th decades)

**Etiology**

- hair cell degeneration
- age related degeneration of basilar membrane, possibly genetic etiology
- cochlear neuron damage
- ischemia of inner ear

**Clinical Features**

- progressive, bilateral hearing loss initially at high frequencies, then middle frequencies
- loss of discrimination of speech especially with background noise present – patients describe people as mumbling
- recruitment phenomenon: inability to tolerate loud sounds
- tinnitus

**Treatment**

- hearing aid if patient has difficulty functioning, hearing loss >30-35 dB, and good speech discrimination
- ± lip reading, auditory training, auditory aids (doorbell and phone lights)

Presbycusis is the most common cause of SNHL.

**Sudden Sensorineural Hearing Loss****Clinical Features**

- presents as a sudden onset of significant SNHL (usually unilateral) ± tinnitus, aural fullness
- usually idiopathic, rule out other causes:
  - autoimmune causes (e.g. ESR, rheumatoid factor, ANA)
  - MRI to rule out tumour and/or CT to rule out ischemic/hemorrhagic stroke if associated with any other focal neurological signs (e.g. vertigo, ataxia, abnormality of CN V or VII, weakness)

**Treatment**

- oral corticosteroids within 3 d of onset: prednisone 1 mg/kg/d for 10-14 d

**Prognosis**

- depends on degree of hearing loss
- 70% resolve within 10 to 14 d
- 20% experience partial resolution
- 10% experience permanent hearing loss

Sudden sensorineural hearing loss may easily be confused with ischemic brain events. It is important to keep a high index of suspicion especially with elderly patients presenting with sudden sensorineural hearing loss as well as vertigo.

**Autoimmune Inner Ear Disease****Etiology**

- idiopathic
- may be associated with systemic autoimmune diseases (i.e. rheumatoid arthritis, SLE), vasculitides (i.e. granulomatosis with polyangiitis, polyarteritis nodosa) and allergies

**Epidemiology**

- most common between ages 20-50

**Clinical Features**

- rapidly progressive or fluctuating bilateral SNHL
- $\pm$  tinnitus, aural fullness, vestibular symptoms (i.e. ataxia, disequilibrium, vertigo)

**Investigations**

- autoimmune work-up: CBC, ESR, ANA, rheumatoid factor

**Treatment**

- high-dose corticosteroids: treat early for at least 30 d
- consider cytotoxic medication for steroid non-responders

## Drug Ototoxicity

**Aminoglycosides**

- streptomycin and gentamicin (vestibulotoxic), kanamycin and tobramycin (cochleotoxic)
- toxic to hair cells by any route: oral, IV, and topical (if the TM is perforated)
- destroys sensory hair cells: outer first, inner second (therefore otoacoustic emissions are lost first)
- high frequency hearing loss develops earliest
- ototoxicity occurs days to weeks post-treatment
- must monitor with peak and trough levels when prescribed, especially if patient has neutropenia and/or history of ear or renal problems
- q24h dosing recommended (with amount determined by creatinine clearance)
- aminoglycoside toxicity displays saturable kinetics therefore once daily dosing presents less risk than divided daily doses
- duration of treatment is the most important predictor of ototoxicity
- treatment: immediately stop aminoglycosides

**Salicylates**

- hearing loss with tinnitus, reversible if discontinued

**Antimalarials (Quinines)**

- hearing loss with tinnitus
- reversible if discontinued but can lead to permanent loss

**Others**

- many antineoplastic agents are ototoxic (weigh risks vs. benefits)
- loop diuretics

## Noise-Induced Sensorineural Hearing Loss

**Pathogenesis**

- 85 to 90 dB over months or years or single sound impulses  $>135$  dB can cause cochlear damage
- bilateral SNHL initially and most prominently at 4000 Hz (resonant frequency of the temporal bone), known as “boilermaker’s notch” on audiogram, extends to higher and lower frequencies with time (see Figure 16D, OT10)
- speech reception not altered until hearing loss  $>30$  dB at speech frequency, therefore considerable damage may occur before patient complains of hearing loss
- difficulty with speech discrimination, especially in situations with competing noise

**Phases of Hearing Loss**

- dependent on: intensity of sound and duration of exposure
- temporary threshold shift:
  - when exposed to loud sound, decreased sensitivity or increased threshold for sound
  - may have associated aural fullness and tinnitus
  - with removal of noise, hearing returns to normal
- permanent threshold shift:
  - hearing does not return to previous state

**Treatment**

- hearing aid
- prevention:
  - ear protectors: muffs, plugs
  - limit exposure to noise with frequent rest periods
  - regular audiologic follow-up

## Temporal Bone Fractures

Table 8. Features of Temporal Bone Fractures (see Figure 18)

	Transverse (1)	Longitudinal (2)
<b>Extension</b>	Into bony labyrinth and internal auditory meatus	Into middle ear
<b>Incidence</b>	10 to 20%	70 to 90%
<b>Etiology</b>	Frontal/occipital trauma	Lateral skull trauma
<b>CN pathology</b>	CN VII palsy (50%)	CN VII palsy (10 to 20%)
<b>Hearing loss</b>	Sensorineural loss due to direct cochlear injury	Conductive hearing loss secondary to ossicular injury
<b>Vestibular symptoms</b>	Sudden onset vestibular symptoms due to direct semicircular canal injury (vertigo, spontaneous nystagmus)	Rare
<b>Other features</b>	Intact external auditory meatus, tympanic membrane $\pm$ hemotympanum Spontaneous nystagmus CSF leak in Eustachian tube to nasopharynx $\pm$ rhinorrhea (risk of meningitis)	Torn tympanic membrane or hemotympanum Bleeding from external auditory canal Step formation in external auditory canal CSF otorrhea Battle's sign = mastoid ecchymoses Raccoon eyes = periorbital ecchymoses

- characterized as longitudinal or transverse relative to the long axis of the petrous temporal bone
- rarely are temporal bone fractures purely transverse or longitudinal, often it is a mixed picture

### Diagnosis

- otoscopy
- do not syringe or manipulate external auditory meatus due to risk of inducing meningitis via TM perforation
- CT head
- audiology, facial nerve tests (for transverse fractures), Schirmer's test (of lacrimation), stapedial reflexes if CN VII palsy
- if suspecting CSF leak: look for halo sign, send fluid for  $\beta$ -2 transferrin

### Treatment

- ABCs
- medical – expectant, prevent otogenic meningitis
- surgical – explore temporal bone, indications:
  - CN VII palsy (immediate and complete)
  - gunshot wound
  - depressed fracture of external auditory meatus
  - early meningitis (mastoidectomy)
  - bleeding intracranially from sinus
  - CSF otorrhea (may resolve spontaneously)

### Complications

- acute otitis media  $\pm$  labyrinthitis  $\pm$  mastoiditis
- meningitis/epidural abscess/brain abscess
- post-traumatic cholesteatoma

Figure 18. Types of temporal bone fractures

#### Signs of Basilar Skull Fracture

Battle's Sign: ecchymosis of the mastoid process of the temporal bone

Raccoon Eyes

CSF Rhinorrhea/Otorrhea

Cranial Nerve Involvement: facial palsy  
→ CN VII, nystagmus → CN VI, facial numbness → CN V

**The halo sign:** the double ringed appearance of CSF fluid on white filter paper as it separates out from blood.

Hemotympanum can be indicative of temporal bone trauma.

#### House-Brackmann Facial Nerve Grading System

Grade I: Normal facial motor function

Grade II: Mild dysfunction

- Slight weakness
- Normal symmetry and tone at rest
- Complete eye closure

Grade III: Moderate dysfunction

- Obvious weakness
- Grade IV: Moderately severe dysfunction
- Obvious weakness
- $\pm$  disfiguring asymmetry
- Incomplete eye closure
- No forehead motion
- Mouth asymmetric motion

Grade V: Severe dysfunction

- Barely perceptible motion of mouth
- Asymmetric at rest

Grade VI: Total paralysis

- No movement

## Facial Nerve (CN VII) Paralysis

### Etiology

- supranuclear and nuclear (MS, poliomyelitis, cerebral tumours)
- infranuclear (see Table 9)

### Treatment

- treat according to etiology plus provide corneal protection with artificial tears, nocturnal lid taping, tarsorrhaphy, gold weighting of upper lid
- facial paralysis that does not resolve with time or with medical treatment will often be referred for possible reanimation techniques to restore function
  - common reanimation techniques include:
    - ♦ direct facial nerve anastomosis
    - ♦ interpositional grafts
    - ♦ anastomosis to other motor nerves
    - ♦ muscle transpositions

Table 9. Differential Diagnosis of Peripheral Facial Paralysis (PFP)

Etiology	Incidence	Findings	Investigations	Treatment, Follow-up, and Prognosis (Px)
<b>Bell's Palsy</b> Idiopathic, (HSV) infection of the facial nerve Diagnosis of exclusion	80 to 90% of PFP  <b>Risk Factors:</b> Diabetes Pregnancy Viral prodrome (50%)	<b>Hx:</b> Acute onset Numbness of ear Schirmer's test Recurrence (12%) + FHx (14%) Hyperacusis (30%)  <b>P/E:</b> Paralysis or paresis of all muscle groups on one side of the face Absence of signs of CNS disease Absence of signs of ear or CPA diseases	Stapedial reflex absent Audiology normal (or baseline) EMG – best measure for prognosis Topographic testing MRI with gadolinium – enhancement of CN VII and VIII High resolution CT	<b>Rx:</b> Protect the eye to prevent exposure keratitis with patching or tarsorrhaphy Systemic steroids may lessen degeneration and hasten recovery Consider antiviral (acyclovir)  <b>F/U:</b> Spontaneous remission should begin within 3 wk of onset Delayed (3 to 6 mo) recovery portends at least some functional loss  <b>Px:</b> 90% recover spontaneously and completely overall; >90% recovery if paralysis was incomplete Poorer if hyperacusis, > 60 yr, diabetes, HTN, severe pain
<b>Ramsay-Hunt Syndrome (Herpes Zoster Oticus)</b> Varicella zoster infection of CN VII/VIII	4.5 to 9% of PFP  <b>Risk Factors:</b> > 60 yr Impaired immunity Cancer Radiotherapy Chemotherapy	<b>Hx:</b> Hyperacusis SNHL Severe pain of pinna, mouth, or face  <b>P/E:</b> Vesicles on pinna, ext. canal (erupt 3-7 d after onset of pain) Associated herpes zoster ophthalmicus (uveitis, keratoconjunctivitis, optic neuritis, or glaucoma)	Stapedial reflex absent Audiology – SNHL Viral ELISA studies to confirm MRI with gadolinium (86% of facial nerves enhance)	<b>Rx:</b> Pt. should avoid touching lesions to prevent spread of infection Systemic steroids can relieve pain, vertigo, avoid postherpetic neuralgia Acyclovir may lessen pain, aid healing of vesicles  <b>F/U:</b> 2 to 4 wk  <b>Px:</b> Poorer prognosis than Bell's palsy; 22% recover completely, 66% incomplete paralysis, 10% complete paralysis
<b>TEMPORAL BONE FRACTURE</b>				
<b>Longitudinal (90%)</b>	20% have PFP	<b>Hx:</b> Blow to side of head  <b>P/E:</b> Trauma to side of head Neuro findings consistent with epidural/subdural bleed	Skull X-rays CT head	<b>Px:</b> Injury usually due to stretch or impingement; may recover with time
<b>Transverse (10%)</b>	40% have PFP	<b>Hx:</b> Blow to frontal or occipital area  <b>P/E:</b> Trauma to front or back of head	Skull X-rays CT head	<b>Px:</b> Nerve transection more likely
<b>Iatrogenic</b>		Variable (depending on level of injury)	Wait for lidocaine to wear off EMG	<b>Rx:</b> Exploration if complete nerve paralysis No exploration if any movement present

Source: Paul Warrick, MD

## Rhinitis

### Definition

- inflammation of the lining (mucosa) of the nasal cavity

Table 10. Classification of Rhinitis

Inflammatory	Non-Inflammatory
<ul style="list-style-type: none"> <li>Perennial non-allergic               <ul style="list-style-type: none"> <li>Asthma, ASA sensitivity</li> </ul> </li> <li>Allergic               <ul style="list-style-type: none"> <li>Seasonal</li> <li>Perennial</li> </ul> </li> <li>Atrophic               <ul style="list-style-type: none"> <li>Primary: <i>Klebsiella ozena</i> (especially in elderly)</li> <li>Acquired: post-surgery if too much mucosa or turbinate has been resected</li> </ul> </li> <li>Infectious               <ul style="list-style-type: none"> <li>Viral: e.g. rhinovirus, influenza, parainfluenza, etc.</li> <li>Bacterial: e.g. <i>S. aureus</i></li> <li>Fungal</li> <li>Granulomatous: TB, syphilis, leprosy</li> </ul> </li> <li>Non-infectious               <ul style="list-style-type: none"> <li>Sarcoidosis</li> <li>Granulomatosis with polyangiitis</li> </ul> </li> <li>Irritant               <ul style="list-style-type: none"> <li>Dust</li> <li>Chemicals</li> <li>Pollution</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Rhinitis medicamentosa               <ul style="list-style-type: none"> <li>Topical decongestants</li> </ul> </li> <li>Hormonal               <ul style="list-style-type: none"> <li>Pregnancy</li> <li>Estrogens</li> <li>Thyroid</li> </ul> </li> <li>Idiopathic vasomotor</li> </ul>

**Rhinitis medicamentosa:** rebound congestion due to the overuse of intranasal vasoconstrictors. For prevention, use of these medications for only 5-7 d is recommended.

**Table 11. Nasal Discharge: Character and Associated Conditions**

Character	Associated Conditions
Watery/mucoid	Allergic, viral, vasomotor, CSF leak (halo sign)
Mucopurulent	Bacterial, foreign body
Serosanguinous	Neoplasia
Bloody	Trauma, neoplasia, bleeding disorder, hypertension/vascular disease

## Allergic Rhinitis (Hay Fever)

### Definition

- rhinitis characterized by an IgE-mediated hypersensitivity to foreign allergens
- acute-and-seasonal or chronic-and-perennial
- perennial allergic rhinitis often confused with recurrent colds

### Etiology

- when allergens contact the respiratory mucosa, specific IgE antibody is produced in susceptible hosts
- concentration of allergen in the ambient air correlates directly with the rhinitis symptoms

### Epidemiology

- age at onset usually <20 yr
- more common in those with a personal or family history of allergies/atopy

### Clinical Features

- nasal: obstruction with pruritus, sneezing
- clear rhinorrhea (containing increased eosinophils)
- itching of eyes with tearing
- frontal headache and pressure
- mucosa: swollen, pale, "boggy"
- seasonal (summer, spring, early autumn)
  - pollens from trees
  - lasts several weeks, disappears and recurs following year at same time
- perennial
  - inhaled: house dust, wool, feathers, foods, tobacco, hair, mould
  - ingested: wheat, eggs, milk, nuts
  - occurs intermittently for years with no pattern or may be constantly present

### Complications

- chronic sinusitis/polyps
- serous otitis media

### Diagnosis

- history
- direct exam
- allergy testing

### Treatment

- education: identification and avoidance of allergen
- nasal irrigation with saline
- antihistamines (e.g. diphenhydramine, fexofenadine)
- oral decongestants (e.g. pseudoephedrine, phenylpropanolamine)
- topical decongestant (may lead to rhinitis medicamentosa)
- other topicals: steroids (fluticasone), disodium cromoglycate, antihistamines, ipratropium bromide
- oral steroids if severe
- desensitization by allergen immunotherapy

Congestion reduces nasal airflow and allows the nose to repair itself (i.e. washes away the irritants). Treatment should focus on the initial insult rather than target this defense mechanism.

## Vasomotor Rhinitis

- neurovascular disorder of nasal parasympathetic system (vidian nerve) affecting mucosal blood vessels
- nonspecific reflex hypersensitivity of nasal mucosa
- caused by:
  - temperature change
  - alcohol, dust, smoke
  - stress, anxiety, neurosis
  - endocrine: hypothyroidism, pregnancy, menopause
  - parasympathomimetic drugs
  - beware of rhinitis medicamentosa: reactive vasodilation due to prolonged use (>5 d) of nasal drops and sprays (Dristan®, Otrivin®)

### Clinical Features

- chronic intermittent nasal obstruction, varies from side to side
- rhinorrhea: thin, watery
- mucosa and turbinates: swollen
- nasal allergy must be ruled out

### Treatment

- elimination of irritant factors
- parasympathetic blocker (Atrovent® nasal spray)
- steroids (e.g. beclomethasone, fluticasone)
- surgery (often of limited lasting benefit): electrocautery, cryosurgery, laser treatment or removal of inferior or middle turbinates
- vidian neurectomy (rarely done)
- symptomatic relief with exercise (increased sympathetic tone)

## Rhinosinusitis

### Pathogenesis of Rhinosinusitis

- ostial obstruction or dysfunctional cilia permit stagnant mucous and consequently infection
- all sinuses drain to a common prechamber under the middle meatus called the osteomeatal complex

### Definition

- inflammation of the mucosal lining of the sinuses and nasal passages

### Classification

- acute: <4 wk
- subacute: 4-8 wk
- chronic: >8-12 wk

**Table 12. Etiologies of Rhinosinusitis**

<b>Ostial obstruction</b>	Inflammation	<ul style="list-style-type: none"> <li>• URTI</li> <li>• Allergy</li> </ul>
	Mechanical	<ul style="list-style-type: none"> <li>• Septal deviation</li> <li>• Turbinate hypertrophy</li> <li>• Polyps</li> <li>• Tumours</li> <li>• Adenoid hypertrophy</li> <li>• Foreign body</li> <li>• Congenital abnormalities (e.g. cleft palate)</li> </ul>
	Immune	<ul style="list-style-type: none"> <li>• Granulomatosis with polyangiitis</li> <li>• Lymphoma, leukemia</li> <li>• Immunosuppressed patients (e.g. neutropenics, diabetics, HIV)</li> </ul>
<b>Systemic</b>		<ul style="list-style-type: none"> <li>• Cystic fibrosis</li> <li>• Immotile cilia (e.g. Kartagener's)</li> </ul>
<b>Direct extension</b>	Dental	<ul style="list-style-type: none"> <li>• Infection</li> </ul>
	Trauma	<ul style="list-style-type: none"> <li>• Facial fractures</li> </ul>

## Acute Bacterial Rhinosinusitis

### Definition

- bacterial infection of the paranasal sinuses and nasal passages lasting >7 d
- clinical diagnosis requiring  $\geq 2$  major symptoms, at least one of the symptoms is either nasal obstruction or purulent/dicoloured nasal discharge
  - **major symptoms**
    - ♦ facial pain/pressure/fullness
    - ♦ nasal obstruction
    - ♦ purulent/dicoloured nasal discharge
    - ♦ hyposmia/anosmia
  - **minor symptoms**
    - ♦ headache
    - ♦ halitosis
    - ♦ fatigue
    - ♦ dental pain
    - ♦ cough
    - ♦ ear pain/fullness

### Etiology

- bacteria: *S. pneumoniae* (35%), *H. influenzae* (35%), *M. catarrhalis*, *S. aureus*, anaerobes (dental)
- children are more prone to a bacterial etiology, but viral is still more common
- maxillary sinus most commonly affected
- must rule out fungal causes (mucormycosis) in immunocompromised hosts (especially if painless, black or pale mucosa on examination)

### Clinical Features

- sudden onset of
  - nasal blockage/congestion and/or purulent nasal discharge/posterior nasal drip
  - $\pm$  facial pain or pressure, hyposmia, sore throat
- persistent/worsening symptoms >5 to 7 d or presence of purulence for 3 to 4 d with high fever
- speculum exam: erythematous mucosa, mucopurulent discharge, pus originating from the middle meatus
- predisposing factors: viral URTI, allergy, dental disease, anatomical defects
- differentiate from acute viral rhinosinusitis (course: <10 d, peaks by 3 d)

### Management

- depends on symptom severity (i.e. intensity/duration of symptoms, impact on quality of life)
- mild-moderate: INCS
  - if no response within 72 h, add antibiotics
- severe: INCS + antibiotics
- antibiotics:
  - 1st line: amoxicillin x 10 d (TMP-SMX or macrolide if penicillin allergy)
- if no response to 1st line antibiotics within 72 h, switch to 2nd line
  - 2nd line: fluoroquinolones or amoxicillin-clavulanic acid inhibitors
- adjuvant therapy (saline irrigation, analgesics, oral/topical decongestant) may provide symptomatic relief
- CT indicated only if complications are suspected

#### Acute Rhinosinusitis Complications

Consider hospitalization if any of the following are suspected

- Orbital (Chandler's classification)
  - Periorbital cellulitis
  - Orbital cellulitis
  - Subperiosteal abscess
  - Orbital abscess
  - Cavernous sinus thrombosis
- Intracranial
  - Meningitis
  - Abscess
- Bony
  - Subperiosteal frontal bone abscess ("Pott's Puffy tumour")
  - Osteomyelitis
- Neurologic
  - Superior orbital fissure syndrome (CN III/IV/VI palsy, immobile globe, dilated pupils, ptosis, V1 hypoesthesia)
  - Orbital apex syndrome (as above, plus neuritis, papilledema, decreased visual acuity)

#### FESS = Functional Endoscopic Sinus Surgery

Opening of the entire osteomeatal complex in order to facilitate drainage while sparing the sinus mucosa.

## Chronic Rhinosinusitis

### Definition

- inflammation of the mucosa of paranasal sinuses and nasal passages >8 to 12 wk
- diagnosis requiring  $\geq 2$  major symptoms for >8 to 12 wk and  $\geq 1$  objective finding of inflammation of the paranasal sinuses (CT/endoscopy)

### Etiology

- unclear etiology but the following may contribute or predispose:
  - inadequate treatment of acute rhinosinusitis
  - bacterial colonization/biofilms
    - ♦ *S. aureus*, *enterobacteriaceae*, *pseudomonas*, *S. pneumoniae*, *H. influenzae*,  $\beta$ -hemolytic *streptococci*
  - fungal infection (e.g. *Aspergillus*, *Zygomycetes*, *Candida*)
  - anatomic abnormality (e.g. lost ostia patency, deviated septum – predisposing factors)
  - allergy/allergic rhinitis
  - ciliary disorder (e.g. cystic fibrosis, Kartagener's)
  - chronic inflammatory disorder (e.g. granulomatosis with polyangiitis)
  - untreated dental disease

Allergic fungal rhinosinusitis is a chronic sinusitis affecting mostly young, immunocompetent, atopic individuals. Treatment options include FESS  $\pm$  intranasal topical steroids, antifungals, and immunotherapy.

**Clinical Features** (similar to acute, but less severe)

- chronic nasal obstruction
- purulent anterior/posterior nasal discharge
- facial congestion/fullness
- facial pain/pressure
- hyposmia/anosmia
- halitosis
- chronic cough
- maxillary dental pain

**Management**

- identify and address contributing or predisposing factors
- obtain CT or perform endoscopy
- if polyps present: INCS, oral steroids  $\pm$  antibiotics (if signs of infection), refer to Otolaryngologist/Head and Neck Surgeon
- if polyps absent: INCS, antibiotics, saline irrigation, oral steroids (severe cases)
- antibiotics for 3 to 6 wk
  - amoxillin-clavulanic acid inhibitors, fluoroquinolone (moxifloxacin), macrolide (clarithromycin), clindamycin, Flagyl® (metronidazole)
- surgery if medical therapy fails or fungal sinusitis: FESS, balloon sinuplasty

**Complications**

- same as acute sinusitis, mucocele

## Epistaxis

**Blood Supply to the Nasal Septum** (see Figure 4, OT3)

1. Superior posterior septum:
    - internal carotid  $\rightarrow$  ophthalmic  $\rightarrow$  anterior/posterior ethmoidal
  2. Posterior septum:
    - external carotid  $\rightarrow$  internal maxillary  $\rightarrow$  sphenopalatine artery  $\rightarrow$  nasopalatine
  3. Lower anterior septum:
    - external carotid  $\rightarrow$  facial artery  $\rightarrow$  superior labial artery  $\rightarrow$  nasal branch
    - external carotid  $\rightarrow$  internal maxillary  $\rightarrow$  descending palatine  $\rightarrow$  greater palatine
- these arteries all anastomose to form Kiesselbach's plexus, located at Little's area (anterior-inferior portion of the cartilaginous septum)
  - bleeding from above middle turbinate is internal carotid, and from below is external carotid

90% of nose bleeds occur in Little's area.

**Table 13. Etiology of Epistaxis**

Type	Causes
<b>Local</b>	Trauma (most common) <ul style="list-style-type: none"> <li>• Fractures: facial, nasal</li> <li>• Self-induced: digital, foreign body</li> </ul>
	Iatrogenic: nasal, sinus, orbit surgery
	Barometric changes
	Nasal dryness: dry air $\pm$ septal deformities
	Septal perforation
<b>Systemic</b>	Chemical: cocaine, nasal sprays, ammonia, etc.
	Coagulopathies <ul style="list-style-type: none"> <li>• Meds: anticoagulants, NSAIDs</li> <li>• Hemophilias, von Willebrand's</li> <li>• Hematological malignancies</li> <li>• Liver failure, uremia</li> </ul>
	Vascular: hypertension, atherosclerosis, Osler-Weber-Rendu (hereditary hemorrhagic telangiectasia)
	Others: GPA, SLE
	Tumours <ul style="list-style-type: none"> <li>• Benign: polyps, inverting papilloma, angiofibroma</li> <li>• Malignant: squamous cell carcinoma, esthesioneuroblastoma</li> </ul>
	Inflammation <ul style="list-style-type: none"> <li>• Rhinitis: allergic, non-allergic</li> <li>• Infections: bacterial, viral, fungal</li> </ul>
	Idiopathic

**Special Cases**

- Adolescent male with unilateral recurrent epistaxis – consider juvenile nasopharyngeal angiofibroma (JNA). This is the most common benign tumour of the nasopharynx
- Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

**Investigations**

- CBC, PT/PTT (if indicated)
- x-ray, CT as needed

**Treatment**

- locate bleeding and achieve hemostasis

**1. ABCs**

- patient leans forward to minimize swallowing blood and avoid airway obstruction
- apply constant firm pressure for 20 min on cartilaginous part of nose (not bony pyramid)
- if significant bleeding, assess vitals for signs of hemorrhagic shock  $\pm$  IV NS, cross match blood

## 2. Determine Site of Bleeding

- anterior/posterior hemorrhage defined by location in relationship to bony septum
- visualize nasal cavity with speculum
- use cotton pledget with topical lidocaine ± topical decongestant (i.e. Otrivin®) to help identify area of bleeding (often anterior septum)
- if suspicion of bleeding disorder, coagulation workup (platelet number and platelet function assay)

## 3. Control the Bleeding

- first line topical vasoconstrictors (Otrivin®)
- if first line fails and bleeding adequately visualized, cauterize with silver nitrate
- **do not cauterize both sides of the septum** at one time due to risk of septal perforation from loss of septal blood supply

### A. Anterior hemorrhage treatment

- if fail to achieve hemostasis with cauterization:
  - ♦ place anterior pack\* with half inch Vaseline®-soaked ribbon gauze strips layered from nasal floor toward nasal roof extending to posterior choanae or lubricated absorbable packing (i.e. Gelfoam wrapped in Surgicel®) for 2 to 3 d
  - ♦ can also attempt packing with Merocel® or nasal tampons of different shapes
  - ♦ can also apply Floseal® (hemostatic matrix consisting of topical human thrombin and cross-linked gelatin) if other methods fail

### B. Posterior hemorrhage treatment

- if unable to visualize bleeding source, then usually posterior source:
  - ♦ place posterior pack\* using a Foley catheter, gauze pack, or Epistat® balloon
  - ♦ subsequently, layer anterior packing bilaterally
  - ♦ admit to hospital with packs in for 3 to 5 d
  - ♦ watch for complications: hypoxemia (naso-pulmonic reflex), toxic shock syndrome (Rx: remove packs immediately), pharyngeal fibrosis/stenosis, alar/septal necrosis, aspiration

### C. If anterior/posterior packs fail to control epistaxis

- ligation or embolization of culprit arterial supply by interventional radiology
- ± septoplasty

\* antibiotics for any posterior pack or any pack left for >48 h because of risk of toxic shock syndrome

## 4. Prevention

- prevent drying of nasal mucosa with humidifiers, saline spray, or topical ointments
- avoidance of irritants
- medical management of hypertension and coagulopathies

# Hoarseness

## Definitions

- hoarseness: change in voice quality, ranging from voice harshness to voice weakness. Reflects abnormalities anywhere along the vocal tract from oral cavity to lungs
- dysphonia: a general alteration in voice quality
- aphonia: no sound emanates from vocal folds

If hoarseness present for >2 wk in a smoker, laryngoscopy must be done to rule out malignancy.

# Acute Laryngitis

## Definition

- <2 wk inflammatory changes in laryngeal mucosa

## Etiology

- viral: influenza, adenovirus
- bacterial: Group A *Streptococcus*
- mechanical acute voice strain → submucosal hemorrhage → vocal cord edema → hoarseness
- environmental: toxic fume inhalation

## Clinical Features

- URTI symptoms, hoarseness, aphonia, cough attacks, ± dyspnea
- true vocal cords erythematous/edematous with vascular injection and normal mobility

## Treatment

- usually self-limited, resolves within ~1 wk
- voice rest
- humidification
- hydration
- avoid irritants (e.g. smoking)
- treat with antibiotics if there is evidence of coexistent bacterial pharyngitis

## Vocal Cord Paralysis

**Unilateral:** affected cord lies in the paramedian position, inadequate glottic closure during phonation → weak, breathy voice. Usually medializes with time whereby phonation and aspiration improve. Treatment options include voice therapy, injection laryngoplasty (Radiesse), medialization using silastic block.

**Bilateral:** cords rest in midline therefore voice remains good but respiratory function is compromised and may present as stridor. If no respiratory issues, may monitor closely and wait for improvement. If respiratory issues, intubate and will likely require a tracheotomy.

## Chronic Laryngitis

### Definition

- >2 wk inflammatory changes in laryngeal mucosa

### Etiology

- repeated attacks of acute laryngitis
- chronic irritants (dust, smoke, chemical fumes)
- chronic voice strain
- chronic rhinosinusitis with postnasal drip
- chronic alcohol use
- esophageal disorders: GERD, Zenker's diverticulum, hiatus hernia
- systemic: allergy, hypothyroidism, Addison's disease

### Clinical Features

- chronic dysphonia: rule out malignancy
- cough, globus sensation, frequent throat clearing 2° to GERD
- laryngoscopy: cords erythematous, thickened with ulceration/granuloma formation, and normal mobility

### Treatment

- remove offending irritants
- treat related disorders (e.g. antisecretory therapy for GERD)
- speech therapy with voice rest
- ± antibiotics ± steroids to decrease inflammation
- laryngoscopy to rule out malignancy

## Vocal Cord Polyps

### Definition

- structural manifestation of vocal cord irritation
- acutely, polyp forms 2° to capillary damage in the subepithelial space during extreme voice exertion

### Etiology

- most common benign tumour of vocal cords
- voice strain (muscle tension dysphonia)
- laryngeal irritants (GERD, allergies, tobacco)

### Epidemiology

- 30 to 50 yr of age
- M>F

### Clinical Features

- hoarseness, aphonia, cough attacks ± dyspnea
- pedicled or sessile polyp on free edge of vocal cord
- typically polyp asymmetrical, soft, and smooth
- more common on the anterior 1/3 of the vocal cord
- intermittent respiratory distress with large polyps

### Treatment

- avoid irritants
- endoscopic laryngeal microsurgical removal if persistent or if high risk of malignancy

#### Vocal Cords: Polyps vs. Nodules

Polyps	Nodule
Unilateral, asymmetric	Bilateral
Acute onset May resolve spontaneously	Gradual onset Often follow a chronic course
Subepithelial capillary breakage	Acute: submucosal hemorrhage or edema Chronic: hyalinization within submucous lesion
Soft, smooth, fusiform, pedunculated mass	Acute: small, discrete nodules Chronic: hard, white, thickened fibrosed nodules
Surgical excision if persistent or in presence of risk factors for laryngeal cancer	Surgical excision if refractory

## Vocal Cord Nodules

### Definition

- vocal cord callus
- aka "screamer's or singer's nodules"

### Etiology

- early nodules occur 2° to submucosal hemorrhage
- mature nodules result from hyalinization which occurs with long term voice abuse
- chronic voice strain
- frequent URTI, smoke, alcohol

**Epidemiology**

- frequently in singers, children, bartenders, and school teachers
- F>M

**Clinical Features**

- hoarseness worst at end of day
- on laryngoscopy:
  - often bilateral
  - at the junction of the anterior 1/3 and posterior 2/3 of the vocal cords – point of maximal cord vibration
- chronic nodules may become fibrotic, hard, and white

**Treatment**

- voice rest
- hydration
- speech therapy
- avoid irritants
- surgery rarely indicated for refractory nodules

## Benign Laryngeal Papillomas

**Etiology**

- HPV types 6, 11
- possible hormonal influence, possibly acquired during delivery

**Epidemiology**

- biphasic distribution: 1) birth to puberty (most common laryngeal tumour) and 2) adulthood

**Clinical Features**

- hoarseness and airway obstruction
- can seed into tracheobronchial tree
- highly resistant to complete removal
- some juvenile papillomas resolve spontaneously at puberty
- may undergo malignant transformation
- laryngoscopy shows wart-like lesions in supraglottic larynx and trachea

**Treatment**

- microdebridement or CO<sub>2</sub> laser
- adjuvants under investigation: interferon, cidofovir, acyclovir
- HPV vaccine may prevent/decrease the incidence but more research is needed

## Laryngeal Carcinoma

- see *Neoplasms of the Head and Neck*, OT34

## Salivary Glands

### Sialadenitis

**Definition**

- inflammation of salivary glands

**Etiology**

- viral most common (mumps)
- bacterial causes: *S. aureus*, *S. pneumoniae*, *H. influenzae*
- obstructive vs. non-obstructive
- obstructive infection involves salivary stasis and bacterial retrograde flow

**Predisposing Factors**

- HIV
- anorexia/bulimia
- Sjögren's syndrome
- Cushing's, hypothyroidism, DM
- hepatic/renal failure
- meds that increase stasis: diuretics, TCAs,  $\beta$ -blockers, anticholinergics, antibiotics
- sialolithiasis (can cause chronic sialadenitis)

**Clinical Features**

- acute onset of pain and edema of parotid or submandibular gland that may lead to marked swelling
- $\pm$  fever
- $\pm$  leukocytosis
- $\pm$  suppurative drainage from punctum of the gland

**Investigations**

- U/S imaging to differentiate obstructive vs. non-obstructive sialadenitis

**Treatment**

- bacterial: treat with cloxacillin  $\pm$  abscess drainage, sialogogues
- viral: no treatment

Mumps usually presents with bilateral parotid enlargement  $\pm$  sensorineural hearing loss  $\pm$  orchitis.

## Sialolithiasis

**Definition**

- ductal stone (mainly hydroxyapatite) in adults, sand/sludge in children, leading to chronic sialadenitis
- 80% in submandibular gland, <20% in parotid gland, ~1% in sublingual gland

**Risk Factors**

- any condition causing duct stenosis or a change in salivary secretions (e.g. dehydration, diabetes, EtOH, hypercalcemia, psychiatric medication)

**Clinical Features**

- pain and tenderness over involved gland
- intermittent swelling related to meals
- digital palpation reveals presence of calculus

**Investigations**

- ultrasound  $\pm$  sialogram

**Treatment**

- may resolve spontaneously
- encourage salivation to clear calculus
- massage, analgesia, antibiotics, sialogogues (e.g. lemon wedges, sour lemon candies), warm compresses
- remove calculi endoscopically, by dilating duct or orifice, or by excision through floor of the mouth
- if calculus is within the gland parenchyma, the whole gland must be excised

Bilateral enlargement of the parotid glands may be a manifestation of a systemic disease, such as Sjögren's or an eating disorder (i.e. anorexia, bulimia).

## Salivary Gland Neoplasms

**Etiology**

- anatomic distribution
  - parotid gland: 70-85%
  - submandibular gland: 8-15%
  - sublingual gland: 1%
  - minor salivary glands, most concentrated in hard palate: 5-8%
- malignant (see Table 15, OT35 and Table 16, OT36)
- benign
  - benign mixed (pleomorphic adenoma): 80%
  - Warthin's tumour (5 to 10% bilateral, M>F): 10%
  - cysts, lymph nodes and adenomas: 10%
  - oncocytoma: <1%

**Epidemiology**

- 3 to 6% of all head and neck neoplasms in adults
- mean age at presentation: 55 to 65
- M=F

A mass sitting above an imaginary line drawn between the mastoid process and angle of the mandible is a parotid neoplasm until proven otherwise.

## Parotid Gland Neoplasms

### Clinical Features

- 80% benign (pleomorphic adenoma – most common), 20% malignant (mucoepidermoid – most common)
- painless slow-growing mass
- if bilateral, suggests benign process (Warthin's tumour, Sjögren's, bulimia, mumps) or possible lymphoma

### Investigations

- FNA biopsy
- CT or MRI to determine extent of tumour

### Treatment

- treatment of choice is surgery for all salivary gland neoplasms – benign and malignant
- pleomorphic adenomas are excised due to risk of malignant transformation (5% risk over prolonged period of time)
- superficial tumour
  - superficial parotidectomy above plane of CN VII ± radiation
  - incisional biopsy contraindicated
- deep lesion
  - near-total parotidectomy sparing as much of CN VII as possible
  - if CN VII involved then it is removed and cable grafted
- complications of parotid surgery
  - hematoma, infection, salivary fistula, temporary facial paresis, Frey's syndrome (gustatory sweating)

### Prognosis

- benign: excellent, <5% of pleomorphic adenomas may recur
- malignant: dependent on stage and type of malignancy (see OT36)

#### DDx Parotid Tumour

##### Benign

- Pleomorphic adenoma
- Warthin's tumour (more common in men)
- Benign lymphoepithelial cysts

##### Malignant

- Mucoepidermoid carcinoma
- Adenoid cystic carcinoma
- Acinic cell carcinoma

Frey's syndrome is a post-operative complication characterized by gustatory sweating. It is due to aberrant innervation of cutaneous sweat glands by parasympathetic nerve fibres that are divided during surgery.

## Neck Masses

### Approach to a Neck Mass

- ensure that the neck mass is not a normal neck structure (hyoid, transverse process of C1 vertebra, prominent carotid bulb)
- any neck mass persisting for more than 2 wk should be investigated for possible neoplastic causes

**Table 14. Acquired Causes of Neck Lumps According to Age**

Age (yr)	Possible Causes of Neck Lump		
<20	1. Congenital	2. Inflammatory/Infectious	3. Neoplastic
20-40	1. Inflammatory	2. Congenital	3. Neoplastic
>40	1. Neoplastic	2. Inflammatory	3. Congenital

### Differential Diagnosis

- congenital
  - lateral (branchial cleft cyst, lymphatic/venous/venolymphatic malformation)
  - midline (thyroglossal duct cyst, dermoid cyst, laryngocele)
- infectious/inflammatory
  - reactive lymphadenopathy (2° to tonsillitis, pharyngitis)
  - infectious mononucleosis
  - Kawasaki, Kikuchi, Kimura
  - HIV
  - salivary gland calculi, sialadenitis
  - thyroiditis
- granulomatous disease
  - mycobacterial infections
  - sarcoidosis
- neoplastic
  - lymphoma
  - salivary gland tumours
  - thyroid tumours
  - metastatic malignancy ("unknown primary")

#### Inflammatory vs. Neoplastic Neck Masses

	Inflammatory	Neoplastic
<b>History</b>		
Painful	Y	N
H&N infection	Y	N
Fever	Y	N
Weight loss	N	Y
CA risk factors	N	Y
Age	Younger	Older
<b>Physical</b>		
Tender	Y	N
Rubbery	Y	Occ.
Rock hard	N	Y
Mobile	Y	± fixed

## Evaluation

### Investigations

- history and physical (including nasopharynx and larynx)
- all other investigations and imaging are dependent upon clinical suspicion following history and physical
- laboratory investigations
  - WBC: infection vs. lymphoma
  - Mantoux TB test
  - thyroid function tests and scan
- imaging
  - neck U/S
  - CT scan
  - angiography: vascularity and blood supply to mass
  - radiologic exam of stomach, bowel and sinuses
- biopsy: for histologic examination
  - FNA: least invasive
  - needle biopsy
  - open biopsy: for lymphoma
- identification of possible primary tumour (rule out a metastatic lymph node from an “unknown primary”)
  - panendoscopy: nasopharyngoscopy, laryngoscopy, esophagoscopy, bronchoscopy with washings, and biopsy of suspicious lesions
  - biopsy of normal tissue of nasopharynx, tonsils, base of tongue, and hypopharynx
  - primary identified 95% of time → stage and treat
  - primary occult 5% of time: excisional biopsy of node for histologic diagnosis → manage with radiotherapy and/or neck dissection (squamous cell carcinoma)

## Congenital Neck Masses

### Branchial Cleft Cysts/Fistula

#### Embryology

- at the 6th week of development, the 2nd branchial arch grows over the 3rd and 4th arches and fuses with the neighbouring caudal pre-cardial swelling forming the cervical sinus
- 3 types of malformations:
  1. branchial fistula: persistent communication between skin and GI tract
  2. branchial sinus: blind-ended tract opening to skin
  3. branchial cyst: persistent cervical sinus with no external opening

#### Clinical Features

- 2nd branchial cleft malformations most common
  - sinuses and fistulae present in infancy as a small opening anterior to the sternocleidomastoid muscle
  - cysts present as a smooth, painless, slowly enlarging lateral neck mass, often following an URTI
- 1st branchial cleft malformations present as sinus/fistula or cyst in preauricular area or over angle of mandible
- 3rd branchial cleft malformations present as recurrent thyroiditis or thyroid abscess and have a tract leading usually to the left pyriform sinus
- there is controversy whether or not 4th branchial cleft anomalies exist, as they may be remnants of the thyrothymic axis

#### Treatment

- surgical removal of cyst or fistula tract
- if infected: allow infection to settle before removal

Figure 19. Branchial cleft cysts

## Thyroglossal Duct Cysts

### Embryology

- thyroid originates as ventral midline diverticulum at base of tongue caudal to junction of 3rd and 4th branchial arches (foramen cecum) and migrates down to inferior aspect of neck
- thyroglossal duct cysts are vestigial remnants of tract

### Clinical Features

- usually presents in childhood or 2nd to 4th decades as a midline cyst that enlarges with URTI and elevates with swallowing and tongue protrusion

### Treatment

- pre-operative antibiotics to reduce inflammation
- small potential for neoplastic transformation so complete excision of cyst and tissue around tract up to foramen cecum at base of tongue with removal of central portion of hyoid bone (Sistrunk procedure) recommended

## Lymphatic Malformation

### Definition

- lymphatic malformation arising from vestigial lymph channels of neck

### Clinical Features

- usually present by age 2
- can be macrocystic (composed of large thin-walled cysts, usually below level of mylohyoid muscle) or microcystic (composed of minute cysts, usually above level of mylohyoid muscle)
- usually painless, soft, compressible
- infection causes a sudden increase in size

### Treatment

- can regress spontaneously after bacterial infection, therefore do not plan surgical intervention until several months after infection
- macrocystic lesions can be treated by sclerotherapy or surgical excision
- microcystic lesions are difficult to treat, but can be debulked

## Neoplasms of the Head and Neck

### Pre-Malignant Disease

- leukoplakia
  - hyperkeratosis
  - risk of malignant transformation 5 to 20%
- erythroplakia
  - red superficial patches adjacent to normal mucosa
  - commonly associated with epithelial dysplasia
  - associated with carcinoma in situ or invasive tumour in 40% of cases
- dysplasia
  - histopathologic presence of mitoses and prominent nucleoli
  - involvement of entire mucosal thickness = carcinoma in situ
  - associated progression to invasive cancer in 15 to 30% of cases

### Investigations

- initial metastatic screen includes chest x-ray
- scans of liver, brain, and bone only if clinically indicated
- CT scan is superior to MRI for the detection of pathologic nodal disease and bone cortex invasion
- MRI is superior to discriminate tumour from mucus and to detect bone marrow invasion
- ± PET scans

### Treatment

- treatment depends on:
  - histologic grade of tumour
  - stage
  - physical and psychological health of patient
  - facilities available
  - expertise and experience of the medical and surgical oncology team
- in general:
  - 1° surgery for malignant oral cavity tumours with radiotherapy reserved for salvage or poor prognostic indicators
  - 1° radiotherapy for nasopharynx, oropharynx, hypopharynx, larynx malignancies with surgery reserved for salvage
  - palliative chemotherapy for metastatic or incurable disease
  - concomitant chemotherapy increases survival in advanced disease
  - chemotherapy has a role as induction therapy prior to surgery and radiation
  - panendoscopy to detect primary disease when lymph node metastasis is identified
  - anti-EGFR treatment (cetuximab, panitumumab) has a role as concurrent therapy with radiation (for advanced local and regional disease)

### Prognosis

- synchronous tumours occur in 9 to 15% of patients
- late development of 2nd primary most common cause of post-treatment failure after 36 mo

**All patients presenting with a head and neck mass should be asked if they are experiencing the following obstructive, referred, or local symptoms:**

- Dyspnea or stridor (positional vs. non-positional)
- Hoarseness or dysphonia
- Otalgia
- Non-healing oral ulcer
- Dysphagia
- Hemoptysis, hematemesis

**Detection of cervical lymph nodes on physical examination:**  
False negative rate: 15 to 30%  
False positive rate: 30 to 40%

**Pathological lymphadenopathy defined radiographically as:**

- A jugulodigastric node > 1.5 cm in diameter, or a retropharyngeal node > 1 cm in diameter
- A node of any size which contains central necrosis

**Common sites of distant metastases for head and neck neoplasms:**  
lungs > liver > bones

**Table 15. Quick Look-Up Summary of Head and Neck Malignancies – Etiology and Epidemiology**

Etiology	Epidemiology	Risk Factors
<b>Oral Cavity</b>		
95% SCC others: sarcoma, melanoma, minor salivary gland tumour	Mean age: 50 to 60 M>F Most common site of H&N cancers 50% on anterior 2/3 of tongue	Smoking/EtOH Poor oral hygiene Leukoplakia, erythroplakia Lichen planus, chronic inflammation Sun exposure – lip HPV infection
<b>Nose and Paranasal Sinus</b>		
75 to 80% SCC Adenocarcinoma (2 <sup>nd</sup> most common) and mucoepidermoid 99% in maxillary/ethmoid sinus 10% arise from minor salivary glands	Mean age: 50 to 70 Rare tumours ↓ incidence in last 5 to 10 yr	Wood/shoe/textile industry Hardwood dust (nasal/ethmoid sinus) Nickel, chromium (maxillary sinus) Air pollution Chronic rhinosinusitis
<b>Carcinoma of the Pharynx – Subtypes (Nasopharynx, Oropharynx, Hypopharynx and Larynx)</b>		
<b>Nasopharynx</b>		
90% SCC ~10% lymphoma	Mean age: 50 to 59 M:F = 2.4:1 Incidence 0.8 per 100,000 100x increased incidence in Southern Chinese	Epstein-Barr virus (EBV) Salted fish Nickel exposure Poor oral hygiene Genetic – Southern Chinese
<b>Oropharynx</b>		
95% SCC – poorly differentiated	Mean age: 50 to 70 M:F = 4:1	Smoking/EtOH HPV Infection
<b>Hypopharynx</b>		
95% SCC 3 sites: 1. pyriform sinus (60%) 2. post-cricoid (30%) 3. post pharyngeal wall (10%)	Mean age: 50 to 70 M>F 8 to 10% of all H&N cancer	Smoking/EtOH
<b>Larynx</b>		
SCC most common 3 sites: 1. supraglottic (30 to 35%) 2. glottic (60 to 65%) 3. subglottic (1%)	Mean age: 45 to 75 M:F = 10:1 45% of all H&N cancer	Smoking/EtOH HPV 16 infection strongly associated with the risk of laryngeal squamous cell cancers (Li et al., 2013)
<b>Salivary Gland</b>		
40% mucoepidermoid 30% adenoid cystic 5% acinic cell 5% malignant mixed 5% lymphoma	Mean age: 55 to 65 M=F 3 to 6% of all H&N cancer Rate of malignancy: Parotid 15 to 25% Submandibular 37 to 43% Minor salivary >80%	
<b>Thyroid ( 90% benign – 10% malignant)</b>		
>80% papillary 5-15% follicular 5% medullary <5% anaplastic 1 to 5% Hurthle cell 1 to 2% metastatic	Children Adults <30 or >60 Nodules more common in females Malignancy more common in males	Radiation exposure Family history – papillary CA or multiple endocrine neoplasia – MEN II Older age Male Papillary – Gardner's, Cowden's, familial adenomatous polyposis (FAP)
<b>Parathyroid</b>		
	Mean age: 44 to 55 yr Rare tumour	

**Risk Factors for Head and Neck Cancer include:**

- Smoking
- EtOH (this is synergistic with smoking)
- Radiation
- Occupational/Environmental exposures
- Oral HPV infection (independent of smoking and EtOH exposure)

The smaller the salivary gland, the greater the likelihood that a mass in the gland is malignant.

**Table 16. Quick Look-Up Summary of Head and Neck Malignancies – Diagnosis and Treatment**

Clinical Features	Investigations	Treatment	Prognosis
<b>Oral Cavity</b> Asymptomatic neck mass (30%) Non-healing ulcer ± bleeding Dysphagia, sialorrhea, dysphonia Oral fetor, otalgia, leukoplakia or erythroplakia (pre-malignant changes or CIS)	Biopsy CT	1° surgery local resection ± neck dissection ± reconstruction 2° radiation	5 yr survival: - T1/T2: 75% - T3/T4: 30 to 35% Poor prognostic indicators: Depth of invasion, close surgical margins location (tongue worse than floor of mouth) Cervical nodes, extra capsular spread
<b>Nose and Paranasal Sinus</b> <b>Early symptoms:</b> Unilateral nasal obstruction Epistaxis, rhinorrhea <b>Late symptoms:</b> 2° to invasion of nose, orbit, nerves, oral cavity, skin, skull base, cribriform plate	CT/MRI Biopsy	Surgery and radiation Chemoradiotherapy	5 yr survival: 30 to 60% Poor prognosis 2° to late presentation
<b>Nasopharynx</b> Cervical nodes (60 to 90%) Nasal obstruction, epistaxis Unilateral otitis media ± hearing loss CN III to VI, IX to XII (25%) Proptosis, voice change, dysphagia	Nasopharyngoscopy Biopsy CT/MRI	1° radiation, chemoradiation Surgery for limited or recurrent disease	5 yr survival: - I: 79% - II: 72% - III: 50 to 60% - IV: 36 to 42%
<b>Oropharynx</b> Odynophagia, otalgia Ulcerated/enlarged tonsil Fixed tongue/trismus/dysarthria Oral fetor, bloody sputum Cervical lymphadenopathy (60%) Distant mets: lung/bone/liver (7%)	Biopsy CT	1° radiation 2° surgery local resection ± neck dissection ± reconstruction	Base of tongue – control rates T1: >90%, T4: 13 to 52% Tonsils – cure rate T1/T2: 90 to 100%, T4: 15 to 33% HPV-positive tumours have an approximately 20% improved overall survival rate
<b>Hypopharynx</b> Dysphagia, odynophagia Otagia, hoarseness Cervical lymphadenopathy	Pharyngoscopy Biopsy CT	1° radiation 2° surgery	5 yr survival: T1: 53% T2/T3: 36-39% T4: 24%
<b>Larynx</b> Dysphagia, odynophagia, globus Otagia, hoarseness, Dyspnea/stridor Cough/hemoptysis Cervical nodes (rare w/ glottic CA)	Laryngoscopy CT/MRI	1° radiation 2° surgery 1° surgery for bulky T4 disease	5 yr survival: T4 >40% (surgery with radiation) Control rate early lesions >90% (radiation) 10 to 12% of small lesions fail radiotherapy
<b>Salivary Gland</b> Painless mass CN VII palsy Cervical lymphadenopathy Rapid growth Invasion of skin Constitutional signs/symptoms	FNA MRI/CT	1° surgery ± neck dissection: Post-op radiotherapy Chemotherapy if unresectable	Parotid: 10 yr survival: 85, 69, 43, and 14% for stages I to IV Submandibular: 2 yr survival: 82%, 5 year: 69% Minor salivary gland: 10 yr survival: 83, 52, 25, 23% for stages I to IV
<b>Thyroid</b> Thyroid mass, cervical nodes Vocal cord paralysis Hyper/hypothyroidism Dysphagia	FNA U/S	1° surgery I <sup>131</sup> for intermediate and high risk well differentiated thyroid cancer	Recurrences occur within 5 yr Need long-term f/u: clinical exam, thyroglobulin
<b>Parathyroid</b> Increased serum Ca <sup>2+</sup> Neck mass Bone disease, renal disease Pancreatitis	Sestamibi	Wide surgical excision Post-op monitoring of serum Ca <sup>2+</sup>	Recurrence rates 1 yr: 27% 5 yr: 82% 10 yr: 91% Mean survival: 6 to 7 yr

## Thyroid Carcinoma

**Table 17. Bethesda Classification of Thyroid Cytology**

Category	Risk of Malignancy
Non-diagnostic or unsatisfactory	Unknown
Benign	0-3%
Follicular lesion of undetermined significance/ Atypia of undetermined significance	5-15%
Follicular/Hurthle cell neoplasms	15-30%
Suspicious for malignancy	60-75%
Malignant	97-99%

**Table 18. Thyroid Carcinoma**

	Papillary	Follicular	Medullary	Anaplastic	Lymphoma
<b>Incidence</b> (% of all thyroid cancers)	70 to 75%	10%	3 to 5% (10% familial 90% sporadic)	<5%	<1%
<b>Route of Spread</b>	Lymphatic	Hematogenous	Lymphatic and hematogenous		
<b>Histology</b>	Orphan Annie nuclei Psammoma bodies Papillary architecture	Capsular/vascular invasion Invasion influences prognosis	Amyloid May secrete calcitonin, prostaglandins, ACTH, serotonin, kallikrein or bradykinin	Giant cells Spindle cells	
<b>Other</b>	Ps – Papillary cancer Popular (most common) Palpable lymph nodes Positive I <sup>131</sup> uptake Positive prognosis Post-op I <sup>131</sup> scan to guide treatments	Fs – Follicular cancer Far away mets Female (3:1) NOT FNA (can't be diagnosed by FNA) Favourable prognosis	Ms – Medullary cancer Multiple endocrine neoplasia (MEN IIa or IIb) aMyloid Median node dissection	More common in elderly 70% in women 20 to 30% have Hx of differentiated thyroid Ca (mostly papillary) or nodular goiter mass Rapidly enlarging neck Rule out lymphoma	Usually non-Hodgkin's lymphoma Rapidly enlarging thyroid mass Hx of Hashimoto's thyroiditis increases risk 60x 4:1 female predominance dysphagia, dyspnea, stridor, hoarseness, neck pain, facial edema, accompanied by "B" symptoms*
<b>Prognosis</b>	98% at 10 yr	92% at 10 yr	50% at 10 yr 20% at 10 yr if detected when clinically palpable	20 to 35% at 1 yr 13% at 10 yr	5 yr survival Stage IE 55%-80% Stage IIE 20%-50% Stage IIE/IV 15%-35%
<b>Treatment</b>	Small tumours: Near total thyroidectomy or lobectomy Diffuse/bilateral: Total thyroidectomy ± Post-op I <sup>131</sup> tx	Small tumours: Near total thyroidectomy/lobectomy/isthmectomy Large/diffuse tumours: Total thyroidectomy	Total thyroidectomy Median lymph node dissection if lateral cervical nodes +ve Modified neck dissection Post-op thyroxine Tracheostomy Screen asymptomatic relatives	Radiation and chemotherapy Small tumours: Total thyroidectomy ± external beam	Non-surgical Combined radiation Chemotherapy (CHOP**)

\*B symptoms = fever, night sweats, weight loss >10% in 6 mo

\*\* CHOP = cyclophosphamide, adriamycin, vincristine, prednisone

### Approach to Thyroid Nodule

- all patients with thyroid nodules require evaluation of serum TSH and ultrasound
- any nodule >5 mm with suspicious sonographic features (particularly microcalcifications) should undergo FNA
- any nodule >1 cm should undergo FNA
- when performing repeat FNA on initially non-diagnostic nodules, U/S-guided FNA should be employed
- nuclear scanning has minimal value in the investigation of the thyroid nodule

**Table 19. Management of the Thyroid Nodule**

Treatment	Indications
Radioiodine therapy	For the treatment of hyperthyroidism or as adjuvant treatment after surgery in the treatment of papillary or follicular carcinoma
Chemotherapy and/or radiotherapy	Anaplastic CA or thyroid lymphoma
Surgical excision	Mass that is "suspicious" on FNA Malignancy other than anaplastic CA or thyroid lymphoma Mass that on FNA is benign but increasing in size on serial imaging and/or >3-4 cm in size Hyperthyroidism not amenable to medical therapy

\*U/S findings: cystic: risk of malignancy <1%, solid: risk of malignancy approx. 10%, solid with cystic components: risk of malignancy same as if solid

**Indications for post-op radioactive iodine ablation – I<sup>131</sup>**  
Adjuvant therapy: decrease recurrent disease  
RAI therapy: treat persistent cancer

# Pediatric Otolaryngology

## Acute Otitis Media (AOM)

### Definition

- acute inflammation of middle ear

### Epidemiology

- 60 to 70% of children have at least 1 episode of AOM before 3 yr of age
- 18 mo to 6 yr most common age group
- peak incidence January to April
- one third of children have had  $\geq 3$  episodes by age 3

### Etiology

- *S. pneumoniae*: 35% of cases (incidence decreasing due to pneumococcus vaccine)
- *H. influenzae*: 25% of cases
- *M. catarrhalis*: 10% of cases
- *S. aureus* and *S. pyogenes* (all  $\beta$ -lactamase producing)
- anaerobes (newborns)
- Gram-negative enterics (infants)
- viral

### Predisposing Factors

- Eustachian tube dysfunction/obstruction:
  - swelling of tubal mucosa:
    - ♦ upper respiratory tract infection (URTI)
    - ♦ allergic rhinitis
    - ♦ chronic rhinosinusitis
  - obstruction/infiltration of Eustachian tube ostium:
    - ♦ tumour: nasopharyngeal carcinoma (adults)
    - ♦ adenoid hypertrophy (not due to obstruction but by maintaining a source of infection)
    - ♦ barotrauma (sudden changes in air pressure)
  - inadequate tensor palati function: cleft palate (even after repair)
  - abnormal Eustachian tube:
    - ♦ Down syndrome (horizontal position of Eustachian tube), Crouzon syndrome, and Apert syndrome
- disruption of action of:
  - cilia of Eustachian tube: Kartagener's syndrome
  - mucus secreting cells
  - capillary network that provides humoral factors, PMNs, phagocytic cells
- immunosuppression/deficiency due to chemotherapy, steroids, diabetes mellitus, hypogammaglobulinemia, cystic fibrosis

### Risk Factors

- bottle feeding, pacifier use
- second-hand smoke
- crowded living conditions (day care/group child care facilities) or sick contacts
- male
- family history

### Pathogenesis

- obstruction of Eustachian tube  $\rightarrow$  air absorbed in middle ear  $\rightarrow$  negative pressure (an irritant to middle ear mucosa)  $\rightarrow$  edema of mucosa with exudate/effusion  $\rightarrow$  infection of exudate from nasopharyngeal secretions

### Clinical Features

- triad of otalgia, fever (especially in younger children), and conductive hearing loss
- rarely tinnitus, vertigo, and/or facial nerve paralysis
- otorrhea if tympanic membrane perforated
- infants/toddlers
  - ear-tugging (this alone is not a good indicator of pathology)
  - hearing loss, balance disturbances (rare)
  - irritable, poor sleeping
  - vomiting and diarrhea
  - anorexia
- otoscopy of TM
  - hyperemia
  - bulging, pus may be seen behind TM
  - loss of landmarks: handle and long process of malleus not visible

#### Clinical Assessment of AOM in Paediatrics JAMA 2010;304:2161-2169

In assessment of AOM in paediatrics, ear pain is the most useful symptom with a likelihood ratio (LR) between 3.0 and 7.3. Useful otoscopic signs include erythematous (LR 8.4, 95% CI 7-11), cloudy (LR 3.4, 95% CI 2.8-4.2), bulging (LR 5.1, 95% CI 3.6-7.3), and immobile tympanic membrane on pneumatic otoscopy (LR 3.1, 95% CI 2.6-3.7).

## Diagnosis and Management

- American Academy of Pediatrics (AAP) Guidelines 2013 suggest the following action statements (adapted):
  - Diagnose AOM if:**
    - Moderate to severe bulging of TM or new onset of otorrhea not due to otitis externa
    - Mild bulging of tympanic membrane and recent (<48 h) ear pain or intense erythema of TM
    - Do not diagnose AOM if no middle ear effusion (based on pneumatic otoscopy or tympanometry)

## Management of AOM

- Assess for pain. If pain present, treat the pain
- For severe unilateral or bilateral AOM (moderate or severe otalgia, or otalgia for 48 h, or temperature 39°), prescribe antibiotics if 6 mo or older
- For nonsevere bilateral AOM (mild otalgia, otalgia <48 h, temperature <39°), prescribe antibiotics if 6 to 23 mo
- For nonsevere unilateral AOM, prescribe antibiotics or observe with close follow up based on joint decision making with parents if 6 to 23 mo
- For nonsevere unilateral or bilateral AOM, prescribe antibiotics or observe with close follow up based on joint decision making with parents if 24 mo or older
- Antibiotic treatment when given should consist of:
  - amoxicillin if child has not received amoxicillin in past 30 d, child does not have purulent conjunctivitis, or child is not allergic to penicillin
  - add  $\beta$ -lactamase coverage if received amoxicillin in past 30 d, has purulent conjunctivitis, or has history of recurrent AOM not responsive to amoxicillin
  - reassess if symptoms worsen or fail to respond to treatment within 48 to 72 h
  - do NOT prescribe prophylactic antibiotics to reduce frequency of AOM
- Tympanostomy tubes can be offered for recurrent AOM (3 episodes in 6 mo, 4 episodes in 1 yr) with 1 episode in preceding 6 mo
- Recommend pneumococcal vaccine and annual influenza vaccine to all children
- Encourage exclusive breastfeeding for at least 6 mo
- Avoid tobacco smoke

- antibiotic treatment hastens resolution: 10 d course
  - 1st line:
    - amoxicillin 80-90 mg/kg/d divided into two doses: safe, effective, and inexpensive
    - if penicillin allergic: macrolide (clarithromycin, azithromycin – high resistance), trimethoprim-sulphamethoxazole (Bactrim®)
  - 2nd line:
    - amoxicillin-clavulanic acid (Clavulin®)
    - cephalosporins: cefuroxime axetil (Ceftin®), ceftriaxone (Rocephin®), cefaclor (Ceclor®), cefixime (Suprax®)
    - AOM deemed unresponsive if clinical signs/symptoms and otoscopic findings persist beyond 48 h of antibiotic treatment
- symptomatic therapy:
  - antipyretics/analgesics (e.g. acetaminophen)
  - decongestants: may relieve nasal congestion but does not treat AOM
- prevention:
  - parent education about risk factors
  - antibiotic prophylaxis: amoxicillin or macrolide shown effective at half therapeutic dose
  - pneumococcal and influenza vaccine
  - surgery:
    - choice of surgical therapy for recurrent AOM depends on whether local factors (Eustachian tube dysfunction) are responsible (use ventilation tubes), or regional disease factors (tonsillitis, adenoid hypertrophy, sinusitis) are responsible

## Complications of AOM

- otologic:
  - TM perforation
  - chronic suppurative OM
  - ossicular necrosis
  - cholesteatoma
  - persistent effusion (often leading to hearing loss)
- CNS:
  - meningitis
  - brain abscess
  - facial nerve paralysis
- other:
  - mastoiditis
  - labyrinthitis
  - sigmoid sinus thrombophlebitis

### Antibiotics for Acute Otitis Media in Children

Cochrane DB Syst Rev 2004;1:CD000219

**Study:** Meta-analysis of Randomized Controlled Trials (RCTs) on children (>6 mo) with acute otitis media comparing any antibiotic regime to placebo.  
**Data Sources:** Cochrane Central Register of Controlled Trials (2003 issue 1), MEDLINE (January 2000 to March 2003), and EMBASE (January 1990 to March 2003) without language restrictions.

**Main Outcomes:** 1) Pain at 24 h, and 2-7 d. 2) Hearing measured by tympanometry at 1 and 3 mo.

**Patients:** Pain: 24 h, 4 studies (n=717); 2-7 d 9 studies (n=2287). Hearing: 1 mo, 3 studies (n=472); 3 mo, 2 studies (n=370).

**Results:** Treatment with antibiotics had no significant impact on pain at 24 h. However, pain at 2-7 d was lower in the antibiotic groups with an NNT of 16 (p<0.00001). Antibiotics had no significant effect on hearing.

**Conclusion:** The role of antibiotics is largely restricted to pain control. This can also be achieved by analgesics. Therefore, parents should be counseled that other analgesics may be a safer option.

### Indications for Myringotomy and Tympanostomy Tubes in Recurrent AOM (RAOM) and OME

- Persistent OME >3 mo
- Lack of response to >3 mo of antibiotic therapy
- Persistent effusion for ≥3 mo after episode of AOM
- RAOM (>3 episodes in 6 mo, or >4 in 12 mo)
- Bilateral conductive hearing loss of >30 dB
- Chronic retraction of the tympanic membrane or pars flaccida
- Bilateral OME lasting >4 to 6 mo
- Craniofacial anomalies predisposing to middle ear infections (e.g. cleft palate)
- Complications of AOM or OME

Otolaryngologists' perceptions of the indications for tympanostomy tube insertion in children. *CMAJ* 2000;162:1285-1288

Clinical indicators myringotomy and tympanostomy tubes. American Academy of Otolaryngology – Head and Neck Surgery, 2010. Available at: <http://www.entnet.org/Practice/Myringotomy-and-Tympanostomy-tubes.cfm>

### Complications of Tympanostomy Tubes

#### Early

- Extrusion
- Blockage
- Persistent otorrhea

#### Late

- Myringosclerosis
- Persistent TM perforation
- Cholesteatoma

## Otitis Media with Effusion (OME)

### Definition

- presence of fluid in the middle ear without signs or symptoms of ear infection

### Epidemiology

- most common cause of pediatric hearing loss
- not exclusively a pediatric disease
- follows AOM frequently in children
- middle ear effusions have been shown to persist following an episode of AOM for 1 mo in 40% of children, 2 mo in 20%, and 3+ mo in 10%

### Risk Factors

- same as AOM

### Clinical Features

- hearing loss  $\pm$  tinnitus
  - confirm with audiogram and tympanogram (flat) (see Figure 16B, OT10 and Figure 17B, OT11)
- fullness – blocked ear
- $\pm$  pain, low grade fever
- otoscopy of tympanic membrane:
  - discolouration – amber or dull grey with “glue” ear
  - meniscus fluid level behind TM
  - air bubbles
  - retraction pockets/TM atelectasis
  - most reliable finding with pneumotoscopy is immobility

### Treatment

- expectant: 90% resolve by 3 mo
- document hearing loss with audiogram
- no statistical proof that antihistamines, decongestants, antibiotics clear disease faster
- surgery: myringotomy  $\pm$  ventilation tubes  $\pm$  adenoidectomy (if enlarged or on insertion of second set of tubes after first set falls out)
- ventilation tubes to equalize pressure and drain ear

### Complications of Otitis Media with Effusion (OME)

- hearing loss, speech delay, learning problems in young children
- chronic mastoiditis
- ossicular erosion
- cholesteatoma especially when retraction pockets involve pars flaccida or postero-superior TM
- retraction of tympanic membrane, atelectasis, ossicular fixation

## Adenoid Hypertrophy

- size peaks at age 5 and resolves by age 12
- increase in size with repeated URTI and allergies

### Clinical Features

- nasal obstruction:
  - adenoid facies (open mouth, high arched palate, narrow midface, malocclusion)
  - history of hypernasal voice and snoring
  - long term mouth breather; minimal air escape through nose
- choanal obstruction:
  - chronic rhinosinusitis/rhinitis
  - obstructive sleep apnea
- chronic inflammation:
  - nasal discharge, post-nasal drip, and cough
  - cervical lymphadenopathy

### Diagnosis

- enlarged adenoids on nasopharyngeal exam (usually with flexible nasopharyngoscope)
- enlarged adenoid shadow on lateral soft tissue x-ray

### Complications

- Eustachian tube obstruction leading to serous otitis media
- interference with nasal breathing, necessitating mouth-breathing
- malocclusion
- sleep apnea/respiratory disturbance
- orofacial developmental abnormalities

**Figure 20. Waldeyer's ring**

An interrupted circle of protective lymphoid tissue at the upper ends of the respiratory and alimentary tracts

## Adenoidectomy

### Indications for Adenoidectomy

- chronic upper airway obstruction with sleep disturbance/apnea  $\pm$  cor pulmonale
- chronic nasopharyngitis resistant to medical treatment
- chronic serous otitis media and chronic suppurative otitis media (with 2nd set of tubes)
- recurrent acute otitis media resistant to antibiotics
- suspicion of nasopharyngeal malignancy
- persistent rhinorrhea

### Contraindications

- uncontrollable coagulopathy
- recent pharyngeal infection
- short or abnormal palate (cleft or false palate, zona pellucida)

### Complications

- bleeding, infection
- velopharyngeal insufficiency (hypernasal voice or nasal regurgitation)
- scarring of Eustachian tube orifice

## Sleep-Disordered Breathing in Children

### Definition

- spectrum of sleep-related breathing abnormalities ranging from snoring to OSA

### Epidemiology

- peak incidence between 2 and 8 yr when tonsils and adenoids are the largest relative to the pharyngeal airway

### Etiology

- due to a combination of anatomic and neuromuscular factors:
  - adenotonsillar hypertrophy
  - craniofacial abnormalities
  - neuromuscular hypotonia (i.e. cerebral palsy, Down syndrome)
  - obesity

### Clinical Features

- heavy snoring, mouth breathing, pauses or apnea, enuresis, excessive daytime sleepiness, behavioural/learning problems, diagnosis of ADHD, morning headache, failure to thrive

### Investigations

- flexible nasopharyngoscopy for assessment of nasopharynx and adenoids
- polysomnography (obstructive apnea-hypopnea index  $>1/h$  considered abnormal)

### Treatment

- surgical: bilateral tonsillectomy and adenoidectomy
- nonsurgical: CPAP, BiPAP, sleep hygiene

## Acute Tonsillitis

### Etiology

- Group A  $\beta$ -hemolytic *streptococci* (most common) and Group C or G *streptococci*
- *S. pneumoniae*, *S. aureus*, *H. influenzae*, *M. catarrhalis*
- EBV

### Clinical Features

- symptoms:
  - sore throat
  - dysphagia, odynophagia, trismus
  - malaise, fever
  - otalgia (referred)
- signs:
  - tender cervical lymphadenopathy, especially submandibular, jugulodigastric
  - tonsils enlarged, inflammation  $\pm$  exudates/white follicles
  - strawberry tongue, scarlatiniform rash (scarlet fever)
  - palatal petechiae (infectious mononucleosis)

**Trismus:** motor disturbance of the trigeminal nerve, leading to spasm of the muscles of mastication, with difficulty in opening the mouth (lockjaw).

**DDx Sore Throat**

- Streptococcal pharyngitis
- Viral pharyngitis
- Infectious mononucleosis
- Tonsillitis
- Peritonsillar abscess
- Foreign body/trauma
- Leukemia
- Hodgkin's disease

**Investigations**

- CBC
- swab for C&S
- latex agglutination tests
- Monospot® – less reliable in children <2 yr old

**Treatment**

- soft diet, ample fluid intake
- gargle with warm saline solution
- analgesics and antipyretics
- antibiotics:
  - only after appropriate swab for C&S
  - 1st line penicillin or amoxicillin (erythromycin if penicillin allergy) x 10 d
  - rheumatic fever risk emerges approximately 9 d after the onset of symptoms:
    - ♦ antibiotics are utilized mainly to avoid this serious sequela and to provide earlier symptomatic relief
  - no evidence for the role of antibiotics in the avoidance of post-streptococcal glomerulonephritis

**Complications of Tonsillitis**

- Rheumatic heart disease
- Arthritis
- Scarlet fever
- Peritonsillar abscess (Quinsy), intratonsillar
- Deep neck space infection
- Sepsis
- Glomerulonephritis

## Peritonsillar Abscess (Quinsy)

**Definition**

- cellulitis of space behind tonsillar capsule extending onto soft palate leading to abscess

**Etiology**

- bacterial: Group A strep (GAS) (50% of cases), *S. pyogenes*, *S. aureus*, *H. influenzae*, and anaerobes

**Epidemiology**

- can develop from acute tonsillitis with infection spreading into plane of tonsillar bed
- unilateral
- most common in 15 to 30 yr old age group

**Clinical Features**

- fever and dehydration
- sore throat, dysphagia, and odynophagia
- extensive peritonsillar swelling but tonsil may appear normal
- edema of soft palate
- uvular deviation
- involvement of motor branch of CN V (can lead to trismus)
- dysphonia (edema → failure to elevate palate) 2° to CN X involvement
- unilateral referred otalgia
- cervical lymphadenitis

**Complications**

- aspiration pneumonia 2° to spontaneous rupture of abscess
- airway obstruction
- lateral dissection into parapharyngeal and/or carotid space
- bacteremia
- retropharyngeal abscess

**Treatment**

- secure airway
- surgical drainage (incision or needle aspiration) with C&S
- warm saline irrigation
- IV penicillin G x 10 d if cultures positive for GAS
- add PO/IV metronidazole or clindamycin x 10 d if culture positive for *Bacteroides*
- consider tonsillectomy after second episode

**Other Parapharyngeal Space Infection**

- pharyngitis
- parotitis (see *Salivary Glands*, OT29)
- otitis
- mastoiditis (Bezold's abscess)
- odontogenic infection

**Quinsy Triad**

- Trismus
- Uvular deviation
- Dysphonia ("hot potato voice")

## Tonsillectomy

### Absolute Indications

- most common indication: sleep-disordered breathing
- 2nd most common indication: recurrent throat infections
- tonsillar hypertrophy causing upper airway obstruction, obstructive sleep apnea, severe dysphagia, or cardiopulmonary complications such as cor pulmonale
- suspicion of malignancy (e.g. lymphoma, squamous cell carcinoma)
- orofacial/dental deformity
- hemorrhagic tonsillitis

### Relative Indications (to reduce disease burden)

- recurrent throat infection with a frequency of at least 7 episodes in the past year, at least 5 episodes per year for 2 yr, or at least 3 episodes per year for 3 yr, with documentation in the medical record for each episode of sore throat and 1 or more of the following: temperature  $>38.3^{\circ}\text{C}$ , cervical adenopathy, tonsillar exudate, or positive test for Group A  $\beta$ -hemolytic *streptococcus* (Paradise Criteria)
- chronic tonsillitis with halitosis (bad breath) or sore throat  $\pm$  tonsilloliths (clusters of calcified material that form in the crevices of the tonsils)
- complications of tonsillitis: quinsy/peritonsillar abscess, parapharyngeal abscess, retropharyngeal abscess
- failure to thrive

### Relative Contraindications

- velopharyngeal insufficiency: overt or submucous/covert cleft of palate, impaired palatal function due to neurological or neuro-muscular abnormalities
- hematologic: coagulopathy, anemia
- infectious: active local infection without urgent obstructive symptoms

### Complications

- hemorrhage: early – within 24 h; delayed – 7-10 d
- odynophagia and/or otalgia; dehydration 2° to odynophagia
- infection
- atlantoaxial subluxation (Grisel's syndrome): rare

## Airway Problems in Children

### DIFFERENTIAL DIAGNOSIS BY AGE GROUP

#### Neonates (obligate nose breathers)

- extralaryngeal:
  - choanal atresia (e.g. CHARGE syndrome)
  - nasopharyngeal dermoid, glioma, encephalocele
  - glossoptosis: Pierre-Robin sequence, Down syndrome, lymphatic malformation, hemangioma
- laryngeal:
  - laryngomalacia: most common cause of stridor in children
  - laryngocele
  - vocal cord palsy (due to trauma or Arnold-Chiari malformation)
  - glottic web
  - subglottic stenosis
  - laryngeal cleft
- tracheal:
  - tracheoesophageal fistula
  - tracheomalacia
  - vascular rings

#### 2 to 3 Months

- congenital:
  - laryngomalacia
  - vascular: subglottic hemangioma (more common), innominate artery compression, double aortic arch
  - laryngeal papilloma
- acquired:
  - subglottic stenosis: post intubation
  - tracheal granulation: post intubation
  - tracheomalacia: post tracheotomy and TEF repair

**Infants – Sudden Onset**

- foreign body aspiration
- croup
- bacterial tracheitis
- caustic ingestion
- epiglottitis

**Children and Adults**

- infection:
  - Ludwig's angina
  - peritonsillar/parapharyngeal abscess
  - retropharyngeal abscess
- neoplastic:
  - squamous cell carcinoma (SCC) (adults): larynx, hypopharynx
  - retropharyngeal: lymphoma, neuroblastoma
  - nasopharyngeal: carcinoma, rhabdomyosarcoma
- allergic:
  - angioneurotic edema
  - polyps (suspect cystic fibrosis in children)
- trauma:
  - laryngeal fracture, facial fracture
  - burns and lacerations
  - post-intubation
  - caustic ingestion
- congenital:
  - lingual thyroid/tonsil

## Signs of Airway Obstruction

**Stridor**

- note quality, timing (inspiratory or expiratory)
- body position important:
  - lying prone: subglottic hemangioma, double aortic arch
  - lying supine: laryngomalacia, glossoptosis
- site of stenosis:
  - vocal cords or above: inspiratory stridor
  - subglottis and extrathoracic trachea: biphasic stridor
  - distal tracheobronchial tree: expiratory stridor

**Respiratory Distress**

- nasal flaring
- supraclavicular and intercostal indrawing
- sternal retractions
- use of accessory muscles of respiration
- tachypnea
- cyanosis
- altered LOC

**Feeding Difficulty and Aspiration**

- supraglottic lesion
- laryngomalacia
- vocal cord paralysis
- laryngeal cleft g aspiration pneumonia
- TEF

## Acute Laryngotracheobronchitis (Croup)

- inflammation of tissues in subglottic space ± tracheobronchial tree
- swelling of mucosal lining and associated with thick, viscous, mucopurulent exudate which compromises upper airway (subglottic space narrowest portion of upper airway)
- normal function of ciliated mucous membrane impaired

**Etiology**

- viral: parainfluenzae I (most common), II, III, influenza A and B, RSV

**Signs of Croup****The 3 Ss**

Stridor  
Subglottic swelling  
Seal bark cough

**Clinical Features**

- age: 4 mo to 5 yr
- preceded by URTI symptoms
- generally occurs at night
- biphasic stridor and croupy cough (loud, sea-lion bark)
- appear less toxic than epiglottitis
- supraglottic area normal
- rule out foreign body and subglottic stenosis
- “steeples-sign” on AP x-ray of neck
- if recurrent croup, think subglottic stenosis

**Treatment**

- racemic epinephrine via nebulizer q1-2h, prn (only if in respiratory distress)
- systemic corticosteroids (e.g. dexamethasone, prednisone)
- adequate hydration
- close observation for 3 to 4 h
- intubation if severe
- hospitalize if poor response to steroids after 4 h and persistent stridor at rest
- consider alternate diagnosis if poor response to therapy (e.g. bacterial tracheitis)
- if recurrent episodes of croup-like symptoms, consider bronchoscopy several weeks after acute episode settles to rule out underlying subglottic stenosis

## Acute Epiglottitis

- acute inflammation causing swelling of supraglottic structures of the larynx without involvement of vocal cords

**Etiology**

- *H. influenzae* type B
- relatively uncommon condition due to Hib vaccine

**Clinical Features**

- any age, most commonly 1 to 4 yr
- rapid onset
- toxic-looking, fever, anorexia, restlessness
- cyanotic/pale, inspiratory stridor, slow breathing, lungs clear with decreased air entry
- prefers sitting up, open mouth, drooling, tongue protruding, sore throat, dysphagia

**Investigations and Management**

- investigations and physical examination may lead to complete obstruction, thus preparations for intubation or tracheotomy must be made prior to any manipulation
- stat ENT/anesthesia consult(s)
- WBC (elevated), blood and pharyngeal cultures after intubation
- lateral neck radiograph (only done if patient stable)

**Treatment**

- secure airway
- IV access with hydration
- antibiotics: IV cefuroxime, cefotaxime, or ceftriaxone
- moist air
- extubate when leak around tube occurs and afebrile
- watch for meningitis

Acute epiglottitis is a medical emergency.

When managing epiglottitis, it is important not to agitate the child, as this may precipitate complete obstruction.

**Thumb sign:** cherry-shaped epiglottic swelling seen on lateral neck radiograph.

## Subglottic Stenosis

**Congenital**

- diameter of subglottis <4 mm in neonate (due to thickening of soft tissue of subglottic space or maldevelopment of cricoid cartilage)

**Acquired**

- following prolonged, repeated or traumatic intubation:
  - most commonly due to endotracheal intubation; nasal intubation is less traumatic and preferred in long term intubation as it puts less pressure on the subglottis (tube sits at different orientation) and there is less movement
  - subglottic stenosis is related to duration of intubation and pressure of the endotracheal tube cuff
- can also be due to foreign body, infection (e.g. TB, diphtheria, syphilis) or chemical irritation

**Clinical Features**

- biphasic stridor
- respiratory distress
- recurrent/prolonged croup

**Diagnosis**

- rigid laryngoscopy and bronchoscopy

**Treatment**

- if soft stenosis: divide tissue with knife or laser, dilate with balloon  $\pm$  steroids
- if firm stenosis: laryngotracheoplasty

## Laryngomalacia

- short aryepiglottic folds, omega-shaped epiglottis, pendulous mucosa
- caused by indrawing of supraglottis on inspiration leading to laryngopharyngeal reflux of acid

**Clinical Features**

- high-pitched inspiratory stridor at 1 to 2 wk
- constant or intermittent and more pronounced supine
- usually mild but when severe can be associated with cyanosis or feeding difficulties, leading to failure to thrive

**Treatment**

- observation is usually sufficient as symptoms spontaneously subside by 12 to 18 mo in >90% of cases
- in the case of severe laryngomalacia, division of the aryepiglottic folds (supraglottoplasty) provides relief

Laryngomalacia is the most common cause of stridor in infants.

## Foreign Body

**Ingested**

- usually stuck at cricopharyngeus
- coins, toys, batteries (emergency)
- presents with drooling, dysphagia, stridor if very large

**Aspirated**

- usually stuck at right mainstem bronchus
- peanuts, carrot, apple core, popcorn, balloons
- presentation
  - stridor if lodged in trachea
  - unilateral "asthma" if bronchial, therefore often misdiagnosed as asthma
  - if totally occludes airway: cough, lobar pneumonia, atelectasis, mediastinal shift, pneumothorax, death

Foreign body inhalation is the most common cause of accidental death in children.

**Diagnosis and Treatment**

- any patient with suspected foreign body should be kept NPO immediately
- inspiration-expiration chest x-ray (if patient is stable)
- bronchoscopy or esophagoscopy with removal
- rapid onset, not necessarily febrile or elevated WBC

Batteries MUST be ruled out as a foreign body (vs. coins) as they are lethal and can erode through the esophagus. Batteries have a halo sign around the rim on AP xray and a step deformity on lateral xray.

## Deep Neck Space Infection

- most commonly arise from an infection of the mandibular teeth, tonsils, parotid gland, deep cervical lymph nodes, middle ear, or the sinuses
- often a rapid onset and may progress to fatal complications

**Etiology**

- usually mixed aerobes and anaerobes that represent the flora of the oral cavity, upper respiratory tract, and certain parts of the ears and eyes

Trismus means the pterygoids are involved and airway will become increasingly hard to access.

**Clinical Features**

- sore throat or pain and trismus
- dysphagia and odynophagia
- stridor and dyspnea
- late findings may include dysphonia and hoarseness
- swelling of the face and neck, erythema
- asymmetry of the oropharynx with purulent oral discharge
- lymphadenopathy

These investigations should be obtained carefully and the surgeon should consider accompanying the patient as the worst place to lose an airway is during imaging.

**Diagnosis**

- lateral cervical view plain radiograph
- CT
- MRI

Ludwig's angina is the prototypical infection of the submandibular and sublingual space.

**Treatment**

- secure the airway
- surgical drainage
- maximum doses of IV systemic antimicrobials regimens according to the site of infection

# Common Medications

Table 20. Antibiotics

Generic Name (Brand Name)	Dose	Indications	Notes
amoxicillin (Amoxil <sup>®</sup> , Amoxi <sup>®</sup> , Amox <sup>®</sup> )	Adult: 500 mg PO tid Children: 80-90 mg/kg/d in 2 divided doses	<i>Streptococcus</i> , <i>Pneumococcus</i> , <i>H. influenzae</i> , Proteus coverage	May cause rash in patients with infectious mononucleosis
piperacillin with tazobactam (Zosyn <sup>®</sup> )	3 g PO q6h	Gram-positive and negative aerobes and anaerobes plus <i>Pseudomonas</i> coverage	May cause pseudomembranous colitis
ciprofloxacin (Cipro <sup>®</sup> , Ciloxan <sup>®</sup> )	500 mg PO bid	<i>Pseudomonas</i> , <i>Streptococci</i> , MRSA, and most Gram-negative; no anaerobic coverage	Do not give systemic quinolones to children
erythromycin (Erythrocin <sup>®</sup> , EryPed <sup>®</sup> , Staticin <sup>®</sup> , T-Stat <sup>®</sup> , Erybid <sup>®</sup> , Novorythro Encap <sup>®</sup> )	500 mg PO qid	Alternative to penicillin	Ototoxic

Table 21. Otic Drops

Generic Name (Brand Name)	Dose	Indications	Notes
ciprofloxacin (Ciprodex <sup>®</sup> )	4 gtt in affected ear bid	For otitis externa and complications of otitis media <i>Pseudomonas</i> , <i>Streptococci</i> , MRSA, and most Gram-negative; no anaerobic coverage	
neomycin, polymyxin B sulfate, and hydrocortisone (Cortisporin Otic <sup>®</sup> )	5 gtt in affected ear tid	For otitis externa Used for inflammatory conditions which are currently infected or at risk of bacterial infections	May cause hearing loss if placed in inner ear
hydrocortisone and acetic acid (VoSol HC <sup>®</sup> )	5-10 gtt in affected ear tid	For otitis media	Bactericidal by lowering pH
tobramycin and dexamethasone (TobraDex <sup>®</sup> )	5-10 gtt in affected ear bid	For chronic suppurative otitis media	Risk of vestibular or cochlear toxicity

Table 22. Nasal Sprays

Generic Name (Brand Name)	Indications	Notes
<b>Steroid</b>		
flunisolide (Rhinalar <sup>®</sup> ) budesonide (Rhinocort <sup>®</sup> ) triamcinolone (Nasacort <sup>®</sup> ) beclomethasone (Beconase <sup>®</sup> ) mometasone furoate, monohydrate (Nasonex <sup>®</sup> ) fluticasone furoate (Avamys <sup>®</sup> )	Allergic rhinitis Chronic sinusitis	Requires up to 4 wk of consistent use to have effect Long term use Dries nasal mucosa; get minor bleeding Patient should stop if epistaxis May sting Flonase <sup>®</sup> and Nasonex <sup>®</sup> not absorbed systemically
<b>Antihistamine</b>		
levocarbastine (Livostin <sup>®</sup> )	Allergic rhinitis	Immediate effect If no effect by 3 d then discontinue Use during allergy season
<b>Decongestant</b>		
xylometazoline (Otrivin <sup>®</sup> ) oxymetazoline (Dristan <sup>®</sup> ) phenylephrine (Neosynephrine <sup>®</sup> )	Acute sinusitis Rhinitis	Careful if patient has hypertension Short term use (<5 d) If long term use, can cause decongestant addiction (i.e. rhinitis medicamentosa)
<b>Antibiotic/Decongestant</b>		
framycetin, gramicidin, phenylephrine (Soframycin <sup>®</sup> )	Acute sinusitis	
<b>Anticholinergic</b>		
ipratropium bromide (Atrovent <sup>®</sup> )	Vasomotor rhinitis	Careful not to spray into eyes as can cause burning or precipitation of narrow angle glaucoma Increased rate of epistaxis when combined with topical nasal steroids
<b>Lubricants</b>		
saline, NeilMed <sup>®</sup> , Rhinaris <sup>®</sup> , Secaris <sup>®</sup> , Polysporin <sup>®</sup> , Vaseline <sup>®</sup>	Dry nasal mucosa	Use prn Rhinaris <sup>®</sup> and Secaris <sup>®</sup> may cause stinging

## Pediatric Quick Reference Values

**Table 1. Average Vitals at Various Ages**

Age	Pulse (bpm)	Respiratory Rate (br/min)	sBP (mmHg)
Neonate	90-170	40-60	70-90
3-12 months	80-165	30-55	80-100
1-2 years	80-125	25-45	90-100
3-11 years	70-115	18-30	100-110
12-15 years	60-100	12-18	110-130

## Primary Care

### Visit Overview

- schedule:
  - newborn (within 1 wk post-discharge), 1, 2, 4, 6, 9, 12, 15, 18, 24 mo
  - annually between age 2 to 6; every other year between age 6 to 11
- content:
  - history and physical exam including growth, development, and nutrition
  - routine immunization
  - counseling and anticipatory guidance

### Routine Immunization

**Table 2. Publicly Funded Immunization Schedule for Ontario, August 2011**

Age	DTaP-IPV-Hib	dTaP-IPV	Pneu-C-13	Rot-1	Men-C-C	MMR	Var	MMRV	Men-C-ACYW	HepB	HPV-4	Tdap	Inf
2 months	✓IM		✓IM	✓PO									
4 months	✓IM		✓IM	✓PO									
6 months	✓IM												
12 months			✓IM		✓IM	✓SC							
15 months							✓SC						
18 months	✓IM												
4-6 years		✓IM						✓SC					
Grade 7									✓IM	✓IM			
Grade 8 female											✓IM		
14-16 years												✓IM	
Every autumn													✓IM

IM = intramuscular; PO = per oral; SC = subcutaneous

## Acronyms

AAP	American Association of Pediatricians
ALPS	autoimmune lymphoproliferative syndrome
AOM	acute otitis media
ARND	alcohol-related neurodevelopmental disorder
ASD	atrial septal defect
ASOT	antistreptolysin-o-titre
ATN	acute tubular necrosis
CAS	Children's Aid Society
CF	cystic fibrosis
CHD	congenital heart defect
CMV	cytomegalovirus
CP	cerebral palsy
CPS	Canadian Pediatric Society
DI	diabetes insipidus
DIC	disseminated intravascular coagulopathy
DM	diabetes mellitus
DS	Down syndrome
EBV	Epstein-Barr virus
FASD	fetal alcohol spectrum disorder
FSH	follicle stimulating hormone
FTT	failure to thrive
GA	gestational age
GERD	gastroesophageal reflux disease
GH	growth hormone
GN	glomerulonephritis
HIE	hypoxic ischemic encephalopathy
HSP	Henoch-Schönlein purpura
HUS	hemolytic uremic syndrome
IBW	ideal body weight
ICH	intracranial hemorrhage
IUGR	intra-uterine growth retardation
IVH	intraventricular hemorrhage
IVIg	intravenous immunoglobulin
LH	luteinizing hormone
LLSB	lower left sternal border
LOC	level of consciousness
LP	lumbar puncture
LRTI	lower respiratory tract infection
NICU	neonatal intensive care unit
PDA	patent ductus arteriosus
PKU	phenylketonuria
PUVA	psoralen + UVA
RDS	respiratory distress syndrome
RUSB	right upper sternal border
SEM	systolic ejection murmur
SLE	systemic lupus erythematosus
TPN	total parenteral nutrition
UMN	upper motor neuron
URTI	upper respiratory tract infection
UVA	ultraviolet
VSD	ventricular septal defect

**Table 2. Publicly Funded Immunization Schedule for Ontario, August 2011** (continued)

Vaccine	Adverse Reaction	Contraindication
DTaP-IPV	Prolonged crying Hypotonic unresponsive state (rare) Seizure on day of vaccine (rare)	Evolving unstable neurologic disease Hyporesponsive/hypotonic following previous vaccine Anaphylactic reaction to neomycin or streptomycin
Rot-1	Cough Diarrhea, vomiting	History of intussusception Immunocompromised Abdominal disorder (e.g. Meckel's diverticulum) Received blood products (e.g. immunoglobulin) within 42 d
MMR	Measle-like rash (7-14d) Lymphadenopathy, arthralgia, arthritis Parotitis (rare) Especially painful injection	Pregnancy Immunocompromised infants (except healthy HIV positive children) Anaphylactic reaction to gelatin
Var	Mild varicella-like papules or vesicles	Pregnant or planning to get pregnant within 3 mo Anaphylactic reaction to gelatin
HepB		Anaphylactic reaction to Baker's yeast
MMRV	Same as MMR and Var vaccines	Same as MMR and Var vaccines
dTAP		1st trimester pregnancy
Inf	Malaise, myalgia Febrile seizure Hypersensitivity reaction	Egg-allergic individuals – unless the risk of the disease outweighs the small risk of a systemic hypersensitivity reaction. Referral to an allergy specialist is recommended, as vaccination might be possible after careful evaluation, skin testing and graded challenge or desensitization.
HPV-4	Pruritis	

DTaP-IPV = diphtheria, tetanus, acellular pertussis, inactivated polio vaccine (i.e. Pentacel<sup>®</sup>, Pentavax<sup>®</sup>); Hib = *hemophilus influenza* type b conjugate vaccine; Pneu-C-13 = pneumococcal 13-valent conjugate vaccine; Rot-1 = rotavirus oral vaccine; MMR = measles, mumps, rubella vaccine; Men-C-C = meningococcal c conjugate vaccine; Var = varicella vaccine; HepB = hepatitis b vaccine; MMRV = measles, mumps, rubella, varicella vaccine; dTAP = diphtheria, tetanus, acellular pertussis vaccine; Inf = influenza vaccine; HPV-4 = human papilloma virus vaccine

**Any Vaccine:****Adverse Reactions**

**Local:** induration, tenderness, redness, swelling

**Systemic:** fever, rash, irritability

**Allergic:** urticaria, rhinitis, anaphylaxis

**Contraindications**

Moderate/severe illness  $\pm$  fever

Allergy to vaccine component

No need to delay vaccination for mild URTI

**Canadian Immunization Guide**

National Advisory Committee on Immunization. Canadian Immunization Guide (CIG), 2006, 7th edition. Public Health Agency of Canada, 2006. Available at: <http://www.phac-aspc.gc.ca/publicat/cig-gci/>

**Vaccination in Cases of Asplenia or Hyposplenia (such as Sickle Cell Disease)**

- Should receive all routine immunizations, including the yearly influenza vaccine
- No vaccines are contraindicated
- Susceptible to infection by encapsulated bacteria (*S. pneumoniae*, *H. influenzae*, *N. meningitidis*)
- For meningococcal, pneumococcal and *Haemophilus influenza* b vaccines: regular vaccination in infancy according to recommended immunization schedules, PLUS:
  - Meningococcal vaccination:
    - Meningococcal-C-Conjugate at age  $\geq 2$  yr + Quadrivalent Men-P-ACYW at least 2 wk later
    - Booster of Men-P-ACYW q2-5 yr
  - Pneumococcal vaccination:
    - Pneumococcal polysaccharide vaccine (Pneu-P-23) at age  $\geq 2$  yr
    - Single booster of Pneu-P-23 at age  $\geq 3$  yr
  - *Haemophilus influenzae* type b vaccination:
    - Consider single booster at age  $> 5$  yr

According to the CDC, the weight of currently available scientific evidence does not support the hypothesis that MMR vaccine causes either autism or IBD. The landmark paper linking autism to the MMR vaccine (*Lancet* 1998;351:637-641) was retracted due to false claims in the article (*Lancet* 2010;375:445).

**Safety and Efficacy of an Attenuated Vaccine against Severe Rotavirus Gastroenteritis**  
*NEJM* 2006;354:11-22

**Study:** Randomized, double-blind, phase 3 trial. Patients: 63,225 healthy infants from Latin America and Finland.

**Intervention:** Two oral doses of HRV vaccine vs. placebo at 2 and 4 mo of age.

**Outcome:** Episodes of gastroenteritis and severity  
**Results:** The vaccine is 85% efficacious against severe rotavirus gastroenteritis and hospitalizations associated with gastroenteritis and 100% efficacious against more severe gastroenteritis.

## Vaccine Administration

- injection site:
  - infants (<12 mo): anterolateral thigh
  - children: deltoid
- timing of injection:
  - DTaP+IPV+Hib given in single injection
  - varicella and MMR vaccines given at either the same visit or separated by  $>4$  wk (MMRV at 4-6 yr)
  - hepatitis B vaccine given in 3 doses of 0.5 mL (0, 1, 6 mo) either at school in grade 7 (2 adult doses of 1 mL one month apart for teens) (Ontario) or at birth if at increased risk (i.e. endemic country, mother or household contact HBsAg positive)
  - HPV-4 vaccine given in 3 doses (0, 2, 6 mo) to grade 8 females in Ontario schools

## Growth and Development

**Growth**

- growth is not linear:
  - most rapid growth during first two years and at puberty
  - tissues grow at different times
    - ♦ first two years = CNS; mid-childhood = lymphoid tissue; puberty = gonads
- measurement of growth:
  - premature infants (<37 wk) use corrected gestational age until age 2 yr
  - body proportion = upper / lower segment ratio (use symphysis pubis as midpoint)
    - ♦ newborn = 1.7, adult male = 0.97, adult female = 1.0

## Average Growth Parameters

**Table 3. Parameter of Average Growth**

	Normal	Growth	Comments
<b>Birth Weight</b>	3.25 kg (7 lbs)	Gain 20-30 g/d (term neonate) 2 x birth wt by 4-5 mo 3 x birth wt by 1 yr 4 x birth wt by 2 yr	Weight loss (up to 10% of birth wt) in first 7 d of life is normal Neonate should regain birth weight by ~10-14 d of age
<b>Length/Height</b>	50 cm (20 in)	25 cm in 1st yr 12 cm in 2nd yr 8 cm in 3rd yr then 4-7 cm/yr until puberty 1/2 adult height at 2 yr	Measure supine length until 2 yr of age, then measure standing height
<b>Head Circumference</b>	35 cm (14 in)	2 cm/mo for 1st 3 mo 1 cm/mo at 3-6 mo 0.5 cm/mo at 6-12 mo	Measure around occipital, parietal, and frontal prominences to obtain the greatest circumference

## Reflexes

**Table 4. Reflexes**

Reflex	Maneuver to Elicit Reflex	Appropriate Reflex Response
Moro	Infant placed semi-upright, head supported by examiner's hand, sudden withdrawal of supported head with immediate resupport	Abduction and extension of the arms, opening of the hands, followed by flexion and adduction of arms
Galant	Infant held in ventral suspension and one side of back is stroked along paravertebral line	Pelvis will move in the direction of stimulated side
Grasp	Placement of examiner's finger in infant's palm	Flexion of infant's fingers
ATNR	Turn infant's head to one side	"Fencing" posture (extension of ipsilateral leg and arm and flexion of contralateral leg)
Placing	Dorsal surface of infant's foot placed touching edge of table	Flexion followed by extension of ipsilateral limb up onto table (resembles primitive walking)
Rooting	Tactile stimulus near mouth	Infant pursues stimulus with face
Parachute	Tilt infant to side while in sitting position	Ipsilateral arm extension, present by 6-8 mo

ATNR = asymmetric tonic neck reflex

## Developmental Milestones

**Table 5. Developmental Milestones**

Age*	Gross Motor	Fine Motor	Speech and Language	Adaptive and Social Skills
<b>1 month</b>	Turns head side to side when supine	Hands fisted, thumb in fist	Cries, startles to loud noises	Calms when comforted
<b>2 months</b>	Briefly raises head when prone, holds head erect when upright	Pulls at clothes	Variety of sounds (e.g. coos, gurgles)	Smiles responsively, recognizes and calms down to familiar voice, follows movement with eyes
<b>4 months</b>	Lifts head and chest when prone, holds head steady when supported sitting, rolls prone to supine	Briefly holds object when placed in hand, reaches for midline objects	Turns head towards sounds	Laughs responsively, follows moving toy or person with eyes, responds to people with excitement (e.g. leg movement)
<b>6 months</b>	Tripod sit, pivots in prone position	Ulnar grasp, transfers objects from hand to hand, brings objects to mouth	Babbles	Stranger anxiety, beginning of object permanence
<b>9 months</b>	Sits well without support, crawls, pulls to stand, stands with support	Early pincer grasp with straight wrist	"Mama, dada" – appropriate, imitates 1 word, responds to "no" regardless of tone	Plays games (e.g. peek-a-boo), reaches to be picked up
<b>12 months</b>	Gets into sitting position without help, stands without support, walks while holding on	Neat pincer grasp, releases ball with throw	2 words, follows 1-step command, uses facial expression, sounds, actions to make needs known	Responds to own name, separation anxiety begins

\*Use corrected gestational age until 2 yr

### Scoliosis Screening

Despite mass school screening implemented in parts of the USA and Canada in the 1970s-90s, the Canadian (1994) and American (2004) Task Forces on Preventive Health Care do NOT currently recommend routine screening using the Forward Bend Test (FBT). Cohort studies indicate that the forward bend test has poor sensitivity for identifying pathological curves. Furthermore, there is no evidence to suggest that screening and increased bracing lead to better outcomes.

### Abnormal Reflex Response

- Absence may suggest CNS abnormality
- Persistence after 4-6 mo may indicate abnormality (e.g. cerebral palsy)
- Asymmetry suggests focal motor lesions (e.g. brachial plexus injury)
- Upgoing plantar reflex (Babinski's sign) normal in infants up to age 2 yr

### Pediatric Developmental Milestones

- 1 yr: single words
- 2 yr: 2-word sentences; understands 2 step commands
- 3 yr: 3-word combinations; rides tricycle
- 4 yr: counts 4 objects

**Table 5. Developmental Milestones** (continued)

Age*	Gross Motor	Fine Motor	Speech and Language	Adaptive and Social Skills
<b>15 months</b>	Walks without support, crawls up stairs/steps	Picks up and eats finger foods, scribbles, stacks 2 blocks	Says 4-5 words, points to needs/wants	Looks to see how others react (e.g. after falling)
<b>18 months</b>	Runs, walks forward pulling toys or carrying objects	Tower of 3 cubes, scribbling, eats with spoon	10 words, follows simple commands	Show affection towards others, points to show interest in something
<b>24 months</b>	Climbs up 2 feet per step, runs, kicks ball, walks up and down steps	Tower of 6 cubes, undresses	2-3 word phrases, uses "I, me, you", 50% intelligible, understands 2-step commands	Parallel play, helps to dress
<b>3 years</b>	Tricycle, climbs up 1 foot per step, down 2 feet per step, stands on one foot briefly	Copies a circle, turns pages one at a time, puts on shoes, dress/undress fully except buttons	Combines 3 or more words into sentence, recognize colors, prepositions, plurals, counts to 10, 75% intelligible	Knows sex, age, shares some of the time, plays make-believe games
<b>4 years</b>	Hops on 1 foot, down 1 foot per step	Copies a cross, uses scissors, buttons clothes	Speech intelligible, uses past tense, 100% intelligible, understands 3-part directions	Cooperative play, fully toilet-trained by day, tries to comfort someone who is upset
<b>5 years</b>	Skips, rides bicycle	Copies a triangle and square, prints name, ties shoelaces	Fluent speech, future tense, alphabet, retells sequence of a story	Cooperates with adult requests most of the time, separates easily from caregiver

\*Use corrected gestational age until 2 yr

**Developmental Red Flags**

- Gross motor: not walking at 18 mo
- Fine motor: handedness at <10 mo
- Speech: <3 words at 18 mo
- Social: not smiling at 3 mo; not pointing at 15-18 mo

## Nutrition

### Dietary Requirement

Weight	<10 kg	10-20 kg	>20 kg
kcal	100 kcal/kg/d	1000 cal + 50 kcal/kg/d for each kg >10	1500 cal + 20 kcal/kg/d for each kg >20

### Dietary Recommendations

- 0 to 6 months: breast milk or formula
  - exclusive breast milk during first 6 mo recommended over formula unless contraindicated
  - breastfed infants require supplements: vitamin K (all babies get at birth, breastfed or not), vitamin D (400-800 IU/d), fluoride (after 6 mo if not sufficient in water), iron (6-12 mo, only if not receiving fortified cereals/meat/meat alternatives)
- >6 months: solid food introduction – do not delay beyond 9 mo
  - 2 to 3 new foods per week with a few days in between each food to allow time for adverse reaction identification
  - suggested order of introduction:
    - ♦ meat, meat alternatives, and iron enriched cereal (rice cereal is least allergenic)
    - ♦ pureed vegetables
    - ♦ fruit
- 9 to 12 months: finger foods and switch to homogenized (3%) milk
  - foods to avoid:
    - ♦ honey until past 12 mo (risk of botulism)
    - ♦ added sugar, salt
    - ♦ excessive milk (i.e. no more than 16 oz/d after a yr)
    - ♦ juice (not nutritious, too much sugar)
    - ♦ anything that is a choking hazard (chunks, round foods like grapes)

### Breastfeeding

- content of breast milk:
  - colostrum (first few days): clear, rich in nutrient (i.e. high protein, low fat), immunoglobulin
  - mature milk: 70:30 whey:casein ratio, fat from dietary butterfat, carbohydrate from lactose
- advantages:
  - easily digested, low renal solute load
  - immunologic
    - ♦ contains IgA, macrophages, active lymphocytes, lysozymes, lactoferrin (which inhibits *E. coli* growth in intestine)
    - ♦ lower pH promotes growth of lactobacillus in GI tract
  - parent-child bonding
  - economical, convenient

- contraindicated if mother:
  - is receiving chemotherapy or radioactive compounds
  - has HIV/AIDS, active untreated TB, herpes in breast region
  - is using >0.5 g/kg/d alcohol or illicit drugs
  - is taking medications known to cross to breast milk
  - oral contraceptive pills *not* a contraindication to breastfeeding (estrogen may decrease lactation, but is not dangerous to infant)
  - MotherRisk – valuable research and counselling on reproductive risk or safety of drugs, chemicals, and maternal disease
- complications in infant:
  - breastfeeding jaundice (first 1-2 wk): due to lack of milk production and subsequent dehydration (see *Jaundice*, P73), likely mechanical problem
  - breast milk jaundice (0.5% of newborns, persists up to 4-6 mo): rare, not fully understood, thought to be due to substances in breast milk that inhibit conjugation of bilirubin or increase enterohepatic circulation of bilirubin, likely a biochemical problem. Check bilirubin to rule out conjugated hyperbilirubinemia.
    - ♦ baby presents healthy and thriving, and jaundice resolves
  - poor weight gain: consider dehydration or failure to thrive
  - oral candidiasis (thrush): check baby's mouth for white cheesy material that does not scrape off; treat baby with antifungal such as nystatin (Mycostatin®) (treat mother topically to prevent transmission). Can occur in breast or bottle-fed infants.

**Table 6. Formula Compared to Breast Milk**

Type of Nutrition	Indications	Content (as compared to breast milk)
<b>Cow's milk based</b> (Enfamil®, Similac®)	Prematurity Transition into breastfeed Contraindication to breastfeed	Lower whey:casein ratio Plant fats instead of dietary butterfat
<b>Fortified formula</b>	Low birth weight Prematurity	Higher calories and vitamins A, C, D, K May only be used in hospital due to risk of fat-soluble vitamin toxicity
<b>Soy protein</b> (Isomil®, Prosobee®)	Galactosemia Lactose intolerance (note: true lactose intolerance rare in children under age 5)	Corn syrup solids or sucrose in place of lactose
<b>Partially hydrolyzed proteins</b> (Good Start®)	Delayed gastric emptying Risk of cow's milk allergy	Protein is 100% whey with no casein
<b>Protein hydrolysate</b> (Nutramigen®, Alimentum®, Pregestimil®, Portagen®)	Malabsorption Food allergy	Protein is 100% casein with no whey Corn syrup solids, sucrose or tapioca starch instead of lactose Expensive
<b>Amino acid</b> (Neocate®)	Food allergy Short gut	Free amino acids (no protein) Corn syrup solids instead of lactose Very expensive
<b>Metabolic</b>	Inborn errors of metabolism	Various different compositions for children with galactosemia, propionic acidemia, etc.

**Medications that Cross into Breast Milk:**

- antimetabolites
- bromocriptine
- chloramphenicol
- high dose diazepam
- ergots
- gold
- metronidazole
- tetracycline
- lithium
- cyclophosphamide

**Signs of Inadequate Intake:**

- <6 wet diapers/d after first wk
- <7 feeds/d
- Rule of thumb: ~1 stool/d of age for first wk
- Sleepy or lethargic, sleeping throughout the night <6 wk
- Weight loss >10% of birth weight
- Jaundice

**Nutrition for Healthy Term Infants, Birth to Six Months: An Overview**

*Paediatric Child Health* 2013;18:206-207

**Study:** Guidelines by the Canadian Pediatric Society (CPS).

**Patients:** Healthy term infants.

**Recommendations:** The Nutrition and Gastroenterology Committee of the Canadian Paediatric Society recommend exclusive breastfeeding for the first 6 mo of life with a daily vitamin D supplement of 10 µg (400 IU) for healthy, term, breastfed infants. When transitioning to solid foods, the committee recommends meat, meat alternatives and iron-fortified cereal.

There is no evidence that restriction of highly allergenic foods is beneficial in the first year of life. There is also no evidence that dietary restrictions during pregnancy or breastfeeding are protective to the child. May consider restricting nuts for risk of severe reactions.

## Injury Prevention Counselling

- injuries are the leading cause of death in children >1 yr of age
- main causes: motor vehicle crashes, burns, drowning, falls, choking, infanticide

**Table 7. Injury Prevention Counselling**

0-6 months	6-12 months	1-2 years	2-5 years
Do not leave alone on bed, on change table or in tub	Install stair barriers	Never leave unattended	Bicycle helmet
Keep crib rails up	Discourage use of walkers	Keep pot handles turned to back of stove	Never leave unsupervised at home, driveway or pool
Check water temperature before bathing	Avoid play areas with sharp-edged tables and corners	Caution with whole grapes, nuts, raw carrots, hotdogs, etc. due to choking hazard	Teach bike safety, stranger safety, and street safety
Do not hold hot liquid and infant at the same time	Cover electrical outlets	No running while eating	Swimming lessons (>4 yr), sunscreen (from 6 mo), toddler seats in the car, fences around pools, dentist by age 3
Check milk temperature before feeding	Unplug appliances when not in use		
Appropriate car seats are required before leaving hospital	Keep small objects, plastic bags, cleaning products, and medications out of reach		
	Supervise during feeding		

## Common Complaints

### Breath Holding Spells

- epidemiology: 0.1-5% of healthy children 6 mo-4 yr of age, usually start during first year of life
- etiology: child is provoked (usually by anger, injury, or fear) → holds breath and becomes silent → spontaneously resolves or loses consciousness
- types:
  - cyanotic (more common), usually associated with anger/frustration
  - pallid, usually associated with pain/surprise
- management:
  - usually resolves spontaneously and rarely progresses to seizure
  - help child control response to frustration and avoid drawing attention to spell

### Circumcision

- elective procedure
  - not covered by OHIP in Ontario, but recent evidence shows health benefits outweigh risks and justify access to procedure
  - often for religious or culture reasons
- benefits: prevention of phimosis and slightly reduced incidence of UTI, balanitis, cancer of the penis
- complications (<1%): local infection, bleeding, urethral injury
- contraindications: presence of genital abnormalities (e.g. hypospadias) or known bleeding disorder

#### Circumcision

*Pediatrics* 2012;130:e756-e785

**Study:** Guidelines by the American Academy of Pediatrics (AAP).

**Recommendations:** The American Academy of Pediatrics radically changed their position on male circumcision in 2012. The report from the AAP now states that the preventative health benefits outweigh the risks of the procedure and that the procedure is well-tolerated with adequate pain management and sterility. Stated benefits include the prevention of urinary tract infection, penile cancer, transmission of some sexually transmitted infections, including HIV. There is believed to be no effect on penile sexual function, sensitivity or sexual satisfaction. Acute complications are rare and more common if the procedure is done by an untrained provider.

**Note:** The Canadian Pediatric Society (CPS) has not yet updated their position on male circumcision since 1996, which stated that the CPS is opposed to routine circumcision. A new statement is expected soon.

### Crying/Fussing Child

- history:
  - description of baseline feeding, sleeping, crying patterns
  - infectious symptoms: fever, tachypnea, rhinorrhea, ill contacts
  - feeding intolerance: gastroesophageal reflux with esophagitis, nausea, vomiting, diarrhea, constipation
  - trauma
  - recent immunizations (vaccine reaction) or medications (drug reactions), including maternal drugs taken during pregnancy (neonatal withdrawal syndrome) and drugs that may be transferred via breast milk
  - inconsistent history, pattern of numerous emergency department visits, high-risk social situations all raise concern of abuse

**Table 8. Physical Examination and Differential Diagnosis**

Organ System	Examination Findings	Possible Diagnosis
<b>HEENT</b>	Bulging fontanelle Blepharospasm, tearing Retinal hemorrhage Oropharyngeal infections	Meningitis, shaken baby syndrome, hydrocephalus Corneal abrasion, glaucoma Shaken baby syndrome Thrush, gingivostomatitis, herpangina, otitis media
<b>Neurological</b>	Irritability or lethargy	Meningitis, shaken baby syndrome
<b>Cardiovascular</b>	Poor perfusion  Tachycardia	Sepsis, anomalous coronary artery, meningitis, myocarditis, congestive heart failure (CHF) Supraventricular tachycardia
<b>Respiratory</b>	Tachypnea Grunting	Pneumonia, CHF Respiratory disease, response to pain
<b>Abdominal</b>	Mass, empty RLQ	Intussusception
<b>Genitourinary</b>	Scrotal swelling Penile/clitoral swelling	Incarcerated hernia, testicular torsion Hair tourniquet
<b>Rectal</b>	Anal fissure Hemoccult positive stool	Constipation or diarrhea Intussusception, necrotizing enterocolitis, volvulus
<b>Musculoskeletal</b>	Point tenderness or decreased movement	Fracture, syphilis, osteomyelitis, toe/finger hair tourniquet

## Dentition and Caries

### Dentition

- primary dentition (20 teeth)
  - first tooth at 5-9 mo (lower incisor), then 1 per month
  - 6-8 central teeth by 1 yr
  - assessment by dentist 6 mo after eruption of first tooth and certainly by 1 yr of age (Grade B recommendation)
- secondary dentition (32 teeth)
  - first adult tooth is 1st molar at 6 yr, then lower incisors

### Caries

- milk caries: decay of superior front teeth and back molars in first 4 yr of life
- cause: often due to prolonged feeding (e.g. put to bed with bottle, prolonged breastfeeding)
- prevention:
  - no bottle at bedtime, clean teeth after last feed
  - minimize juice and sweetened pacifier
  - clean teeth with soft damp cloth or toothbrush and water
  - water fluoridation

## Enuresis

### Definition

- involuntary urinary incontinence by day and/or night in child >5 yr

### General Approach

- should be evaluated if dysuria, change in colour, odour, stream, secondary or diurnal, change in gait, stool incontinence

### Primary Nocturnal Enuresis

- definition: wet only at night during sleep, bladder control has never been attained
- epidemiology: boys > girls; 10% of 6 yr olds, 3% of 12 yr olds, 1% of 18 yr olds
- etiology: developmental disorder or maturational lag in bladder control while asleep
- management:
  - time and reassurance (~20% resolve spontaneously each yr)
  - behaviour modification (limiting fluids, voiding prior to sleep), bladder retention exercises, scheduled toileting has limited effectiveness
  - conditioning: "wet" alarm wakes child upon voiding (70% success rate)
  - medications (considered second line therapy, may be used for sleepovers/camp): DDAVP oral tablets (high relapse rate, costly), imipramine (Tofranil\*) (rarely used, lethal if overdose, cholinergic side effects)

Treatment for primary nocturnal enuresis should not be considered until 7 yr of age due to high rate of spontaneous cure.

### Secondary Enuresis

- definition: develops after child has sustained period of bladder control (>6 mo)
- etiology: inorganic regression due to stress or anxiety (e.g. birth of sibling, significant loss, family discord), focused on other activities, secondary to organic disease (UTI, DM, DI, neurogenic bladder, cerebral palsy (CP), sickle cell disease, seizures, pinworms)
- management: treat underlying cause

### Diurnal Enuresis

- definition: daytime wetting (60-80% also wet at night)
- etiology: micturition deferral (holding urine until last minute) due to psychosocial stressor (e.g. shy), structural anomalies (e.g. ectopic ureteral site, neurogenic bladder), UTI, constipation, CNS disorders
- management: treat underlying cause, behavioural (scheduled toileting, double voiding, good bowel program), pharmacotherapy

## Encopresis

- definition: fecal incontinence in a child >4 yr old, at least once per month for 3 months
- prevalence: 1-1.5% of school-aged children (rare in adolescence); M:F = 6:1 in school-aged children
- causes: chronic constipation (retentive encopresis), Hirschsprung disease, hypothyroidism, hypercalcemia, spinal cord lesions, anorectal malformations

## Retentive Encopresis

- definition
  - child holds bowel movement, develops constipation, leading to fecal impaction and seepage of soft or liquid stool (overflow incontinence)
- etiology
  - physical: painful stooling often secondary to constipation
  - emotional: disturbed parent-child relationship, coercive toilet training, social stressors
- clinical presentation
  - history
    - ♦ crosses legs or stands on toes to resist urge to defecate
    - ♦ distressed by symptoms, soiling of clothes
    - ♦ toilet training coercive or lacking in motivation
    - ♦ may show oppositional behavior
    - ♦ abdominal pain
  - physical exam
    - ♦ digital rectal exam: large fecal mass in rectal vault
    - ♦ anal fissures (result from passage of hard stools)
    - ♦ palpable stool in LLQ
- management
  - complete clean-out of bowel: PEG 3350 given orally is most effective, enemas and suppositories may be second line therapies, but these are invasive and often less effective
  - maintenance of regular bowel movements (see *Pediatric Gastroenterology, Constipation Treatment*, P38)
  - assessment and guidance regarding psychosocial stressors
  - behavioural modification
- complications: recurrence, toxic megacolon (requires >3-12 mo to treat), bowel perforation

## Failure to Thrive

- definition
  - weight <3rd percentile, or falls across two major percentile curves, or <80% of expected weight for height and age
  - inadequate caloric intake most common factor in poor weight gain
  - may have other nutritional deficiencies (e.g. protein, iron, vitamin D)
  - factors affecting physical growth: genetics, intrauterine factors, internal time clock, nutrition, endocrine hormones, chronic infections/diseases, psychosocial factors
- clinical presentation
  - history
    - ♦ nutritional intake
    - ♦ current symptoms
    - ♦ past illnesses
    - ♦ family history: growth, puberty, parental height and weight including mid-parental height
    - ♦ psychosocial history
- physical exam
  - ♦ growth parameters, plotted: height (Ht), weight (Wt), head circumference (HC), arm span
  - ♦ vital signs
  - ♦ complete head to toe exam
  - ♦ dysmorphic features or evidence of chronic disease
  - ♦ upper to lower segment ratio
  - ♦ sexual maturity staging
  - ♦ signs of abuse or neglect
- investigations (as indicated by clinical presentation)
  - CBC, blood smear, electrolytes, T4, TSH, GH, IGF-1
  - bone age x-ray
  - chromosomes/karyotype
  - chronic illness: chest (CXR, sweat Cl<sup>-</sup>), cardiac (CXR, ECG, ECHO), GI (celiac screen, inflammatory markers, malabsorption), renal (urinalysis), liver (enzymes, albumin)

### Energy Requirements

- 0-10 kg: 100 kcal/kg/d
- 1-20 kg: 1,000 kcal + 50 kcal/kg/d for each kg >10
- >20 kg: 1,500 kcal + 20 kcal/kg/d for each kg >20

### Calculating Upper to Lower (U/L) Segment Ratio

- Upper segment: Top of head to pubic symphysis
- Lower segment: Pubic symphysis to floor
- U/L: upper segment/lower segment

### Upper to Lower (U/L) Segment Ratio

- **Increased** in achondroplasia, short limb syndromes, hypothyroid, storage diseases
- **Decreased** in Marfan's, Klinefelter's, Kallman's syndromes, and testosterone deficiency

### Mid-Parental Height (MPH)

- Boys target height = (father ht + mother ht + 13)/2
- Girls target height = (father ht + mother ht - 13)/2

**Table 9. Failure to Thrive Patterns**

Healthy	Medical Illness	Non-Organic
<b>Weight</b> and <b>height</b> proportionally small Familial (BA = CA) Constitutional Growth Delay (BA < CA)	<b>Weight</b> and <b>height</b> proportionally small Syndrome Chromosomal  <b>Weight</b> falls more than height (FTT) Chronic illness Lack of intake  <b>Height</b> falls more than weight (short stature) Endocrine	<b>Weight</b> falls more than height (FTT) Multifactorial

BA=bone age; CA=chronological age

**Organic FTT (10%)**

- inadequate intake
  - non-organic
  - vomiting, oromotor dysfunction, anorexia
- excessive consumption
  - CHD, CF, hyperthyroidism
- abnormal utilization
  - inborn errors of metabolism
- excessive output
  - IBD, celiac, malabsorption
- management: treat specific cause

**Non-Organic FTT (90%)**

- most common cause of FTT
- results from complex factors in parent-child relationship
  - dietary intake, knowledge about feeding
  - feeding environment
  - parent-child interaction, attachment
  - child behaviours, hunger/satiety cues
  - social factors – stress, poverty
- management
  - most as outpatient using multidisciplinary approach: primary care physician, dietitian, psychologist, social work, child protection services
  - medical: oromotor problems, iron-deficient anemia, gastroesophageal reflux
  - nutritional: educate about age-appropriate foods, calorie boosting, mealtime schedules and environment to reach goal of 90-110% IBW, correct nutritional deficiencies, and promote catch-up growth/development
  - behavioural: positive reinforcement, mealtime environment

**Energy Requirements**

- see *Nutrition*, P6

**Clinical Signs of FTT****SMALL KID**

Subcutaneous fat loss

Muscle atrophy

Alopecia

Lethargy

Lagging behind normal

Kwashiorkor

Infection (recurrent)

Dermatitis

**Infantile Colic**

- definition: unexplained paroxysms of irritability and crying for >3 h/d, >3 d/wk for >3 wk in an otherwise healthy, well-fed baby (rule of 3s)
- epidemiology: 10% of infants; usual onset 10 d to 3 mo of age with peak at 6-8 wk
- etiology: lag in development of normal peristaltic movement in gastrointestinal tract; other theories suggest a lack of self-soothing mechanisms or extreme of normal
- management:
  - parental relief, rest and reassurance
  - hold baby, soother, car ride, music, vacuum, check diaper
  - medications (Ovol® drops, gripe water) have no proven benefit, some evidence for probiotics
  - if breastfeeding, elimination of cow's milk protein from mother's diet (effective in very small percentage of cases)
  - try casein hydrosylates formula (Nutramigen®)
  - time – all resolve, most in the first 2-3 mo of life

**Obesity**

- definition: BMI >95th percentile for age and height
- risk factors: genetic predisposition (e.g. both parents obese – 80% chance of obese child)
- etiology: organic causes are rare (<5%): Prader-Willi, Carpenter, Turner, Cushing syndromes, hypothyroidism
- complications: association with hypertension, dyslipidemia, slipped capital femoral epiphysis, type 2 diabetes, asthma, obstructive sleep apnea, gynecomastia, polycystic ovarian disease, early menarche, irregular menses, psychological trauma (e.g. teasing, decreased self-esteem, unhealthy coping mechanisms, depression)
- childhood obesity is not reliable predictor of adult obesity unless >180% ideal body weight, adolescent obesity good predictor of adult obesity
- management:
  - encouragement and reassurance; engagement of entire family
  - diet: qualitative changes (do not encourage weight loss, but allow for linear growth to catch up with weight), special diets used by adults are not encouraged
  - very low calorie diets for preadolescents are not recommended
  - behaviour modification: increase activity, change eating habits/meal patterns
  - education: multidisciplinary approach, dietitian, counselling
  - surgery and pharmacotherapy are not frequently used in children
  - increase activity, reduce screen time

**Geographic and Demographic Variation in the Prevalence of Overweight Canadian Children**  
*Obesity Research 2003;11:668-673***Purpose:** To determine geographic and demographic variation in the prevalence of overweight Canadian children.**Study:** Assessment of trends in BMI using data from the 1981 Canadian Fitness Survey and the 1996 National Longitudinal Survey of Children and Youth.**Main Outcomes:** The prevalence of overweight and obese children age 7-13 yr, secular trends from 1981 to 1996 by province, and provincial variation after adjusting for socioeconomic and demographic characteristics.**Results:** In 1996, 33% of boys and 26% of girls were classified as overweight, and 10% of boys and 9% of girls were classified as obese. The odds ratio associated with the 1981 to 1996 change in the prevalence of overweight children was 3.24 (95% CI, 2.83-3.70) for Canada as a whole. There are clear regional differences, with those in Atlantic Canada more likely to be overweight and Prairie children less likely. These differences were not sufficiently accounted for by differences in socioeconomic circumstances.**Conclusions:** The prevalence of childhood obesity is increasing in all areas of Canada, although more so in Atlantic Canada.

## Poison Prevention

- keep all types of medicines, vitamins, and chemicals locked up in a secure container
- potentially dangerous: drugs, drain cleaners, furniture polish, insecticides, cosmetics, nail polish remover, automotive products
- do not store any chemicals in juice, soft drink, or water bottles
- keep alcoholic beverages out of reach: 3 oz hard liquor can kill a 2-yr-old
- always read labels before administering medicine to ensure correct drug and dose

## Rashes

**Table 10. Common Pediatric Rashes**

Type of Rash	Differential	Appearance	Management
<b>Diaper Dermatitis</b>			
	Irritant contact dermatitis	Shiny, red macules/patches, no flexural involvement	Eliminate direct skin contact with urine and feces, allow periods of rest without a diaper, frequent diaper changes, topical barriers (petrolatum, zinc oxide or paste), short-term low-potency topical corticosteroids (severe cases)
	Seborrheic dermatitis	Yellow, greasy macules/plaques on erythema, scales	Short-term topical low-potency corticosteroid
	Candidal dermatitis	Erythematous macerated papules/plaques, satellite lesions	Antifungal agents
<b>Other Dermatitis</b>			
	Atopic dermatitis	Erythematous papules/plaques, oozing, excoriation, lichenification, classic areas of involvement	Eliminate exacerbating factors, maintain skin hydration, corticosteroids, topical calcineurin inhibitor
	Nummular dermatitis	Annular erythematous plaques, oozing, crusting	Avoid irritant if identified, potent topical steroid in emollient base, short-term systemic steroids $\pm$ antibiotics (severe)
	Allergic contact dermatitis	Red papules/plaques/vesicles/bullae, only in area of allergen	Mild: soothing lotion (i.e. calamine lotion) Moderate: topical moderate/strong potency Severe: systemic corticosteroids and antihistamine
	Irritant contact dermatitis	Morphology depends on irritant	Avoid skin contact
	Dyshidrotic dermatitis	Papulovesicular, cracking/fissuring, hands and feet ("Tapioca pudding")	Mild/Moderate: medium/potent topical corticosteroids Severe: systemic corticosteroids, local PUVA or UVA treatments
	Seborrheic dermatitis	See above, sebaceous areas such as nasolabial folds and scalp	
<b>Infectious</b>			
	Scabies	Polymorphic (red excoriated papules/nodules, burrows), in web spaces/folds, very pruritic	Permethrin (Nix) 5% cream for patient and family (2 applications, 1 wk apart)
	Impetigo	Honey-coloured crusts or superficial bullae	Oral antibiotics (e.g. cephalexin/erythromycin) Topical if mild: fucidic acid or mupirocin cream
	Tinea corporis	Round erythematous plaques, central clearing and scaly border	Topical anti-fungal for skin, systemic anti-fungals for nails/head
<b>Pediatric Exanthems</b> (see <i>Infectious Pediatric Exanthems</i> , P58, <a href="#">Dermatology</a> , D40)			
<b>Drug Reactions</b> (see <a href="#">Dermatology</a> , D22)			
<b>Acne</b> (see <a href="#">Dermatology</a> , D11)			

## Sleep Disturbances

### Types of Sleep Disturbances

- insufficient sleep quantity
  - difficulty falling asleep (e.g. Limit Setting Sleep Disorder)
    - ♦ preschool and older children
    - ♦ bedtime resistance
    - ♦ due to caregiver's inability to set consistent bedtime rules and routines
    - ♦ often exacerbated by child's oppositional behaviours

- poor sleep quality
  - frequent arousals (e.g. sleep-onset association disorder)
    - ♦ infants and toddlers
    - ♦ child learns to fall asleep only under certain conditions or associations (with parent, held, rocked or fed, with light on, in front of television), and child loses ability to self-soothe
    - ♦ during the normal brief arousal periods of sleep (q90-120 min), child cannot fall back asleep because same conditions are not present
  - obstructive sleep apnea
    - ♦ epidemiology: 1-5% of preschool aged children, more common in black children
    - ♦ definition: partial or intermittent complete airway obstruction during sleep causing disrupted ventilation and sleep pattern
    - ♦ features: snoring/gasping/noisy breathing during sleep and irritable/tired/hyperactive during the day
    - ♦ sequelae: cardiovascular (hypertension/LV remodeling due to sympathetic activation), growth, cognitive, and behavioural deficits
    - ♦ risk factors: adenotonsillar hypertrophy, obesity
    - ♦ management: watchful waiting, weight reduction, airway pressure devices, or surgery depending on the cause
    - ♦ adenotonsillectomy does not improve executive function or attention but reduces symptoms and improves behaviour, quality of life, and polysomnographic findings
- parasomnias
  - episodic nocturnal behaviours
  - often involves cognitive disorientation and autonomic/skeletal muscle disturbance
  - e.g. sleep walking, sleep terrors, nightmares

### Management of Sleep Disturbances

- set strict bedtimes and “wind-down” routines
- do not send child to bed hungry
- positive reinforcement for limit setting sleep disorder
- always sleep in bed, in a dark, quiet, and comfortable room, without associations
- do not use bedroom for timeouts
- systematic ignoring and gradual extinction for sleep onset association disorder

### Nightmares

- epidemiology: common in boys, 4-7 yr old
- associated with REM sleep (anytime during night)
- features: upon awakening, child is alert and clearly recalls frightening dream
  - ± associated with daytime stress/anxiety
- management: reassurance

### Night Terrors

- epidemiology: 15% of children have occasional episodes
- abrupt sitting up, eyes open, screaming
- clinical features: occurs in early hours of sleep, stage 4 of sleep; signs of panic and autonomic arousal, no memory of event, inconsolable, stress/anxiety can aggravate them
- course: remits spontaneously at puberty
- management: reassurance for parents, ensure child is safe (e.g. if sleepwalks)

#### Daily Sleep Requirement

- <6 mo 16 h
- 6 mo 14.5 h
- 12 mo 13.5 h
- 2 yr 13 h
- 4 yr 11.5 h
- 6 yr 9.5 h
- 12 yr 8.5 h
- 18 yr 8 h

#### Nap Patterns

- 2/d at 1 yr
- 1/d at 2 yr: 2-3 h
- 0.5/d at 5 yr: 1.7 h

## Toilet Training

- 90% of children attain bladder control before bowel control
- generally females train earlier than males
- 25% by 2 yr old (in North America), 98% by 3 yr old have daytime bladder control
- signs of toilet readiness:
  - ambulating independently, stable on potty, desire to be independent or to please caregivers (i.e. motivation), sufficient expressive and receptive language skills (2-step command level), can stay dry for several hours (large enough bladder), can recognize need to go, able to remove clothing

## Sudden Infant Death Syndrome (SIDS)

### Definition

- sudden and unexpected death of an infant <12 mo of age in which the cause of death cannot be found by history, examination, or a thorough postmortem and death scene investigation

### Epidemiology

- 0.5/1000 (leading cause of death between 1-12 mo of age); M:F = 3:2
- more common in children placed in prone position
- in full term infants, peak incidence is 2-4 mo, 95% of cases occur by 6 mo
- increase in deaths during peak respiratory syncytial virus (RSV) season
- most deaths occur between midnight and 8 AM

**Risk Factors**

- prematurity, smoking in household, socially disadvantaged, higher incidence in aboriginals and African Americans
- risk of SIDS is increased 3-5x in siblings of infants who have died of SIDS

**Prevention**

- “Back to Sleep, Front to Play” (place infant on back when sleeping)
- allow supervised play time daily in prone position (“tummy time”)
- alarms, monitors not recommended – increase anxiety, do not prevent life-threatening events
- avoid overheating and overdressing
- appropriate infant bedding (firm mattress, avoid loose bedding and crib bumper pads)
- no smoking
- risks associated with bedsharing: sleeping on a sofa, sleeping with an infant after consumption of alcohol/street drugs, infant sleeping with someone other than primary caregiver
- pacifiers appear to have a protective effect; do not reinsert if falls out

**Apparent Life-Threatening Events (ALTEs)**

A group of conditions often marked by an episode of apnea, cyanosis, change in tone, or change in mental status occurring in a child, where an observer fears the child may be dying. There is no clear connection between most ALTEs and SIDS. Evaluating for a cause of the ALTE (e.g. infection, cardiac, neurologic) is guided by history, physical examination and period of observation.

## Child Abuse and Neglect

**Definition**

- an act of commission (physical, sexual, or psychological abuse) or omission (neglect) by a caregiver that harms a child

**Legal Duty to Report**

- upon reasonable grounds to suspect abuse and/or neglect, physicians are required by legislation to contact the Child Protective Services (CPS) to personally disclose all information relevant to the child safety concern
- duty to report overrides patient confidentiality; physician is protected against liability

**Ongoing Duty to Report**

- if there are additional reasonable grounds to suspect abuse and/or neglect, a further report to the CPS must be made

**Risk Factors**

- environmental factors: social isolation, poverty, domestic violence
- caregiver factors: personal history of abuse, psychiatric illness, substance abuse, single parent family, poor social and vocational skills, below average intelligence
- child factors: difficult temperament, disability, special needs (e.g. developmental delay), premature

## Physical Abuse

**History**

- history that is not compatible with physical findings, or history not reproducible
- delay in seeking medical attention that is unexplained by other factors

**Physical Exam**

- physical findings not explained by underlying medical condition
- growth parameters (weight, height, head circumference)
- recurrent or multiple injuries not explained by accidental injury or child's development level
- patterned skin injuries: belt buckle, hand prints, burns that do not match provided history
- injury location: bruises on areas with abundant soft-tissue cushioning, such as abdomen, buttocks, genitalia, fleshy part of cheek; bruises on ears; posterior rib/metaphyseal/scapular/vertebral/sternal fractures (more suspicious for non-accidental injuries); immersion burns (e.g. hot water)
- altered mental status: head injury, poisoning
- head trauma is the leading cause of death in child maltreatment [e.g. acceleration-deceleration forces (shaking), direct force application (blow or impact)]

**Investigations**

- document all injuries on a body diagram: type, location, size, shape, colour, pattern
  - photography of skin injuries is ideal (police or hospital photography preferred; do not use physician's personal camera)
- blood tests to rule out medical causes (e.g. thrombocytopenia or coagulopathy)
- screen for abdominal trauma (transaminases and amylase): if increased, abdo CT recommended
- skeletal survey in children <2 yr:
  - bone scan can be beneficial for assessing rib fractures (not helpful for skull or metaphyseal region due to active bone growth) – consider bone scan if equivocal findings on initial skeletal survey
  - dilated eye examination by pediatric ophthalmologist to rule out retinal hemorrhage
  - be aware of “red herrings” (e.g. Mongolian blue spots vs. bruises)
  - neuroimaging: CT and/or MRI

“If no bruising, no bruising.”

**Presentation of Neglect**

- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents, no stranger anxiety

## Sexual Abuse

### Epidemiology

- peak ages at 2-6 and 12-16 yr
- most perpetrators are male and known to child
  - in decreasing order: family member, non-relative known to victim, stranger

### History

- diagnosis usually depends on child disclosing to someone or forensic interview done by a trained individual
- psychosocial: specific or generalized fears, depression, nightmares, social withdrawal, lack of trust, low self-esteem, school failure, sexually aggressive behaviour, advanced sexual knowledge, sexual preoccupation or play

### Physical Exam

- recurrent UTIs, pregnancy, STIs, vaginitis, vaginal bleeding, pain, genital injury, enuresis

### Investigations

- depend on presentation, age, sex, and pubertal development of child
  - sexual assault examination kit within 24 h if prepubertal, within 72 h if pubertal
  - rule out STI, UTI, pregnancy (consider STI prophylaxis or emergency contraception)
  - rule out other injuries (vaginal/anal/oral penetration, fractures, head trauma)

## Neglect

### History

- from child and each caregiver separately (if possible)

### Physical exam

- head to toe (do not force), growth parameters, nutrition status
- dental care
- emotional state

### Investigations

- blood tests to rule out medical causes (e.g. thrombocytopenia or coagulopathy)

### Management of Physical Abuse, Child Abuse and Neglect

- report all suspicions to CPS; request emergency visit if imminent risk to child or any siblings in the home
- acute medical care: hospitalize for medical evaluation or treatment of injuries if indicated
- arrange consultation to social work and appropriate follow-up
- may need to discharge child directly to CPS or to responsible guardian under CPS supervision

## Adolescent Medicine

### Adolescent History (HEEADSSS)

- tailor your history according to the clinical context

**Home:** Who do you live with? What kind of place do you live in?

**Education/Employment:** What grade are you in? What are your favourite subjects? What was your average on your last report card?

**Eating:** Tell me about your meals/snacks in a typical day? Have you ever gone on a diet? (for *Eating Disorders* – see [Psychiatry](#), PS29)

**Activities:** What do you do after school? On the weekends? How much time do you spend on the computer/watching TV every day? Do you use Facebook?

**Drugs:** Which seems to be more popular at your school, alcohol or drugs? How often do you drink/smoke marijuana/take other drugs? Do you smoke cigarettes? When you drink, do you usually get drunk? Have you ever passed out or not been able to remember what happened while you were drinking? Has anything bad ever happened to you while you were drunk or stoned? (for *Substance Abuse* – see [Psychiatry](#), PS21)

**Sexuality:** Are you romantically interested in anyone? When you think about having sex with someone, do you think about girls, boys or both? Have you ever had sex with anyone? Whether the answer is yes or no, the next question is: What activities would you include in the term 'having sex'? What do you do to prevent getting a sexually transmitted infection/getting pregnant/getting someone pregnant? Has anyone ever given you money, drugs or other stuff in exchange for sex? (for *Sexually Transmitted Infections* – see [Gynecology](#), GY26)

### Adolescent Psychosocial Assessment

#### HEEADSSS

Home  
Education/Employment  
Eating  
Activities  
Drugs  
Sexuality  
Suicide and depression  
Safety

Rates of drug use in high school students who have used in the past year: alcohol (58.2%), cannabis (25.6%), tobacco (11.7%).

**Suicidality/Depression:** On a scale of 1 to 10, where 1 is so sad that you might kill yourself and 10 is the happiest you could be, where are you most days? Is there a difference between school days and the weekend? Have you ever thought seriously about suicide? Did you make a plan? (for *Depression/Suicide* – see [Psychiatry](#), PS9, PS4)

**Safety/Violence:** Do you ever get into a car with a driver who has been drinking? Do you always wear a seatbelt/bicycle helmet? Are you being bullied at school? Has anyone ever touched you in an unwanted way?

For *Normal and Abnormal Pubertal Development*, P31

Prevalence rates of depression: 1-2% in pre-pubertal children and 6-8% in adolescents.

Date rape comprises 80% of sexual assault in teenagers.

## Cardiology

### Congenital Heart Disease (CHD)

#### PRENATAL CIRCULATION

Figure 1. Prenatal circulation

#### Embryologic Development

- most critical period of fetal heart development is between 3-8 wk gestation
- single heart tube grows rapidly forcing it to bend back upon itself and assume the shape of a four chambered heart, insults at this time are most likely to lead to CHD

#### Before Birth

- fetal lungs are bypassed by flow through fetal shunts:
  - shunting deoxygenated blood
    - ♦ ductus arteriosus: connection between pulmonary artery and aorta
  - shunting oxygenated blood
    - ♦ foramen ovale: connection between R and L atria
    - ♦ ductus venosus: connecting between umbilical vein and IVC
- circulation (Figure 1)

#### At Birth

- with first breath, lungs open up and pulmonary resistance decreases allowing pulmonic blood flow
- separation of low resistance placenta → systemic circulation becomes a high resistance system → ductus venosus closure
- increased pulmonic flow → increased left atrial pressures → foramen ovale closure
- increased oxygen concentration in blood after first breath → decreased prostaglandins → ductus arteriosus closure
- closure of fetal shunts and changes in vascular resistance → infant circulation assumes normal adult flow

Fetal circulation is designed so that oxygenated blood is preferentially delivered to the brain and myocardium.

### Epidemiology

- 8/1000 live births have CHD, which may present as a heart murmur, heart failure, or cyanosis; ventricular septal defect is the most common lesion

### Investigations

- Echocardiogram, ECG, CXR

### CYANOTIC VS. ACYANOTIC CONGENITAL HEART DISEASE

- cyanosis: blue mucous membranes, nail beds, and skin secondary to an absolute concentration of deoxygenated hemoglobin of at least 3 g/dL
- acyanotic heart disease: (i.e. L to R shunt, obstruction occurring beyond lungs) blood passes through pulmonary circulation → oxygenation takes place → low levels of deoxygenated blood in systemic circulation → no cyanosis
- cyanotic heart disease: (i.e. R to L shunt) blood bypasses the lungs → no oxygenation occurs → high levels of deoxygenated hemoglobin enters the systemic circulation → cyanosis

#### Characteristic Chest X-Ray Findings in Congenital Heart Disease

- Boot-shaped heart: tetralogy of Fallot, tricuspid atresia
- Egg-shaped heart: transposition of great arteries
- "Snowman" heart: total anomalous pulmonary venous return

Figure 2. Common congenital heart diseases

## Acyanotic Congenital Heart Disease

### 1. LEFT TO RIGHT SHUNT LESIONS

- extra blood is displaced through a communication from the left to the right side of the heart → increased pulmonary blood flow → increased pulmonary pressures
- shunt volume is dependent upon three factors: (1) size of defect (2) pressure gradient between chambers or vessels (3) peripheral outflow resistance
- untreated shunts can result in pulmonary vascular disease, left ventricular dilatation and dysfunction, right ventricular hypertension and hypertrophy (RVH), and ultimately R to L shunts

#### Atrial Septal Defect (ASD)

- 3 types: *ostium primum* (common in Down syndrome), *ostium secundum* (most common type, 50-70%), *sinus venosus* (defect located at entry of superior vena cava into right atrium)
- epidemiology: 6-8% of congenital heart lesions
- natural history:
  - 80-100% spontaneous closure rate if ASD diameter <8 mm
  - if remains patent, congestive heart failure (CHF) and pulmonary hypertension can develop in adult life
- clinical presentation:
  - history: often asymptomatic in childhood
  - physical exam: grade 2-3/6 pulmonic outflow murmur, widely split and fixed S2
- investigations:
  - ECG: right axis deviation (RAD), mild RVH, right bundle branch block (RBBB)
  - CXR: increased pulmonary vasculature
- management: elective surgical or catheter closure between 2-5 yr of age

#### Ventricular Septal Defect (VSD)

- most common congenital heart defect (30-50%)
- small VSD (majority)
  - clinical presentation:
    - history: asymptomatic, normal growth, and development
    - physical exam: early systolic to holosystolic murmur, best heard at LLSB, thrill
  - investigations: ECG and CXR are normal
  - management: most close spontaneously

- moderate-to-large VSD
  - epidemiology: CHF by 2 mo; late secondary pulmonary hypertension if left untreated
  - clinical presentation
    - ♦ history: delayed growth, decreased exercise tolerance, recurrent URTIs or “asthma” episodes
    - ♦ physical exam: holosystolic murmur at LLSB, mid-diastolic rumble at apex, size of VSD is inversely related to intensity of murmur
  - investigations:
    - ♦ ECG: left ventricular hypertrophy (LVH), left atrial hypertrophy (LAH), RVH
    - ♦ CXR: increased pulmonary vasculature, cardiomegaly, CHF
  - management: treatment of CHF and surgical closure by 1 yr old

#### Moderate-to-large VSD

Size of VSD is inversely related to intensity of murmur.

### Patent Ductus Arteriosus (PDA)

- patent vessel between descending aorta and left pulmonary artery (normally, functional closure within first 15 h of life, anatomical closure within first days of life)
- epidemiology:
  - 5-10% of all congenital heart defects
  - delayed closure of ductus is common in premature infants (1/3 of infants <1750 g); this is different from PDA in term infants
- natural history: spontaneous closure common in premature infants, less common in term infants
- clinical presentation
  - history: asymptomatic, or have apneic or bradycardic spells, poor feeding, accessory muscle use, CHF
  - physical exam:
    - ♦ tachycardia, bounding pulses, hyperactive precordium, wide pulse pressure, continuous “machinery” murmur best heard at left infraclavicular area
- investigations:
  - ECG: may show LAE, LVH, RVH
  - CXR: normal to mildly enlarged heart, increased pulmonary vasculature, prominent pulmonary artery
  - ECHO: diagnostic
- management
  - indomethacin (Indocin®): PGE2 antagonist (PGE2 maintains ductus arteriosus patency) is only effective in premature infants
  - catheter or surgical closure if PDA causes respiratory compromise, FTT, or persists beyond 3rd month of life

Figure 3. Patent ductus arteriosus (PDA)

#### Physical Exam for PDA (in term infant)

- Heavy “machinery” murmur
- High pulse rate
- Wide pulse pressure
- Hyperactive precordium
- Big bounding pulse

## 2. OBSTRUCTIVE LESIONS

- present with decreased urine output, pallor, cool extremities and poor pulses, shock or sudden collapse

### Coarctation of the Aorta

- definition: narrowing of aorta (almost always at the level of the ductus arteriosus)
- epidemiology: commonly associated with bicuspid aortic valve (50%); Turner syndrome (35%)
- clinical presentation
  - history: often asymptomatic
  - physical exam:
    - ♦ upper extremity systolic pressures of 140-145 mmHg
    - ♦ few have high BP in infancy (160-200 mmHg systolic), but this decreases as collaterals develop
    - ♦ decreased blood pressure and weak/absent pulses in lower extremities
    - ♦ radial-femoral delay
    - ♦ absent or systolic murmur with late peak at apex, left axilla, and left back
    - ♦ if severe, presents with shock in the neonatal period when the ductus closes
- investigations: ECG shows RVH early in infancy, LVH later in childhood
- prognosis: can be complicated by hypertension; if associated with other lesions (e.g. PDA, VSD) can lead to CHF
- management: give prostaglandins to keep ductus arteriosus patent for stabilization and perform surgical correction in neonates. For older infants and children balloon arterioplasty may be an alternative to surgical correction.

Figure 4. Coarctation of the aorta

### Aortic Stenosis

- 4 types: valvular (75%), subvalvular (20%), supravalvular and idiopathic hypertrophic subaortic stenosis (IHSS) (5%)
- clinical presentation
  - history: often asymptomatic, but may be associated with CHF, exertional chest pain, syncope or sudden death
  - physical exam: systolic ejection murmur (SEM) at RUSB with aortic ejection click at the apex (only for valvar stenosis)
- management: valvular stenosis is usually treated with balloon valvuloplasty, patients with subvalvular or supravalvular stenosis require surgical repair, exercise restriction required

## Pulmonary Stenosis

- 3 types: valvular (90%), subvalvular, or supra-valvular
- definition of critical pulmonic stenosis:
  - inadequate pulmonary blood flow, dependent on ductus for oxygenation, progressive hypoxia and cyanosis
- natural history: may be part of other congenital heart lesions (e.g. Tetralogy of Fallot) or in association with syndromes (e.g. congenital rubella, Noonan syndrome)
- clinical presentation
  - history: spectrum from asymptomatic to CHF
  - physical exam: wide split S2 on expiration, SEM at LUSB, pulmonary ejection click (for valvular lesions)
- investigations:
  - ECG: RVH
  - CXR: post-stenotic dilation of the main pulmonary artery
- management: surgical repair if critically ill, or if symptomatic in older infants/children

### Causes of Cyanotic Heart Disease – Think 1,2,3,4,5

- ONE** big trunk (Truncus arteriosus)
- TWO** interchanged vessels (Transposition of the great vessels)
- THREE** leaflets (Tricuspid atresia)
- FOUR** anatomical abnormalities (Tetralogy of Fallot)
- FIVE** words (Total anomalous pulmonary venous return)

Figure 5. Tetralogy of Fallot (TOF)

### Tetralogy of Fallot

- Ventricular septal defect (VSD)
- Right ventricular outflow tract obstruction (RVOTO)
- Aortic root “overriding” VSD
- Right ventricular hypertrophy

### Ebstein's Anomaly

- Septal and posterior leaflets of tricuspid valve are malformed and displaced into the RV
- Potential for RV dysfunction, tricuspid stenosis, tricuspid regurgitation (TR) or functional pulmonary atresia if RV unable to open pulmonic valves
- Accessory conduction pathways (WPW) are often present

### Etiology

- Unknown, associated with maternal lithium and benzodiazepine use in 1st trimester

### Treatment

- Newborns: consider closure of tricuspid valve + aortopulmonary shunt, or transplantation
- Older children: tricuspid valve repair or valve replacement + ASD closure

Figure 6. Transposition of the great arteries (TGA)

## Cyanotic Congenital Heart Disease

- systemic venous return re-enters systemic circulation directly
- most prominent feature is cyanosis ( $O_2$  sat <75%)
- hyperoxic test differentiates between cardiac and other causes of cyanosis
  - obtain preductal, right radial ABG in room air, then repeat after the child inspires 100%  $O_2$
  - if  $PaO_2$  improves to greater than 150 mmHg, cyanosis less likely cardiac in origin

### 1. RIGHT TO LEFT SHUNT LESIONS

#### Tetralogy of Fallot

- epidemiology: 10% of all CHD, most common cyanotic heart defect diagnosed beyond infancy with peak incidence at 2-4 mo of age
- pathophysiology:
  - embryological defect due to anterior and superior deviation of the outlet septum leading to: VSD, RVOTO (e.g. pulmonary stenosis), over-riding aorta and RVH
    - ♦ infants may initially have a L → R shunt (therefore no cyanosis); however, RVOTO is progressive, leading to increasing R → L shunting with hypoxemia and cyanosis
    - ♦ degree of RVOTO determines the direction and degree of shunt and, therefore, the extent of clinical cyanosis and degree of RVH
- clinical presentation
  - history: hypoxic “tet” spells
    - ♦ during exertional states (crying, exercise) the increasing pulmonary vascular resistance and decrease in systemic resistance causes an increase in right-to-left shunting
    - ♦ clinical features include paroxysm of rapid and deep breathing, irritability and crying, increasing cyanosis, decreased intensity of murmur (decreased flow across RVOTO)
    - ♦ if severe, can lead to decreased level of consciousness, seizures, death
  - physical exam
    - ♦ single loud S2 due to severe pulmonary stenosis (i.e. RVOTO), systolic ejection murmur (LSB)
- investigations:
  - ECG: RAD, RVH
  - CXR: boot shaped heart, decreased pulmonary vasculature, right aortic arch (in 20%)
- management of spells:  $O_2$ , knee-chest position, fluid bolus, morphine sulfate, propranolol
- treatment: surgical repair at 4-6 mo of age; earlier if marked cyanosis or “tet” spells

### 2. OTHER CYANOTIC CONGENITAL HEART DISEASES

#### Transposition of the Great Arteries (TGA)

- epidemiology: 3-5% of all congenital cardiac lesions, most common cyanotic CHD in neonate
- pathophysiology: parallel pulmonary and systemic circulations
  - systemic: body → RA → RV → aorta → body
  - pulmonary: lungs → LA → LV → pulmonary artery → lungs
  - survival is dependent on mixing through PDA and/or atrial or ventricular septal defects
- physical exam:
  - neonates: ductus arteriosus closure causes rapidly progressive severe hypoxemia unresponsive to oxygen therapy, acidosis, and death
  - VSD present: cyanosis is not prominent; CHF within first weeks of life
  - VSD absent: no murmur
- investigations:
  - ECG: RAD, RVH, or may be normal
  - CXR: egg-shaped heart with narrow mediastinum (“egg on a string”)

- **management:**
  - symptomatic neonates: prostaglandin E1 infusion to keep ductus open until balloon atrial septostomy
  - surgical repair: arterial switch performed in the first two weeks in those without a VSD while LV muscle is still strong

### Total Anomalous Pulmonary Venous Connection

- epidemiology: 1-2% of CHD
- pathophysiology:
  - all pulmonary veins drain into right-sided circulation (systemic veins, RA)
  - no direct oxygenated pulmonary venous return to left atrium
  - often associated with obstruction at connection sites
  - ASD must be present for oxygenated blood to shunt into the LA and systemic circulation
- **management:** surgical repair in all cases and required urgently for severe cyanosis

### Truncus Arteriosus

- pathophysiology:
  - single great vessel gives rise to the aorta, pulmonary and coronary arteries
  - truncal valve overlies a large VSD
  - potential for coronary ischemia with fall in pulmonary vascular resistance
- management: surgical repair within first 6 wk of life

### Hypoplastic Left Heart Syndrome (HLHS)

- epidemiology: 1-3% of CHD; commonest cause of death from CHD in first month of life
- pathophysiology: LV hypoplasia may include atretic or stenotic mitral and/or aortic valve, small ascending aorta, and coarctation of the aorta with resultant systemic hypoperfusion
- systemic circulation is dependent on ductus patency; upon closure of the ductus, infant presents with circulatory shock and metabolic acidosis
- management:
  - intubate and correct metabolic acidosis
  - IV infusion of PGE1 to keep ductus open
  - surgical palliation (overall survival 50% to late childhood) or heart transplant

#### 4 Features of Hypoplastic LHS

- Hypoplastic LV
- Narrow mitral/aortic valves
- Small Ascending Aorta
- Contracted Aorta

## Congestive Heart Failure (CHF)

- see [Cardiology](#), C30

### Etiology

- CHD
- arteriovenous malformations (AVMs)
- cardiomyopathy
- arrhythmias
- acute hypertension
- anemia
- cor pulmonale
- myocarditis

### History

- infant: feeding difficulties, early fatigability, diaphoresis while sleeping or eating, respiratory distress, lethargy, FTT
- child: decreased exercise tolerance, fatigue, decreased appetite, failure to thrive, respiratory distress, frequent URTIs or "asthma" episodes
- orthopnea, paroxysmal nocturnal dyspnea, pedal/dependent edema are all uncommon in children

### Physical Findings

- 4 key features: tachycardia, tachypnea, cardiomegaly, hepatomegaly
- FTT
- alterations in peripheral pulses, four limb blood pressures (in some CHDs)
- dysmorphic features associated with congenital syndromes

### Investigations

- CXR: cardiomegaly, pulmonary venous congestion

### Management

- general: sitting up, O<sub>2</sub>, sodium and water restriction, increased caloric intake
- pharmacologic: diuretics, afterload reduction (i.e. ACE inhibitor), digoxin rarely used
- curative: correction of underlying cause

#### 4 Key Features of CHF

##### 2 Tachy's and 2 Megaly's

- Tachycardia
- Tachypnea
- Cardiomegaly
- Hepatomegaly

## Dysrhythmias

- see [Cardiology](#), C12
- can be transient or permanent, congenital (structurally normal or abnormal) or acquired (toxin, infection, infarction)

### Sinus Arrhythmia

- phasic variations with respiration (present in almost all normal children)

### Sinus Tachycardia

- rate of impulses arising from sinus node is elevated (>150 bpm in infants, >100 bpm in older children)
- etiology: hypertension, fever, anxiety, sepsis, anemia/hypoxia, PE, drugs, etc.
- differentiate from SVT (see below) by slowing the sinus rate (vagal massage,  $\beta$ -blockers) to identify sinus P waves

### Premature Atrial Contractions (PACs)

- may be normal variant or can be caused by electrolyte disturbances, hyperthyroidism, cardiac surgery, digitalis toxicity

### Premature Ventricular Contractions (PVCs)

- common in adolescents
- benign if single, uniform, disappear with exercise, and no associated structural lesions
- if not benign, may degenerate into more severe dysrhythmias

### Supraventricular Tachycardia (SVT)

- abnormally rapid heart rhythm originating above the ventricles – most frequent sustained dysrhythmia in children
- not life-threatening, but can lead to symptoms

### Complete Heart Block

- congenital heart block can be caused by maternal anti-Ro or anti-La (e.g. mother with SLE)
- often diagnosed in utero (may lead to development of fetal hydrops)
- clinical symptoms related to level of block (the lower the block, the slower the heart rate and greater the symptoms of inadequate cardiac output)
- symptomatic patients need a pacemaker

#### Pediatric vs. Adult ECG

Pediatric ECG findings that may be normal:

- HR >100 bpm
- Shorter PR, QT intervals and QRS duration
- Inferior and lateral small Q waves
- RV larger than LV in neonates, so normal to have:
  - Right axis deviation
  - Large precordial R waves
  - Upright T waves
  - Inverted T waves in the anterior precordial leads from early infancy to teen years

## Heart Murmurs

- 50-80% of children have audible heart murmurs at some point in their childhood
- most childhood murmurs are functional (e.g. “innocent”) without associated structural abnormalities and have normal ECG and radiologic findings
- in general, murmurs can become audible or accentuated in high output states, e.g. fever, anemia

**Table 11. Differentiating Heart Murmurs**

	Innocent	Pathological
<b>History and Physical</b>	Asymptomatic	Symptoms and signs of cardiac disease (FIT, exercise intolerance)
<b>Timing</b>	SEM	All diastolic, pansystolic, or continuous (except venous hum)
<b>Grade</b>	<3/6	≥3/6 (palpable thrill)
<b>Splitting</b>	Physiologic S2	May have fixed split or single S2
<b>Extra sounds/Clicks</b>	None	May be present
<b>Change of Position</b>	Murmur varies	Unchanged

**Table 12. Five Innocent Heart Murmurs**

Type	Description	Age	Differential Diagnosis
<b>Peripheral Pulmonic Stenosis</b>	Neonates, low-pitched, radiates to axilla and back	Neonates, usually disappears by 3-6 mo	Patent Ductus Arteriosus Pulmonary stenosis
<b>Still's Murmur</b>	Vibratory, LLSB or apex, SEM	3-6 yr	Subaortic stenosis Small ventricular septal defect
<b>Venous Hum</b>	Infraclavicular hum, continuous, R>L	3-6 yr	Patent Ductus Arteriosus
<b>Pulmonary Ejection</b>	Soft, blowing, LUSB, SEM	8-14 yr	Atrial septal defect Pulmonary stenosis
<b>Supraclavicular Arterial Bruit</b>	Low intensity, above clavicles	Any age	Aortic stenosis Bicuspid aortic valve

## Infective Endocarditis

- see [Infectious Diseases](#), ID17

## Development

### Approach to Global Developmental Delay

- also known as Early Developmental Impairment (EDI)

#### Definition

- performance significantly below average in two or more areas of development (i.e. gross motor, fine motor, language, cognitive, social, adaptive)
- when persistent, these become developmental disabilities which are lifelong impairments

#### Epidemiology

- 5-10% of children have neurodevelopmental delay
- careful evaluation can reveal a cause in 50-70% of cases

#### Etiology

- CNS abnormalities (meningitis/encephalitis, brain malformation, trauma, etc.)
- sensory deficits (hearing, vision)
- environmental (psychosocial neglect, lead exposure, antenatal drug or alcohol exposure, etc.)
- genetic/chromosomal disorders (Down syndrome, Fragile X, etc.)
- metabolic disorders (inborn errors of metabolism, hypothyroidism, etc.)
- obstetrical (prematurity, hypoxic ischemic encephalopathy, TORCH infections, etc.)

#### Clinical Presentation

- history
  - intrauterine exposures, perinatal events
  - detailed developmental milestones: rate of acquisition, regression of skills
  - associated problems: feeding, seizures, behaviour, sleep
  - family history, consanguinity
  - social history
- physical
  - dysmorphic features, hepatosplenomegaly, neurocutaneous markers, growth parameters, detailed neurological examination
- investigations
  - neurodevelopmental assessment, vision and hearing test, psychosocial evaluation, OT, PT and/or SLP assessments, genetics consultation
  - laboratory testing and imaging (guided by history and physical exam)
    - ♦ microarray, chromosomes, FISH, Fragile X testing, neuroimaging, metabolic workup, neuroelectrophysiologic testing

#### Management

- dependent on specific area of delay
- therapy services (e.g. speech and language therapy for language delay, OT and/or PT for motor delay), early intervention services (e.g. infant development services, Ontario Early Years Centres)

## Intellectual Disability

### Definition

- state of functioning that begins in childhood and is characterized by limitations in both intelligence and adaptive skills
- referred to as mental retardation in DSM-IV, not a term used in clinical settings
- historically defined as an IQ <70

### Epidemiology

- 1% of general population; M:F = 1.5:1

### Etiology

- any disorder that interferes with brain development and functioning
- prenatal (majority): TORCH infections, fetal alcohol syndrome
- genetic/metabolic: DS, Fragile X, PKU, untreated or delayed diagnosis of congenital hypothyroidism, CNS abnormalities, other chromosomal/metabolic disorders

### Risk Factors

- male, consanguineous parents, family history, older maternal age, decreasing maternal education, certain ethnicities
- prenatal: pre-eclampsia, maternal malnutrition or DM
- perinatal: prematurity, low birth weight, birth trauma/hypoxia
- postnatal: intracranial hemorrhage, CNS or other serious infection, hypoxia, environmental toxins, psychosocial deprivation, malnutrition

### Clinical Presentation

- history
  - well below average general intellectual functioning
  - significant deficits in adaptive functioning in at least two of: communication, self-care, home-living, social skills, self-direction, academic skills, work, leisure, health, safety
- physical
  - check growth, dysmorphic features, complete physical exam
- investigations
  - standardized psychology assessment (includes IQ test and measure of adaptive functioning)
  - vision, hearing, and neurologic assessment
  - genetic and metabolic testing as indicated

### Management

- main objective: enhance adaptive functioning level
- requires an interprofessional team with strong case co-ordination
- emphasize community-based treatment and early intervention
- individual/family therapy, behaviour management services, therapy services (e.g. OT, SLP), medications for associated conditions
- education: life skills, vocational training, communication skills, family education
- psychosocial support for individual and family; respite care

### Prognosis

- higher rates of sensory deficits, motor impairment, behavioural/emotional disorders, seizures, psychiatric illness

#### DSM-IV Criteria for Intellectual Disability

- Significant sub-average intellectual function
- Significant limitations in adaptive function
- Onset before 18 yr old

#### Classification of Intellectual Disability

Severity	% Cases	IQ
Mild	85	50-70
Moderate	10	35-49
Severe	3-4	20-34
Profound	1-2	<20

## Language Delay

### Definition

- no universally accepted definition, but often identified around 18 mo of age with enhanced well baby visit
- if formally tested, performance on a standardized assessment of language is at least one standard deviation below mean of age
- can be expressive, receptive, or both
- expressive language: ability to produce or use language
- receptive language: ability to understand language

### Epidemiology

- ~10-15% of 2 yr old children have a language delay, but only 4-5% remain delayed after 3 yr of age
- ~6-8% of school-aged children have specific language impairment (many of whom were not identified before school entry)

## Etiology

- cognitive disability
- constitutional language delay
- genetic/metabolic: DS, Fragile X syndrome, Williams syndrome, hypothyroidism, PKU, etc.
- hearing impairment
- mechanical problems: cleft palate, cranial nerve palsy
- medical condition: seizure disorder (includes acquired epileptic aphasia), CP, TORCH infection, iron deficiency, lead poisoning, etc.
- autism spectrum disorder (ASD)
- psychosocial: neglect or abuse
- selective mutism

## Risk Factors

- male, positive family history, prematurity, psychosocial (poverty, low parental education, maternal depression)

## Clinical Presentation

- history
  - concerns about hearing, delay in language development or regression in previously normal language development
  - delayed language milestones on well-child check up; presence of red flags
  - must determine if language delay is expressive, receptive or mixed
  - children with expressive language delays may have concurrent behaviour problems or drooling (because of abnormal oral musculature)
  - risk factors for hearing loss (hereditary, recurrent AOM) and language delay
- physical
  - guided by history: look for abnormal growth, dysmorphisms, unusual social interactions (lack of eye contact, not pointing)
  - include full exam of the external/internal ear (e.g. TM scarring), oral pharynx (e.g. cleft palate) and neurologic system (including tone)
- investigations
  - use of language specific screens in primary care setting: The Early Language Milestone, CAT/CLAMS, MCHAT, etc.
  - all children with suspected language delay MUST be referred to an audiologist for a hearing assessment
  - CBC (to rule out anemia), venous blood lead levels, genetic/metabolic workup as indicated

## Management

- specific to etiology
- often multidisciplinary and requires appropriate referrals: early intervention services, special education services, SLP, ENT and dental professionals, general support services
- primary care provider can help reinforce family's understanding of delay and provide follow-up and care coordination
- prevention: parents can read aloud to their child, engage in dialogic reading, avoid baby talk, narrate daily activities, etc.

## Prognosis

- depends on etiology
- if language delay persists beyond 5 yr old then more likely to have difficulties in adulthood
- persistent language delay is associated with poor academic performance, behavioural problems, social isolation

### Risk Factors for Sensorineural Hearing Loss

- Genetic syndromes/family history
- Congenital (TORCH) infections
- Craniofacial abnormalities
- <1,500 g birthweight
- Hyperbilirubinemia/kernicterus
- Asphyxia/low APGAR scores
- Bacterial meningitis, viral encephalitis

Bilingual exposure generally does NOT explain a frank delay in language development.

Primary care physicians should suspect a receptive language delay in any young child with an expressive language delay.

## Fetal Alcohol Spectrum Disorder (FASD)

### Definition

- term describing the range of effects of prenatal exposure to alcohol, including physical, mental, behavioural and learning disabilities
- no "safe" level of alcohol consumption during pregnancy has been established
- spectrum includes: Fetal Alcohol Syndrome (FAS), partial Fetal Alcohol Syndrome (pFAS), Alcohol-Related Birth Defects (ARBD), and Alcohol-Related Neurodevelopmental Disorder (ARND)

### Epidemiology

- prevalence of FAS and FASD is 0.1% and 1.0%, respectively
- most common preventable cause of intellectual disability

### Pathogenesis

- specific mechanism of FASD is unknown, but hypothesis include nutritional deficits, toxic effects of acetaldehyde, alteration of placental transport, abnormal protein synthesis, and altered cerebral neurotransmitter

**Diagnosis**

- often misdiagnosed or missed entirely
- diagnosis of FAS, ARBD and ARND all require evidence of maternal drinking during pregnancy
- criteria for diagnosis of FAS
  - a) growth deficiency: low birth weight and/or decelerating weight over time not due to nutrition
  - b) characteristic pattern of facial anomalies: short palpebral fissures, flattened philtrum, thin upper lip, flat midface
  - c) central nervous system dysfunction: microcephaly and/or neurobehavioural dysfunction (hyperactivity, fine motor problems, attention deficits, learning disabilities, cognitive disabilities, difficulties in adaptive functioning, etc.)
- criteria for diagnosis of ARBD
  - a) congenital anomalies, including malformations and dysplasias of the cardiac, skeletal, renal, ocular, and auditory systems
- criteria for diagnosis of ARND
  - a) central nervous system dysfunction (similar to FAS)
  - b) complex pattern of behavioural or cognitive abnormalities inconsistent with developmental level that cannot be explained by familial background or environment alone

**Management**

- early diagnosis is essential to prevent secondary disabilities
- no cure, but individuals with FASD and their families should be linked to community resources and services to improve outcome

**Prognosis**

- secondary disabilities include unemployment, mental health problems, difficulties with the law, inappropriate sexual behaviour, disrupted school experience, peer problems

## Learning Disabilities

**Definition**

- specific and persistent failure to acquire academic skills despite conventional instruction, adequate intelligence, and sociocultural opportunity
- a significant discrepancy between a child's intellectual ability and their academic performance
- several types or ADLs: learning disabilities in reading, writing, mathematics

**Epidemiology**

- prevalence: 2-10%
- high incidence of psychiatric comorbidity: anxiety, dysthymia, conduct disorder (CD), major depressive disorder (MDD), oppositional defiant disorder (ODD), attention deficit hyperactivity disorder (ADHD)

**Etiology**

- pathogenesis is unknown, likely genetic factors involved
- learning disabilities may be associated with a number of conditions:
  - genetic/metabolic: Turner syndrome, Klinefelter syndrome
  - perinatal: prematurity, low birth weight, birth trauma/hypoxia
  - postnatal: CNS damage, hypoxia, environmental toxins, FAS, psychosocial deprivation (understimulation), malnutrition
- poor visual acuity is NOT a cause

**Risk Factors**

- positive family history, prematurity, other developmental and mental health conditions, neurologic disorders (e.g. seizure disorders, neurofibromatosis), history of CNS infection/irradiation/traumatic injury

**Clinical Presentation**

- history and physical
  - school difficulties (academic achievement, behaviour, attention, social interaction)
  - development of negative self-concept → reluctance to participate even in areas of strength
  - social issues: overt hostility towards parents/teachers; difficulties making friends for several reasons (problems remembering names, difficulties with language to engage in conversations, inability to understand games and complex rules, etc.), bullying and anxiety
  - look for dysmorphisms, complete physical exam
- investigations
  - standardized tests for IQ
  - individual scores on achievement tests in reading, mathematics or written expression (WISC III, WRAT) >2 SD below that expected for age, education, and IQ

## Management

- provide quality instruction for specific learning disability
- support student by modifying the curriculum and/or providing accommodations (e.g. scribe for writing, extra time for tests, photocopied notes, etc.)
- consider grade retention in certain students (no guidelines exist, very rare in Ontario)
- specialized education placements that can provide educational remediation

## Prognosis

- limited information available about persistence of learning disabilities over time
- low self-esteem, poor social skills, 40% school drop-out rate

## Motor Delay

- see *Cerebral Palsy*, P90 and *Muscular Dystrophy*, P44

## Endocrinology

## Anti-Diuretic Hormone

### Diabetes Insipidus (DI)

- see [Endocrinology](#), E19 and [Nephrology](#), NP11

### Syndrome of Inappropriate Antidiuretic Hormone (SIADH)

- see [Endocrinology](#), E19 and [Nephrology](#), NP9

## Diabetes Mellitus (DM)

### DM Type 1

- insulin deficiency following destruction of the pancreatic  $\beta$  cells

### Epidemiology

- most common form of diabetes mellitus in children, M=F
- variable prevalence internationally, affects ~1:4000 children in Canada
- can present at any age, but bimodal peaks at 5-7 yr old and at puberty

### Etiology

- type 1A: cell-mediated autoimmune destruction of  $\beta$ -cells of the pancreas
- type 1B: rare, non-immune variation; unknown cause
- disease results from some level of genetic predisposition and an environmental trigger
  - HLA locus confers ~50% of genetic susceptibility
  - trigger likely infectious and/or hormonal (as suggested by bimodal peaks in age of onset)

### Risk Factors

- positive family history of DM1, personal or family history of other autoimmune diseases

### Clinical Presentation

- history
  - initially presents as polyuria, often manifested as nocturia or secondary enuresis
  - polydipsia, weight loss (lack of insulin leading to a catabolic state) and polyphagia
  - diabetic ketoacidosis on initial presentation (~20%): vomiting, abdominal pain, confusion/lethargy
- physical
  - tachypnea, signs of dehydration,  $\downarrow$  LOC, Kussmaul's respiration, ketone breath
- investigations
  - initial tests: urine dipstick (glucose, ketones), random blood glucose ( $>11.1$ )
  - DKA bloodwork: venous/arterial blood gas, osmolarity, plasma glucose, bicarbonate, HbA1C, serum ketones, BUN, Cr, electrolytes, CBC
  - if etiology is unclear, consider ordering autoimmune antibodies (anti-Gad, anti-islet)

### Management

- disclose diagnosis and prompt patient education around survival skills, meal plans and insulin injections
- refer patient to facility capable of managing DM1
- management is multi-disciplinary and family-centered
- initial insulin dosing
  - 2/3 of total daily insulin dose in AM (1/3 rapid acting + 2/3 intermediate-acting)
  - 1/3 of total daily insulin dose in PM (1/3 rapid acting + 2/3 intermediate-acting)

### Diagnostic Criteria for Diabetes Mellitus (Types 1 and 2)

One of:

- HbA1C  $\geq 6.5\%$  (not validated in children)
- Fasting glucose  $\geq 7.0$  mmol/L
- 2 h plasma glucose during OGTT  $\geq 11.1$  mmol/L
- Random glucose  $\geq 11.1$  mmol/L with classic symptoms of hyperglycemia (polyuria, polydipsia, weight loss)

### Blood Glucose Targets by Age

Age range	Pre-meal blood glucose target	HbA1c target
<6	6-12	<8.5%
6-12	6-10	<8%
>12	4-7	<7%

- blood glucose monitoring
  - tight glycemic control decreases rate of long term complications
  - target glucose range: in infants/toddlers from 6-10 mmol/L, in children 4-10 mmol/L, in adolescents 4-7 mmol/L
  - for tighter control, may consider continuous subcutaneous insulin infusion (CSII) pump or MDI (multiple daily injections regimen: basal insulin plus analog for meals)
  - young children are more susceptible to hypoglycemia
- if DKA present: ABCs, admit, correct dehydration, correct acidosis (start insulin infusion), restore normal blood glucose, identify/treat precipitating event
  - low threshold to investigate (CT/MRI) and treat DKA, as cerebral edema is a major concern
  - see [Endocrinology](#), E11
- screen for micro- and macrovascular complications (regular ophthalmology assessments, blood pressure, urine microalbuminemia), concurrent autoimmune diseases (thyroiditis, celiac disease, etc.) and mental health issues (depression, eating disorders)

### Prognosis

- no cure currently
- short-term complications
  - hypoglycemia: due to missed/delayed meals, excess insulin or exercise, illness; can lead to seizures and/or coma; reversed with PO/IV glucose or IM glucagon
  - hyperglycemia: due to intercurrent illness, diet-to-insulin mismatch, ↑ risk of end-organ damage
  - DKA: due to missed insulin doses, infection; most common cause of death
- long-term complications
  - microvascular: retinopathy, nephropathy, neuropathy
  - macrovascular: metabolic syndrome
  - increased risk of other autoimmune diseases

### DM Type 2

- see [Family Medicine](#), FM22, [Endocrinology](#), E6
- impaired glucose metabolism due to increased peripheral insulin resistance
- rare before 10 yr of age, but more common in older children/adolescents
- prevalence is rising mainly due to the increased incidence of childhood obesity
- risk factors: obesity, positive family history, female gender, certain ethnic groups
- clinical presentation may be similar to that of DM1, though most children are asymptomatic
- may present in DKA or hyperglycemic hyperosmotic nonketotic (HONK) state
- management: diet, physical activity (60 min of moderate to intense exercise per day, limit non-academic screen time to 2 h/d), weight loss, oral hypoglycemics (metformin used in children because it does not cause hypoglycemia), insulin
- prognosis: includes microvascular and macrovascular complications similar to DM1

## Growth

### APPROACH TO SHORT STATURE

#### Definition

- short stature – height <3rd percentile
- poor growth evidenced by growth deceleration (height crosses major percentile lines, growth velocity <25th percentile)

#### Epidemiology

- ~2.5% of the population by definition

#### Etiology

- see sidebar

#### Clinical Presentation

- history and physical
  - plot on growth curve (special growth charts available for Turner syndrome, achondroplasia, DS)
  - decreased growth velocity may be more worrisome than actual height
  - see Figure 7 for the approach to short stature
- investigations
  - calculate mid-parental height: children are usually in a percentile between their parents' height (see *Mid-Parental Height* sidebar, P10)
  - AP x-ray of left hand and wrist for bone age
  - remaining investigations guided by history and physical (e.g. TSH, sweat chloride, etc.)

#### Short Stature DDx

##### ABCDEFG

**A**lone (neglected infant)  
**B**one dysplasias (rickets, scoliosis, mucopolysaccharidoses)  
**C**hromosomal (Turner, Down)  
**D**elayed growth (constitutional)  
**E**ndocrine (low growth hormone, Cushing, hypothyroid)  
**F**amilial  
**G**I malabsorption (celiac, Crohn's)

#### 4 Questions to Ask when Evaluating Short Stature

- Was there IUGR?
- Is the growth proportionate?
- Is the growth velocity normal?
- Is bone age delayed?

## Management

- depends on severity of problem as perceived by parents/child
- no treatment for non-pathological short stature, except for idiopathic short stature
- GH therapy if requirements met (see *Growth Hormone Deficiency*, below)
- other conditions that are treated: Turner, Prader-Willi, chronic renal failure
- support and management of resultant self-image issues, social anxiety, etc.

To check for proportionality, measure upper to lower segment ratio (U/L) using the pubic symphysis as your landmark. Normals are 1.7 for newborn, 1.4 for young child, 0.9 for adult male, 1.0 for adult female.

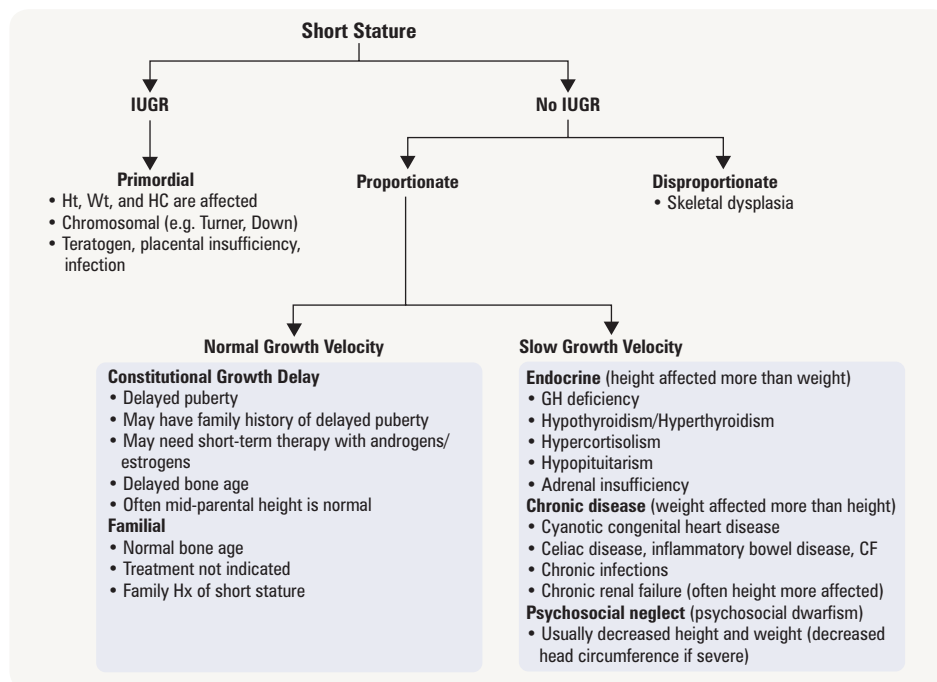

Figure 7. Approach to the child with short stature

## GROWTH HORMONE (GH) DEFICIENCY

- a rare but treatable cause of short stature in children

### Epidemiology

- 1/10,000-1/4,000 children

### Etiology

- GH important for chondrocyte proliferation and IGF-1 release → IGF-1 acts at long bones, liver
- congenital GH deficiency: idiopathic, embryologic CNS malformation (associated with midline facial anomalies, neurologic defects, micropenis in males, hypoglycemia), perinatal asphyxia, rare mutations
- acquired GH deficiency: tumours (e.g. craniopharyngioma), trauma, cranial infection, irradiation, post-surgical

### Risk Factors

- previous head trauma, history of intracranial bleed or infection, head surgery or irradiation, positive family history, breech delivery

### Clinical Presentation

- history and physical
  - congenital: growth may be normal in first 6 mo (insulin main growth factor), growth deceleration after; look for micropenis
  - acquired: severe growth failure, ↑ weight/height ratio (short and chubby), infantile fat distribution, immature face with underdeveloped nasal bridge and frontal bossing, high-pitched voice, sparse and thin hair growth, delayed puberty
  - hypothalamic: pituitary dysfunction (micropenis, cryptorchidism, optic nerve hypoplasia, etc.)
- investigations
  - blood glucose (hypoglycemia), AP x-ray of left hand and wrist for bone age (delayed), IGF-1
  - testing for GH deficiency (stimulation testing), only performed when
    - ♦ height <3rd percentile
    - ♦ decreased growth velocity
    - ♦ midline craniofacial anomalies
    - ♦ episodes of hypoglycemia
    - ♦ delayed bone age, puberty

- physiologic increase in GH with arginine, clonidine, insulin, dopamine, or propranolol
- positive test if failure to raise GH  $>5.7$  ng/mL post-stimulation

**Management**

- GH therapy indicated if
  - GH shown to be deficient by 2 different stimulation tests
  - growth velocity  $<3$ rd percentile or height  $<<3$ rd percentile
  - bone age x-rays show unfused epiphyses/delayed bone age
  - Turner syndrome, Noonan syndrome, Prader-Willi syndrome, chronic renal failure, idiopathic short stature
- support and management of resultant self-image issues, social anxiety, etc.

**Prognosis**

- if administered at an early age, GH therapy can help patients achieve adult height
- children treated with recombinant GH are at a slightly increased risk of developing pseudotumor cerebri, slipped capital femoral epiphysis and worsening scoliosis
- rare side effects: pancreatitis, transient gynecomastia, increase of growth/pigmentation of nevi

**TALL STATURE**

- height greater than two SD above the mean for a given age, sex and race

**Etiology**

- constitutional/familial
- endocrine: Beckwith-Wiedemann syndrome, hyperthyroidism, hypophyseal gigantism, precocious puberty
- genetic: homocystinuria, Klinefelter syndrome, Marfan syndrome, Sotos syndrome

## Hypercalcemia/Hypocalcemia/Rickets

- see [Endocrinology](#), E39, E40, E45

## Hyperthyroidism and Hypothyroidism

- may be congenital or acquired (for acquired causes, see [Endocrinology](#), E22 and 27)

**CONGENITAL HYPERTHYROIDISM**

- also known as neonatal Graves' disease

**Epidemiology**

- $\sim 1:25,000$  neonates, M=F

**Etiology**

- results from transplacental passage of maternal thyroid stimulating antibodies from mother with a history of Graves' disease

**Clinical Presentation**

- history and physical
  - clinical manifestations may be masked if mother on antithyroid treatment
  - may present with tachycardia with congestive heart failure, heart murmur, goiter, craniosynostosis, irritability, poor feeding, FTT
- investigations
  - serum levels of TSH and free T4 in all infants with suspected congenital hypothyroidism or infants born to mothers with Graves' disease

**Management**

- methimazole until antibodies cleared
- symptomatic treatment as needed (e.g.  $\beta$ -blockers to control tachycardia)

**Prognosis**

- if prompt and adequate treatment given, most neonates improve rapidly
- antibodies usually spontaneous cleared by 2-3 mo of life
- fetal or neonatal hyperthyroidism may have adverse effects on CNS development, leading to developmental and behaviour problems

## CONGENITAL HYPOTHYROIDISM

### Epidemiology

- incidence: 1:4000-1:2000 newborns births; F:M=2:1
- one of the most common preventable causes of intellectual disability

### Etiology

- may be classified as permanent primary, central and transient hypothyroidism
- ~85% of primary cases are sporadic (mostly thyroid dysgenesis), remaining 15% hereditary (mostly inborn errors of thyroid synthesis)
- causes of transient hypothyroidism: maternal antibody-mediated, iodine deficiency (rare in developed countries), prenatal exposure to antithyroid medications

### Clinical Presentation

- history and physical
  - usually asymptomatic in neonatal period because maternal T4 crosses the placenta
  - may have: prolonged jaundice, constipation, sluggish, hoarse cry, lethargy, poor feeding, macroglossia, coarse facial features, large fontanelles, umbilical hernia
- investigations
  - diagnosis through newborn screening of TSH or free T4; abnormal results should be confirmed with serum levels from venipuncture

### Management

- thyroxine replacement

### Prognosis

- excellent outcome if treatment started within 1-2 mo of birth
- if treatment started after 3-6 mo of age, may result in permanent developmental delay and/or disability (mild to profound)

## Sexual Development

### AMBIGUOUS GENITALIA

#### Definition

- newborn or child whose gender is difficult to assign based on the appearance of genitalia
- subtype of disorders of sex differentiation (DSD): a condition in which development of chromosomal, gonadal or anatomic sex is atypical
- subtypes: 46,XX DSD, 46,XY DSD, ovotesticular DSD (true hermaphrodite)

#### Epidemiology

- incidence of genital abnormalities at birth is as high as 1:300
- prevalence of complex anomalies with true sexual ambiguity much lower at ~1:5000

#### Etiology

- 46,XY DSD
  - inborn error of testosterone biosynthesis or Leydig cell hypoplasia
  - 5- $\alpha$ -reductase deficiency, androgen receptor deficiency or insensitivity
  - luteinizing hormone (LH)/hCG unresponsiveness
- 46,XX DSD
  - virilizing congenital adrenal hyperplasia (CAH) (most common)
  - maternal source: virilizing ovarian or adrenal tumours, untreated maternal CAH, placental aromatase deficiency
- ovotesticular DSD
  - both ovarian follicles and seminiferous tubules in the same patient with a 46,XX karyotype
  - mixed gonadal dysgenesis

#### Risk Factors

- parental consanguinity, positive family history of ambiguous genitalia, early childhood illness/death or primary amenorrhea, maternal medications during pregnancy (androgens, progesterones, danazol, phenytoin, aminoglutethimide, endocrine disruptors)

#### Clinical Presentation

- history
  - thorough obstetrical history, including prenatal screens and maternal medications
  - family history: autosomal recessive pattern may suggest CAH, X-linked recessive pattern may suggest androgen insensitivity syndrome

- physical
  - male pseudohermaphrodite (XY): small phallus, hypospadias, undescended testicles
  - female pseudohermaphrodite (XX): clitoral hypertrophy, labioscrotal fusion
  - look for concurrent midline defects, dysmorphic features and congenital abnormalities
- investigations
  - karyotype and genetic work-up as indicated
  - blood work: electrolytes and renin (evidence of salt-wasting in CAH); 17-OH-progesterone, androgens, FSH and LH
  - imaging: abdominal U/S to look for uterus, testicles, ovaries

### Management

- depends on underlying etiology
- avoid announcement of probable sex or use of personal pronouns until all tests are complete
- continuous psychosocial support for parents and child during development
- elective surgical reconstruction of genitalia is sometimes possible

## CONGENITAL ADRENAL HYPERPLASIA (CAH)

### Definition

- autosomal recessive disorder characterized by the partial or total defect of various synthetic enzymes of the adrenal cortex required for cortisol and aldosterone production

### Epidemiology

- occurs in ~1:15,000 live births
- most common cause of ambiguous genitalia

### Etiology

- for biosynthetic pathways of adrenal cortex, see [Endocrinology](#), E29
- 21-hydroxylase deficiency (21-OH) responsible for ~95% of CAH cases
- results in ↓ cortisol and aldosterone production with shunting toward ↑↑ androgens
- cortisol deficiency leads to elevated ACTH, which causes adrenal hyperplasia
- rarer causes include deficiencies in 11-OH, cholesterol desmolase, 17-OH and 3-HSD

### Clinical Presentation

- depends on which enzyme in cortisol synthesis pathway is defective
- presentation of 21-OH deficiency can be divided into:
  - classic deficiency with salt wasting: inadequate aldosterone resulting in FTT, hyperkalemia, hyponatremia, hypoglycemia, acidosis
  - classic deficiency without salt wasting: simple virilizing type
  - non-classic: signs/symptoms of androgen excess (amenorrhea, precocious puberty, etc.)
- 21-OH deficiency screening is part of many newborn screening programs across North America
- high serum levels of 17-OH progesterone in random blood sample diagnostic for 21-OH deficiency

### Management

- correct any abnormalities in fluids, electrolytes or serum glucose
- provide glucocorticoids/mineralcorticoids as necessary, extra glucocorticoids in times of stress
- psychosocial support

### Prognosis

- complications if untreated include virilization, acne, salt wasting, hypotension

## NORMAL PUBERTAL DEVELOPMENT

### Physiology

- puberty occurs with the maturation of the hypothalamic–pituitary–gonadal (HPG) axis
- ↑ pulsatile release of GnRH → ↑ release of LH and FSH → maturation of gonads, release of sex steroids → secondary sexual characteristics
- adrenal production of androgens also required

### Females

- onset: age 8-13 yr old (may start as early as 7 yr in girls of African descent)
- usual sequence (Figure 8)
  1. thelarche: breast budding
  2. pubarche: axillary hair, body odour, mild acne
  3. growth spurt
  4. menarche: mean age 12.5 yr; indicates that growth spurt is almost complete; menses may be irregular in duration and length of cycle
- early puberty is common and often constitutional, late puberty is rare (rule out organic causes)

## Males

- onset: age 9-14 yr old
- usual sequence
  1. testicular enlargement
  2. penile enlargement
  3. pubarche: axillary and facial hair, body odour, mild acne
  4. growth spurt: occurs later in boys
- early puberty is uncommon (rule out organic causes), late puberty is common and often constitutional
- gynecomastia (transient development of breast tissue) is a common self-limited condition seen in 50% of male during puberty (but any discharge from nipple or fixed mass should be investigated)

## Tanner Staging

- scale used in paediatrics that defines physical measurements of development based on external primary and secondary sex characteristics

Figure 8. Tanner staging

## PRECOCIOUS PUBERTY

### Definition

- development of secondary sexual characteristics 2-2.5 SD before population mean
- <8 yr old for females, <9 yr old for males

### Epidemiology

- 1/10,000, F>M

### Etiology

- usually idiopathic in females (90%), more suggestive of pathology in males (50%)
- central (GnRH dependent)
  - hypergonadotropic hypergonadism; hormone levels as in normal puberty
  - premature activation of the HPG axis
  - differential diagnosis: idiopathic or constitutional (most common), CNS disturbances (tumours, hamartomas, post-meningitis, increased ICP, radiotherapy), neurofibromatosis (NF), primary severe hypothyroidism
- peripheral (GnRH independent)
  - hypogonadotropic hypergonadism
  - differential diagnosis: adrenal disorders (CAH, adrenal neoplasm), testicular/ovarian tumour, gonadotropin/hCG secreting tumour (hepatoblastoma, intracranial teratoma, germinoma), exogenous steroid administration, McCune-Albright syndrome, aromatase excess syndrome, rarely hypothyroidism (Van-Wyk-Grumbach syndrome)

**Clinical Presentation**

- history
  - symptoms of puberty, family history of precocious puberty, medical illness
- physical
  - growth velocity: prepubertal: 4 to 6 cm/yr, growth spurt: boys 8-10 cm/yr, girls 6-8 cm/yr
  - complete physical exam, including Tanner staging and neurological assessment
- investigations
  - initial screening tests: bone age, serum hormone levels (estradiol, testosterone, LH, FSH, TSH, free T4, DHEA-S, 17-OH progesterone)
  - secondary tests: MRI head, pelvic U/S,  $\beta$ -hCG, GnRH and/or ACTH stimulation test

A child with proven central precocious puberty should receive an MRI of the brain.

**Management**

- indications for medical intervention to delay progression of puberty: rapid advancement of puberty, early age, risk of compromise of final adult height, psychological
- central causes: goals are to preserve height and alleviate psychosocial stress; GnRH agonists (e.g. leuprolide) most effective
- peripheral causes: goal is to limit effects of elevated sex steroids; treat underlying cause; medications that decrease the production of a specific sex steroid or blocks its effects (e.g. ketoconazole, spiroinolactone, tamoxifen, anastrozole), surgical intervention

**DELAYED PUBERTY****Definition**

- failure to develop secondary sex characteristics by 2-2.5 SD beyond the population mean
  - for males: lack of testicular enlargement by 14 yr old
  - for females: lack of breast development by 13 yr old OR absence of menarche by 16 yr old or within 5 yr of pubertal onset

**Epidemiology**

- M>F

**Etiology**

- usually constitutional delay in males, more suggestive of pathology in females
- central causes
  - constitutional delay in activation of hypothalamic-pituitary-gonadal axis (most common)
  - hypogonadotropic hypogonadism
- peripheral causes
  - hypergonadotropic hypogonadism (e.g. primary gonadal failure, gonadal damage, Turner syndrome, hormone deficiency, androgen insensitivity syndrome, etc.)

**Clinical Presentation**

- history
  - weight loss, short stature, family history of puberty onset, medical illness, high performance athletes (females)
- physical
  - growth velocity (minimum 4 cm/yr), Tanner staging, neurological exam, complete physical exam
- investigations
  - initial screening tests: bone age, serum hormone levels (estradiol, testosterone, LH, FSH, TSH, free T4, IGF-1), CBC, electrolytes, BUN, Cr, liver function tests, liver enzymes, ESR, CRP, urinalysis
  - secondary tests: MRI head, pelvic U/S, karyotype, IBD panel, celiac disease panel, LH levels following GnRH agonist

**Management**

- identify and treat underlying cause
- hormonal replacement: cyclic estradiol and progesterone for females, testosterone for males

# Gastroenterology

## Vomiting

### History

- characteristic of emesis (e.g. projectile, bilious, bloody)
- pattern of emesis (e.g. association with feeds, cyclic, morning)
- associated symptoms (e.g. anorexia, diarrhea, etc.)
- red flags: bilious or bloody emesis, projectile vomit, abdominal distension and tenderness, high fever, signs of dehydration

### Physical Findings

- vital signs to determine clinical status and hydration state
- dictated by suspected differential (see Table 13)

### Investigations

- CBC, electrolytes, BUN, Cr, amylase, lipase done routinely
- in sick child, add: ESR, venous blood gases, culture and sensitivity (blood, stool), imaging
- dictated by suspected differential (see Table 13)

**Table 13. Common Differential Diagnosis, Associated Findings and Diagnostic Approach Based on Age**

Cause	Suggestive Findings	Diagnostic Approach
<b>NEONATES – NON-BILIOUS</b>		
Tracheoesophageal fistula	Vomiting, excessive secretions soon after birth (e.g. drooling, choking, respiratory distress), inability to feed, inability to advance through NG tube	Inability to advance NG tube, CXR, upper GI series with water-soluble contrast
Pyloric stenosis	Projectile vomiting immediately after feeding, dehydrated, palpable “olive” in RUQ, decreased stools, hunger	U/S of pylorus, upper GI study Electrolytes, blood gas (hypokalemic, hypochloremic metabolic alkalosis)
GERD	Fussiness after feeds, spit ups, arching of back, poor weight gain	Empiric trial of acid suppression, pH monitoring study, UGI, endoscopy
Sepsis	Fever, lethargy, tachycardia, tachypnea, widening pulse pressure	CBC, cultures (blood, urine, CSF), CXR
Inborn error of metabolism	Poor feeding, failure to thrive, jaundice, hepatosplenomegaly, cardiomyopathy, dysmorphism, developmental delay	Electrolytes, blood gas (hyponatremic, hyperkalemic metabolic acidosis), lactate, ammonia, LFTs, BUN, Cr, serum Glu, bilirubin, PT/PTT, CBC
<b>NEONATES – BILIOUS</b>		
Duodenal atresia	Bilious vomiting, abdominal distension, often seen in Down’s syndrome, jaundice, polyhydramnios during pregnancy	AXR, upper GI series (‘double bubble’ sign)
Malrotation with volvulus	Bilious emesis, abdominal distension, pain, bloody stool, shock	AXR, upper GI series, contrast enema
Hirschsprung’s disease	Bilious emesis, abdominal distension, pain, failure to pass stool	AXR, upper GI series, contrast enema, rectal biopsy
<b>CHILDREN AND ADOLESCENTS</b>		
Gastroenteritis	Diarrhea, fever, sick contact, recent travel	CBC, stool culture
Appendicitis	Periumbilical discomfort that later localizes to RLQ, fever, anorexia	Abdominal U/S
Intussusception	Colicky progressive abdominal pain, drawing of leg up to chest, lethargy, bloody stool	Abdominal U/S
Non-GI infection (e.g. meningitis)	Fever, localized findings depending on cause	Cultures (CSF, blood, urine), brain imaging
Increased intracranial pressure	Nocturnal waking, progressive recurrent headache worse with Valsalva, nuchal rigidity	Brain CT without contrast Therapeutic LP in idiopathic intracranial hypertension
Toxic ingestion	Finding possibly varying by substance- toxidrome, often a history of ingestion	Qualitative and sometimes quantitative levels (urine, blood)
Pregnancy	Amenorrhea, morning sickness, bloating, breast tenderness	Urine $\beta$ -HCG
Cyclic vomiting	At least 3 self-limited episodes of vomiting lasting 12 h, 7 d between episodes, no organic cause of vomiting	Diagnosis of exclusion

**Vomiting:** forceful expulsion of stomach contents through the mouth.

**Regurgitation:** the return of partially digested food from the stomach to the mouth.

### Pyloric Stenosis 3 Ps

Palpable mass  
Peristalsis visible  
Projectile vomiting (2-4 wk after birth)

**Management**

- rehydration (see *Nephrology*, P79)
- treat underlying cause (see detailed differential diagnosis above)

## Gastroesophageal Reflux

**Epidemiology**

- extremely common in infancy (up to 50%)

**Clinical Presentation**

- vomiting typically soon after feeding, non-bilious, rarely contains blood, small volume (<30 mL)

**Investigations**

- thriving baby requires no investigation
- investigations required if concomitant FTT, feeding aversion, recurrent cough, pneumonia or bronchospasm, GI blood loss or symptoms persist after 18 mo

**Management**

- conservative: thickened feeds, frequent and smaller feeds
- medical:
  - short-term parenteral (NG) feeding to enhance weight gain
  - ranitidine, omeprazole: decreases gastric acidity, decreases esophageal irritation
  - domperidone, metoclopramide: improves gastric emptying and GI motility
- surgical: indicated for failure of medical therapy (Nissen fundoplication)

**Complications**

- esophagitis, strictures, Barrett's esophagus, FTT, aspiration, oral feeding aversion

## Tracheoesophageal Fistula (TEF)

- see [General Surgery](#), GS64

## Pyloric Stenosis

- see [General Surgery](#), GS61

## Duodenal Atresia

- see [General Surgery](#), GS63

## Malrotation of the Intestine

- see [General Surgery](#), GS62

## Diarrhea

- definition of diarrhea varies with diet and age (stool normalcy difficult to define in children)
- infants → increase in stool frequency to twice as often per day; older children → 3+ loose or watery stools/d
- duration: acute: <2 wk; chronic: >2 wk

**Pathophysiology**

- osmotic: due to non-absorbable solutes in GI tract (e.g. lactose intolerance)
- secretory: increased secretion of Cl<sup>-</sup> ions and water in intestinal lumen (e.g. bacterial toxin)
- malabsorption: decreased GI surface area (e.g. short bowel syndrome)

**History**

- frequency, duration, quality of diarrhea
- associated symptoms (e.g. fever, abdominal pain, hematochezia, etc.)
- recent antibiotic use or recent travel
- elements of diet

**Physical Findings**

- vital signs to determine clinical status and hydration state
- dictated by suspected differential (see Tables 14 and 15, P36)

Diarrhea is defined as an increase in frequency and/or decreased consistency of stools compared to normal.

Normal stool volume:  
Infants: 5-10 g/kg  
Children: 200 g/d

**Diarrhea Red Flags**  
Bloody stool, fever, petechiae or purpura, signs of severe dehydration, weight loss/FTT.

## Investigations

- acute diarrhea:
  - stool for culture and sensitivity, ova and parasites, electron microscopy for viruses, *C. difficile* toxin, microscopy (leukocytes suggestive of invading pathogen), blood and urine cultures, bloodwork
- chronic diarrhea:
  - serial heights, weights, growth percentiles
  - if child growing well and thriving, workup is limited (stool cultures as above, stool reducing substances)
  - red flags: poor growth, chronic rash, other serious infections, hospitalizations for dehydration
    - ♦ require full work-up (as per below)
  - stool: consistency, pH, reducing substances, microscopy, occult blood, O&P, C&S, *C. difficile* toxin, 3 d fecal fat,  $\alpha$ -1 antitrypsin clearance, fecal elastase
  - urinalysis, urine culture
  - CBC, differential, ESR/CRP, smear, electrolytes, total protein, albumin, carotene,  $\text{Ca}^{2+}$ ,  $\text{PO}_4^{3-}$ ,  $\text{Mg}^{2+}$ , Fe, ferritin, folate, fat-soluble vitamins, PTT, INR
  - sweat chloride, celiac screen, thyroid function tests, urine vanillyl mandelic acid (VMA) and homovanillic acid (HVA), HIV test, lead levels
  - CXR, upper GI series and follow-through
  - specialized tests: endoscopy, small bowel biopsy

### Indications for Medical Evaluation of Acute Diarrhea

- Age < 6 mo
- Fever
- Visible blood in stool
- Frequent, substantial volume of diarrhea
- Signs of dehydration
- Change in mental status

MMWR Recomm Rep 2003; 52 (RR-16):1-16

## Differential Diagnosis

Table 14. Differential Diagnosis of Diarrhea

	Infectious			Non-infectious
<b>Acute</b>	<b>Viral</b> Rotavirus Norwalk Enteric Adenovirus	<b>Bacterial</b> <i>Salmonella</i> <i>Campylobacter</i> <i>Shigella</i> Pathogenic <i>E. coli</i> <i>Yersinia</i> <i>C. difficile</i>	<b>Parasitic</b> <i>Giardia lamblia</i> <i>Entamoeba histolytica</i>	<b>Antibiotic-induced</b> Non-specific: associated with systemic infection Hirschsprung's disease Toxin ingestion Primary disaccharide deficiency
<b>Chronic</b>	<b>0 – 3 months</b>	<b>3 months – 3 years</b>	<b>3 – 18 years</b>	<b>Uncommon</b>
<b>ØFFT</b>	GI infection	GI infection Toddler's diarrhea	GI infection Lactase deficiency Irritable bowel syndrome	Drug-induced Chronic constipation UTI
<b>FFT</b>	Disaccharidase deficiency Cow's milk protein intolerance Cystic fibrosis	Celiac disease	IBD Endocrine (thyrotoxicosis, Addison's) Neoplastic (pheochromocytoma, lymphoma)	Short bowel syndrome Schwachman-Diamond syndrome

## Infective Diarrhea

Table 15. Infective Diarrhea

	Viral Infection	Bacterial Infection
<b>Etiology</b>	Most common cause of gastroenteritis Commonly: rotaviruses, astroviruses, Norwalk virus (typically older children)	
<b>Presentation Clinical</b>	Associated with URIs Resolves in 3-7 d Slight fever, malaise, vomiting, vague abdominal pain	Severe abdominal pain High fever Bloody diarrhea
<b>Risk Factors</b>	Day care	Travel Poorly cooked meat Poorly refrigerated foods Prolonged antibiotics
<b>Management</b>	Prevention and treatment of dehydration most important (see <i>Dehydration</i> , P79) Early refeeding advisable, start with small amounts of easily digested carbohydrates, postpone dairy and fibrous vegetables Antibiotic therapy when indicated, antidiarrheal medications not indicated Notify Public Health authorities if appropriate	

## Toddler's Diarrhea

### Epidemiology

- most common cause of chronic diarrhea during infancy
- onset between 6-36 mo of age, ceases spontaneously between 2-4 yr

### Clinical Presentation

- diagnosis of exclusion in thriving child
- 4-6 bowel movements per day
- diet history (e.g. excess juice intake overwhelms small bowel resulting in disaccharide malabsorption)
- stool may contain undigested food particles
- excoriated diaper rash

### Management

- reassurance that it is self-limiting
- 4Fs (adequate Fibre, normal Fluid intake, 35-40% Fat, discourage excess Fruit juice)

## Lactase Deficiency (Lactose Intolerance)

### Clinical Presentation

- chronic, watery diarrhea and abdominal pain, bloating associated with dairy intake
- primary lactose intolerance: crampy abdominal pain with loose stool (older children, usually of East Asian and African descent)
- secondary lactose intolerance: older infant, persistent diarrhea (post viral/bacterial infection, Celiac disease, or IBD)

### Diagnosis

- trial of lactose-free diet
- watery stool, acid pH, positive reducing sugars
- positive breath hydrogen test if >6 yr

### Management

- lactose-free diet, soy formula
- lactase-containing tablets/capsules/drops (e.g. Lacteeze®, Lactaid®)

## Irritable Bowel Syndrome

- diagnosis of exclusion in older child/adolescent; may be similar to recurrent abdominal pain
- management: encourage high fibre diet, reassurance, medications (cAMP inhibitors) rarely for refractory cases

## Celiac Disease

- see [Gastroenterology](#), G18
- in children: presents at any age, usually 6-24 mo with the introduction of gluten in the diet
- FTT with poor appetite, irritability, apathy, rickets, wasted muscles, flat buttocks, rarely distended abdomen
- GI symptoms: anorexia, nausea, vomiting, edema, anemia, abdominal pain
- non-GI manifestations: iron-deficiency anemia, dermatitis herpetiformis, dental enamel hypoplasia, osteopenia/osteoporosis, short stature, delayed puberty, behavioural changes
- associated with other autoimmune disorders

Celiac disease is associated with an increased prevalence of IgA deficiency. Since tTG is an IgA-detecting test, you must order an accompanying IgA level.

A Celiac disease diet must avoid gluten present in **"BROW"** foods

**B**arley  
**R**ye  
**O**ats (controversial)  
**W**heat

## Milk Protein Allergy

### Pathophysiology

- immune-mediated mucosal injury (IgE and non-IgE-mediated)

### Clinical Presentation

- up to 50% of children intolerant to cow's milk may be intolerant to soy protein as well
- often history of atopy
- can present as:
  - proctocolitis: mild diarrhea, small amounts of bloody stools (common presentation in young infant)
  - enterocolitis: vomiting, diarrhea, anemia, hematochezia
  - enteropathy: chronic diarrhea, hypoalbuminemia

**Management**

- casein hydrolysate formula (dairy-free e.g. Nutramigen®, Pregestimil®) or mother may remove all milk protein from diet and continue breastfeeding (with adequate calcium and vit D intake)

**Inflammatory Bowel Disease (IBD)**

- see [Gastroenterology](#), G19

**Cystic Fibrosis (CF)**

- see [Respirology](#), P95

**Constipation**

- decreased stool frequency (<3 stools/wk) and/or stool fluidity (hard, pellet-like)

**FUNCTIONAL CONSTIPATION**

- 99% of cases of constipation

**Pathophysiology**

- lack of fibre in diet or change in diet, poor fluid intake, behavioural
  - infants: often occurs when introducing cow's milk after breast milk due to high fat and solute content, lower water content
  - toddlers/older children: can occur during toilet training, or due to pain on defecation, stool withholding

**Management**

- clean out: PEG 3350 flakes, picosalax, biscodyl, PEGlyte®
- maintenance: adequate fluid intake (if <6 mo, 150 mL/kg/d), adequate dietary fibre, stool softening (PEG 3350, mineral oil), appropriate toilet training technique
- months of maintenance treatment is often required

**Complications**

- pain retention cycle: anal fissures + pain → withhold passing stool → chronic dilatation ± overflow incontinence

**HIRSCHSPRUNG'S DISEASE (Congenital Aganglionic Megacolon)**

- see [General Surgery](#), GS63

**OTHER ORGANIC DISORDERS CAUSING CONSTIPATION**

- endocrine: hypothyroidism, DM, hypercalcemia
- neurologic: spina bifida
- anatomic: bowel obstruction, anus (imperforate, atresia, stenosis)
- drugs: lead, chemotherapy, opioids

**Abdominal Pain****ACUTE ABDOMINAL PAIN****History**

- description of pain (location, radiation, duration, constant vs. colicky, relation to meals)
- associated symptoms: nausea, vomiting, diarrhea, fever

**Physical Examination**

- abdominal exam, peritoneal signs, bowel sounds, rectal exam, rash

**Investigations**

- CBC, differential, urinalysis to rule out urinary tract infection (UTI)

**Table 16. Differential Diagnosis of Acute Abdominal Pain**

Gastrointestinal	Hepatobiliary Tract	Genitourinary	Hematologic	Miscellaneous
Gastroenteritis	Cholecystitis	UTI	Henoch-Schönlein Purpura	DKA
Appendicitis	Pancreatitis	Nephrolithiasis	Sickle cell crisis	Pneumonia
Meckel's diverticulum		Testicular torsion		Somatization
Mesenteric adenitis		Ovarian torsion		
Ileus		Ectopic pregnancy		
Intestinal obstruction (incarcerated hernia, intussusception, volvulus)		PID		
Malabsorption		Endometriosis		
IBS		Menstruation		
Constipation				

**APPENDICITIS**

- see [General Surgery](#), GS28
- most common cause of acute abdomen after 5 yr of age
- clinical features: low grade fever, abdominal pain, anorexia, N/V (after onset of pain), peritoneal signs (generalized peritonitis is a common presentation in infants/young children)
- treatment: surgical
- complications: perforation (common in young children), abscess

**INTUSSUSCEPTION**

- telescoping of segment of bowel into distal segment causing ischemia and necrosis

**Epidemiology**

- 90% idiopathic, children with CF or GJ tube at significantly increased risk
- 50% between 3-12 mo, 75% before 2 yr of age

**Pathophysiology**

- usual site: ileocecal junction; jejunum in children with GJ tubes
- lead point of telescoping segment may be swollen Peyer's patches, Meckel's diverticulum, polyp, malignancy, Henoch-Schönlein Purpura

**Clinical Presentation**

- "classic triad" (only in 10-15% of patients)
- sudden onset of recurrent, paroxysmal, severe periumbilical pain with pain-free intervals
- later vomiting (may be bilious) and rectal bleeding (late finding)
- shock and dehydration

**Intussusception – Classic Triad**

- Abdominal pain
- Palpable mass
- Red currant jelly stools

**Diagnosis**

- U/S, air enema

**Management**

- air enema can be therapeutic (reduces intussusceptions in 75% of cases), reduction under hydrostatic pressure, surgery rarely needed

**Chronic Abdominal Pain****Rule of 3s**

- 3 episodes of severe pain
- Child > 3 yr old
- Over 3 month period

**Red Flags for Organic Etiology of Chronic Abdominal Pain**

- Age < 5 yr old
- Fever
- Localizes pain away from midline
- Anemia
- Rectal bleeding
- Rash
- Pain awakens child at night
- Travel history
- Prominent vomiting, diarrhea
- Weight loss or failure to gain weight
- Joint pain

**Chronic Abdominal Pain****Epidemiology**

- prevalence: 10% of school children (peak at 8-10 yr), F>M

**Etiology**

- organic (<10%)
  - gastrointestinal
    - ♦ constipation (cause vs. effect), infectious
    - ♦ IBD, esophagitis, peptic ulcer disease, lactose intolerance
    - ♦ anatomic anomalies, masses
    - ♦ pancreatic, hepatobiliary
  - genitourinary causes
    - ♦ recurrent urinary tract infections, nephrolithiasis, chronic PID, Mittelschmerz
  - neoplastic
- Functional/Recurrent Abdominal Pain (RAP) (90%)

### Clinical Presentation

- clustering episodes of vague, crampy periumbilical/epigastric pain, vivid pain description
- seldom awakens child from sleep, less common on weekends
- aggravated by exercise, alleviated by rest
- psychological factors related to onset and/or maintenance of pain, school avoidance
- psychiatric comorbidity: anxiety, somatoform, mood, learning disorders, sexual abuse, eating disorders, elimination disorders
- diagnosis of exclusion

### Investigations

- CBC, ESR, urinalysis, stools for O&P, C&S, occult blood

### Management

- continue to attend school
- manage any emotional or family problems, counselling
- trial of high fibre diet, trial of lactose-free diet
- reassurance

### Prognosis

- pain resolves in 30-50% of kids within 2-6 wk of diagnosis
- 30-50% of kids with RAP have functional pain as adults (e.g. irritable bowel syndrome)

## Abdominal Mass

Table 17. Differential Diagnosis for Abdominal Mass

	Benign	Malignant
<b>Renal</b> (note: 50% of abdominal masses in newborn are renal in origin)	Hydronephrosis Polycystic kidney disease (PCKD) Hamartoma	Nephroblastoma (Wilms' tumour) Renal cell carcinoma (RCC)
<b>Adrenal</b>		Neuroblastoma
<b>Ovarian</b>	Ovarian cysts	Ovarian tumours
<b>Other</b>	Splenomegaly Pyloric stenosis Abdominal hernia Teratoma Fecal impaction	Lymphoma Rhabdomyosarcoma Retroperitoneal sarcoma

## Upper Gastrointestinal Bleeding

- see [Gastroenterology](#), G25

## Lower Gastrointestinal Bleeding

- see [Gastroenterology](#), G27

### Epidemiology

- acute:
  - infectious (bacterial, parasitic)
  - antibiotic-induced (*C. difficile*)
  - necrotizing enterocolitis in preterm infants
  - anatomic
  - malrotation/volvulus, intussusception
  - Meckel's diverticulitis
  - anal fissures, hemorrhoids
  - vascular/hematologic
  - Henoch-Schönlein Purpura (HSP)
  - hemolytic uremic syndrome (HUS)
  - coagulopathy
- chronic:
  - anal fissures (most common)
  - colitis
  - inflammatory bowel disease (IBD)
  - allergic (milk protein)
  - structural
  - polyps (most are hamartomas)
  - neoplasms (rare)
  - coagulopathy

### Physical Examination

- hemodynamic status, evidence of FTT, fever
- anal and rectal exam: tags, fissures, anal fistulas, polyps, foreign body, blood per rectum
- stool appearance
- NG aspirate
- lower GI bleed may present as melena (if it involves the small bowel) or hematochezia

**Investigations**

- stool cultures (C&S, *C. difficile* toxin)
- urinalysis and microscopy
- CBC, smear, differential, ESR, CRP, electrolytes, urea, creatinine, INR, PTT, albumin, iron studies, amoeba titers
- radiologic investigations
- abdominal x-ray to rule out obstruction
- Meckel's radionuclide scan

**Management**

- acute stabilization: ABCs, volume and blood replacement, bowel rest (NPO, NG tube)
- once stable, endoscopy and/or surgery as indicated

## Genetics, Dysmorphisms and Metabolism

### Genetic Anomalies

**Minor and Major Anomalies**

- minor anomaly: an unusual anatomic feature that is of no serious medical or cosmetic consequence to the patient
- major anomaly: anomaly that creates significant medical, surgical or cosmetic problems for the patient

**Mechanism for Anomalies**

- malformation: results from an intrinsically abnormal developmental process (e.g. polydactyly)
- disruption: results from the extrinsic breakdown of, or interference with, an originally normal developmental process (e.g. amniotic band disruption sequence)
- deformation: alteration of the final form of a structure by mechanical forces (e.g. Potter deformation sequence)
- dysplasia: abnormal development that results in abnormal organization of cells into tissues (e.g. bone dysplasia)

**Multiple Anomalies**

- association: non-random occurrence of multiple independent anomalies that appear together more than would be predicted by chance but are not believed to have a single etiology (e.g. VACTERL)
- sequence: related anomalies that come from a single initial major anomaly or precipitating factor that changes the development of other surrounding or related tissues or structures (e.g. Potter sequence)
- syndrome: a pattern of anomalies that occur together and are caused by a single known or unknown cause (e.g. Down syndrome)

**VACTERL**

- V** Vertebral dysgenesis
- A** Anal atresia (imperforate anus)  
± fistula
- C** Cardiac anomalies
- T-E** TracheoEsophageal fistula  
± esophageal atresia
- R** Renal anomalies
- L** Limb anomalies

### Approach to the Dysmorphic Child

- genetic disorders are the most common cause of infant death in developed countries

**General Approach to the Dysmorphic Child**

- Are the anomalies major or minor?
- What is the mechanism underlying the anomaly?
- Do the anomalies fit as part of an association, sequence or syndrome?

**History**

- prenatal/obstetrical history (see [Obstetrics](#), OB2)
- complete 3 generation family pedigree: consanguinity, stillbirths, neonatal deaths, specific illnesses, intellectual disability, multiple miscarriages, ethnicity

## Physical Examination

Figure 9. Physical examination of the dysmorphic child

Check the umbilical cord for 2 arteries and 1 vein. The presence of a single umbilical artery may be associated with other congenital anomalies.

## Investigations

- prenatal counselling and assessing risk of recurrence
- serial photographs if child is older
- x-rays for bony abnormalities
- cytogenetic studies
  - karyotype if recognized syndrome
  - chromosome microarray analysis (array comparative genomic hybridization) if developmental delay with multiple congenital anomalies
  - fluorescent in situ hybridization (FISH) if microdeletion syndrome or trisomy suspected
  - chromosomes in skin fibroblasts if mosaicism suspected and microarray is normal
- biochemistry: specific enzyme assays
- single gene testing

## Genetics

### MECHANISMS OF INHERITANCE

#### Mendelian Inheritance

- disorders caused by mutation of one or both copies of a gene, inherited in one of two patterns:
  - autosomal: encoded by genes on one of 22 pairs of autosomes (chromosomes 1-22)
  - X-linked: encoded by a gene on the X chromosome

#### Triplet Repeat Expansions

- disorder in which trinucleotide repeats in certain genes exceed the normal number and result in altered expression of the gene or production of an abnormal protein (e.g. Fragile X syndrome, spinocerebellar ataxias, myotonic dystrophy, Huntington disease)

#### Imprinting Disorders

- imprinting: epigenetic process that involves methylation or acetylation of DNA, affecting gene expression
- imprinted genes are expressed differently depending on whether they are inherited from the mother or the father (parent-of-origin gene expression)
- occur when imprinted alleles are silenced (e.g. Prader-Willi syndrome, Angelman syndrome, Beckwith-Wiedemann syndrome)

#### Mitochondrial Inheritance

- disorders caused by mutations of the DNA present in mitochondria
- inheritance pattern: mother passes on the defect to all her children; father does not pass on the defect since embryo only receives mitochondria from the mother (in the egg)

### METHODS OF GENETIC TESTING

- microarray analysis
  - a microarray is a collection of DNA probes attached to a solid surface
  - microarray analysis can identify small deletions or duplications of genetic material anywhere in the genome
  - indicated when there is developmental delay + one or more major malformations

#### Autosomal Dominant (AD)

Disorder is expressed in a heterozygote (inheritance is 'vertical', both males and females are affected and can transmit the trait) e.g. neurofibromatosis type I.

#### Autosomal Recessive (AR)

Disorder is manifested if both copies of the gene have mutations (inheritance is 'horizontal', disease not found in multiple generations, parents of an affected child are usually normal) e.g. cystic fibrosis.

#### X-linked

**Males** have a single X chromosome and are affected by recessive and dominant X-linked disorders, while **females** have two X chromosomes and recessive X-linked disorders are rarely expressed in females e.g. Duchenne Muscular Dystrophy (DMD).

- FISH
  - usually to identify a gain or loss of chromosomal material
- karyotype
  - microscopic analysis of all 46 chromosomes with a special stain that shows large changes in the number or structure of chromosomes

## Genetic Syndromes

**Table 18. Common Genetic Syndromes**

	Trisomy 21	Trisomy 18	Trisomy 13
<b>Disease</b>	Down syndrome	Edwards syndrome	Patau syndrome
<b>Incidence</b>	1:600-800 births Most common abnormality of autosomal chromosomes Rises with advanced maternal age from 1:1500 at age 20 to 1:20 by age 45	1:6000 live births Female:male = 3:1	1:10,000 live births
<b>Cranium/brain</b>	Mild microcephaly, flat occiput, 3rd fontanelle, brachycephaly	Microcephaly, prominent occiput	Microcephaly, sloping forehead, occipital scalp defect, holoprosencephaly
<b>Eyes</b>	Upslanting palpebral fissures, inner epicanthal folds, speckled iris (Brushfield spots), refractive errors (myopia), acquired cataracts, nystagmus, strabismus	Microphthalmia, hypotelorism, iris coloboma, retinal anomalies	Microphthalmia, corneal abnormalities
<b>Ears</b>	Low-set, small, overfolded upper helix, frequent AOM, hearing loss	Low-set, malformed	Low-set, malformed
<b>Facial Features</b>	Protruding tongue, large cheeks, low flat nasal bridge, small nose	Cleft lip/palate Small mouth, micrognathia	60-80% cleft lip and palate
<b>Skeletal/MSK</b>	Short stature Excess nuchal skin Joint hyperflexibility (80%) including dysplastic hips, vertebral anomalies, atlantoaxial instability	Short stature Clenched fist with overlapping digits, hypoplastic nails, clinodactyly, polydactyly	Severe growth retardation Polydactyly, clenched hand
<b>Cardiac Defect</b>	50%, particularly AVSD	60% (VSD, PDA, ASD)	80% (VSD, PDA, ASD)
<b>GI</b>	Duodenal/esophageal/anal atresia, TE fistula, Hirschsprung's disease, chronic constipation	Hernia, TEF	
<b>GU</b>	Cryptorchidism, rarely fertile	Polycystic kidneys, cryptorchidism	Polycystic kidneys
<b>CNS</b>	Hypotonia at birth Low IQ, developmental delay, hearing problems Onset of Alzheimer's disease in 40s	Hypertonia	Hypo- or hypertonia Seizures, deafness Severe developmental delay
<b>Other Features</b>	Transverse palmar crease, clinodactyly and absent middle phalanx of the 5th finger 1% lifetime risk of leukemia Polycythemia Hypothyroidism	Small for gestational age (SGA) Rocker-bottom feet	Single umbilical artery Midline anomalies: scalp, pituitary, palate, heart, umbilicus, anus Rocker-bottom feet
<b>Prognosis/Management</b>	Prognosis: long-term management Per AAP Guidelines (Health Supervision of Children with Down syndrome), recommend chromosomal analysis, CBC, echo, yearly thyroid test, atlanto-occipital x-ray at 2 yr, sleep study, hearing test, and ophthalmology assessment	44% die in 1st month 10% survive past 1 yr (profound intellectual disability in survivors)	33% die in 1st month, 50% by 2nd month, 90% by 1 yr from FTT Profound intellectual disability in survivors

**Table 19. Most Common Sex Chromosome Disorders**

	Fragile X Syndrome	Klinefelter Syndrome	Turner Syndrome	Noonan Syndrome
<b>Genotype</b>	X-linked Genetic anticipation CGG trinucleotide repeat on X chromosome measurable by molecular analysis	47,XXY (most common) 48,XXXY, 49,XXXXY	45,X (most common)	46,XX or 46,XY Autosomal dominant (not a sex chromosome disorder) with variable expression Higher transmission of affected maternal gene
<b>Incidence</b>	1:3600 males, 1:6000 females Most common heritable cause of intellectual disability in boys	1:1000 live male births Increased risk with advanced maternal age	1:4000 live female births Risk not increased with advanced maternal age	1:2000 male and female live births
<b>Phenotype</b>	Overgrowth: Prominent jaw, forehead, and nasal bridge with long and thin face, large protuberant ears, macroorchidism, hyperextensibility, and high arched palate Complications: Seizures, scoliosis, mitral valve prolapse	Tall, slim, underweight No features prepuberty Postpuberty: male may suffer from developmental delay, long limbs, gynecomastia, lack of facial hair	Short stature, short webbed neck, low posterior hair line, wide carrying angle Broad chest, widely spaced nipples Lymphedema of hands and/or feet, cystic hygroma in newborn with polyhydramnios, lung hypoplasia Coarctation of aorta, bicuspid aortic valve Renal and cardiovascular abnormalities, increased risk of HTN Less severe spectrum with mosaic	Certain phenotypic features similar to females with Turner syndrome; therefore, sometimes called the "male Turner syndrome", although it affects both males and females Short stature, webbed neck, triangular facies, hypertelorism, low set ears, epicanthal folds, ptosis Pectus excavatum Right-sided congenital heart disease, pulmonary stenosis

Table 19. Most Common Sex Chromosome Disorders (continued)

	Fragile X Syndrome	Klinefelter Syndrome	Turner Syndrome	Noonan Syndrome
<b>IQ and Behaviour</b>	Mild to moderate intellectual disability, 20% of affected males have normal IQ ADHD and/or autism Female carriers may show intellectual impairment Male carriers may demonstrate tremor/ataxia syndrome in later life	Mild intellectual disability Behavioural or psychiatric disorders – anxiety, shyness, aggressive behaviour, antisocial acts	Mildly deficient to normal intelligence	Moderate intellectual disability in 25% of patients
<b>Gonad and Reproductive Function</b>	Prepubertal carrier females at risk of developing premature ovarian failure	Infertility due to hypogonadism/hypospermia	Streak ovaries with deficient follicles, infertility, primary amenorrhea, impaired development of secondary sexual characteristics	Delayed puberty
<b>Diagnosis/Prognosis/Management</b>	Molecular testing of <i>FMR1</i> gene: overamplification of the trinucleotide repeat, length of segment is proportional to severity of clinical phenotype (genetic anticipation)	Increased risk of germ cell tumours and breast cancer  Management: Testosterone in adolescence	Normal life expectancy if no complications Increased risk of X-linked diseases Management: ECHO, ECG to screen for cardiac malformation GH therapy for short stature Estrogen replacement at time of puberty for development of secondary sexual characteristics	Management: Affected males may require testosterone replacement therapy at puberty ECHO, ECG

Table 20. Other Genetic Syndromes

	DiGeorge Syndrome	Prader-Willi Syndrome	Angelman Syndrome	CHARGE Syndrome
<b>Genotype</b>	Microdeletions of chromosome region 22q11	Due to deletion of paternal chromosome 15q11 or two maternal chromosome 15s (maternal uniparental disomy)	Due to maternally derived deletion of the usually maternally expressed genes The paternal copy is silenced epigenetically	2/3 of children with CHARGE have been found to have a CHD7 mutation on chromosome 8
<b>Incidence</b>	Second most common genetic diagnosis (next to Down syndrome)	1:15,000		1:10,000
<b>Clinical Features</b>	<b>“CATCH 22”</b> Cyanotic CHD (may account for up to 5% of all cases of CHD) Anomalies: craniofacial anomalies typically micrognathia and low set ears Thymic hypoplasia “immunodeficiency” recurrent infections Cognitive impairment Hypoparathyroidism, hypocalcemia 22q11 microdeletions High risk for psychiatric disorders	<b>“H<sub>3</sub>O”</b> : Hypotonia and weakness, Hypogonadism, Obsessive Hyperphagia, Obesity Short stature, almond-shaped eyes, small hands and feet with tapering of fingers Development delay (variable) Hypopigmentation, DM II	Ataxia with severe intellectual disability, seizures, tremulousness, hypotonia Midface hypoplasia, fair hair, uncontrollable laughter	<b>“CHARGE”</b> <b>C</b> Coloboma <b>H</b> congenital Heart disease <b>A</b> choanal Atresia <b>R</b> mental Retardation <b>G</b> GU anomalies <b>E</b> Ear anomalies

## Muscular Dystrophy (MD)

- group of inherited diseases characterized by progressive skeletal and cardiac muscle degeneration

### DUCHENNE MUSCULAR DYSTROPHY (DMD)

#### Epidemiology

- 1:4000 males

#### Etiology

- X-linked recessive: 1/3 spontaneous mutations, 2/3 inherited mutations
- missing structural protein (dystrophin) → muscle fibre fragility → fibre breakdown → necrosis and regeneration

#### Clinical Presentation

- proximal muscle weakness by age 3, positive Gower's sign, waddling gait, toe walking
- pseudohypertrophy of calf muscles (muscle replaced by fat) and wasting of thigh muscles
- decreased reflexes
- non-progressive delayed motor and cognitive development (dysfunctional dystrophin in brain)
- cardiomyopathy

#### Gower's Sign

Child uses hands to “climb up” the legs to move from a sitting to a standing position.

**Diagnosis**

- molecular genetic studies of dystrophin gene (DMD) (first line)
- family history (pedigree analysis)
- increased CK (50-100x normal) and lactate dehydrogenase
- elevated transaminases
- muscle biopsy, electromyography (EMG)

**Management**

- supportive (e.g. physiotherapy, wheelchairs, braces), prevent obesity
- cardiac health monitoring and early intervention
- bone health monitoring and intervention (vit D, bisphosphonates)
- steroids (e.g. prednisone or deflazacort)
- surgical (for scoliosis)
- gene therapy trials underway

**Complications**

- patient usually wheelchair-bound by 12 yr of age
- early flexion contractures, scoliosis, osteopenia of immobility, increased risk of fracture
- death due to pneumonia/respiratory failure or CHF in 2nd-3rd decade

## Metabolic Disease

- an inherited disorder of metabolism; often autosomal recessive
- infants and older children may present with failure to thrive (FTT) or developmental delay
- in Ontario, universal newborn screening looks for: 9 organic acid disorders, 6 amino acid disorders, 5 fatty acid oxidation defects, 3 hemoglobinopathies, 2 endocrinopathies, galactosemia, biotinidase deficiency, cystic fibrosis, and hearing loss
- types of disorders
  - proteins: PKU, tyrosinemia, organic acid disorders, urea cycle defects
  - carbohydrates: galactosemia, glycogen storage diseases
  - fats: fatty acid oxidation defects
  - organelle disorders: congenital disorders of glycosylation, mucopolysaccharidosis

**Clinical Manifestations**

- vomiting and acidosis after feeding initiation (amino acid or carbohydrate metabolic disorder)
- hepatosplenomegaly (metabolites accumulate in the liver)
- neurologic syndrome: acute and chronic encephalopathy, intellectual disability, megalencephaly (mucopolysaccharide disorders)
- severe acidosis (aminoaciduria), hyperammonemia (urea cycle and organic acid disorders)
- growth retardation, seizures, coma, hypoglycemia
- autonomic manifestations (e.g. pallor, sweating, tremor)

**Physical Exam**

- odour: burnt sugar, sweaty feet, musty, ammonia-like
- skin: hypo/hyperpigmentation, rash, xanthomas
- hair: alopecia, hirsutism, abnormal architecture, fair colouring
- eyes: cornea (clouding, crystals), lens (cataracts, dislocation), retina (macular cherry red spot, pigment retinopathy, optic atrophy)

**Initial Investigations**

- important to send lab studies at initial presentation in order to facilitate immediate diagnosis and treatment
- check newborn screening results
- electrolytes, ABGs (calculate anion gap, rule out acidosis)
- CBC with differential and smear
- blood glucose (hypoglycemia seen with organic acidemia, fatty acid oxidation defects and glycogen storage diseases)
- lactate, ammonium (hyperammonemia with urea cycle defects), plasma  $\text{Ca}^{2+}$  and  $\text{Mg}^{2+}$
- routine urinalysis: ketonuria must be investigated
- carnitine levels with acylcarnitine profile
- others: urate, urine nitroprusside, plasma amino acid screen, urine organic acids, CSF glycine, free fatty acids (3- $\beta$ -hydroxybutyrate ratio  $>4$  in fatty acid oxidation defect)
- storage diseases: urine mucopolysaccharide and oligosaccharide screen

Metabolic disease must be ruled out in any newborn who becomes acutely ill after a period of normal behaviour and development or with a family history of early infant death even if the newborn screen is negative.

## Phenylketonuria (PKU)

### Epidemiology

- 1:10,000; autosomal recessive disease

### Etiology

- deficiency of phenylalanine hydroxylase prevents conversion of phenylalanine to tyrosine leading to build up of toxic metabolites
- mothers who have PKU may have infants with congenital abnormalities

### Clinical Presentation

- baby is normal at birth, then develops a musty odour, eczema, hypertonia, tremors, and mental retardation
- hypopigmentation due to low tyrosine (fair hair, blue eyes)

### Management

- PKU screening at birth
- dietary restriction of phenylalanine starting within the first 10 d of life
- duration of dietary restriction controversial – lifelong or until end of puberty; should be resumed during pregnancy to maintain normal phenylalanine levels

## Galactosemia

### Epidemiology

- 1:60,000; autosomal recessive disease

### Etiology

- most commonly due to deficiency of galactose-1-phosphate uridylyltransferase leading to an inability to process lactose/galactose

### Clinical Presentation

- signs of liver and renal failure, jaundice, FTT and cataracts with ingestion of lactose/galactose

### Management

- elimination of galactose from the diet (e.g. dairy, breast milk)
- most infants are fed a soy-based diet

### Complications

- increased risk of sepsis, especially *E. coli*
- if the diagnosis is not made at birth, liver and brain damage may become irreversible

## Hematology

### Approach to Anemia

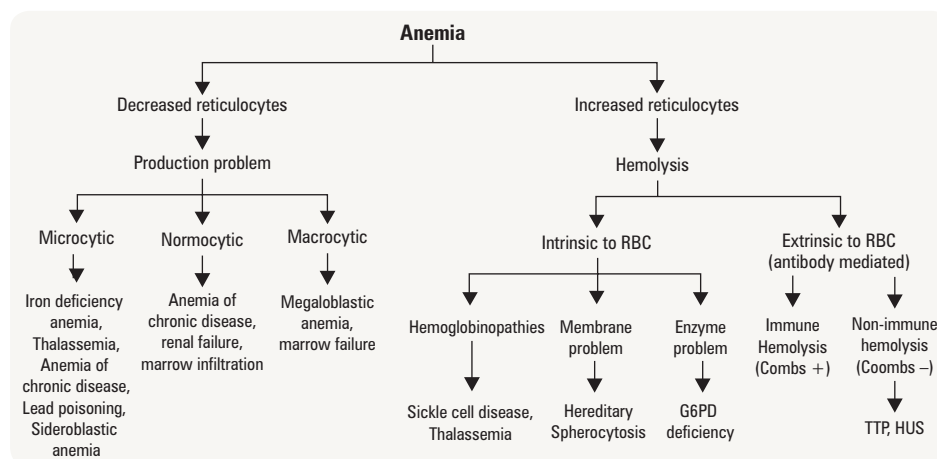

Figure 10. Anemia

## Physiologic Anemia

- high Hb (>170 g/L) and reticulocyte count at birth is caused by a hypoxic environment in utero
- after birth, levels start to fall due to shorter fetal RBC lifespan, decreased RBC production (during first 6-8 wk of life, there is virtually no erythropoiesis due to new O<sub>2</sub> rich environment), and increasing blood volume secondary to growth
- lowest levels about 100 g/L at 8-12 wk age (earlier and more exaggerated in premature infants); levels rise spontaneously with activation of erythropoiesis
- no treatment usually required

### Normal Hb Values by Age

Age	Hb Range (g/L)
Newborn	137-201
2 wk	130-200
3 mo	95-145
6 mo-6 yr	105-140
7-12 yr	110-160
Adult female	120-160
Adult male	140-180

## Iron Deficiency Anemia

- most common cause of childhood anemia
- full term infants exhaust iron reserves by 6 mo of age
- premature infants have lower reserves, therefore exhausted by 2-3 mo of age
- common diagnosis between 6 mo-3 yr and 11-17 yr due to periods of rapid growth and increased iron requirements; adolescents also have poor diet and menstrual losses

### Etiology

- dietary risk factors
- age >6 mo: <2 servings/d of iron-fortified cereal, red meat, or legumes
- age <12 mo: use of low-iron formula (<10 mg/L), primary diet of cow, goat or soy milk
- age 1-5 yr: >20 oz/d of non-fortified milk
- blood loss
  - iatrogenic: repeated blood sampling (especially in hospitalized neonates)
  - allergic: cow's milk protein-induced colitis

### Clinical Manifestation

- usually asymptomatic until marked anemia, pallor, fatigue, pica (eating non-food materials), tachycardia, systolic murmur

### Investigations

- CBC: low Hb, MCV and MCH, reticulocyte count normal or high (absolute number low)
- Mentzer index (MCV/RBC) can help distinguish iron deficiency anemia from thalassemia
  - ratio <13 suggests thalassemia; ratio >13 suggests iron deficiency
- blood smear: hypochromic, microcytic RBCs, pencil shaped cells, poikilocytosis
- iron studies: low ferritin, other (low iron, high TIBC)
- initial therapy: trial of iron

### Prevention

- breastfed term infants: begin iron supplementation (1 mg/kg/d) at 4-6 mo, continuing until able to eat ≥2 feeds/d of iron-rich foods
- non-breastfed (<50% of diet) term infants: give iron-fortified formula from birth
- premature infants: give iron supplements from 1 mo through to 1 yr of age
- no cow's milk until 9-12 mo, early introduction of red meat and iron-rich vegetables: total daily iron should be 11 mg (age 6-12 mo), 7 mg (age 1-3 yr)
- universal screening of Hb levels recommended at 9 mo
- children at risk (premature, LBW, low SES, First Nations, etc.) fed whole cow's milk in their first year

### Management

- encourage diverse, balanced diet, limit homogenized milk to 16-20 oz/d
- oral iron therapy: 6 mg/kg/d elemental iron, divided bid to tid, for 3 mo
  - increased reticulocyte count in 2-3 d (peaks day 5-7)
  - increased hemoglobin in 4-30 d
  - repletion of iron stores in 1-3 mo
  - repeat hemoglobin levels after 1 mo of treatment
- poor response to oral iron therapy: non-compliance, medication intolerance, ongoing blood loss, IBD, celiac disease, incorrect diagnosis

### Complications

- can cause irreversible effects on development if untreated (behavioural and intellectual deficiencies)
- angular cheilitis, glossitis, koilonychia (spoon nails)

MCV in childhood varies with age  
Rule of thumb: lower normal limit of  
MCV = 70 + age (yr) until 80 fl (adult  
standard).

Iron deficiency is rare in children  
<6 mo in the absence of blood loss or  
prematurity.

Ferritin is an acute phase reactant,  
therefore, normal or high ferritin does  
not exclude iron deficiency anemia  
during an infection.

## Anemia of Chronic Disease

- most often normocytic, normochromic (microcytic, hypochromic may occur with chronic infection/malignancy)
- multifactorial in origin
- chronic inflammatory states including juvenile idiopathic arthritis (JIA), chronic infections, chronic renal failure, and malignancies
- iron stores are variable and ferritin levels are unreliable (acute phase reactant); therefore bone marrow assessment may be necessary for diagnosis
- anemia of chronic renal failure predominantly caused by decreased erythropoietin (EPO) production; treat with EPO if necessary

## Sickle Cell Disease (SCD)

- see [Hematology](#), H19
- identification of specific genotypes important due to differences in frequency, type and severity of clinical complications (most severe: SS, less severe: SC, S- $\beta$  thalassemia, rare: SD)

### Epidemiology

- increased incidence in people of African and Mediterranean heritage

### Pathophysiology

- caused by a genetic defect at position 6 of the  $\beta$ -globin genes
  - HbS: single amino acid replacement (glutamic acid  $\rightarrow$  valine)
- RBCs sickle under conditions of stress (low pO<sub>2</sub>, dehydration, fever, acidosis)
- acute intravascular sickling results in infarction of tissue (capillary occlusion and thrombosis of spleen, lungs, bones, brain, digits)
- hemolysis causes chronic, well-compensated, normochromic normocytic anemia

### Presentation

- clinical disease presents at 5-6 mo of age after fall in fetal Hb
- anemia, fever (medical emergency – infection is leading cause of death in SCD), jaundice, splenomegaly, crisis (dactylitis is often the first presentation)
- sickle cell trait: asymptomatic (may have microscopic hematuria and later isothermia)

### Types of Crises

- vaso-occlusive crisis
  - due to obstruction of blood vessels by rigid, sickled cells  $\rightarrow$  tissue hypoxia  $\rightarrow$  cell death; presents as fever and pain in any organ; most commonly in long bones of arms and legs, chest, abdomen, CNS (stroke), dactylitis (in young children), priapism
  - acute chest crisis: fever, chest pain, progressive respiratory distress, increased WBC count, pulmonary infiltrates
- aplastic crisis: depression of erythropoiesis (decreased reticulocyte count to  $<1\%$ , decreased Hb), generally associated with infection (especially parvovirus B19)
- acute splenic sequestration: sudden, massive pooling of red cells in spleen, splenomegaly, tender spleen, acute fall in hemoglobin, shock, increased reticulocyte count

### Functional Asplenia

- splenic dysfunction usually by 5 yr of age secondary to auto-infarction
- susceptible to infection by encapsulated organisms (especially *S. pneumoniae*)
- all individuals with SCD should be on prophylactic antibiotics, and be vaccinated against pneumococcal/meningococcal/*H. influenzae* type b, along with hepatitis B and influenza
- febrile episodes require immediate evaluation: rule out bacteremia, meningitis, acute chest syndrome, and osteomyelitis (commonly due to *Salmonella* in SCD)

### Other Manifestations

- long term complications: growth delay, bony abnormalities (e.g. avascular necrosis (AVN) of femoral head), gallstones, retinopathy, restrictive lung disease (screen with PFTs), cardiomyopathy (screen with Echo), and pulmonary hypertension

### Management

- acute crises
  - admit for supportive and symptomatic treatment
  - fluids (1.5x maintenance; 1x maintenance only if in chest crisis), analgesia (opioid, multi-modal), antibiotics (e.g. 3rd generation cephalosporins), incentive spirometry and ambulation to decrease risk of chest crisis
  - straight transfusions for symptomatic/significant anemia, evolving chest crisis
  - RBC exchange transfusion for impending stroke, severe chest crisis, persistent priapism
  - O<sub>2</sub> if respiratory distress or chest crisis (with incentive spirometry)
  - cultures and CBC if febrile, reticulocyte counts, CXR or LP if indicated

8% of African Americans carry the HbS trait, 0.2% have the disease. Heterozygotes (trait) are relatively malaria-resistant.

- chronic
  - early aggressive treatment of infections, prophylactic antibiotics (daily oral penicillin)
  - pneumococcal, meningococcal, hepatitis B, Hib, and influenza vaccines
  - folate supplementation
  - hydroxyurea if frequent crises, history of acute chest syndrome (raises HbF level)
  - transcranial Doppler to assess risk of stroke
  - chronic transfusion program if history of stroke or abnormal transcranial Doppler
  - genetic counselling and education
  - annual fundoscopic exam (after 10 yr old)
  - bi-annual screening for pulmonary hypertension (after 12 yr old)
  - bi-annual chemistry and urinalysis to monitor organ dysfunction

## Thalassemia

- see [Hematology](#), H18

## Hereditary Spherocytosis

- see [Hematology](#), H21

## Glucose-6-Phosphate Dehydrogenase (G6PD) Deficiency

- see [Hematology](#), H22

G6PD deficiency protects against parasitism of RBCs (i.e. malaria).

## Bleeding Disorders

- see [Hematology](#), H25

### Coagulation Defects

- bleeding into joints (hemarthroses) and muscles
- large spreading ecchymoses and hematomas

### Platelet Abnormalities

- petechiae, purpura, bruises, mucocutaneous bleeding (e.g. epistaxis, gingival bleeding), menorrhagia, prolonged bleeding from superficial cuts

**Table 21. Classification of Bleeding Disorders**

Site of Pathophysiology	Mechanism	Examples
Blood Vessels	Vasculitis	Henoch-Schönlein purpura
Platelets	Decreased production Increased destruction Increased consumption Dysfunctional	Drugs, marrow infiltration, leukemia/lymphoma Immune thrombocytopenic purpura, infection, drugs DIC, giant hemangioma, hypersplenism von Willebrand disease, drugs (ASA), uremia
Coagulation Pathway	Vitamin K deficiency Factor VIII deficiency Factor IX deficiency Abnormal vWF	Hemorrhagic disease of the newborn Hemophilia A Hemophilia B von Willebrand disease

## Immune Thrombocytopenic Purpura (ITP)

### Epidemiology

- most common cause of thrombocytopenia in childhood
- peak age: 2-6 yr, M=F
- incidence 5:100,000 children per year

### Etiology

- caused by autoantibodies that bind to platelet membranes → Fc-receptor mediated splenic uptake → destruction of platelets

## Clinical Presentation

- 50% present 1-3 wk after viral illness (URTI, chicken pox)
- sudden onset of petechiae, purpura, epistaxis in an otherwise well child
- clinically significant bleed in only 3% (severe bleed more likely with platelet count <10) with <0.5% risk of intracranial bleed
- no lymphadenopathy, no hepatosplenomegaly
- labs: thrombocytopenia with normal RBC, WBC
- bone marrow aspirate only if atypical presentation ( $\geq 1$  cell line abnormal, hepatosplenomegaly)
- differential diagnosis: leukemia, drug-induced thrombocytopenia, HIV, infection (viral), autoimmune (SLE, ALPS)

## Management

- observation vs. pharmacologic intervention highly debated; spontaneous recovery in >70% of cases within 3 mo
- treatment with IVIg or prednisone if mucosal or internal bleeding, platelets <10, or at-risk of significant bleeding (surgery, dental procedure, concomitant vasculitis or coagulopathy)
- life-threatening bleed: additional platelet transfusion  $\pm$  emergency splenectomy
- persistent (>3-12 mo) or chronic (>12 mo): re-evaluate; treat if symptoms persist
- supportive: avoid contact sports and ASA/NSAIDs

## Hemophilia

- see [Hematology](#), H29

## von Willebrand's Disease

- see [Hematology](#), H28

**Table 22. Evaluation of Abnormal Bruising/Bleeding**

	PFA	PT	PTT	VIII:C	vWF	Platelets	Fibrinogen
<b>Hemophilia A</b>	N	N	$\uparrow$	$\downarrow$	N	N	N
<b>Hemophilia B</b>	N	N	$\uparrow$	N	N	N	N
<b>von Willebrand disease</b>	$\uparrow$	N	N or $\uparrow$	$\downarrow$	$\downarrow$	N	N
<b>DIC</b>	N or $\uparrow$	$\uparrow$	$\uparrow$	$\downarrow$	N	$\downarrow$	$\downarrow$
<b>Vitamin K Deficiency</b>	N	$\uparrow$	$\uparrow$	N	N	N	N
<b>Thrombocytopenia</b>	$\uparrow$	N	N	N	N	$\downarrow$	N

BT = bleeding time; VIII:C = Factor VIII coagulant activity; vWF = von Willebrand's Factor; DIC = disseminated intravascular coagulation

### Corticosteroids versus Intravenous Immune Globulin for the Treatment of Acute Immune Thrombocytopenic Purpura in Children: A Systematic Review and Meta-analysis of Randomized Controlled Trials

*J Pediatr* 2005;147:521-527

**Study:** Meta-analysis of 10 RCTs from 1985-2003. RCTs compared corticosteroids and IVIg in the treatment of pediatric ITP, and had to include patient platelet counts.

**Patients:** 586 children 3 mo-18 yr of age who were presenting for the first time with primary acute ITP, with no other underlying condition.

**Intervention:** Corticosteroids and IVIg at any dose. Corticosteroid treatments included methylprednisolone 10-30 g/kg/d and prednisone 2-4 g/kg/d. IVIg dosing ranged from 0.5-1 g/kg/d. Treatment durations ranged from 1-5 d.

**Main Outcome:** Primary outcome was platelet levels  $>20,000/\text{mm}^3$  ( $20 \times 10^9/\text{L}$ ) at 48 h after treatment. (This outcome was chosen because intracranial hemorrhage rarely occurs at platelet above 20). Secondary outcomes included incidence of ICH.

**Results:** The relative risk (RR) of reaching a platelet count  $>20,000/\text{mm}^3$  at 48 h was 0.74 (95%CI 0.65-0.85) for corticosteroids versus IVIg (at any dose), with a NNT of 4.55 (95%CI 3.23-7.69). Subgroup analyses by dosing favoured IVIg in 6/10 dose comparisons. Only 3/586 children developed ICH – two were treated with corticosteroids and one with IVIg.

**Summary:** Children treated with corticosteroids are less likely to have a platelet count  $>20,000/\text{mm}^3$  than children treated with IVIg after 48 h of therapy. However, optimal dosing of IVIg is unclear, and impact of IVIg versus corticosteroids on ICH and mortality are unclear.

Extensive bruising in the absence of lab abnormalities: consider child abuse.

## Oncology

- cancer is the second most common cause of death after injuries in children after 1 yr of age
- cause is rarely known, but increased risk for:
  - chromosomal syndromes (e.g. Trisomy 21)
  - prior malignancy
  - neurocutaneous syndromes
  - immunodeficiency syndromes
  - family history
  - exposure to radiation, chemicals, biologic agents
- leukemias are the most common type of pediatric malignancy (40%), followed by brain tumours (20%), and lymphomas (15%)
- some malignancies are more prevalent in certain age groups
  - newborns: neuroblastoma, Wilms' tumour, retinoblastoma
  - infancy and childhood: leukemia, neuroblastoma, Wilms' tumour, retinoblastoma
  - adolescence: lymphoma, gonadal tumours, bone tumours
- unique treatment considerations in pediatrics because radiation, chemotherapy, and surgery can impact growth and development, endocrine function and fertility
- good prognosis: treatments have led to remarkable improvements in overall survival and cure rates for many pediatric cancers (>80%)

## Leukemia

- see [Hematology](#), H35, H38, H41, H46

### Epidemiology

- mean age of diagnosis 2-5 yr but can occur at any age
- heterogeneous group of diseases:
  - acute lymphoblastic leukemia (ALL) (80%)
  - acute myeloblastic leukemia (AML) (15%)
  - chronic myelogenous leukemia (CML) (<5%)
- children with Down syndrome are 15x more likely to develop leukemia

### Clinical Presentation

- infiltration of leukemic cells into bone marrow results in bone pain, and bone marrow failure (anemia, neutropenia, thrombocytopenia)
- infiltration into tissues results in lymphadenopathy, hepatosplenomegaly, CNS manifestations, testicular disease
- fever, fatigue, weight loss, bruising, and easy bleeding

### Management

- combination chemotherapy using non-cross resistant chemotherapy agents

### Prognosis

- 80-90% 5-yr event-free survival for ALL, 50-60% 5-yr survival for AML
- patients are stratified into standard risk and high risk based on WBC and age; other prognostic factors include presence of CNS/testicular disease, immunophenotype, cytogenetics, and initial response to therapy (most important prognostic variable)

## Lymphoma

- see [Hematology](#), H42

### Epidemiology

- Hodgkin lymphoma: incidence is bimodal, peaks at ages 15-34 and >50 yr old
- Non-Hodgkin lymphoma: incidence peaks at 7-11 yr

### Clinical Presentation

- Hodgkin lymphoma:
  - most common presentation is persistent, painless, firm, cervical or supraclavicular lymphadenopathy
  - can present as persistent cough or dyspnea (secondary to mediastinal mass) or less commonly as splenomegaly, axillary or inguinal lymphadenopathy
  - constitutional symptoms (B symptoms) in 30% of children
- Non-Hodgkin lymphoma:
  - generally categorized into lymphoblastic, large cell, and Burkitt's/Burkitt's-like lymphoma
  - rapidly growing tumour with distant metastases (unlike adult non-Hodgkin lymphoma)
  - signs and symptoms related to disease site: most commonly abdomen, chest (mediastinal mass), head and neck region

'B Symptoms' = fever, night sweats, unexplained weight loss.

### Management

- Hodgkin lymphoma:
  - combination chemotherapy and radiation
  - aimed at limiting cumulative doses of anthracyclines (toxic to heart) and alkylators (risk of second malignancy, infertility) and limiting dose and field of radiation
  - increasing role for use of PET scanning to assess early disease response and plan therapy.
- Non-Hodgkin lymphoma:
  - combination chemotherapy
  - no added benefit of radiation in pediatric protocols.

### Prognosis

- Hodgkin lymphoma: >90% 5-yr survival
- Non-Hodgkin lymphoma: 75-90% 5-yr survival

## Brain Tumours

- see [Neurosurgery](#), NS10, NS38

## Wilms' Tumour (Nephroblastoma)

### Epidemiology

- usually diagnosed between 2-5 yr; M=F
  - most common primary renal neoplasm of childhood
  - 5-10% of cases both kidneys are affected (simultaneously or in sequence)

### Differential Diagnosis

- hydronephrosis, polycystic kidney disease, renal cell carcinoma, neuroblastoma

### Clinical Presentation

- 80% present with asymptomatic, unilateral abdominal mass
- may also present with hypertension, gross hematuria, abdominal pain, vomiting
- may have pulmonary metastases at time of diagnosis (respiratory symptoms)

### Associated Congenital Abnormalities

- WAGR syndrome (Wilms' tumour, Aniridia, Genital anomalies, mental Retardation) with 11p13 deletion
- Beckwith-Wiedemann syndrome
  - characterized by enlargement of body organs (especially tongue), hemihypertrophy, renal medullary cysts, and adrenal cytomegaly
  - also at increased risk for developing hepatoblastoma, and less commonly adrenocortical tumours, neuroblastomas and rhabdomyosarcomas
- Denys-Drash syndrome
  - characterized by gonadal dysgenesis and nephropathy leading to renal failure

### Management

- staging ± nephrectomy
- chemotherapy; radiation for higher stages

### Prognosis

- 90% long-term survival

## Neuroblastoma

### Epidemiology

- most common cancer occurring in first year of life
- neural crest cell tumour arising from sympathetic tissues (neuroblasts)

### Clinical Presentation

- can originate from any site in sympathetic nervous system, presenting as mass in neck, chest or abdomen mass (most common site is adrenal gland)
- signs and symptoms of disease vary with location of tumour
  - thoracic: dyspnea, Horner's syndrome
  - abdomen: palpable mass
  - spinal cord compression
- metastases are common at presentation (>50% present with advanced stage disease)
  - usually to bone or bone marrow (presents as bone pain, limp)
  - can also present with periorbital ecchymoses, abdominal pain, emesis, fever, weight loss, anorexia, hepatomegaly, "blueberry muffin" skin nodules
- paraneoplastic: hypertension, palpitations, sweating (from excessive catecholamines), diarrhea, FTT (from vasoactive intestinal peptide secretion), opsomyoclonus
- diagnostic criteria (either of the following):
  - unequivocal histologic diagnosis from tumour tissue biopsy
  - evidence of metastasis to bone marrow ("rosettes") on aspirate analysis, with concomitant elevation of urine or serum catecholamine metabolite (VMA, HVA) levels

### Management

- depends on prognostic factors and may include combination of: surgery, radiation, chemotherapy, bone marrow transplantation

### Prognosis

- prognosis is often poor due to late detection
- good prognostic factors:
  - "age and stage" are important determinants of better outcome: 12-18 mo, stage I, II, IV-S disease ("S" designates a "Special" classification only pertaining to infants)
  - primary site: posterior mediastinum and neck
  - low serum ferritin
  - specific histology
  - tumour cell markers: aneuploidy, absent MYCN oncogene amplification

## Bone Tumours

- see [Orthopedics](#), OR42

## Febrile Neutropenia

- see [Infectious Diseases](#), ID39

## Tumour Lysis Syndrome

- see [Hematology](#), H50

## Hyperleukocytosis

- total WBC  $>100 \times 10^9/L$
- common presenting feature of leukemia
- medical emergency
- leukostasis = symptomatic hyperleukocytosis
  - presents clinically with respiratory or neurological distress caused by hyperviscosity of blood
  - risk of intracerebral hemorrhage, pulmonary leukostasis syndrome, tumour lysis syndrome
- management: fluids, allopurinol/rasburicase, fresh frozen plasma/platelets to correct thrombocytopenia, induction chemotherapy, avoid transfusing RBCs unless symptomatic (and then use very small volumes)

## Lymphadenopathy

### Clinical Presentations

- features of malignant lymphadenopathy (LAD): firm, discrete, non-tender, enlarging, immobile,  $\pm$  suspicious mass/imaging findings,  $\pm$  'B' symptoms
- fluctuance, warmth or tenderness are more suggestive of benign nodes (infection)

Most common cause of acute bilateral cervical LAD is viral illness.

### Differential Diagnosis

- infection:
  - viral: URTI, EBV, CMV, adenovirus, HIV
  - bacterial: *S. aureus*, GAS, anaerobes, *Mycobacterium* (e.g. TB), cat scratch disease (*Bartonella*)
  - other: fungal, protozoan, *Rickettsia*
- auto-immune: rheumatoid arthritis, SLE, serum sickness
- malignancy: lymphoma, leukemia, metastatic solid tumours
- storage diseases: Niemann-Pick, Gaucher's
- other: sarcoidosis, Kawasaki disease, histiocytoses

### Investigations

- generalized LAD
  - CBC and differential, blood culture
  - uric acid, LDH
  - ANA, RF, ESR
  - EBV/CMV/HIV serology
  - toxoplasma titre
  - fungal serology
  - CXR
  - TB tests
  - biopsy
- regional LAD
  - period of observation if asymptomatic
  - trial of oral antibiotics
  - ultrasound
  - biopsy (especially if persistent  $>6$  wk and/or 'B' symptoms)

# Infectious Diseases

## Fever

### Definition

- fever: no generally accepted definition, a practical definition is  $>38^{\circ}$  oral or rectal
- fever without a source/focus: acute febrile illness (typically  $<10$  d duration) with no cause of fever even after careful history and physical
- fever of unknown origin: daily or intermittent fevers for at least 2 consecutive weeks of uncertain cause after careful history and physical and initial laboratory assessment

### Etiology

- infectious: anatomic approach (CNS, ears, upper and lower respiratory tract, GI, GU, skin, soft tissue, bones and joints, etc.)
- inflammatory: mainly autoimmune (Kawasaki Disease, JIA, IBD, SLE, etc.)
- malignancy: childhood cancers (leukemia, lymphoma, neuroblastoma, etc.)
- miscellaneous: dehydration, drugs and toxins, post-immunization, familial dysautonomia, factitious disorder, etc.

### Diagnosis

- history: duration, height and pattern of fever, associated symptoms, exposures, constitutional symptoms, ethnic or genetic background, day care, sick contacts, travel
- physical: toxic vs. non-toxic, vitals, growth, complete exams of the: skin, HEENT, chest, abdomen, lymph nodes, genitalia
- investigations: guided by history, physical exam and clinical suspicion; see Figure 11 for guidelines for children from 0-3 yr old

### Evaluation of Neonates and Infants with Fever

- several protocols exist that attempt to identify neonates and young infants at low risk of serious bacterial infection (e.g. Rochester Criteria)
  - such protocols are not as sensitive in the 1-28 d age group; therefore, febrile neonates should be considered high risk regardless of clinical presentation and laboratory findings

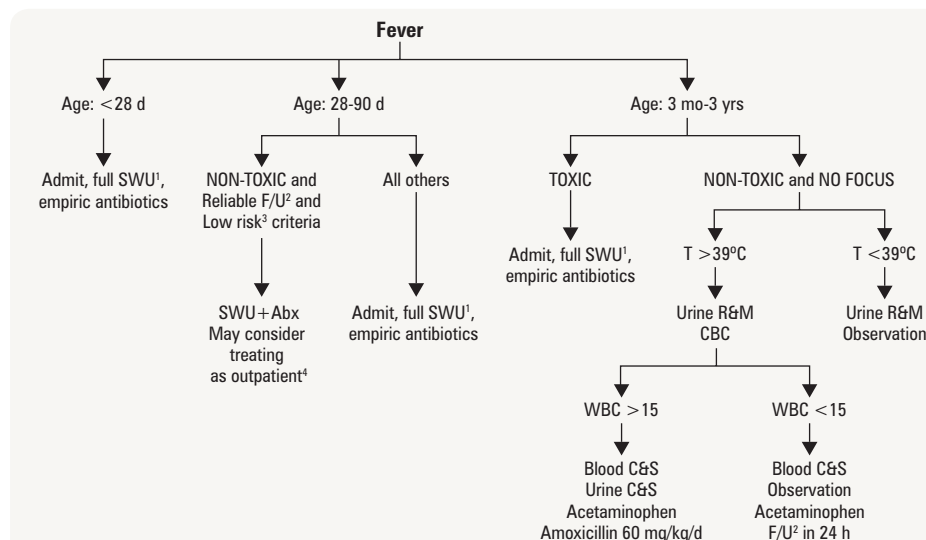

### Management

- admit to hospital if appropriate
- treat the source if known
- replace fluid losses (e.g. from vomiting, diarrhea, etc.); maintenance fluid needs are higher in febrile child
- reassure parents that most fevers are benign and self-limited
- antipyretics are not necessary in most cases, but can be given if child is uncomfortable (acetaminophen and/or ibuprofen)

**Rochester Criteria – developed to identify infants  $\leq 60$  d of age with fever at low risk of serious bacterial infection**

Clinically	Well
WBC count	$5-15 \times 10^9/L$
Bands	$<1.5 \times 10^9/L$
Urinalysis	10 WBC/HPF
Stool (if diarrhea)	5 WBC/HPF
Past Health	Born $>37$ wk Home with/before mom No hospitalizations No prior antibiotic use No prior treatment for unexplained hyperbilirubinemia No chronic disease

#### NOTES

- Full Septic Workup (SWU) – blood C&S, CBC and differential, urine R&M, C&S, LP, CXR if respiratory symptoms, stool C&S if GI symptoms
- Follow-up is crucial – if adequate F/U is not assured, a more aggressive diagnostic and therapeutic approach may be indicated
- Low-Risk (Rochester) Criteria
- Considerable practice variation exists in terms of empiric antibiotics treatment
- Important Principles – the younger the child, the greater the difficulty to clinically assess the degree of illness

Figure 11. Approach to the febrile child

## Acute Otitis Media (AOM)

### Definition

All of:

1. presence of middle ear effusion (MEE)
2. presence of middle ear inflammation (MEI)
3. acute onset of symptoms of MEE and MEI

### Epidemiology

- most frequent diagnosis in sick children visiting clinicians' offices and most common reason for antibiotic administration
- peak incidence between 6-15 mo; ~85% of children have >1 episode by 3 yr old
- seasonal variability: peaks in winter

### Etiology

- primary defect causing AOM: Eustachian tube dysfunction/obstruction → stasis/colonization by pathogens
- bacterial: *S. pneumoniae*, non-typable *H. influenzae*, *M. catarrhalis*, Group A *Streptococcus*, *S. aureus*
- viral: RSV, influenza, parainfluenza, adenovirus
- commonly due to bacterial/viral co-infection

### Risk Factors

- non-modifiable: young age, family history of OM, prematurity, orofacial abnormalities, immunodeficiencies, Down syndrome, race and ethnicity
- modifiable: lack of breastfeeding, day care attendance, household crowding, exposure to cigarette smoke and air pollution, pacifier use

### Diagnosis

- history
  - acute onset of otalgia or ear tugging in a preverbal child, otorrhea, decreased hearing
  - unexplained irritability, fever, upper respiratory symptoms, poor sleeping, anorexia, nausea, vomiting and diarrhea
- physical
  - febrile
  - MEE on otoscopy: immobile tympanic membrane, acute otorrhea, loss of bony landmarks, opacification of TM, air-fluid level behind TM
  - MEI on otoscopy: bulging TM with marked discolouration (hemorrhagic, red, grey, or yellow)

### Management

- observation for 48-72 h without antimicrobials may be appropriate since >80% of AOM in children resolve spontaneously
- criteria for watchful waiting approach:
  - child is >6 mo old
  - child does not have immunodeficiency, chronic cardiac or pulmonary disease, anatomical abnormalities of the head or neck, a history of complicated otitis media (suppurative complications of chronic perforation) or Down syndrome
  - the illness is not severe – otalgia appears to be mild and fever is <39°C in the absence of antipyretics
  - parents are capable of recognizing signs of worsening illness and can readily access medical care if the child does not improve
- antimicrobials are indicated if child does not meet the criteria for watchful waiting or does not improve/worsens during observation (Table 23)
- maintain hydration
- symptomatic relief: acetaminophen, ibuprofen
- referral to otolaryngology for myringotomy and tympanostomy tubes may be warranted for recurrent infections (see [Otolaryngology](#), OT39 for indications)

**Table 23. Treatment of AOM**

Antimicrobial Agents for Acute Otitis Media (AOM)
<b>First-line treatment (no penicillin allergy):</b> Amoxicillin: 75 mg/kg/d to 90 mg/kg/d divided three times per day
<b>Second-line treatment:</b> Cefprozil: 30 mg/kg/d divided twice per day Cefuroxime axetil: 30 mg/kg/d divided twice per day Ceftriaxone: 50 mg/kg intramuscularly (or intravenously) x 1 dose Azithromycin: 10 mg/kg OD x 1 dose, then 5 mg/kg OD x 4 doses Clarithromycin: 15 mg/kg/d divided twice per day
<b>If initial therapy fails (i.e. no symptomatic improvement after 2-3 d):</b> Amoxicillin-clavulanate: 90 mg/kg/d amoxicillin, 6.4 mg/kg/d clavulanate divided twice per day for 10 d If AOM-related symptoms do not resolve with amoxicillin/clavulanate, a course of ceftriaxone 50 mg/kg/d intramuscularly (or intravenously) once per day x 3 doses could be considered

#### Management of Acute Otitis Media

*Paediatr Child Health* 2009;14:457-460

**Purpose:** Updates a previous document published in 1998.

**Study:** Evidence-based guideline by the Canadian Pediatric Society (CPS).

**Recommendations:** The watchful waiting approach (observation for 48-72 h without antibiotics) is appropriate except for:

- Children ≤6 mo
- Children with immunodeficiency
- Children with chronic cardiac or pulmonary disease
- Children with anatomical abnormalities of the head or neck
- History of complicated otitis media
- Children with Down syndrome
- Parent are incapable of recognizing signs of worsening illness or cannot readily access medical care if child does not improve
- If the child's status worsens or fails to improve in 48-72 h, antibiotic treatment must be started.

**Complications**

- extracranial:
  - hearing loss and speech delay (secondary to persistent MEE), TM perforation, extension of suppurative process to adjacent structures (mastoiditis, petrositis, labyrinthitis), cholesteatoma, facial nerve palsy, middle ear atelectasis, ossicular necrosis, vestibular dysfunction
- intracranial:
  - meningitis, epidural and brain abscess, subdural empyema, lateral and cavernous sinus thrombosis, carotid artery thrombosis

## Diphtheria

**Definition**

- upper respiratory bacterial illness caused by *Corynebacterium diphtheriae*
- characterized by pharyngitis, low-grade fever, and nasopharyngeal pseudomembranes released by bacteria (with possible dermatologic, cardiac and/or nervous system involvement)

**Epidemiology**

- routine immunization has significantly reduced morbidity and mortality
- diphtheria now very rare

**Etiology**

- caused by lysogenized phage
- transmitted by direct contact or droplet spread; incubation period is 2-5 d

**Risk Factors**

- unvaccinated, immunocompromised, travel to or inhabitants of endemic countries

**History**

- early symptoms similar to a common cold: low-grade fever, sore throat, anorexia, malaise
- later symptoms (due to Diphtheria toxin): pallor, diaphoresis, stupor, coma

**Physical**

- grey membranes may cover tonsils and soft palate (at day 2-3); becomes greenish or black with hemorrhage
- cervical lymphadenopathy; "bull neck" secondary to submandibular edema in severe disease

**Investigations**

- throat culture (specifically state that diphtheria is suspected as some labs only look for group A *Streptococcus* on routine throat cultures)

**Management**

- treat based on clinical suspicion; awaiting culture results will postpone treatment and worsen prognosis
- diphtheria antitoxin
- penicillin G or erythromycin (halts further toxin production and prevents carrier state)

**Prognosis**

- 5-10 % mortality for respiratory diphtheria
- complications: airway obstruction, recurrent laryngeal nerve palsy
- associated conditions: diphtheritic peripheral neuritis, myocarditis

## Gastroenteritis

**Definition**

- inflammation (generally of infectious etiology) of the stomach and small intestine leading to illness characterized by nausea, vomiting and diarrhea

**Epidemiology**

- cause of 3-5 million childhood deaths annually worldwide
- viral gastroenteritis most commonly affects children aged 6 mo – 5 yr

**Etiology**

- viral (rotavirus, adenovirus, astrovirus), bacterial (*E. coli*, *Salmonella*, *Shigella*, *Campylobacter*) or parasitic (*Giardia lamblia*)
- rotavirus in ~50% of cases; primarily transmitted fecal-orally; incubation period of ~2 d
- antibiotic-associated (*Clostridium difficile*)

**Risk Factors**

- young age, day care attendance, infected household member, immunocompromised, antibiotic use (*Clostridium difficile*)

**History**

- non-specific: diarrhea, vomiting, fever, anorexia, headache, myalgias, abdominal cramps
- bacterial and parasitic agents more common in older children (2-4 yr): blood and/or mucous in stool, recent travel, consumption of unprocessed meats, recent antibiotic use or hospitalization
- recent infectious contacts: symptoms usually begin 24-48 h after exposure

**Physical**

- febrile
- dehydrated: must assess extent (see *Dehydration*, P79)

**Investigations**

- not usually necessary in young children
- stool analysis: leukocytes/erythrocytes suggests bacterial or parasitic etiology; pH <6 and presence of reducing substances suggests viral etiology

**Management**

- re-hydration: replace deficits, ongoing losses and maintenance needs (see P79)
- oral rehydration therapy (ORT) preferred for mild-moderate dehydration in acute gastroenteritis
- antiemetics may reduce vomiting, but increase diarrhea
- regular diet of small frequent feeds recommended in mild illness
- may return to age-appropriate diet once re-hydrated and vomiting stops
- antibiotics or antiparasitic agents sometimes indicated in bacterial or parasitic gastroenteritis
- promote regular hand-washing and return to school 24 h after last diarrheal episode to prevent transmission
- oral rotavirus vaccine now available in Canada

**Complications**

- viral gastroenteritis usually self-limiting (lasts 3-7 d in most cases)
- adverse effects related to hypovolemia, shock, tissue acidosis, and rapid onset and over-correction of electrolyte imbalances
- death in severe dehydration (rare in developed countries)

## HIV Infection

- see [Infectious Diseases](#), ID41

**Epidemiology**

- 20-30% risk of vertical transmission in untreated HIV infected women, <1% with antiretroviral treatment during pregnancy and perinatally

**Transmission**

- infants and children: most often vertical (transplacentally in majority, maternal blood, exposure to infected secretions during delivery, breast milk)
- adolescents: sexual intercourse, needles (IV drug use and tattoos), blood products (rare)

**Risk Factors**

- HIV positive mother or mother with HIV positive partner
- IV illicit drug use (IVDU)
- unprotected sex
- sexual abuse
- receipt of blood products (rare)

**Clinical Features of AIDS in Infants and Children**

- signs and symptoms occur often within the first year, most within 2 yr of age
- encephalopathy, recurrent/persistent thrush, persistent diaper candidiasis, chronic interstitial pneumonitis (relatively common), opportunistic infections (especially *Pneumocystis jiroveci* (PJP) pneumonia), hepatomegaly, lymphadenopathy, failure to thrive

**Management**

- adequate nutrition (breastfeeding contraindicated in developed countries)
- suppression of HIV with HAART
- prompt treatment of infections
- prophylaxis:
  - TMP/SMX for PJP, azithromycin for mycobacterium avium complex (MAC); nystatin, ketoconazole, acyclovir if indicated
  - all routine immunizations (including live vaccines if well), but avoid oral-polio vaccine and BCG

## Infectious Pediatric Exanthems

Disease	Pathogen(s)	Incubation period	Communicability	Mode of Transmission	Rash	Associated Features	Management	Outcomes and complications
<b>Erythema Infectiosum (aka Fifth Disease)</b>	Parvovirus B19	4-14 d	Low risk of transmission once symptomatic	Respiratory secretions or infected blood	Appearance: uniform, erythematous maculopapular 'lacy' rash Timing: 10-17 d after symptoms (immune response) Distribution: bilateral cheeks ('slapped cheeks') with circumoral sparing; may affect trunk and extremities	Initial 7-10 d of flu-like illness and fever Rash may be warm, non-tender, and pruritic Less common presentations include 'gloves and socks syndrome' or STAR complex (sore throat, arthritis, rash)	Supportive	Rash fades over days to week, but may reappear months later with sunlight, exercise Aplastic crisis
<b>Gianotti-Crosti Syndrome (aka Papular Acrodermatitis)</b>	EBV and Hep B (majority)	Variable	None	—	Appearance: asymptomatic symmetric papules Distribution: face, cheeks, extremities, spares trunk bilateral cheeks	Viral prodrome May have lymphadenopathy and/or hepatosplenomegaly	Supportive	Resolves in 3-12 wk
<b>Hand, Foot and Mouth Disease</b>	Coxsackie group A	3-5 d	Likely 1-7 d after symptoms but may be up to months	Direct and indirect contact with infected bodily fluids, fecal-oral	Appearance: vesicles and pustules on an erythematous base Distribution: acral	Enanthem: vesicles in the POSTERIOR oral cavity (pharynx, tongue)	Supportive	Mainly dehydration
<b>Herpes Simplex</b>	HSV 1,2	1-26 d	Direct contact, often through saliva for HSV-1 and sexual contact for HSV-2	Direct contact with infected secretions or mucuous membranes	Grouped vesicles on an erythematous base	Enanthem: vesicles/erosions in the ANTERIOR oral cavity (buccal mucosa, tongue) May present with herpetic whitlow (autoinoculation)	Mainly supportive Consider oral or topical antivirals	Local: secondary skin infections, keratitis, gingivostomatitis CNS: encephalitis Disseminated hepatitis, DIC
<b>Kawasaki Disease</b>	See P100							
<b>Measles</b>	Morbillivirus	8-13 d	4 d before and after rash	Airborne	Appearance: erythematous maculopapular Timing: 3 d after start of symptoms Distribution: starts at hairline and spreads downwards with sparing of palms and soles	Prodrome of cough, coryza, conjunctivitis (3 Cs) Enanthem: Koplik's spots 1-2 d before rash Desquamation Positive serology for measles IgM	Infected: symptomatic Unimmunized contacts: measles vaccine within 72 h of exposure or IgG within 6 d of exposure Respiratory isolation, report to public health Prevention: MMR vaccine	Secondary bacterial infections: AOM, sinusitis, pneumonia Encephalitis Rare: myocarditis, pericarditis, thrombocytopenia, Stevens-Johnson syndrome, glomerulonephritis, subacute sclerosing panencephalitis

Disease	Pathogen(s)	Incubation period	Communicability	Mode of Transmission	Rash	Associated Features	Management	Outcomes and complications
<b>Non-Specific Enteroviral Exanthems</b>	Enteroviruses	Variable	Variable	Direct and indirect contact with infected bodily fluids	Polymorphous rash (macules, papules, vesicles, petechiae, utricaria)	Systemic involvement is rare, but possible	Supportive Diagnosis confirmed using viral cultures (NP and rectal swabs)	Self-limiting
<b>Rosela</b>	HHV 6	5-15 d	Unknown	—	Appearance: blanching, pink, maculopapular Timing: appears once fever subsides Distribution: starts at the neck and trunk and spreads to the face and extremities	High grade fever Common: irritability, anorexia lymphadenopathy, erythematous TM and pharynx, Nagayama sign Less common: cough, coryza, bulging fontanelles	Supportive	CNS: febrile seizures (10-25%), aseptic meningitis Thrombocytopenia
<b>Rubella</b>	Rubivirus	14-21 d	7 d before and after eruptions	Droplet	Appearance: pink, maculopapular Timing: 1-5 d after start of symptoms Distribution: starts on face and spreads to neck and trunk	Prodrome of low grade fever and occipital/retroauricular nodes STAR complex (sore throat, arthritis, rash) Positive serology for rubella IgM	Infected: symptomatic Prevention: MMR vaccine Report to public health	Excellent prognosis with acquired disease Arthritis may last days to weeks Encephalitis Irreversible defects in congenitally infected patients (i.e. congenital rubella syndrome)
<b>Scarlet Fever</b>	See P61							
<b>Varicella</b>	Varicella zoster virus	0-21 d	1-2 d pre-eruptions and 5 d post-eruption	Mainly airborne, but also through direct contact with vesicle fluid	Appearance: crops of skin lesions, polymorphic, from macules to papules to vesicles to crusts Timing: 1-3 d after start of symptoms Distribution: generalized	Significant pruritis Enanthem: vesicular lesions which may become pustular or ulcerate	Supportive Avoid salicylates (due to risk of Reye syndrome) Consider antivirals Respiratory and contact isolation, report to public health Prevention: varicella vaccine	Skin: bacterial suprainfection, necrotizing fasciitis CNS: acute encephalitis and cerebellar ataxia Systemic: hepatitis, DIC Congenital varicella syndrome if intrapartum infection

## Infectious Mononucleosis

### Definition

- systemic viral infection caused by Epstein-Barr virus (EBV) with multivisceral involvement; often called “the great imitator”

### Epidemiology

- peak incidence between 15-19 yr old
- ~50% of children in developed countries have a primary EBV infection by 5 yr old, but <10% of children develop clinical infection

### Etiology

- EBV: a member of herpesviridae
- transmission is mainly through infected saliva (“kissing disease”) and sexual activity (less commonly); incubation period of 1-2 mo

### Risk Factors

- infectious contacts, sexually active, multiple sexual partners in the past

### History

- prodrome: 2-3 d of malaise, anorexia
- infants and young children: often asymptomatic or mild disease
- older children and adolescents: malaise, fatigue, fever, sore throat, abdominal pain (often LUQ), headache, myalgia

### Physical

- classic triad: febrile, generalized non-tender lymphadenopathy, pharyngitis/tonsillitis (exudative)
- ± hepatosplenomegaly
- ± periorbital edema, ± rash (urticarial, maculopapular or petichial) – more common after inappropriate treatment with  $\beta$  lactam antibiotics
- any “-itis” (including arthritis, hepatitis, nephritis, myocarditis, meningitis, encephalitis, etc.)

### Investigations

- heterophil antibody test (Monospot® test)
  - 85% sensitive in adults and older children, but only 50% sensitive if <4 yr of age
  - false positive results with HIV, SLE, lymphoma, rubella, parvovirus
- EBV titres
- CBC and differential, blood smear: atypical lymphocytes, lymphocytosis, Downey cells, ± anemia, ± thrombocytopenia
- throat culture to rule out streptococcal pharyngitis

### Management

- supportive: adequate rest, hydration, saline gargles and analgesics for sore throat
- splenic enlargement is often not clinically apparent so all patients should avoid contact sports for 6-8 wk
- if airway obstruction secondary to nodal and/or tonsillar enlargement is present (especially younger children), admit for steroid therapy
- acyclovir does NOT reduce duration of symptoms or result in earlier return to school/work

### Prognosis

- most acute symptoms resolve in 1-2 wk, though fatigue may last for months
- short-term complications: splenic rupture, Guillain-Barré syndrome

## Infectious Pharyngitis/Tonsillitis

### Definition

- inflammation of the pharynx, especially the tonsils if present, causing a sore throat

### Etiology

- viral (~80%): adenoviruses, enteroviruses, coxsackie, upper respiratory tract viruses, EBV, CMV
- bacterial (~20%): mainly Group A *Streptococcus*, *M. pneumonia* (older children), *N. gonorrhea* (sexually active), *C. diphtheriae* (unvaccinated)
- fungal: *Candida*

### Epidemiology

- season: GAS pharyngitis more common in late winter or early spring; viral all yr long
- age: GAS pharyngitis peak incidence at 5-12 yr of age and uncommon <3 yr; viral pharyngitis affects all ages

## History

- GAS: sore throat (may be severe), fever, malaise, headache, abdominal pain, N/V, absence of other URTI symptoms
- viral: sore throat (often mild), conjunctivitis, cough, rhinorrhea, hoarseness, diarrhea, flu-like symptoms (fever, malaise, myalgias)

## Physical

- GAS: febrile, pharyngeal/tonsillar erythema and exudates, enlarged (>1 cm) and tender anterior cervical lymph nodes, palatal petechiae, strawberry tongue, scarlatiniform rash
- viral: afebrile, absent/mild tonsillar exudates, minor and non-tender adenopathy, viral exanthems

## Investigations

- no single sign or symptom reliably identifies GAS as the causative organism in children with sore throat
- scores are used to predict if throat culture will be positive (e.g. McIsaac Criteria)
  - these score systems have not been found to be sensitive or specific enough to diagnose GAS in children and adolescents with sore throat
- suspected diagnosis of GAS pharyngitis should be confirmed with a rapid streptococcal antigen test and a follow-up throat culture if the rapid test is negative

## Management

- antibiotics (for group A *Streptococcus/S. pyogenes*)
  - penicillin V or amoxicillin or erythromycin (if penicillin allergy) x 10 d
  - can prevent rheumatic fever if given within 9 d of symptoms; does NOT alter risk of post-streptococcal glomerulonephritis
- supportive: hydration and acetaminophen for discomfort due to pain and/or fever
- follow-up: if uncomplicated course, no follow-up or post-antibiotic throat cultures needed
- prophylaxis: consider tonsillectomy for proven, recurrent streptococcal tonsillitis

## Complications

- preventable with antibiotics: AOM, sinusitis, cervical adenitis, mastoiditis, retropharyngeal/peritonsillar abscess, sepsis
